### With antimicrobials

See notes above for comment on compound preparations

**Canesten HC® (Bayer Consumer Care) (BN)**

**Cream**, hydrocortisone 1%, clotrimazole 1%, net price 30 g = £2.42. Label: 28, counselling, application, see p. 788. Potency: mild

**Excipients** include benzyl alcohol, cetostearyl alcohol, hydroxybenzoates (parabens)

**Note** A 15-g tube is on sale to the public for the treatment of athlete’s foot and fungal infection of skin folds with associated inflammation

**Daktacort® (Janssen) (BN)**

**Cream**, hydrocortisone 1%, miconazole nitrate 2%, net price 30 g = £2.49. Label: 28, counselling, application, see p. 788. Potency: mild

**Excipients** include butylated hydroxyanisole, disodium edetate

### Cautions

**interactions** Appendix 1 (antifungals, imidazole)

**Dental prescribing on NHS** May be prescribed as Miconazole and Hydrocortisone Cream for max. 7 days

**Note** A 15-g tube is on sale to the public for the treatment of athlete’s foot and candidal intertrigo

**Ointment**, hydrocortisone 1%, miconazole nitrate 2%, net price 30 g = £2.50. Label: 28, counselling, application, see p. 788. Potency: moderate

**Excipients** none as listed in section 13.1.3

**Note** If stinging occurs, manufacturer advises dilute to half-strength with aqueous cream for 1 week then transfer to undiluted preparation (but see section 13.1.1 for advice to avoid dilution where possible)

### With antimicrobials

See notes above for comment on compound preparations

**Locoid® (Astellas) (BN)**

**Creme**, hydrocortisone butyrate 0.1%, net price 30 g = £1.69, 100 g = £4.93. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include cetostearyl alcohol, hydroxybenzoates (parabens)

**Lipocream**, hydrocortisone butyrate 0.1%, net price 30 g = £1.69, 100 g = £5.17. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include benzyl alcohol, cetostearyl alcohol, hydroxybenzoates (parabens)

**Note** For bland cream basis see Lipobase®, section 13.2.1

**Ointment**, hydrocortisone butyrate 0.1%, net price 30 g = £1.60, 100 g = £4.93. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include cetostearyl alcohol, hydroxybenzoates (parabens)

**Scalp lotion**, hydrocortisone butyrate 0.1%, in an aqueous isopropyl alcohol basis, net price 100 mL = £6.83. Label: 15, 28, counselling, application, see p. 788. Potency: potent

**Excipients** none as listed in section 13.1.3

**Locoid Crelo® (Astellas) (BN)**

**Lotion** (topical emulsion), hydrocortisone butyrate 0.1% in a water-miscible basis, net price 100 g (with applicator nozzle) = £5.91. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include butylated hydroxytoluene, cetostearyl alcohol, hydroxybenzoates (parabens), propylene glycol

### HYDROCORTISONE BUTYRATE

**Indications** Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids; psoriasis, see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**

- Apply thinly 1–2 times daily

**Lipocream**, hydrocortisone butyrate 0.1%, net price 30 g = £1.69, 100 g = £5.17. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include cetostearyl alcohol, hydroxybenzoates (parabens)

**Note** For bland cream basis see Lipobase®, section 13.2.1

**Ointment**, hydrocortisone butyrate 0.1%, net price 30 g = £1.60, 100 g = £4.93. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include cetostearyl alcohol, hydroxybenzoates (parabens)

**Scalp lotion**, hydrocortisone butyrate 0.1%, in an aqueous isopropyl alcohol basis, net price 100 mL = £6.83. Label: 15, 28, counselling, application, see p. 788. Potency: potent

**Excipients** none as listed in section 13.1.3

**Lipocream**, hydrocortisone butyrate 0.1%, net price 30 g = £1.69, 100 g = £5.17. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include cetostearyl alcohol, hydroxybenzoates (parabens)

**Note** For bland cream basis see Lipobase®, section 13.2.1

**Ointment**, hydrocortisone butyrate 0.1%, net price 30 g = £1.60, 100 g = £4.93. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include cetostearyl alcohol, hydroxybenzoates (parabens)

**Scalp lotion**, hydrocortisone butyrate 0.1%, in an aqueous isopropyl alcohol basis, net price 100 mL = £6.83. Label: 15, 28, counselling, application, see p. 788. Potency: potent

**Excipients** none as listed in section 13.1.3

### ALCLOMETASONE DIPROPIONATE

**Indications** inflammatory skin disorders such as eczemas

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**

- Apply thinly 1–2 times daily

---

**ALCLOMETASONE DIPROPIONATE**

**Indications** Severe inflammatory skin disorders such as eczemas

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**

- Apply thinly 1–2 times daily
Modrasone® (TEVA UK) ¶
Cream, alclometasone dipropionate 0.05%, net price 50 g = £2.68. Label: 28, counselling, application, see p. 788. Potency: moderate
Excipients include cetostearyl alcohol, chlorocresol, propylene glycol

BECLOMETASONE DIPROPIONATE
(Butamethasone dipropionate)

Indications severe inflammatory skin disorders such as eczema unresponsive to less potent corticosteroids; psoriasis, see notes above
Cautions see notes above
Contra-indications see notes above
Side-effects see notes above
Dose
• Apply thinly 1–2 times daily
Beclometasone (Non-proprietary) ¶
Cream, beclometasone dipropionate 0.025%, net price 30 g = £68.00. Label: 28, counselling, application, see p. 788. Potency: potent
Ointment, beclometasone dipropionate 0.025%, net price 30 g = £68.00. Label: 28, counselling, application, see p. 788. Potency: potent

BETAMETHASONE ESTERS

Indications severe inflammatory skin disorders such as eczema unresponsive to less potent corticosteroids; psoriasis, see notes above
Cautions see notes above
Contra-indications see notes above
Side-effects see notes above
Dose
• Apply thinly 1–2 times daily
Betnovate® (GSK) ¶
Cream, betamethasone (as valerate) 0.1% in a water-miscible basis, net price 30 g = £1.43, 100 g = £4.05. Label: 28, counselling, application, see p. 788. Potency: potent
Excipients include cetostearyl alcohol, chlorocresol
Ointment, betamethasone (as valerate) 0.1% in an anhydrous paraffin basis, net price 30 g = £1.43, 100 g = £4.05. Label: 28, counselling, application, see p. 788. Potency: potent
Excipients include cetostearyl alcohol, chlorocresol
Scalp application, betamethasone (as valerate) 0.1% in a water-miscible basis, net price 100 mL = £4.58. Label: 28, counselling, application, see p. 788. Potency: potent
Excipients include cetostearyl alcohol, hydroxybenzoates (parabens)

With salicylic acid
See notes above for comment on compound preparations
For prescribing information on salicylic acid, see, p. 800

Diprosalic® (MSD) ¶
Ointment, betamethasone (as dipropionate) 0.05%, salicylic acid 3%, net price 30 mL = £2.73, 100 mL = £7.80. Label: 28, counselling, application, see p. 788. Potency: potent
Excipients none as listed in section 13.1.3
Dose apply thinly 1–2 times daily; max. 60 g per week
Scalp application, betamethasone (as dipropionate) 0.05%, salicylic acid 2%, in an alcoholic basis, net price 100 mL = £10.10. Label: 28, counselling, application, see p. 788. Potency: potent
Excipients include disodium edetate
Dose apply a few drops 1–2 times daily
With antimicrobials
See notes above for comment on compound preparations

Betamethasone and cloquinol (Non-proprietary)  
Cream, betamethasone (as valerate) 0.1%, cloquinol 3%, net price 30 g = £9.48. Label: 28, counselling, application, see p. 788. Potency: potent
Excipients  may include cetostearyl alcohol, chlorocresol
Note  Stains clothing

Ointment, betamethasone (as valerate) 0.1%, cloquinol 3%, net price 30 g = £9.48. Label: 28, counselling, application, see p. 788. Potency: potent
Note  Stains clothing

Betamethasone and neomycin (Non-proprietary)  
Cream, betamethasone (as valerate) 0.1%, neomycin sulfate 0.5%, net price 30 g = £9.48, 100 g = £28.01. Label: 28, counselling, application, see p. 788. Potency: potent
Excipients  may include cetostearyl alcohol, chlorocresol

Ointment, betamethasone (as valerate) 0.1%, neomycin sulfate 0.5%, net price 30 g = £9.48, 100 g = £28.01. Label: 28, counselling, application, see p. 788. Potency: potent

Fucibet® (LEO)  
Cream, betamethasone dipropionate 0.064% (equiv betamethasone 0.05%), clotrimazole 1%, net price 30 g = £6.34. Label: 28, counselling, application, see p. 788. Potency: potent
Excipients  include benzyl alcohol, cetostearyl alcohol, chlorocresol

Lotiderm® (TEVA UK)  
Cream, betamethasone dipropionate 0.064% (equiv betamethasone 0.05%), clotrimazole 1%, net price 30 g = £6.34. Label: 28, counselling, application, see p. 788. Potency: potent
Excipients  include benzyl alcohol, cetostearyl alcohol, propylene glycol

CLOBETASOL PROPIONATE

Indications  short-term treatment only of severe resistant inflammatory skin disorders such as recalcitrant eczemas unresponsive to less potent corticosteroids; psoriasis, see notes above

Cautions  see notes above
Contra-indications  see notes above
Side-effects  see notes above

Dose  
• Apply thinly 1–2 times daily

1 Eumovate® (GSK)  
Cream, clobetasol propionate 0.05%, net price 30 g = £1.86, 100 g = £5.44. Label: 28, counselling, application, see p. 788. Potency: moderate
Excipients  include beeswax substitute, cetostearyl alcohol, chlorocresol

Ointment, clobetasol propionate 0.05%, net price 30 g = £2.69, 100 g = £7.90. Label: 28, counselling, application, see p. 788. Potency: very potent
Excipients  include beeswax (or beeswax substitute), cetostearyl alcohol, chlorocresol, propylene glycol

CLOBETASONE BUTYRATE

Indications  eczemas and dermatitis of all types; maintenance between courses of more potent corticosteroids

Cautions  see notes above
Contra-indications  see notes above
Side-effects  see notes above

Dose  
• Apply thinly 1–2 times daily

1 Eumovate® (GSK)  
Cream, clobetasone butyrate 0.05%, net price 30 g = £1.86, 100 g = £5.44. Label: 28, counselling, application, see p. 788. Potency: moderate
Excipients  include beeswax substitute, cetostearyl alcohol, chlorocresol

Ointment, clobetasone butyrate 0.05%, net price 30 g = £1.86, 100 g = £5.44. Label: 28, counselling, application, see p. 788. Potency: moderate
Excipients  none as listed in section 13.1.3

With antimicrobials  See notes above for comment on compound preparations

Clobetasol with neomycin and nystatin (Non-proprietary)  
Cream, clobetasol propionate 0.05%, neomycin sulfate 0.5%, nystatin 100 000 units/g, net price 30 g = £64.00. Label: 28, counselling, application, see p. 788. Potency: very potent
Excipients  none as listed in section 13.1.3

Ointment, clobetasol propionate 0.05%, neomycin sulfate 0.5%, nystatin 100 000 units/g, in a paraffin basis, net price 30 g = £64.00. Label: 28, counselling, application, see p. 788. Potency: very potent

With antimicrobials  See notes above for comment on compound preparations

Trimovate® (GSK)  
Cream, clobetasol propionate 0.05%, oxytetracycline 3% (as calcium salt), nystatin 100 000 units/g, net price 30 g = £3.29. Label: 28, counselling, application, see p. 788. Potency: very potent
Excipients  include cetostearyl alcohol, chlorocresol, sodium metabisulphite
Note  Stains clothing

1. Cream can be sold to the public for short-term symptomatic treatment and control of patches of eczema and dermatitis (but not seborrhoeic dermatitis) in adults and children over 12 years provided pack does not contain more than 15 g
**DIFLUCORTOLONE VALERATE**

**Indications**  severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids; high strength (0.3%), short-term treatment of severe exacerbations; psoriasis, see notes above

**Cautions**  see notes above

**Contra-indications**  see notes above

**Side-effects**  see notes above

**Dose**  
- Apply thinly 1–2 times daily for up to 4 weeks (0.1% preparations) or 2 weeks (0.3% preparations), reducing strength as condition responds; max. 60 g of 0.3% per week

**Nerisone® (Meadow)**

- **Cream**, difluorotolone valerate 0.1%, net price 30 g = £1.59. Label: 28, counselling, application, see p. 788. Potency: potent
- **Excipients**  include disodium edetate, hydroxybenzoates (parabens), stearyl alcohol
- **Oily cream**, difluorotolone valerate 0.1%, net price 30 g = £2.56. Label: 28, counselling, application, see p. 788. Potency: potent
- **Excipients**  include beeswax
- **Ointment**, difluorotolone valerate 0.1%, net price 30 g = £1.59. Label: 28, counselling, application, see p. 788. Potency: potent
- **Excipients**  none as listed in section 13.1.3

**Nerisone Forte® (Meadow)**

- **Oily cream**, difluorotolone valerate 0.3%, net price 15 g = £2.09. Label: 28, counselling, application, see p. 788. Potency: very potent
- **Excipients**  include beeswax
- **Ointment**, difluorotolone valerate 0.3%, net price 15 g = £2.09. Label: 28, counselling, application, see p. 788. Potency: very potent
- **Excipients**  none as listed in section 13.1.3

**FLUCINOLONE ACETONIDE**

**FLUOCINOLONE ACETONIDE**

(0.025%, net price 30 g = £4.14, 100 g = £11.75. Label: 28, counselling, application, see p. 788. Potency: potent
- **Excipients**  include benzyl alcohol, cetostearyl alcohol, polysorbates, propylene glycol
- **Gel**, fluocinolone acetonide 0.025%, net price 30 g = £5.36, 60 g = £10.02. For use on scalp and other hairy areas. Label: 28, counselling, application, see p. 788. Potency: potent
- **Excipients**  include hydroxybenzoates (parabens), propylene glycol
- **Ointment**, fluocinolone acetonide 0.025%, net price 30 g = £4.14, 100 g = £11.75. Label: 28, counselling, application, see p. 788. Potency: potent
- **Excipients**  include propylene glycol, wool fat

**Synalar® (GP Pharma)**

- **Cream**, fluocinolone acetonide 0.00625%, net price 50 g = £4.84. Label: 28, counselling, application, see p. 788. Potency: moderate
- **Excipients**  include benzyl alcohol, cetostearyl alcohol, polysorbates, propylene glycol
- **Ointment**, fluocinolone acetonide 0.00625%, net price 50 g = £4.84. Label: 28, counselling, application, see p. 788. Potency: moderate
- **Excipients**  include propylene glycol, wool fat

**Synalar 1 in 4 Dilution® (GP Pharma)**

- **Cream**, fluocinolone acetonide 0.0025%, net price 30 g = £4.58. Label: 28, counselling, application, see p. 788. Potency: mild
- **Excipients**  include benzyl alcohol, cetostearyl alcohol, polysorbates, propylene glycol

**Synalar 1 in 10 Dilution® (GP Pharma)**

- **Cream**, fluocinolone acetonide 0.00025%, net price 30 g = £4.14. Label: 28, counselling, application, see p. 788. Potency: very potent
- **Excipients**  include propylene glycol, wool fat

**FLUDROXYCORTIDE**

(13Skin

(0.0125%, net price 60 g = £2.09. Label: 28, counselling, application, see p. 788. Potency: potent
- **Excipients**  include propylene glycol, wool fat

**Haelan® (Tyrpharm)**

- **Cream**, fluorodrocortisone 0.0125%, net price 60 g = £3.26. Label: 28, counselling, application, see p. 788. Potency: moderate
- **Excipients**  include cetyl alcohol, propylene glycol
- **Ointment**, fluodrocortisone 0.0125%, net price 60 g = £3.26. Label: 28, counselling, application, see p. 788. Potency: moderate
- **Excipients**  include beeswax, cetyl alcohol, polysorbate

- **Tape**, polyethylene adhesive film impregnated with fluorodrocortisone 4 micrograms/cm², net price 7.5 cm × 50 cm = £9.27, 7.5 cm × 200 cm = £24.95

- **Dose**  for chronic localised recalcitrant dermatoses (but not acute or weeping), cut tape to fit lesion, apply to clean, dry skin shorn of hair, usually for 12 hours daily

**SYNALAR**

See notes above for comment on compound preparations

**Synalar C® (GP Pharma)**

- **Cream**, fluocinolone acetonide 0.025%, cloquinol 3%, net price 15 g = £2.66. Label: 28, counselling, application, see p. 788. Potency: potent
- **Excipients**  include cetostearyl alcohol, disodium edetate, hydroxybenzoates (parabens), polysorbates, propylene glycol
- **Ointment**, fluocinolone acetonide 0.025%, cloquinol 3%, net price 15 g = £2.66. Label: 28, counselling, application, see p. 788. Potency: potent
- **Note**  stains clothing
- **Excipients**  include benzyl alcohol, cetostearyl alcohol, polysorbates, propylene glycol

**Synalar N® (GP Pharma)**

- **Cream**, fluocinolone acetonide 0.025%, neomycin sulfate 0.5%, net price 30 g = £4.36. Label: 28, counselling, application, see p. 788. Potency: potent
- **Excipients**  include cetyl alcohol, hydroxybenzoates (parabens), polysorbates, propylene glycol
- **Ointment**, fluocinolone acetonide 0.025%, neomycin sulfate 0.5%, in a greasy basis, net price 30 g = £4.36. Label: 28, counselling, application, see p. 788. Potency: potent
- **Excipients**  include propylene glycol, wool fat
MOMETASONE FUROATE

**Indications** severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids; psoriasis, see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**
- Apply thinly once daily (to scalp in case of lotion)

**Mometasone** (Non-proprietary) 

| Ointment | mometasone furoate 0.1%, net price 30 g = £3.24, 100 g = £10.80. Label: 28, counselling, application, see p. 788. Potency: potent
| Excipients | include beeswax

| Cream | mometasone furoate 0.1%, net price 30 g = £4.32, 100 g = £12.44. Label: 28, counselling, application, see p. 788. Potency: potent
| Excipients | include beeswax, propylene glycol

**Scalp lotion**

| mometasone furoate 0.1% in an aqueous isopropyl alcohol basis, net price 30 mL = £4.36. Label: 28, counselling, application, see p. 788. Potency: potent
| Excipients | include propylene glycol

**TRIAMCINOLONE ACETONIDE**

**Indications** severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids; psoriasis, see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**
- Apply thinly 1–2 times daily

**Aureocort** (AMCo)

| Ointment | triamcinolone acetonide 0.1%, chlortetracycline hydrochloride 3%, in an anhydrous greasy basis containing wool fat and white soft paraffin, net price 15 g = £3.51. Label: 28, counselling, application, see p. 788. Potency: potent
| Excipients | include wool fat

**Note** Stains clothing

13.5 Preparations for eczema and psoriasis

13.5.1 Preparations for eczema

13.5.2 Preparations for psoriasis

13.5.3 Drugs affecting the immune response

**Eczema (dermatitis)** has several causes, which may influence treatment. The main types of eczema are irritant, allergic contact, atopic, venous and discoid; different types may co-exist. Lichenification, due to scratching and rubbing, may complicate any chronic
eczema. Atopic eczema is the most common type and it usually involves dry skin as well as infection and lichenification.

Management of eczema involves the removal or treatment of contributory factors including occupational and domestic irritants. Known or suspected contact allergens should be avoided. Rarely, ingredients in topical medicinal products may sensitise the skin; the BNF lists active ingredients together with excipients that have been associated with skin sensitisation.

Skin dryness and the consequent irritant eczema requires emollients (section 13.2.1) applied regularly (at least twice daily) and liberally to the affected area; this can be supplemented with bath or shower emollients. The use of emollients should continue even if the eczema improves or if other treatment is being used.

Topical corticosteroids (section 13.4) are also required in the management of eczema; the potency of the corticosteroid should be appropriate to the severity and site of the condition. Mild corticosteroids are generally used on the face and on flexures; potent corticosteroids are generally required for use on adults with discoid or lichenified eczema or with eczema on the scalp, limbs, and trunk. Treatment should be reviewed regularly, especially if a potent corticosteroid is required. In patients with frequent flares (2–3 per month), a topical corticosteroid can be applied on 2 consecutive days each week to prevent further flares.

Bandages (including those containing zinc and ichthammol) are sometimes applied over topical corticosteroids or emollients to treat eczema of the limbs. Dry-wrap dressings can be used to provide a physical barrier to help prevent scratching and improve retention of emollients.

For the role of topical pimecrolimus and tacrolimus in atopic eczema see section 13.5.3.

Infection Bacterial infection (commonly with Staphylococcus aureus and occasionally with Streptococcus pyogenes) can exacerbate eczema and requires treatment with topical or systemic antibacterial drugs (section 13.10.1 and section 5.1). Antibacterial drugs should be used in short courses (typically 1 week) to reduce the risk of drug resistance or skin sensitisation. Associated eczema is treated simultaneously with a topical corticosteroid which can be combined with a topical antimicrobial.

Eczema involving widespread or recurrent infection requires the use of a systemic antibacterial that is active against the infecting organism. Products that combine an antiseptic with an emollient application (section 13.2.1) and with a bath emollient (section 13.2.1.1) can also be used; antiseptic shampoos (section 13.9) can be used on the scalp.

Intertriginous eczema commonly involves candida and bacteria; it is best treated with a mild or moderately potent topical corticosteroid and a suitable antimicrobial drug.

Widespread herpes simplex infection may complicate atopic eczema and treatment with a systemic antiviral drug (section 5.3.2.1) is indicated.

The management of seborrhoeic dermatitis is described below.

Management of other features of eczema Lichenification, which results from repeated scratching is treated initially with a potent corticosteroid. Bandages containing ichthammol paste (to reduce pruritus) and other substances such as zinc oxide can be applied over the corticosteroid or emollient. Coal tar (section 13.5.2) and ichthammol can be useful in some cases of chronic eczema.

A non-sedating antihistamine (section 3.4.1) may be of some value in relieving severe itching or urticaria associated with eczema. A sedating antihistamine (section 3.4.1) can be used if itching causes sleep disturbance. Exudative (weeping) eczema requires a potent corticosteroid initially; infection may also be present and require specific treatment (see above). Potassium permanganate solution (1 in 10 000) can be used in exuding eczema for its antiseptic and astringent effects; treatment should be stopped when exudation stops.

Severe refractory eczema Severe refractory eczema is best managed under specialist supervision; it may require phototherapy or drugs that act on the immune system (section 13.5.3). Alitretinoin (p. 796) is licensed for the treatment of severe chronic hand eczema refractory to potent topical corticosteroids; patients with hyperkeratotic features are more likely to respond to alitretinoin than those with pompholyx.

Seborrhoeic dermatitis Seborrhoeic dermatitis (seborrhoeic eczema) is associated with species of the yeast Malassezia and affects the scalp, paranasal areas, and eyebrows. Shampoos active against the yeast (including those containing ketoconazole and coal tar, section 13.9) and combinations of mild corticosteroids with suitable antimicrobials (section 13.4) are used.

Topical preparations for eczema

**ICHTHAMMOL**

**Indications** chronic lichenified eczema

**Side-effects** skin irritation

**Dose**

- Apply 1–3 times daily

Ichthammol Ointment, BP 1980

Ointment, ichthammol 10%, yellow soft paraffin 45%, wool fat 45%

Zinc and Ichthammol Cream, BP

Cream, ichthammol 5%, cetostearyl alcohol 3%, wool fat 10%, in zinc cream

Available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104

Zinc Paste and Ichthammol Bandage, BP 1993

See Appendix 5 (section A5.8.9)

**Oral retinoid for eczema**

The retinoid, alitretinoin, is licensed for the treatment of severe chronic hand eczema refractory to potent topical corticosteroids; patients with hyperkeratotic features are more likely to respond to alitretinoin than those with pompholyx.

Alitretinoin should be prescribed only by, or under the supervision of, a consultant dermatologist.

Alitretinoin is teratogenic and must not be given to women of child-bearing potential unless they practise effective contraception and then only after detailed assessment and explanation by the physician. See also Pregnancy Prevention under Cautions, below.
NICE guidance
Alitretinoin for the treatment of severe chronic hand eczema in adults (August 2009)

Alitretinoin is recommended for the treatment of severe chronic hand eczema that has not responded to potent topical corticosteroids. Treatment should be stopped as soon as an adequate response has been achieved (hands clear or almost clear), or if the eczema remains severe after 12 weeks, or if an adequate response has not been achieved by 24 weeks.

www.nice.org.uk/TA177

ALITRETINOIN

Indications severe chronic hand eczema refractory to potent topical corticosteroids

Cautions avoid blood donation during treatment and for at least 1 month after stopping treatment; monitor serum lipids (more frequently in those with diabetes, history of hyperlipidaemia, or risk factors for cardiovascular disease)—discontinue if uncontrolled hyperlipidaemia; history of depression; dry eye syndrome; interactions: Appendix 1 (retinoids)

Pregnancy prevention In women of child-bearing potential, exclude pregnancy 1 month before treatment, up to 3 days before treatment, every month during treatment (unless there are compelling reasons to indicate that there is no risk of pregnancy), and 5 weeks after stopping treatment—perform pregnancy test in the first 3 days of the menstrual cycle. Women must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 1 month after stopping treatment. Women should be advised to use at least 1 method of contraception but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone but can be used in conjunction with other contraceptive methods. Each prescription for alitretinoin should be limited to a supply of up to 30 days’ treatment and to seek prompt medical attention if they become pregnant during treatment or within 1 month of stopping treatment

Contra-indications uncontrolled hyperlipidaemia; uncontrolled hypothyroidism; hypervitaminosis A

Hepatic impairment manufacturer advises avoid—no information available

Renal impairment manufacturer advises avoid in severe impairment—no information available

Pregnancy avoid—teratogenic; effective contraception must be used—see Pregnancy Prevention above

Breast-feeding manufacturer advises avoid

Side-effects raised serum concentration of triacylglycerides and of cholesterol (risk of pancreatitis if triglycerides above 9 mmol/litre), flushing; headache; changes in thyroid function tests; anaemia; myalgia, raised creatine kinase, arthralgia; conjunctivitis, dry eyes (may respond to lubricating eye ointment or tear replacement therapy)—sometimes decreased tolerance to contact lenses, eye irritation; dryness of skin and lips, cheilitis, erythema, alopecia; less commonly epistaxis, hyperostosis, ankylosing spondylitis, blurred vision, cataracts, pruritus, and astecotic eczema; rarely benign intracranial hypertension (discontinue if severe headache, nausea, vomiting, papilloedema, or visual disturbances occur) and vasculitis; also reported mood changes, depression, suicidal ideation, ketosis and impaired night vision

Dose

ADULT over 18 years, 30 mg once daily, reduced to 10 mg once daily if not tolerated; patients with diabetes, history of hyperlipidaemia, or risk factors for cardiovascular disease, initially 10 mg once daily, increased if necessary up to max. 30 mg daily

Note Duration of treatment 12–24 weeks; discontinue if no response after 12 weeks. Course may be repeated in those who relapse. See also Pregnancy Prevention, above

Toctino® (Basilea) Form
Capsules, alitretinoin 10 mg (brown), net price 30-cap pack = £411.43; 30 mg (red-brown), 30-cap pack = £411.43. Label: 10, patient information leaflet, 11, 21

13.5.2 Preparations for psoriasis

Psoriasis is characterised by epidermal thickening and scaling. It commonly affects extensor surfaces and the scalp.

Occasionally, psoriasis is provoked or exacerbated by drugs such as lithium, chloroquine and hydroxychloroquine, beta-blockers, non-steroidal anti-inflammatory drugs, and ACE inhibitors. Psoriasis may not be seen until the drug has been taken for weeks or months.

Emollients (section 13.2.1), in addition to their effects on dryness, scaling and cracking, may have an anti-proliferative effect in psoriasis, and may be the only treatment necessary for mild psoriasis. They are particularly useful in inflammatory psoriasis and in plaque psoriasis of palms and soles, in which irritant factors can permeate the condition. Emollients are useful adjuncts to other more specific treatment.

More specific topical treatment for chronic stable plaque psoriasis on extensor surfaces of trunk and limbs involves the use of vitamin D analogues, coal tar, dithranol, and the retinoid tazarotene. However, they can irritate the skin and they are not suitable for the more inflammatory forms of psoriasis; their use should be suspended during an inflammatory phase of psoriasis. The efficacy and the irritancy of each substance varies between patients. If a substance irritates significantly, it should be stopped or the concentration reduced; if it is tolerated, its effects should be assessed after 4 to 6 weeks and treatment continued if it is effective.

Scalp psoriasis is usually scaly, and the scale may be thick and adherent; this will require softening with an emollient cream, ointment, or oil. A tar-based shampoo is first-line treatment for scalp psoriasis; a keratolytic, such as salicylic acid, should also be used if there is significant scaling, to allow other treatments to work.

Some preparations prescribed for psoriasis affecting the scalp, combine salicylic acid with coal tar or sulfur. The product should be applied generously, and an adequate quantity should be prescribed. It should be left on for at least an hour, often more conveniently overnight, before washing off. The use of scalp preparations containing a potent corticosteroid or a vitamin D analogue, either alone or in combination, can also be helpful.

Facial, flexural and genital psoriasis can be managed with short-term use of a mild or moderate potency topical corticosteroid (a mild potency topical corticosteroid is preferred for the initial treatment of facial psoriasis).
Calcitriol or tacalcitol can be used for long-term treatment, or if the response to mild or moderate potency topical corticosteroids is inadequate; calcipotriol is more likely to cause irritation. Low strength tar preparations can also be used. Fimocromulimus or tacrolimus by topical application [unlicensed indication] can be used short-term, under specialist supervision, in patients whose condition has not responded adequately to other treatments, or who are intolerant of them.

Widespread unstable psoriasis of erythrodermic or generalised pustular type requires urgent specialist assessment. Initial topical treatment should be limited to using emollients frequently and generously; emollients should be prescribed in quantities of 1 kg or more. More localised acute or subacute inflammatory psoriasis with hot, spreading or itchy lesions, should be treated topically with emollients or with a corticosteroid of moderate potency.

Calcipotriol and tacalcitol are analogues of vitamin D that affect cell division and differentiation. Calcipotriol is an active form of vitamin D. Vitamin D and its analogues are used first-line for the long-term treatment of plaque psoriasis; they do not smell or stain and they may be more acceptable than tar or dithranol products. Of the vitamin D analogues, tacalcitol and calcipotriol are less likely to iritate.

Coal tar has anti-inflammatory properties that are useful in chronic plaque psoriasis; it also has antiscaling properties. Crude coal tar (coal tar, BP) is the most effective form, typically in a concentration of 1 to 10% in a soft paraffin base, but few outpatients tolerate the smell and mess. Cleaner extracts of coal tar included in proprietary preparations, are more practicable for home use but they are less effective and improvement takes longer. Contact of coal tar products with normal skin is not normally harmful and they can be used for widespread small lesions; however, irritation, contact allergy, and sterile folliculitis can occur. The milder tar extracts can be used on the face and flexures. Tar baths and tar shampoos are also helpful.

Dithranol is effective for chronic plaque psoriasis. Its major disadvantages are irritation (for which individual susceptibility varies) and staining of skin and of clothing. It should be applied to chronic extensor plaques only, carefully avoiding normal skin. Dithranol is not generally suitable for widespread small lesions nor should it be used in the flexures or on the face. Treatment should be started with a low concentration such as dithranol 0.1%, and the strength increased gradually every few days up to 3%, according to tolerance. Proprietary preparations are more suitable for home use; they are usually washed off after 5 to 60 minutes (‘short contact’). Specialist nurses may apply intensive treatment with dithranol paste which is covered by stockinette dressing and usually retained overnight. Dithranol should be discontinued if even a low concentration causes acute inflammation; continued use can result in the psoriasis becoming unstable. When applying dithranol, hands should be protected by gloves or they should be washed thoroughly afterwards.

Tazarotene, a retinoid, has a similar efficacy to vitamin D and its analogues, but is associated with a greater incidence of irritation. Although irritation is common, it is minimised by applying tazarotene sparingly to the plaques and avoiding normal skin; application to the face and in flexures should also be avoided. Tazarotene does not stain and is odourless.

A topical corticosteroid (section 13.4) is not generally suitable for long-term use or as the sole treatment of extensive chronic plaque psoriasis; any early improvement is not usually maintained and there is a risk of the condition deteriorating or of precipitating an unstable form of psoriasis (e.g. erythrodermic psoriasis or generalised pustular psoriasis) on withdrawal. Topical use of potent corticosteroids on widespread psoriasis can also lead to systemic as well as local side-effects. However, topical corticosteroids used short-term may be appropriate to treat psoriasis in specific sites such as the face or flexures (with a mild or moderate corticosteroid), and psoriasis of the scalp, palms, and soles (with a potent corticosteroid). Very potent corticosteroids should only be used under specialist supervision.

Combining the use of a corticosteroid with another specific topical treatment may be beneficial in chronic plaque psoriasis; the drugs may be used separately at different times of the day or used together in a single formulation. Eczema co-existing with psoriasis may be treated with a corticosteroid, or coal tar, or both.

Phototherapy Phototherapy is available in specialist centres under the supervision of a dermatologist. Ultraviolet B (UVB) radiation is usually effective for chronic stable psoriasis and for guttate psoriasis. It may be considered for patients with moderately severe psoriasis in whom topical treatment has failed, but it may irritate inflammatory psoriasis.

Photochemotherapy combining long-wave ultraviolet A radiation with a psoralen (PUVA) is available in specialist centres under the supervision of a dermatologist. The psoralen, which enhances the effect of irradiation, is administered either by mouth or topically. PUVA is effective in most forms of psoriasis, including localised palmpoplantar pustular psoriasis. Early adverse effects include phototoxicity and pruritus. Higher cumulative doses exaggerate skin ageing, increase the risk of dysplastic and neoplastic skin lesions, especially squamous cancer, and pose a theoretical risk of cataracts.

Phototherapy combined with coal tar, dithranol, tazarotene, topical vitamin D or vitamin D analogues, or oral acitretin, allows reduction of the cumulative dose of phototherapy required to treat psoriasis. Systemic treatment Systemic treatment is required for severe, resistant, unstable or complicated forms of psoriasis, and it should be initiated only under specialist supervision. Systemic drugs for psoriasis include acitretin (see below) and drugs that affect the immune response (such as ciclosporin and methotrexate, section 13.5.3).

Systemic corticosteroids should be used only rarely in psoriasis because rebound deterioration may occur on reducing the dose. Acitretin, a metabolite of etretinate, is a retinoid (vitamin A derivative); it is prescribed by specialists. The main indication for acitretin is psoriasis, but it is also used in disorders of keratinisation such as severe Darier’s disease (keratosis follicularis), and some forms of ichthyosis. Although a minority of cases of psoriasis respond well to acitretin alone, it is only moderately effective in many cases and it is combined with other treatments. A therapeutic effect occurs after 2 to 4 weeks and the maximum benefit after 4 months. Consideration should be given to stopping acitretin if the response is inadequate after 4 months at the optimum dose. The manufacturers of acitretin do not recommend
continuous treatment for longer than 6 months. However, some patients may benefit from longer treatment, provided that the lowest effective dose is used, patients are monitored carefully for adverse effects, and the need for treatment is reviewed regularly.

Apart from teratogenicity, which remains a risk for 3 years after stopping, acitretin is the least toxic systemic treatment for psoriasis; in women with a potential for child-bearing, the possibility of pregnancy must be excluded before treatment and effective contraception must be used during treatment and for at least 3 years afterwards (oral progestogen-only contraceptives not considered effective).

### Topical preparations for psoriasis

#### Vitamin D and analogues

Calcipotriol, calcitriol, and tacalcitol are used for the management of plaque psoriasis. They should be avoided by those with calcium metabolism disorders, and used with caution in generalised pustular or erythrodermic exfoliative psoriasis (enhanced risk of hypercalcaemia). Local skin reactions (itching, erythema, burning, paraesthesia, dermatitis) are common. Hands should be washed thoroughly after application to avoid inadvertent transfer to other body areas. Aggravation of psoriasis has also been reported.

### CALCIPOTRIOL

**Indications** see under Dose

**Cautions** see notes above; avoid use on face; avoid excessive exposure to sunlight and sunlamps

**contra-indications** see notes above

**Pregnancy** manufacturers advise use in restricted amounts only if clearly necessary and to monitor urine- and serum-calcium concentration

**Breast-feeding** manufacturer advises avoid unless essential

**Side-effects** see notes above; also photosensitivity, dry skin; rarely facial or perioral dermatitis

**Dose**

- Plaque psoriasis, apply ointment once or twice daily; max. 100 g weekly (less with **scalp solution**, see below); **CHILD** over 6 years, apply twice daily; 6–12 years max. 50 g weekly; over 12 years max. 75 g weekly

  **Note** Patient information leaflet for Dovonex® ointment advises liberal application (but note max. recommended weekly dose, above).

- Scalp psoriasis, apply scalp solution twice daily; max. 60 mL weekly (less with ointment, see below); **CHILD** under 18 years see **BNF for Children**

  **Note** When preparations used together max. total calcipotriol 5 mg in any one week (e.g. scalp solution 60 mL with ointment 30 g or scalp solution 30 mL with ointment 60 g)

**Calcipotriol (Non-proprietary)**

**Ointment**, calcipotriol 50 micrograms/g, net price 120 g = £24.04

**Note** Not licensed for use in children under 18 years

**Scalp solution**, calcipotriol 50 micrograms/mL, net price 60 mL = £41.85, 120 mL = £83.71

**Dovonex® (LEO)**

**Ointment**, calcipotriol 50 micrograms/g, net price 30 g = £5.78

**Excipients** include disodium edetate, propylene glycol

### CALCITRIOL

(1,25-Dihydroxycholecalciferol)

**Indications** mild to moderate plaque psoriasis

**Cautions** see notes above

**Contra-indications** see notes above; do not apply under occlusion

**Pregnancy** manufacturer advises use in restricted amounts only if clearly necessary and to monitor urine- and serum-calcium concentration

**Breast-feeding** manufacturer advises avoid

**Side-effects** see notes above

**Dose**

- **ADULT** and **CHILD** over 12 years, apply twice daily; not more than 35% of body surface to be treated daily, max. 30 g daily

**Siliks® (Galderma)**

**Ointment**, calcitriol 3 micrograms/g, net price 100 g = £16.34

**Excipients** none as listed in section 13.1.3

### TACALCITOL

**Indications** plaque psoriasis

**Cautions** see notes above; avoid eyes; monitor serum calcium if risk of hypercalcaemia; if used in conjunction with UV treatment, UV radiation should be given in the morning and tacalcitol applied at bedtime

**Contra-indications** see notes above

**Pregnancy** manufacturer advises avoid unless no safer alternative—no information available

**Breast-feeding** manufacturer advises avoid application to breast area; no information available on presence in milk

**Side-effects** see notes above
Dose
- **ADULT** and **CHILD** over 12 years, apply once daily preferably at bedtime; max. 10 g **ointment** or 10 mL **lotion** daily
  
  **Note** When lotion and ointment used together, max. total tacrolimus 280 micrograms in any one week (e.g. lotion 30 mL with ointment 40 g)

Curatoderm™ (Almirall)®

- **Lotion**, tacrolimus (as monohydrate) 4 micrograms/g, net price 30 mL = £12.73
- **Excipients** include disodium edetate, propylene glycol
- **Ointment**, tacrolimus (as monohydrate) 4 micrograms/g, net price 30 g = £13.40, 60 g = £23.14, 100 g = £40.86
- **Excipients** none as listed in section 13.1.3

### Tazarotene

**Indications** mild to moderate plaque psoriasis affecting up to 10% of skin area

**Cautions** wash hands immediately after use; avoid contact with eyes, face, intertriginous areas, hair-covered scalp, eczematous or inflamed skin; avoid excessive exposure to UV light (including sunlight, solariums, PUVA or UVB treatment); do not apply emollients or cosmetics within 1 hour of application

**Pregnancy** avoid; effective contraception required (oral progestogen-only contraceptives not considered effective)

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies

**Side-effects** local irritation (more common with higher concentration and may require discontinuation), pruritus, burning, erythema, desquamation, non-specific rash, contact dermatitis, and worsening of psoriasis; rarely stinging and inflamed, dry or painful skin

**Dose**
- **Apply once daily** in the evening usually for up to 12 weeks; **CHILD** under 18 years not recommended

Zora® (Allergan)®

- **Gel**, tazarotene 0.05%, net price 30 g = £14.09; 0.1%, 30 g = £14.80
- **Excipients** include benzyl alcohol, butylated hydroxyanisole, butylated hydroxytoluene, disodium edetate, polysorbate 40

**Non-proprietary preparations**

- **Calamine and Coal Tar Ointment, BP**
  - **Ointment**, calamine 12.5 g, strong coal tar solution 2.5 g, zinc oxide 12.5 g, hydrous wool fat 25 g, white soft paraffin 47.5 g
  - **Excipients** include wool fat
  - **Dose** apply 1–2 times daily

- **Coal Tar and Salicylic Acid Ointment, BP**
  - **Ointment**, coal tar 2 g, salicylic acid 2 g, emulsifying wax 11.4 g, white soft paraffin 19 g, coconut oil 54 g, polysorbate ‘80’ 4 g, liquid paraffin 7.6 g
  - **Excipients** include ceteareth alcohol
  - **Dose** apply 1–2 times daily

- **Zinc and Coal Tar Paste, BP**
  - **Paste**, zinc oxide 6%, coal tar 6%, emulsifying wax 5%, starch 38%, yellow soft paraffin 45%
  - **Excipients** include ceteareth alcohol
  - **Dose** apply 1–2 times daily

**Proprietary preparations**

- **Carbo-Dome®** (Sandoz)
  - **Cream**, coal tar solution 10%, in a water-miscible basis, net price 30 g = £4.77, 100 g = £16.38
  - **Excipients** include beeswax, hydroxybenzoates (parabens)
  - **Dose** psoriasis, apply to skin 2–3 times daily; **CHILD** under 12 years and **ELDERLY**, cream can be diluted with a few drops of water before applying

- **Cocos®** (RPH)
  - **Scalp ointment**, coal tar solution 12%, salicylic acid 2%, precipitated sulfur 4%, in a coconut oil emollient basis, net price 40 g (with applicator nozzle) = £6.22, 100 g = £11.69
  - **Excipients** include ceteareth alcohol
  - **Dose** psoriasis, apply to skin once weekly as necessary (if severe use daily for first 3–7 days), shampoo off after 1 hour; **CHILD** 6–12 years, medical supervision required (not recommended under 6 years)

- **Exorex®** (Forest)
  - **Lotion**, coal tar solution 5% in an emollient basis, net price 100 mL = £8.11, 250 mL = £16.24
  - **Excipients** include hydroxybenzoates (parabens)
  - **Dose** psoriasis, apply to skin or scalp 2–3 times daily; **CHILD** under 12 years and **ELDERLY**, lotion can be diluted with a few drops of water before applying

- **Psoriderm®** (Derma)
  - **Cream**, coal tar 6%, lecithin 0.4%, net price 225 mL = £9.42
  - **Excipients** include isopropyl palmitate, propylene glycol
  - **Dose** psoriasis, apply to skin or scalp 1–2 times daily
  - **Scalp lotion**—section 13.9

- **Sebco®** (Derma UK)
  - **Scalp ointment**, coal tar solution 12%, salicylic acid 2%, precipitated sulfur 4%, in a coconut oil emollient basis, net price 40 g = £4.54, 100 g = £8.52
  - **Excipients** include ceteareth alcohol
  - **Dose** psoriasis, apply to skin or scalp 2–3 times daily; shampoo off after 1 hour; **CHILD** 6–12 years, medical supervision required (not recommended under 6 years)
Dithranol

**DITHRANOL** (Anthralin)

**Indications** subacute and chronic psoriasis, see notes above

**Cautions** avoid use near eyes and sensitive areas of skin; see also notes above

**Contra-indications** hypersensitivity; acute and pustular psoriasis

**Side-effects** local burning sensation and irritation; stains skin, hair, and fabrics

**Dose**

- See notes above and under preparations

**Note** Some of these dithranol preparations also contain coal tar or salicylic acid—for cautions, contra-indications, and side-effects see under Tars (above) or under Salicylic Acid

**Non-proprietary preparations**

- **Dithranol Ointment, BP**

  **Ointment**, dithranol, in yellow soft paraffin; usual strengths 0.1–2%. Part of basis may be replaced by hard paraffin if a stiffer preparation is required.

  Label: 28

- **Dithranol Paste, BP**

  **Paste**, dithranol in zinc and salicylic acid (Lassar’s) paste. Usual strengths 0.1–1% of dithranol. Label: 28

**Proprietary preparations**

- **Dithrocream®** (Dermal)

  **Cream**, dithranol 0.1%, net price 50 g = £3.77; 0.25%, 50 g = £4.04; 0.5%, 50 g = £4.66; 1%, 50 g = £5.42; 2%, 50 g = £6.79. Label: 28

  **Excipients** include cetostearyl alcohol, chlorocresol

  **Dose** for application to skin or scalp; 0.1–0.5% cream suitable for overnight treatment, 1–2% cream for max. 1 hour

1. If dithranol content more than 1%, otherwise may be sold to the public

**Salicylic acid**

**SALICYLIC ACID**

For coal tar preparations containing salicylic acid, see under Tars, p. 799. For dithranol preparations containing salicylic acid see under Dithranol, above

**Indications** hyperkeratotic skin disorders; warts and calluses (section 13.7); scalp conditions (section 13.9); fungal nail infections (section 13.10.2)

**Cautions** see notes above; avoid broken or inflamed skin

**Salicylate toxicity** Salicylate toxicity may occur particularly if applied on large areas of skin or neonatal skin

**Side-effects** sensitivity, excessive drying, irritation, systemic effects after widespread use (see under Cautions)

**Dose**

- See preparations

**Zinc and Salicylic Acid Paste, BP**

**Paste**, (Lassar’s Paste), zinc oxide 24%, salicylic acid 2%, starch 24%, white soft paraffin 50%

Available from 'special-order' manufacturers or specialist importing companies, see p. 1104

**Dose** apply twice daily

**Oral retinoids for psoriasis**

**ACITRETIN**

**Note** Acitretin is a metabolite of etretinate

**Indications** severe extensive psoriasis resistant to other forms of therapy; palmoplantar pustular psoriasis; severe congenital ichthyosis; severe Darier’s disease (keratosis follicularis)

**Cautions** avoid concomitant use of keratolytics; do not donate blood during and for 2 years after stopping therapy (teratogenic risk); check liver function at start, then every 2–4 weeks for first 2 months and then every 3 months; monitor serum-triglyceride and serum-cholesterol concentrations before treatment, 1 month after starting, then every 3 months; diabetes (can alter glucose tolerance—initial frequent blood
glucose checks); investigate atypical musculoskeletal symptoms; in children use only in exceptional circumstances and monitor growth parameters and bone development (premature epiphyseal closure reported); avoid excessive exposure to sunlight and unsupervised use of sunlamps; Interactions: Appen- dix 1 (retinoids) Pregnancy Prevention In women of child-bearing potential (including those with a history of infertility), exclude pregnancy up to 3 days before treatment, every month during treatment, and every 1–3 months for 3 years after stopping treatment. Treatment should be started on day 2 or 3 of menstrual cycle. Women must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 3 years after stopping treatment. Women should be advised to use at least 1 method of contraception, but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone but can be used in conjunction with other contraceptive methods. Each prescription for acitretin should be limited to a supply of up to 30 days treatment and dispensed within 7 days of the date stated on the prescription. Women should be advised to seek medical attention immediately if they become pregnant during treatment or within 3 years of stopping treatment. They should also be advised to avoid alcohol during treatment and for 2 months after stopping treatment

Contra-indications hyperlipidaemia

Hepatic impairment avoid in severe impairment—risk of further impairment

Renal impairment avoid in severe impairment; increased risk of toxicity

Pregnancy avoid—teratogenic; effective contra-ception must be used—see Cautions above

Breast-feeding avoid

Side-effects abdominal pain, diarrhoea, nausea, vomiting, dryness and inflammation of mucous membranes, peripheral oedema, reversible increase in serum-cholesterol and serum-triglyceride concentra-tions (with high doses), headache, arthralgia, myalgia, dryness of conjunctiva (causing conjunctivitis and decreased tolerance to contact lenses), alopecia (reversible on withdrawal), abnormal hair texture, skin exfoliation, pruritus, epidermal fragility, sticky skin, dermatitis, erythema, brittle nails, paronychia; less commonly hepatitis, dizziness, visual disturbances, photosensitivity; rarely peripheral neuropathy; very rarely benign intracranial hypertension (discontinue if severe headache, nausea, vomiting, or visual disturbances occur), bone pain, exostosis (skeletal hyperostosis and extra-osseous calcification reported following long-term treatment with etreti-nate, and premature epiphyseal closure in children, see Cautions above), night blindness, ulcerative keratitis; also reported taste disturbance, rectal haemorrhage, flushing, malaise, drowsiness, granulomatous lesions, impaired hearing, tinnitus, initial worsening of psoriasis, dry skin, sweating

Dose

• ADULT over 18 years (under expert supervision), initially 25–30 mg daily (Darier’s disease 10 mg daily) for 2–4 weeks, then adjusted according to response, usual range 25–50 mg daily; up to 75 mg daily for short periods in psoriasis (see p. 797); CHILD under 18 years see BNF for Children

Neotigason® (Actavis) Capsules, acitretin 10 mg (brown/white), net price 60-cap pack = £17.30; 25 mg (brown/yellow), 60-cap pack = £43.00. Label: 10, patient information leaflet, 11, 21

13.5.3 Drugs affecting the immune response

Drugs affecting the immune response are used for eczema or psoriasis. Systemic drugs acting on the immune system are used under specialist supervision.

Pimecrolimus by topical application is licensed for mild to moderate atopic eczema. Tacrolimus is licensed for topical use in moderate to severe atopic eczema. Both are drugs whose long-term safety is still being evaluated and they should not usually be considered first-line treatments unless there is a specific reason to avoid or reduce the use of topical corticosteroids. Treatment of atopic eczema with topical pimecrolimus or topical tacrolimus should be initiated only by prescribers experienced in managing the condition. For the role of topical tacrolimus and pimecrolimus in the treatment of psoriasis, see section 13.5.2.

NICE guidance Tacrolimus and pimecrolimus for atopic eczema (August 2004)

Topical pimecrolimus and tacrolimus are options for atopic eczema not controlled by maximal topical corticosteroid treatment or if there is a risk of important corticosteroid side-effects (particularly skin atrophy).

Topical pimecrolimus is recommended for moderate atopic eczema on the face and neck of children aged 2–16 years and topical tacrolimus is recommended for moderate to severe atopic eczema in adults and children over 2 years. Pimecrolimus and tacrolimus should be used within their licensed indications.

www.nice.org.uk/TA82

The Scottish Medicines Consortium (p. 4) has advised (March 2010) that tacrolimus ointment (Protopic®) is accepted for restricted use within NHS Scotland for the prevention of flares in those with moderate to severe atopic eczema in accordance with the licensed indications; initiation of treatment is restricted to doctors (including general practitioners) with specialist interest and experience in treating atopic eczema with immunomodulator therapy.

For the role of topical corticosteroids in eczema, see section 13.5.1, and for their role in psoriasis, see section 13.5.2. A short course of a systemic corticosteroid (section 6.3.2) can be given for eczema flares that have not improved despite appropriate topical treatment.

Ciclosporin by mouth can be used for severe psoriasis and for severe eczema. Azathioprine or mycophenolate mofetil (section 8.2.1) are used for severe refractory eczema [unlicensed indication].

Methotrexate can be used for severe psoriasis, the dose being adjusted according to severity of the condition and haematological and biochemical measurements. Folic acid (section 9.1.2) should be given to reduce the possibility of side-effects associated with methotrexate. Folic acid can be given at a dose of 5 mg once weekly [unlicensed indication], on a different day from the methotrexate; alternative regimens of folic acid may be used in some settings.

Etanercept, adalimumab, and infliximab inhibit the activity of tumour necrosis factor (TNFα). They are used for severe plaque psoriasis either refractory to at least 2
standard systemic treatments and phototherapy cannot be used because of intolerance or contra-indications; while either etanercept or adalimumab is considered to be the first choice in stable disease, infliximab or adalimumab may be useful when rapid disease control is required. Ustekinumab (a monoclonal antibody that inhibits interleukins 12 and 23) can be used for severe plaque psoriasis that has not responded to at least 2 standard systemic treatments and phototherapy, or when these treatments cannot be used because of intolerance or contra-indications (see also NICE guidance below). Adalimumab, etanercept, infliximab and ustekinumab are also licensed for psoriatic arthritis (section 10.1.3).

NICE guidance

Adalimumab for plaque psoriasis in adults (June 2008)

Adalimumab is recommended for the treatment of severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) and phototherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Adalimumab should be withdrawn if the response is not adequate after 16 weeks.

www.nice.org.uk/TA180

NICE guidance 2

Etanercept and efalizumab for plaque psoriasis in adults (July 2006)

Etanercept is recommended for severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) and to phototherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Etanercept should be withdrawn if the response is not adequate after 12 weeks.

Following suspension of the marketing authorisation for efalizumab, NICE has temporarily withdrawn its guidance on the use of efalizumab for plaque psoriasis.

www.nice.org.uk/TA103

NICE guidance

Infliximab for plaque psoriasis in adults (January 2008)

Infliximab is recommended for the treatment of very severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) or to phototherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Infliximab should be withdrawn if the response is not adequate after 10 weeks.

www.nice.org.uk/TA134

2. The Scottish Medicines Consortium issued similar advice on the use of etanercept in adults (August 2009) and children over 6 years old (April 2012)

AZATHIOPRINE

Indications severe refractory eczema [unlicensed indication]; inflammatory bowel disease (section 1.5.3); autoimmune conditions and prophylaxis of transplant rejection (section 8.2.1); rheumatoid arthritis (section 10.1.3)

Cautions section 8.2.1

Contra-indications section 8.2.1; also very low or absent thiopurine methyltransferase (TPMT) activity

Hepatic impairment section 8.2.1

Renal impairment section 8.2.1

Pregnancy section 8.2.1

Breast-feeding section 8.2.1

Side-effects section 8.2.1

Dose

- Severe refractory eczema [unlicensed indication], by mouth, normal or high TPMT activity, 1–3 mg/kg daily; intermediate TPMT activity, 0.5–1.5 mg/kg daily

Preparations
Section 8.2.1

CICLOSPORIN

(Cyclosporin)

Indications see under Dose; severe acute ulcerative colitis (section 1.5.3); transplantation and graft-versus-host disease (section 8.2.2)

Cautions section 8.2.2

Additional cautions in atopic dermatitis and psoriasis Contra-indicated in abnormal renal function, uncontrolled hypertension (see also below), infections not under control, and malignancy (see also below). Dermatological and physical examination, including blood pressure and renal function measurements required at least twice before starting. During treatment, monitor serum creatinine every 2 weeks for first 3 months then every month, reduce dose by 25–50% if serum creatinine increases more than 30% above baseline (even if within normal range) and discontinue if reduction not successful within 1 month. Discontinue if hypertension develops that cannot be controlled by dose reduction or antihypertensive therapy. Avoid excessive exposure to sunlight and avoid use of UVB or PUVA. In atopic dermatitis, also allow herpes simplex infections to clear before starting (if they occur during treatment withdraw if severe). Staphylococcus aureus skin infections to clear before starting (if they occur during treatment withdraw if severe).
infections not absolute contra-indication providing controlled (but avoid erythromycin unless no other alternative—see also interactions Appendix I (ciclosporin)); investigate lymphadenopathy that persists despite improvement in atopic dermatitis. In psoriasis, also exclude malignancies (including those of skin and cervix) before starting (biopsy any lesions not typical of psoriasis) and treat patients with malignant or pre-malignant conditions of skin only after appropriate treatment (and if no other option): discontinue if lymphoproliferative disorder develops

**Hepatic impairment** section 8.2.2

**Renal impairment** see Cautions above

**Pregnancy** see Immunosuppressant Therapy, p. 615

**Breast-feeding** section 8.2.2

**Side-effects** section 8.2.2

**Dose**

- Short-term treatment (usually for max. 8 weeks but can be longer under specialist supervision) of severe atopic dermatitis where conventional therapy ineffective or inappropriate, administered in accordance with expert advice, by **mouth**, **ADULT** and **CHILD** over 16 years, initially 2.5 mg/kg daily in 2 divided doses, if good initial response not achieved within 2 weeks, increase rapidly to max. 5 mg/kg daily; initial dose of 5 mg/kg daily in 2 divided doses if very severe; **CHILD** under 16 years see **BNF for Children**

- Severe psoriasis where conventional therapy ineffective or inappropriate, administered in accordance with expert advice, by **mouth**, **ADULT** and **CHILD** over 16 years, initially 2.5 mg/kg daily in 2 divided doses, increased gradually to max. 5 mg/kg daily if no improvement within 1 month; initial dose of 5 mg/kg daily justifed if rapid control required; discontinue if inadequate response after 3 months at the optimum dose; max. duration of treatment usually 1 year unless other treatments cannot be used; **CHILD** under 16 years see **BNF for Children**

**Important** For preparations and counselling and for advice on conversion between the preparations, see section 8.2.2

**Preparations**

Section 8.2.2

---

**METHOTREXATE**

**Indications** severe psoriasis unresponsive to conventional therapy (specialist use only); Crohn’s disease (section 1.5.3); malignant disease (section 8.1.3); rheumatoid arthritis (section 10.1.3)

**Cautions** section 10.1.3; also photosensitivity—psoriasis lesions aggravated by UV radiation (skin ulceration reported)

**Contra-indications** section 10.1.3

**Hepatic impairment** avoid—dose-related toxicity

**Renal impairment** section 10.1.3

**Pregnancy** section 10.1.3

**Breast-feeding** section 10.1.3

**Side-effects** section 10.1.3

**Dose**

- By **mouth** or by intramuscular or **intravenous** or subcutaneous injection, 2.5–10 mg once weekly; increased according to response in steps of 2.5–5 mg at intervals of at least 1 week; usual dose 7.5–15 mg once weekly; max. weekly dose 30 mg; stop treatment if inadequate response after 3 months at the optimum dose; **CHILD** 2–18 years see **BNF for Children**

---

**PIMECROLIMUS**

**Indications** see Dose

**Cautions** UV light (avoid excessive exposure to sunlight and sunlamps), avoid other topical treatments except emollients at treatment site; alcohol consumption (risk of facial flushing and skin irritation)

**Contra-indications** contact with eyes and mucous membranes, application under occlusion, infection at treatment site; congenital epidermal barrier defects; genitourinary tract infection; generalised erythroderma; immunodeficiency; comitant use with drugs that cause immunosuppression (may be prescribed in exceptional circumstances by specialists); application to malignant or potentially malignant skin lesions

**Side-effects** burning sensation, pruritus, erythema, skin infections (including folliculitis and less commonly impetigo, herpes simplex and zoster, molluscum contagiosum); rarely papilloma, skin discoloration, local reactions including pain, paraesthesia, peeling, dryness, oedema, and worsening of eczema; skin malignancy reported

**Dose**

- Short-term treatment of mild to moderate atopic eczema (including flares) when topical corticosteroids cannot be used (see also notes above), apply twice daily until symptoms resolve (stop treatment if eczema worsens or no response after 6 weeks); **CHILD** under 2 years not recommended

- Short-term treatment of facial, flexural, or genital psoriasis in patients unresponsive to, or intolerant of other topical therapy [unlicensed indication] (see also section 13.5.2), **ADULT** over 18 years, apply twice daily until symptoms resolve (max. duration of treatment 4 weeks)

**Elidel** (Meda) [Pat]

Cream, pimecrolimus 1%, net price 30 g = £19.69, 60 g = £37.41, 100 g = £59.07. Label: 4, 11, 28

**Excipients** include benzyl alcohol, cetyl alcohol, propylene glycol, stearyl alcohol

---

**TACROLIMUS**

**Indications** see Dose; other indications section 8.2.2

**Cautions** UV light (avoid excessive exposure to sunlight and sunlamps); alcohol consumption (risk of facial flushing and skin irritation)
Contra-indications  infection at treatment site; congenital epidermal barrier defects; generalised erythroderma; immunodeficiency; concomitant use with drugs that cause immunosuppression (may be prescribed in exceptional circumstances by specialists); application to malignant or potentially malignant skin lesions; avoid contact with eyes and mucous membranes; application under occlusion

Pregnancy  manufacturer advises avoid unless essential; toxicity in animal studies following systemic administration

Breast-feeding  manufacturer advises avoid—present in milk following systemic administration

Side-effects  application-site reactions including rash, irritation, pain and paraesthesia; herpes simplex infection, Kaposi’s varicelliform eruption; application-site infections; less commonly acne; also reported rosacea, malignancies (including skin malignancy, cutaneous lymphomas and other types of lymphomas)

Dose
• Short-term treatment of moderate to severe atopic eczema (including flares) in patients unresponsive to, or intolerant of conventional therapy (see also notes above), ADULT and CHILD over 16 years, initially apply 0.1% ointment thinly twice daily until lesion clears (consider other treatment if eczema worsens or no improvement after 2 weeks); reduce to once daily or switch to 0.03% ointment if condition allows; CHILD 2–16 years, initially apply 0.03% ointment thinly twice daily for up to 3 weeks (consider other treatment if eczema worsens or if no improvement after 2 weeks) then reduce to once daily until lesion clears
• Prevention of flares in patients with moderate to severe atopic eczema and 4 or more flares a year who have responded to initial treatment with topical tacrolimus (see also notes above), ADULT and CHILD over 16 years, apply 0.1% ointment thinly twice weekly; use short-term treatment regimen during an acute flare; review need for preventative therapy after 1 year; CHILD 2–16 years, apply 0.03% ointment thinly twice weekly; use short-term treatment regimen during an acute flare; interrupt preventative therapy after 1 year to reassess condition
• Short-term treatment of facial, flexural, or genital psoriasis in patients unresponsive to, or intolerant of other topical therapy [unlicensed indication] (see also section 13.5.2), ADULT over 18 years, initially apply 0.1% ointment thinly twice daily until symptoms resolve; reduce to once daily or switch to 0.03% ointment if condition allows; max. duration of treatment 4 weeks

Protopic® (Astellas) Ointment, tacrolimus (as monohydrate) 0.03%, net price 30 g = £19.44, 60 g = £35.46; 0.1%, 30 g = £21.60, 60 g = £39.40. Label: 4, 11, 28

Excipients include beeswax

Cytokine modulators

ADALIMUMAB

Indications  see notes above; Crohn’s disease (section 1.5.3); ankylosing spondylitis, polyarticular juvenile idiopathic arthritis, psoriatic arthritis, rheumatoid arthritis (section 10.1.3)

Cautions  section 10.1.3, p. 723

Important  See section 10.1.3, p. 723 for information on tuberculosis and blood disorders

Contra-indications  section 10.1.3, p. 723

Pregnancy  section 10.1.3, p. 723

Breast-feeding  section 10.1.3, p. 723

Side-effects  section 10.1.3, p. 723

Dose
• By subcutaneous injection, plaque psoriasis, ADULT over 18 years, initially 80 mg, then 40 mg on alternate weeks starting 1 week after initial dose; discontinue treatment if no response within 16 weeks

Preparations  Section 10.1.3

ETANERCEPT

Indications  see notes above; ankylosing spondylitis, psoriatic arthritis, polyarticular course juvenile idiopathic arthritis, rheumatoid arthritis (section 10.1.3)

Cautions  section 10.1.3, p. 725

Important  See section 10.1.3, p. 725 for information on tuberculosis and blood disorders

Contra-indications  section 10.1.3, p. 725

Pregnancy  section 10.1.3, p. 725

Hepatic impairment  section 10.1.3, p. 725

Breast-feeding  section 10.1.3, p. 725

Side-effects  section 10.1.3, p. 725

Dose
• By subcutaneous injection, plaque psoriasis, 25 mg twice weekly or 50 mg once weekly for up to 24 weeks; discontinue if no response after 12 weeks; CHILD 6–18 years, 800 micrograms/kg (max. 50 mg) once weekly for up to 24 weeks; discontinue if no response after 12 weeks

Preparations  Section 10.1.3

INFLIXIMAB

Indications  see notes above; inflammatory bowel disease (section 1.5.3); ankylosing spondylitis, psoriatic arthritis, rheumatoid arthritis (section 10.1.3)

Cautions  section 10.1.3, p. 726; monitor for non-melanoma skin cancer before and during treatment

Important  See section 10.1.3, p. 726 for information on tuberculosis, blood disorders, and hypersensitivity reactions

Contra-indications  section 10.1.3, p. 726

Pregnancy  section 10.1.3, p. 726

Breast-feeding  section 10.1.3, p. 726

Side-effects  section 10.1.3, p. 726

Dose
• By intravenous infusion, plaque psoriasis, ADULT over 18 years, 5 mg/kg, repeated 2 weeks and 6 weeks after initial infusion, then every 8 weeks; discontinue if no response within 14 weeks of initial infusion

Preparations  Section 10.1.3

USTEKINUMAB

Indications  see notes above; psoriatic arthritis (section 10.1.3)

Cautions  predisposition to infection; history or development of malignancy; monitor for non-melanoma skin cancer, especially in patients with a history of PUVA treatment or prolonged immuno-
suppressant therapy, or those over 60 years of age; elderly; interactions: Appendix 1 (ustekinumab)  

Tuberculosis Patients should be evaluated for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment (section 5.1.9) for at least 2 months before starting ustekinumab. Patients who have previously received adequate treatment for tuberculosis can start ustekinumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting ustekinumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with ustekinumab. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop  

Contra-indications active infection  

Pregnancy avoid; manufacturer advises effective contraception during treatment and for 15 weeks after stopping treatment  

Breast-feeding manufacturer advises avoid—present in milk in animal studies  

Side-effects diarrhoea, nausea, headache, malaise, dizziness, infections (sometimes severe), arthralgia, myalgia, oropharyngeal pain, pruritus, injection-site reactions; less commonly, depression, facial palsy, nasal congestion, hypersensitivity reactions (possibly delayed onset), pustular psoriasis  

Dose  

- By subcutaneous injection, plaque psoriasis, ADULT over 18 years, body-weight under 100 kg, initially 45 mg, then 45 mg 4 weeks after initial dose, then 45 mg 42 g 12 weeks; body-weight over 100 kg, initially 45–90 mg, then 45–90 mg 4 weeks after initial dose, then 45–90 mg every 12 weeks  

Note Discontinue if no response within 16 weeks  

Stelara® (Janssen) (PS)  

Injection, ustekinumab 90 mg/mL, net price 0.5-mL (45-mg) prefilled syringe = £2147.00. Label: 10, counselling, tuberculosis  

### 13.6 Acne and rosacea  

#### 13.6.1 Topical preparations for acne  

In mild to moderate acne, comedones and inflamed lesions respond well to benzoyl peroxide (see below) or to a topical retinoid (see p. 807). Alternatively, topical application of an antibacterial such as erythromycin or clindamycin may be effective for inflammatory acne. If topical preparations prove inadequate, oral preparations may be needed (section 13.6.2).  

### Benzoyl peroxide and azelaic acid  

**Benzoyl peroxide** is effective in mild to moderate acne. Both comedones and inflamed lesions respond well to benzoyl peroxide. The lower concentrations seem to be as effective as higher concentrations in reducing inflammation. It is usual to start with a lower strength and to increase the concentration of benzoyl peroxide gradually. Adverse effects include local skin irritation, particularly when therapy is initiated, but the scaling and redness often subside with treatment continued at a reduced frequency of application. If the acne does not respond after 2 months then use of a topical antibacterial should be considered.  

**Azelaic acid** has antimicrobial and anticomedonal properties. It may be an alternative to benzoyl peroxide or to a topical retinoid for treating mild to moderate comedonal acne, particularly of the face. Some patients prefer azelaic acid because it is less likely to cause local irritation than benzoyl peroxide.  

#### 13.6.2 Oral preparations for acne  

Acne Treatment of acne should be commenced early to prevent scarring. Patients should be counselled that an improvement may not be seen for at least a couple of months. The choice of treatment depends on whether the acne is predominantly inflammatory or comedonal and its severity.  

Mild to moderate acne is generally treated with topical preparations (section 13.6.1). Systemic treatment (section 13.6.2) with oral antibacterials is generally used for moderate to severe acne or where topical preparations are not tolerated or are ineffective or where application to the site is difficult. Another oral preparation used for acne is the hormone treatment diazidol (cyproterone acetate with ethinyloestradiol), it is for women only.  

Severe acne, acne unresponsive to prolonged courses of oral antibacterials, scarring, or acne associated with psychological problems calls for early referral to a consultant dermatologist who may prescribe isotretinoin for administration by mouth.  

### Rosacea  

Brimonidine (section 13.6.3) is licensed for the treatment of facial erythema in rosacea. Rosacea is not comedonal (but may exist with acne which may be comedonal). The pustules and papules of rosacea respond to topical metronidazole (section 13.10.1.2) or to topical azelaic acid (section 13.6.1). Alternatively, oral administration of oxytetracycline or tetracycline 500 mg twice daily (section 5.1.3), or of erythromycin 500 mg twice daily (section 5.1.5), can be used; courses usually last 6–12 weeks and are repeated intermittently. Doxycycline (section 5.1.3) 100 mg once daily can be used [unlicensed indication] if oxytetracycline or tetracycline is inappropriate (e.g. in renal impairment). A modified-release preparation of doxycycline is licensed in low doses of 40 mg once daily for the treatment of facial rosacea (section 5.1.3). Isotretinoin is occasionally given in refractory cases [unlicensed indication]. Camouflagers (section 13.8.2) may be required for the redness.
### Skin

**Finacea**<sup>®</sup> (Bayer)<br>**Gel**, azelaic acid 15%, net price 30 g = £7.48<br>Excipients include disodium edetate, polysorbate 80, propylene glycol<br>Dose face acne vulgaris, **ADULT** and **CHILD** over 12 years, apply twice daily, discontinue if no improvement after 1 month. Papulopustular rosacea, **ADULT** over 18 years, apply twice daily, discontinue if no improvement after 2 months.

---

**PanOxyl**<sup>®</sup> (GSK)<br>Aquaigel<sup>®</sup> (aqueous gel), benzoyl peroxide 2.5%, net price 40 g = £1.76; 5%, 40 g = £1.92; 10%, 40 g = £2.13<br>Excipients include propylene glycol<br>Cream, benzoyl peroxide 10% in an aqueous basis, net price 40 g = £1.99<br>Excipients include fragrance<br>Wash, benzoyl peroxide 10% in a detergent basis, net price 150 mL = £4.00<br>Excipients include imidurea<br>Note May be difficult to obtain<br>

**Bretroxy**<sup>®</sup> (GSK)<br>Cream, benzoyl peroxide 4% in an aqueous basis, net price 50 g = £4.13<br>Excipients include cetostearyl alcohol, fragrance, stearyl alcohol<br>

### Twin Pack</p>

**Azelol®**<sup>®</sup> (Alliance)<br>Cream, benzoyl peroxide 5%, potassium hydroxyquinoline sulfate 0.5%, in an astringent vanishing-cream basis, net price 50 g = £2.43<br>Excipients include cetostearyl alcohol, edetic acid (EDTA)<br>Dose **ADULT** and **CHILD** over 12 years, apply once daily in the evening.<br>Cream, benzoyl peroxide 5%, clindamycin 1% (as phosphate) in an aqueous basis, net price 25 g = £9.95, 50 g = £19.90<br>Excipients include disodium edetate<br>Dose **ADULT** and **CHILD** over 12 years, apply once daily in the evening.<br>

**Topical antibacterials for acne**

For many patients with mild to moderate inflammatory acne, topical antibacterials may be no more effective than topical benzoyl peroxide or tretinoin. Topical antibacterials are probably best reserved for patients who wish to avoid oral antibacterials or who cannot tolerate them. Topical preparations of erythromycin and clindamycin are effective for inflammatory acne. Topical antibacterials can produce mild irritation of the skin, and on rare occasions cause sensitisation; gastro-intestinal disturbances have been reported with topical clindamycin.

Antibacterial resistance of Propionibacterium acnes is increasing; there is cross-resistance between erythromycin and clindamycin. To avoid development of resistance:

- when possible use non-antibiotic antimicrobials (such as benzoyl peroxide or azelaic acid);
- avoid concomitant treatment with different oral and topical antibacterials;
- if a particular antibacterial is effective, use it for repeat courses if needed (short intervening courses of benzoyl peroxide or azelaic acid may eliminate any resistant propionibacteria);
- do not continue treatment for longer than necessary (however, treatment with a topical preparation should be continued for at least 6 months).

**ANTIBACTERIALS**

**Indications** acne vulgaris

**Cautions** some manufacturers advise preparations containing alcohol are not suitable for use with benzoyl peroxide; discontinue clindamycin preparations immediately if diarrhoea or colitis occur.

**Dolac®**<sup>®</sup> (Pharmacia)<br>Topical solution, clindamycin 1% (as phosphate), in an aqueous alcoholic basis, net price (both with applicator) 30 mL = £4.34, 50 mL = £7.25
Excipients include propylene glycol<br>Dose apply thickly twice daily<br>Lotion, clindamycin 1% (as phosphate) in an aqueous basis, net price 30 mL = £5.08, 60 mL = £10.16
Excipients include cetostearyl alcohol, hydroxybenzoates (parabens)<br>Dose apply thickly twice daily<br>

**Stielym®**<sup>®</sup> (Stiefel)<br>Solution, erythromycin 2% in an alcoholic basis, net price 50 mL = £7.69
Excipients include propylene glycol<br>Dose **ADULT** and **CHILD** over 12 years, apply thrice daily<br>

**Zindacin®**<sup>®</sup> (Crawford)<br>Gel, clindamycin 1% (as phosphate), net price 30 g = £8.66
Excipients include propylene glycol<br>Dose **ADULT** and **CHILD** over 12 years, apply thrice daily
Topical retinoids and related preparations for acne

Topical tretinoin, its isomer isotretinoin, and adapalene (a retinoid-like drug), are useful for treating comedones and inflammatory lesions in mild to moderate acne. Patients should be warned that some redness and skin peeling can occur initially but settles with time. If undue irritation occurs, the frequency of application should be reduced or treatment suspended until the reaction subsides; if irritation persists, discontinue treatment. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop.

Isotretinoin is given by mouth in severe acne; see section 13.6.2 for warnings relating to use by mouth.

Cautions  Topical retinoids should be avoided in severe acne involving large areas. Contact with eyes, nostrils, mouth and mucous membranes, eczematous, broken or sunburned skin should be avoided. These drugs should be used with caution in sensitive areas such as the neck, and accumulation in angles of the nose should be avoided. Exposure to UV light (including sunlight, solariums) should be avoided; if sun exposure is unavoidable, an appropriate sunscreen or protective clothing should be used. Use of retinoids with abrasive cleaners, comedogenic or astringent cosmetics should be avoided. Allow peeling (resulting from other irritant treatments) to subside before using a topical retinoid; if irritation persists, discontinue treatment.

Pregnancy  Topical retinoids are contra-indicated in pregnancy; women of child-bearing age must use effective contraception (oral progestogen-only contraceptives not considered effective).

Side-effects  Local reactions include burning, erythema, stinging, pruritus, dry or peeling skin (discontinue if severe). Increased sensitivity to UVB light or sunlight occurs. Temporary changes of skin pigmentation with tretinoin have been reported. Eye irritation and oedema, and blistering or crusting of skin have been reported rarely.

Differin® (Galderma)  Cream, adapalene 0.1%, net price 45 g = £16.15. Label: 11

Excipients  Include disodium edetate, hydroxybenzoates (parabens)

Gel  adapalene 0.1%, net price 45 g = £16.15. Label: 11

Excipients  Include disodium edetate, hydroxybenzoates (parabens), propylene glycol

With benzoyl peroxide

Epiduo® (Galderma)  Gel, adapalene 0.1%, benzoyl peroxide 2.5%, net price 45 g = £17.91. Label: 11

Excipients  Include disodium edetate, polysorbate 80, propylene glycol

Dose  Adult and Child over 9 years, acne vulgaris, apply thinly once daily in the evening

Note  May bleach clothing and hair

Note  The Scottish Medicines Consortium (p. 4) has advised (March 2014) that Epiduo® should be restricted for use in mild to moderate facial acne when monotherapy with benzoyl peroxide or adapalene is inappropriate.

ISOETRENOIN

Note  Isotretinoin is an isomer of tretinoin

Important  For prescribing information on isotretinoin when given by mouth, see p. 809

Indications  see notes above; oral treatment (see section 13.6.2)

Cautions  (topical application only) see notes above; also personal or familial history of non-melanoma skin cancer

Contra-indications  (topical application only) rosacea, perioral dermatitis

Pregnancy  (topical application only) see notes above

Breast-feeding  avoid

Side-effects  (topical application only) see notes above

Dose  • Apply thinly 1–2 times daily

Isotrex® (Stiefel)  Gel, isotretinoin 0.05%, net price 30 g = £5.94. Label: 11

Excipients  Include butylated hydroxytoluene

With antibacterial

Isoretin® (Stiefel)  Gel, isotretinoin 0.05%, erythromycin 2% in ethanolic basis, net price 30 g = £7.47. Label: 11

Excipients  Include butylated hydroxytoluene

TRETINOIN

Note  Tretinoin is the acid form of vitamin A

Indications  see preparations; malignant disease (section 8.1.5)

Cautions  see notes above

Contra-indications  personal or familial history of non-melanoma skin cancer; rosacea; perioral dermatitis

Pregnancy  see notes above

Breast-feeding  amount of drug in milk probably too small to be harmful; ensure infant does not come in contact with treated areas

Side-effects  see notes above

Dose  • See preparations
Other topical preparations for acne

Preparations containing abrasive agents are not considered beneficial in acne.

A topical preparation of nicotinamide is available for inflammatory acne.

### ABRASIVE AGENTS

**Indications** acne vulgaris (but see notes above)

**Cautions** avoid contact with eyes; discontinue use temporarily if skin becomes irritated

**Contra-indications** superficial venules, telangiectasia

**Brasivol®** (Stiefel)

Paste No. 1, aluminium oxide 38.09% in fine particles, in a soap-detergent basis, net price 75 g = £2.76

Excipients exclude fragrance, N-(3-Chloroallyl) hexaminium chloride (quaternium 15)

**Dose** use instead of soap 1–3 times daily

**NICOTINAMIDE**

**Indications** see under preparation

**Cautions** avoid contact with eyes and mucous membranes (including nose and mouth); reduce frequency of application if excessive dryness, irritation or peeling

**Side-effects** dry skin, pruritus, erythema, burning, irritation

**Nicam®** (Dermal)

Gel, nicotinamide 4%, net price 60 g = £7.10

Excipients none as listed in section 13.1.3

**Dose** inflammatory acne vulgaris, apply twice daily; reduce to once daily or on alternate days if irritation occurs

### 13.6.2 Oral preparations for acne

#### Oral antibacterials for acne

Systemic antibacterial treatment is useful for inflammatory acne if topical treatment is not adequately effective or if it is inappropriate. Anticomедonal treatment (e.g. with topical benzoyl peroxide) may also be required.

Either oxytetracycline or tetracycline (section 5.1.3) is usually given for acne in a dose of 500 mg twice daily. If there is no improvement after the first 3 months another oral antibacterial should be used. Maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer.

Doxycycline and lymecycline (section 5.1.3) are alternatives to tetracycline. Doxycycline can be used in a dose of 100 mg daily. Lymecycline is given in a dose of 408 mg daily.

Although minocycline is as effective as other tetracyclines for acne, it is associated with a greater risk of lupus erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation; it is given in a dose of 100 mg once daily or 50 mg twice daily.

Erythromycin (section 5.1.5) in a dose of 500 mg twice daily is an alternative for the management of acne but propionibacteria strains resistant to erythromycin are becoming widespread and this may explain poor response.

Trimethoprim (section 5.1.8) in a dose of 300 mg twice daily may be used for acne resistant to other antibacterials [unlicensed indication]. Prolonged treatment with trimethoprim may depress haematopoiesis; it should generally be initiated by specialists.

Concomitant use of different topical and systemic antibacterials is undesirable owing to the increased likelihood of the development of bacterial resistance.

#### Hormone treatment for acne

Co-cyprindiol (cyproterone acetate with ethinylestradiol) contains an anti-androgen. It is licensed for use in women with moderate to severe acne that has not responded to topical therapy or oral antibacterials, and for moderately severe hirsutism. Although it is an effective hormonal contraceptive, it should not be used solely for contraception.

Improvement of acne with co-cyprindiol probably occurs because of decreased sebum secretion which is under androgen control. Some women with moderately severe hirsutism may also benefit because hair growth is also androgen-dependent.

There is an increased risk of venous thromboembolism in women taking co-cyprindiol, particularly during the first year of use. The incidence of venous thromboembolism is 1.5–2 times higher in women using co-cyprindiol than in women using combined oral contraceptives containing levonorgestrel, but the risk may be similar to that associated with use of combined oral contraceptives containing third-generation progestogens (desogestrel and gestodene) or drospirenone (see section 7.3.1). It is contra-indicated in those with a history of venous or arterial thromboembolism, or in those with severe or multiple risk factors for arterial disease or venous thromboembolism (see section 7.3.1). Women requiring co-cyprindiol may have an inherently increased risk of cardiovascular disease.

**CO-CYPRINDIOL**

A mixture of cyproterone acetate and ethinylestradiol in the mass proportions 2000 parts to 35 parts, respectively

**Indications** moderate to severe acne in women refractory to topical therapy or oral antibacterials (but see notes above); moderately severe hirsutism

**Cautions** see under Combined Hormonal Contraceptives, section 7.3.1

**Contra-indications** see under Combined Hormonal Contraceptives, section 7.3.1 and notes above

**Hepatic impairment** see under Combined Hormonal Contraceptives, section 7.3.1

**Pregnancy** avoid—risk of feminisation of male fetus with cyproterone

**Breast-feeding** manufacturer advises avoid; possibility of anti-androgen effects in neonate with cyproterone
Side-effects  see under Combined Hormonal Contraceptives, section 7.3.1

Dose

• 1 tablet daily for 21 days starting on day 1 of menstrual cycle; subsequent courses repeated after a 7-day interval (during which withdrawal bleeding occurs); time to symptom remission, at least 3 months; review need for treatment regularly

Co-cyprindiol (Non-proprietary)  ▼ (FM)

Tablets, co-cyprindiol 2000/35 (cyproterone acetate 2 mg, ethinylestradiol 35 micrograms), net price 63-tab pack = £5.42
Brands include Acnocin®, Cicafem®, Clairette®

Dianette® (Bay®)  ▼ (FM)

Tablets, beige, s/c, co-cyprindiol 2000/35 (cypro-terone acetate 2 mg, ethinylestradiol 35 micrograms), net price 63-tab pack = £7.71

Oral retinoid for acne

The retinoid isotretinoin reduces sebum secretion. It is used for the systemic treatment of nodulo-cystic and conglobate acne, severe acne, scarring, acne which has not responded to an adequate course of a systemic antibacterial, or acne which is associated with psychological problems. It is also useful in women who develop acne in the third or fourth decades of life, since late onset acne is frequently unresponsive to antibacterials.

Isotretinoin is a toxic drug that should be prescribed only by, or under the supervision of, a consultant dermatologist. It is given for at least 16 weeks; repeat courses are not normally required.

Side-effects of isotretinoin include severe dryness of the skin and mucous membranes, nose bleeds, and joint pains. The drug is teratogenic and must not be given to women of child-bearing age unless they practise effective contraception (oral progestogen-only contraceptives not considered effective) and then only after detailed assessment and explanation by the physician.

Women must also be registered with a pregnancy prevention programme (see under Cautions below).

Although a causal link between isotretinoin use and psychiatric changes (including suicidal ideation) has not been established, the possibility should be considered before initiating treatment; if psychiatric changes occur during treatment, isotretinoin should be stopped, the prescriber informed, and specialist psychiatric advice should be sought.

13.6.2 Oral preparations for acne 809

ISOTRETINOIN

Note  Isotretinoin is an isomer of tretinoin

Indications  see notes above

Cautions  see notes above; also avoid blood donation during treatment and for at least 1 month after treatment; history of depression; monitor all patients for depression; measure hepatic function and serum lipids before treatment, 1 month after starting and then every 3 months (reduce dose or discontinue if transaminase or serum lipids persistently raised); discontinue if uncontrolled hypertriglyceridaemia or pancreatitis; diabetes; dry eye syndrome (associated with risk of keratitis); avoid keratolytics; interactions: Appendix 1 (retinoids)

Pregnancy prevention  In women of child-bearing potential, exclude pregnancy up to 3 days before treatment (start treatment on day 2 or 3 of menstrual cycle), every month during treatment (unless there are compelling reasons to indicate that there is no risk of pregnancy), and 5 weeks after stopping treatment—perform pregnancy test in the first 3 days of the menstrual cycle. Women should practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 1 month after stopping treatment. Women should be advised to use at least 1 method of contraception, but ideally they should use 2 methods of contraception. Oral progesterone-only contraceptives are not considered effective. Barrier methods should not be used alone, but can be used in conjunction with other contraceptive methods. Each prescription for isotretinoin should be limited to a supply of up to 30 days’ treatment and dispensed within 7 days of the date stated on the prescription; repeat prescriptions or fixed prescriptions are not acceptable. Women should be advised to discontinue treatment and to seek prompt medical attention if they become pregnant during treatment or within 1 month of stopping treatment.

Counselling  Warn patient to avoid wax epilation (risk of epidermal stripping), dermabrasion, and laser skin treatments (risk of scarring) during treatment and for at least 6 months after stopping; patient should avoid exposure to UV light (including sunlight) and use sunscreen and emollient (including lip balm) preparations from the start of treatment.

Contra-indications  hypervitaminosis A, hyperlipidaemia

Hepatic impairment  avoid—further impairment of liver function may occur

Renal impairment  severe impairment, reduce initial dose (e.g. 10 mg daily) and increase gradually up to 1 mg/kg daily as tolerated

Pregnancy  avoidance—teratogenic; effective contraception must be used—see Pregnancy Prevention above

Breast-feeding  avoid

Side-effects  dryness of skin (with dermatitis, scaling, thinning, erythema, pruritus), epidermal fragility (trauma may cause blistering), dryness of lips (sometimes chelitis), dryness of eyes (with blepharitis and conjunctivitis), dryness of pharyngeal mucosa (with hoarseness), dryness of nasal mucosa (with epistaxis), headache, myalgia and arthralgia, raised plasma-tri-glyceride concentration (risk of pancreatitis if tri-glycerides above 9 mmol/litre), raised serum-choles-terol concentration (with reduced high-density lipoprotein concentration), raised blood-glucose concentration, raised serum-transaminase concentra tion, haematuria and proteinuria, thrombocytopenia, thrombocytosis, neutropenia and anaemia; rarely mood changes (depression, aggressive behaviour, anxiety, and very rarely psychosis and suicidal idea tion)—expert referral required, skin reactions (including reports of Stevens-Johnson syndrome and toxic epidermal necrolysis), alopecia; very rarely nausea, hepatitis, inflammatory bowel disease, gastro-intestinal haemorrhage, haemorrhagic diarrhoea (discontinue treatment), benign intracranial hyper tension (avoid concomitant tetracyclines), con vulsions, malaise, drowsiness, dizziness, diabetes mellitus, lymphadenopathy, hyperuricaemia, glomerulonephritis, tendinitis, arthritis, raised serum-crea-tine kinase concentration, bone changes (including reduced bone density, early epiphyseal closure, and skeletal hyperostosis) and calcification of tendons and ligaments (long bone fractures); visual disturbances (papilloedema, corneal opacities, catar acts, decreased night vision, photophobia, blurred vision, colour blindness)—expert referral required and consider withdrawal, decreased tolerance to contact lenses, keratitis, impaired hearing, Gram positive infections of skin and mucous membranes, exacerbation of acne, acne fulminans, allergic vascu
13 Skin

Distress. The warts are painful, unsightly, persistent, or cause usually relies on local tissue destruction. Warts may warts), and the anogenital region (see below); treatment which most frequently affects the hands, feet (plantar Warts (verrucas) are caused by a human papillomavirus, widespread in the public; they are suitable for the removal of warts on hands and feet. Salicylic acid is a useful keratolytic which may be considered first; it is also suitable for the removal of corns and calluses. Preparations of salicylic acid in a collodion basis are available but some patients may develop an allergy to colophony in the formulation. Cryotherapy causes pain, swelling, and blistering, and may be no more effective than topical salicylic acid in the treatment of warts.

### 13.6.3 Topical preparations for rosacea

Brimonidine, a selective alpha₂-adrenoceptor agonist, reduces erythema in rosacea by cutaneous vasoconstriction. For advice on the management of rosacea, see Rosacea, p. 805.

#### BRIMONIDINE TARTRATE

- **Indications** facial erythema in rosacea
- **Cautions** avoid contact with eyes, mouth, and mucous membranes; avoid use on irritated skin or open wounds; apply other topical preparations (including cosmetics) only after brimonidine gel has dried on skin; interactions: Appendix 1 (brimonidine)
- **Pregnancy** manufacturer advises avoid—limited information available
- **Breast-feeding** manufacturer advises avoid—no information available
- **Side-effects** pruritus, burning sensation; less commonly dry mouth, headache, paraesthesia, skin irritation, dry skin
- **Dose**
  - **Adult** over 18 years, apply thinly once daily until erythema subsides (max. 5 mg brimonidine tartrate daily divided over forehead, chin, nose, and cheeks)
  - **Child** over 12 years, 500 micrograms/kg daily (in 1–2 divided doses), increased if necessary to 1 mg/kg daily, for 16–24 weeks (repeat treatment course after a period of at least 8 weeks if relapse after first course); max. cumulative dose 150 mg/kg per course

**Mirvaso** (Galderma)

**Gel**, brimonidine tartrate 5 mg/g, net price 30 g = £33.69. Label: 28

**Excipients** include hydroxybenzoates (parabens), propylene glycol

#### SALICYLIC ACID

- **Indications** see under preparations; psoriasis (section 13.5.2); fungal nail infections (section 13.10.2)
- **Cautions** significant peripheral neuropathy, patients with diabetes at risk of neuropathic ulcers; impaired peripheral circulation; protect surrounding skin and avoid broken skin; not suitable for application to face, anogenital region, or large areas
- **Side-effects** skin irritation, skin ulceration (with high concentrations)
- **Dose**
  - **See under preparations:** advise patient to apply carefully to wart and to protect surrounding skin (e.g. with soft paraffin or specially designed plaster); rub wart surface gently with file or pumice stone once weekly; treatment may need to be continued for up to 3 months

**Cuplex** (Crawford)

**Gel**, salicylic acid 11%, lactic acid 4%, in a collodion basis, net price 5 g = £2.88. Label: 15

**Dose** for plantar and mosaic warts, corns, and calluses, apply twice daily

**Note** Contains colophony (see notes above)

**Duofilm** (GSK)

**Paint**, salicylic acid 16.7%, lactic acid 16.7%, in flexible collodion, net price 15 mL (with applicator) = £2.25. Label: 15

**Dose** for plantar and mosaic warts, apply daily

**Occlusal** (Alliance)

**Cutaneous solution**, salicylic acid 26% in polyacrylic solution, net price 10 mL (with applicator) = £3.56. Label: 15

**Dose** for common and plantar warts, apply daily

**Salactol** (Dermal)

**Paint**, salicylic acid 16.7%, lactic acid 16.7%, in flexible collodion, net price 10 mL (with applicator) = £1.71. Label: 15

**Dose** for warts, particularly plantar warts, verrucas, corns, and calluses, apply daily

**Note** Contains colophony (see notes above)

**Salactac** (Dermal)

**Gel**, salicylic acid 12%, lactic acid 4% in a collodion basis, net price 8 g (with applicator) = £2.98. Label: 15

**Dose** for warts, verrucas, corns, and calluses, apply daily

**Verrugon** (Ransom)

**Ointment**, salicylic acid 50% in a paraffin basis, net price 6 g = £3.12

**Dose** for plantar warts, apply daily

Preparations of salicylic acid, formaldehyde, glutaraldehyde or silver nitrate are available for purchase by the public; they are suitable for the removal of warts on hands and feet. Salicylic acid is a useful keratolytic which may be considered first; it is also suitable for the removal of corns and calluses. Preparations of salicylic acid in a collodion basis are available but some patients may develop an allergy to colophony in the formulation. Cryotherapy causes pain, swelling, and blistering, and may be no more effective than topical salicylic acid in the treatment of warts.

### 13.7 Preparations for warts and calluses

Warts (verrucas) are caused by a human papillomavirus, which most frequently affects the hands, feet (plantar warts), and the anogenital region (see below); treatment usually relies on local tissue destruction. Warts may regress on their own and treatment is required only if the warts are painful, unsightly, persistent, or cause distress.

- **ADULT** and **CHILD** over 12 years, 500 micrograms/kg daily (in 1–2 divided doses), increased if necessary to 1 mg/kg daily, for 16–24 weeks (repeat treatment course after a period of at least 8 weeks if relapse after first course); max. cumulative dose 150 mg/kg per course

**Isotretinoin** (Non-proprietary)

**Capsules**, isotretinoin 5 mg, net price 56-cap pack = £14.78; 20 mg, 56-cap pack = £37.85. Label: 10, patient information leaflet, 11, 21

**Roaccutane** (Roche)

**Capsules**, isotretinoin 10 mg (brown-red), net price 30-cap pack = £14.54; 20 mg (brown-red/white), 30-cap pack = £20.02. Label: 10, patient information card, 11, 21

**Brimonidine**

- **Indications** facial erythema in rosacea
- **Cautions** avoid contact with eyes, mouth, and mucous membranes; avoid use on irritated skin or open wounds; apply other topical preparations (including cosmetics) only after brimonidine gel has dried on skin; interactions: Appendix 1 (brimonidine)
- **Pregnancy** manufacturer advises avoid—limited information available
- **Breast-feeding** manufacturer advises avoid—no information available
- **Side-effects** pruritus, burning sensation; less commonly dry mouth, headache, paraesthesia, skin irritation, dry skin
- **Dose**
  - **Adult** over 18 years, apply thinly once daily until erythema subsides (max. 5 mg brimonidine tartrate daily divided over forehead, chin, nose, and cheeks)
FORMALDEHYDE

Indications  see under preparations
Cautions  see under Salicylic Acid
Side-effects  see under Salicylic Acid

Veracur® (Typarm)

Gel, formaldehyde 0.75% in a water-miscible gel basis, net price 15 g = £2.41
Dose  for warts, particularly plantar warts, apply twice daily

GLUTARALDEHYDE

Indications  warts, particularly plantar warts
Cautions  protect surrounding skin; not for application to face, mucosa, or anogenital areas
Side-effects  rashes, skin irritation (discontinue if severe); stains skin brown
Dose  • Apply twice daily (see also under Salicylic acid)

Glutarol® (Dermal)

Solution (= application), glutaraldehyde 10%, net price 10 mL (with applicator) = £2.07

SILVER NITRATE

Indications  warts, verrucas, umbilical granulomas, over-granulating tissue, cauterisation
Cautions  protect surrounding skin and avoid broken skin; not suitable for application to face, anogenital region, or large areas
Side-effects  chemical burns on surrounding skin; stains skin and fabric
Dose  • Common warts and verrucas, apply moistened caustic pencil tip for 1–2 minutes; repeat after 24 hours up to max. 3 applications for warts or max. 6 applications for verrucas
• Umbilical granulomas, apply moistened caustic pencil tip (usually containing silver nitrate 40%) for 1–2 minutes while protecting surrounding skin with soft paraffin

AVOCA® (Bray)

Caustic pencil, tip containing silver nitrate 40%, potassium nitrate 60%, net price = 94p; silver nitrate 95%, potassium nitrate 5%, treatment pack (including emery file, 6 adhesive dressings and protector pads) = £2.27

Anogenital warts

The treatment of anogenital warts (condylomata acuminata) should be accompanied by screening for other sexually transmitted infections. Podophyllotoxin (the major active ingredient of podophyll) may be used for soft, non-keratinised external anogenital warts. Patients with a limited number of external warts or keratinised lesions may be better treated with cryotherapy or other forms of physical ablation.

Imiquimod cream is licensed for the treatment of external anogenital warts; it may be used for both keratinised and non-keratinised lesions. It is also licensed for the treatment of superficial basal cell carcinoma and actinic keratosis (section 13.8.1).

Inosine pranobex (section 5.3.2.1) is licensed for adjunctive treatment of genital warts but it has been superseded by more effective drugs.

IMIQUIMOD

Indications  see preparations
Cautions  avoid contact with eyes, lips, nostrils, or broken skin, and open wounds; not suitable for internal genital warts; uncircumcised males (risk of phimosis or stricture of foreskin); autoimmune disease; immunosuppressed patients
Pregnancy  no evidence of teratogenicity or toxicity in animal studies; manufacturer advises caution
Breast-feeding  no information available
Side-effects  local reactions (including itching, burning sensation, erythema, erosion, oedema, excoriation, and scabbing); headache; influenza-like symptoms; myalgia; less commonly local ulceration and alopecia; rarely Stevens-Johnson syndrome and cutaneous lupus erythematosus-like effect; very rarely dysuria in women; permanent hypopigmentation or hyperpigmentation reported
Dose  • See preparations

Aldara® (Meda)

Cream, imiquimod 5%, net price 12-sachet pack = £48.60. Label: 10, patient information leaflet
Excipients  include benzyl alcohol, cetyl alcohol, hydroxybenzoates (parabens), polyethanol 60, stearyl alcohol
Condoms  may damage latex condoms and diaphragms
Dose  warts (external genital and perianal), apply thinly 3 times a week at night until lesions resolve (max. 16 weeks); CHILD under 18 years see BNF for Children
Superficial basal cell carcinoma, apply to lesion (and 1 cm beyond it) on 5 nights each week for 6 weeks; assess response 12 weeks after completing treatment
Actinic keratosis, apply to lesion 3 times a week at night for 4 weeks; assess response after a 4 week treatment-free interval; repeat 4-week course if lesions persist; max. 2 courses

Important  Should be rubbed in and allowed to stay on the treated area for 6–10 hours for warts or for 8 hours for basal cell carcinoma and actinic keratosis, then washed off with mild soap and water (uncircumcised males treating warts under foreskin should wash the area daily). The cream should be washed off before sexual contact

Zyclara® (Meda)

Cream, imiquimod 3.75%, net price 28-sachet pack = £113.00. Label: 10, patient information leaflet
Excipients  include benzyl alcohol, cetyl alcohol, hydroxybenzoates (parabens), polyethanol 60, stearyl alcohol
Dose  Actinic keratosis, apply to lesion on face or balding scalp at bedtime for 2 weeks (max. 2 sachets daily); repeat course after a 2-week treatment-free interval; assess response 8 weeks after second course

Important  Should be rubbed in and allowed to stay on the treated area for 8 hours, then washed off with mild soap and water

POODOHPHYLLOTOXIN

Indications  see under preparations
Cautions  avoid normal skin and open wounds; keep away from face; very irritating to eyes
Pregnancy  avoid
Breast-feeding  avoid
Side-effects  local irritation
Skin
the changes responsible for skin cancer
photodamage and UVB contribute to long-term photosensitivity reactions (320–400 nm, known as UVA) are responsible for many sunburn
known as UVB) cause in wavelength. The medium wavelengths (290–320 nm,
Solar ultraviolet radiation is approximately 200–400 nm
wavelength. The medium wavelengths (290–320 nm, known as UVB) cause sunburn. The long wavelengths (320–400 nm, known as UVA) are responsible for many photosensitivity reactions and photodermatoses. Both UVA and UVB contribute to long-term photodamage and to the changes responsible for skin cancer and ageing.

Sunscreen preparations contain substances that protect the skin against UVA and UVB radiation, but they are no substitute for covering the skin and avoiding sunlight. The sun protection factor (SPF, usually indicated in the preparation title) provides guidance on the degree of protection offered against UVB; it indicates the multiples of protection provided against burning, compared with unprotected skin; for example, an SPF of 8 should enable a person to remain 8 times longer in the sun without burning. However, in practice, users do not apply sufficient sunscreen product and the protection is lower than that found in experimental studies. Some manufacturers use a star rating system to indicate the protection against UVA relative to protection against UVB for sunscreen products. However, the usefulness of the star rating system remains controversial. The EU Commission (September 2006) has recommended that the UVA protection factor for a sunscreen should be at least one-third of the sun protection factor (SPF); products that achieve this requirement will be labelled with a UVA logo alongside the SPF classification. Preparations that also contain reflective substances, such as titanium dioxide, provide the most effective protection against UVA.

Sunscreen preparations may rarely cause allergic reactions.

For optimum photoprotection, sunscreen preparations should be applied thickly and frequently (approximately 2 hourly). In photodermatoses, they should be used from spring to autumn. As maximum protection from sunlight is desirable, preparations with the highest SPF should be prescribed.

The European Commission Cosmetic Products Regulation (EC) 1223/2009 requires the use of INCI (International Nomenclature of Cosmetic Ingredients) for cosmetics and sunscreens. This table includes the rINN and the INCI synonym for the active ingredients of sunscreen preparations in the BNF

### Borderline substances

‘ACBS’ are regarded as drugs when prescribed for skin protection against ultraviolet radiation in abnormal cutaneous photosensitivity resulting from genetic disorders or photodermatoses, including vitiligo and those
Photodamage

Patients should be advised to use a high-SPF sunscreen and to minimise exposure of the skin to direct sunlight or sun lamps.

Topical treatments can be used for actinic keratosis. An emollient may be sufficient for mild lesions. Diclofenac gel is suitable for the treatment of superficial lesions in mild disease. Fluorouracil cream is effective against most types of non-hypertrophic actinic keratosis; a solution containing fluorouracil and salicylic acid is available for the treatment of low or moderately thick hyperkeratotic actinic keratoses. Imiquimod (section 13.7) is used for lesions on the face and scalp when cryotherapy or other topical treatments are inadequate or unsuitable; it is particularly suitable for multiple lesions, for periorbital lesions, or for lesions located at sites of poor healing. Imiquimod or topical fluorouracil is used for treating superficial basal cell carcinomas. Photodynamic therapy in combination with methyl-5-aminolevulinate cream is used in specialist centres for treating superficial, nodular basal cell carcinomas when other treatments are unsuitable.

Fluorouracil

Indications superficial malignant and pre-malignant skin lesions; other malignant disease (section 8.1.3)

Cautions avoid contact with eyes and mucous membranes; do not apply to bleeding lesions; caution in handling—irritant to tissues

Pregnancy manufacturers advise avoid (teratogenic)

Breast-feeding manufacturers advise avoid

Side-effects local irritation (use a topical cortico-steroid for severe discomfort associated with inflammatory reactions), photosensitivity, erythema multiforme

Dose See under preparations

Efudix® (Meda) Gel, fluorouracil 5%, net price 40 g = £32.90

Excipients include hydroxybenzoates (parabens), propylene glycol

Actikerall® (Almirall) Cream, fluorouracil 0.5%, salicylic acid 10%, net price 25 mL = £38.30. Label: 15

Excipients include hydroxybenzoates (parabens), propylene glycol, stearyl alcohol

Solution, fluorouracil 0.5%, salicylic acid 10%, net price 25 mL = £38.30. Label: 15

Excipients none as listed in section 13.1.3

Dose low or moderately thick hyperkeratotic actinic keratoses: apply to affected area once daily for up to 12 weeks; if severe side-effects occur, reduce frequency to 3 times a week until side-effects improve, if treating area with thin epidermis, reduce frequency of application and monitor response more often, max. area of skin treated at one time, 25 cm² (e.g. 5 cm x 5 cm)

Due to radiotherapy, chronic or recurrent herpes simplex labialis. Preparations with SPF less than 30 should not normally be prescribed. See also Appendix 2.

Ameluz®, available from Galderma) or 5-aminolaevulinic acid gel (Ameluz®, available from Spirit Health-care) is used in specialist centres for treating superficial and confluent, non-hypertrophic actinic keratosis when other treatments are inadequate or unsuitable; it is particularly suitable for multiple lesions, for periorbital lesions, or for lesions located at sites of poor healing.

Imiquimod or topical fluorouracil is used for treating superficial basal cell carcinomas. Photodynamic therapy in combination with methyl-5-aminolevulinate cream is used in specialist centres for treating superficial, nodular basal cell carcinomas when other treatments are unsuitable.

Diclofenac Sodium

Indications actinic keratosis

Cautions as for topical NSAIDs, see section 10.3.2

Contra-indications as for topical NSAIDs, see section 10.3.2

Side-effects as for topical NSAIDs, see section 10.3.2; also paraesthesia; application of large amounts may result in systemic effects, see section 10.1

Dose • Apply thinly twice daily for 60–90 days; max. 8 g daily

Solaraze® (Almirall) Gel, diclofenac sodium 3% in a sodium hyaluronate basis, net price 50 g = £38.30, 100 g = £76.60

Excipients include benzyl alcohol

Fluorouracil

Indications superficial malignant and pre-malignant skin lesions; other malignant disease (section 8.1.3)

Cautions avoid contact with eyes and mucous membranes; do not apply to bleeding lesions; caution in handling—irritant to tissues

Pregnancy manufacturers advise avoid (teratogenic)

Breast-feeding manufacturers advise avoid

Side-effects local irritation (use a topical cortico-steroid for severe discomfort associated with inflammatory reactions), photosensitivity, erythema multiforme

Dose See under preparations

Efudix® (Meda) Gel, fluorouracil 5%, net price 40 g = £32.90

Excipients include hydroxybenzoates (parabens), propylene glycol, stearyl alcohol

Actikerall® (Almirall) Cream, fluorouracil 0.5%, salicylic acid 10%, net price 25 mL = £38.30. Label: 15

Excipients none as listed in section 13.1.3

Dose low or moderately thick hyperkeratotic actinic keratoses: apply to affected area once daily for up to 12 weeks; if severe side-effects occur, reduce frequency to 3 times a week until side-effects improve, if treating area with thin epidermis, reduce frequency of application and monitor response more often, max. area of skin treated at one time, 25 cm² (e.g. 5 cm x 5 cm)
INGENOL MEBUTATE

Indications  see under Dose
Cautions  avoid contact with eyes, lips, broken skin, or inside of nostrils and ears; avoid occlusive dressings on treated area
Pregnancy  not absorbed from skin, but manufacturer advises avoid
Breast-feeding  not absorbed from skin; ensure infant does not come in contact with treated area for 6 hours after application
Side-effects  local reactions (including erythema, blistering, crusting, erosion, exfoliation, pain, pruritus, oedema, infection), headache; less commonly local ulceration, paraesthesia

Dose
• Actinic keratosis on face and scalp, apply 150 micrograms/g gel once daily for 3 days
• Actinic keratosis on trunk and extremities, apply 500 micrograms/g gel once daily for 2 days

Note  One tube covers skin area of 25 cm². Allow gel to dry on treatment area for 15 minutes. Avoid washing or touching the treated area for 6 hours after application, after this time, area may be washed with mild soap and water. Avoid use immediately after shower or less than 2 hours before bedtime.

PicoTA® (LEO)  Gel, ingenol mebutate 150 micrograms/g, net price $0.76; 500 micrograms/g, 2 x 0.47-g single-use tubes = $6.00; 2% Shampoo

Excipients  include butylated hydroxyanisole, butylated hydroxytoluene, lamb fat, propylene glycol

Finishing powder, translucent, net price $3.27, 70 g = $24.58. ACBS
Excipients  include butylated hydroxyanisole, hydroxybenzoates (parabens)

Keromask® (Lornamead)  Masking cream, (24 shades), net price $15.86. ACBS
Excipients  include butylated hydroxyanisole, hydroxybenzoates (parabens), lamb fat, propylene glycol

Finishing powder, (4 shades), net price $2.00 = $5.68. ACBS
Excipients  include butylated hydroxytoluene, hydroxybenzoates (parabens)

Veil® (Thomas Blake)  Cover cream, (40 shades), net price $19.42, 44 g = $33.35; 70 g = $42.10. ACBS
Excipients  include hydroxybenzoates (parabens), lamb fat derivative
Finishing powder, translucent, net price $3.50 = $24.58. ACBS
Excipients  include butylated hydroxyanisole, hydroxybenzoates (parabens)

Shampoos and other preparations for scalp and hair conditions

Dandruff is considered to be a mild form of seborrhoeic dermatitis (see also section 13.5.1). Shampoos containing antimicrobial agents such as pyrithione zinc (which are widely available) and selenium sulfide may have beneficial effects. Shampoos containing tar extracts may be useful and they are also used in psoriasis. Ketoconazole shampoo should be considered for more persistent or severe dandruff or for seborrhoeic dermatitis of the scalp.

Corticosteroid gels and lotions (section 13.4) can also be used. Shampoos containing coal tar and salicylic acid may also be useful. A cream or an ointment containing coal tar and salicylic acid is very helpful in psoriasis that affects the scalp (section 13.5.2). Patients who do not respond to these treatments may need to be referred to exclude the possibility of other skin conditions.

Cradle cap in infants may be treated with coconut oil or olive oil applications followed by shampooing.

See below for male-pattern baldness and also section 13.5 (psoriasis and eczema), section 13.10.4 (lice), and section 13.10.2 (ringworm).

Shampoos

Ketoconazole 2% (Non-proprietary)  Cream—section 13.10.2
Shampoo, ketoconazole 2%, net price $12.00 = $3.27
Excipients  include imidurea

Brands include Dandrano® 2% Shampoo, Nizoral®

Dose ADULT and CHILD over 12 years, treatment of seborrhoeic dermatitis and dandruff apply twice weekly for 2–4 weeks (prophylaxis apply once every 1–2 weeks), treatment of pityriasis versicolor apply once daily for max. 5 days (prophylaxis apply once daily for up to 3 days before sun exposure), leave preparation on for 3–5 minutes before rinsing.

1. Can be sold to the public for the prevention and treatment of dandruff and seborrhoeic dermatitis of the scalp as a shampoo formulation containing ketoconazole max. 2%, in a pack containing max. 120 mL and labelled to show a max. frequency of application of once every 3 days
Hirsutism

Hirsutism may result from hormonal disorders or as a side-effect of drugs such as minoxidil, corticosteroids, anabolic steroids, androgens, danazol, and progestogens.

Weight loss can reduce hirsutism in obese women.

Women should be advised about local methods of hair removal, and in the mildest cases this may be all that is required.

Efollornithine, an antiprotozoal drug, inhibits the enzyme ornithine decarboxylase in hair follicles. Topical efollornithine can be used as an adjunct to laser therapy for facial hirsutism in women. Efollornithine should be discontinued in the absence of improvement after treatment for 4 months.

Co-cyprindiol (section 13.6.2) may be effective for moderately severe hirsutism. Metformin (section 6.1.2.2) is an alternative in women with polycystic ovary syndrome [unlicensed indication]. Systemic treatment is required for 6–12 months before benefit is seen.

EFLORNITHINE

Indications see notes above

Pregnancy toxicity in animal studies—manufacturer advises avoid

Breast-feeding manufacturer advises avoid—no information available

Side-effects acne, application site reactions including burning and stinging sensation, rash; less commonly abnormal hair texture and growth

Dose

● ADULT over 18 years, apply thinly twice daily

Note Preparation must be rubbed in thoroughly; cosmetics may be applied over treated area 5 minutes after efollornithine; do not wash treated area for 4 hours after application

Vaniqa® (Almirall) (Pfizer) Cream, efollornithine (as hydrochloride monohydrate) 11.5%, net price 60 g = £56.87

Excipients include cetostearyl alcohol, hydroxybenzoates, stearyl alcohol

Note The Scottish Medicines Consortium (September 2005) that efollornithine for facial hirsutism be restricted for use in women in whom alternative drug treatment cannot be used

Androgenetic alopecia

Finasteride is licensed for the treatment of androgenetic alopecia in men. Continuous use for 3–6 months is required before benefit is seen, and effects are reversed 6–12 months after treatment is discontinued.

Topical application of minoxidil may stimulate limited hair growth in a small proportion of adults but only for as long as it is used.

FINASTERIDE

Indications androgenetic alopecia in men; benign prostatic hyperplasia (section 6.4.2)

Cautions section 6.4.2

Side-effects section 6.4.2

Dose

● By mouth 1 mg daily

Propecia® (MSD) (Boehringer) Tablets, f/c, beige, finasteride 1 mg, net price 28-tab pack = £26.99, 84-tab pack = £81.55

Alphosyl 2 in 1® (GSK Consumer Healthcare)

Shampoo, alcoholic coal tar extract 5%, net price 125 mL = £1.89, 250 mL = £4.52

Excipients include hydroxybenzoates (parabens), fragrance

Dose dandruff, use once or twice weekly as necessary; psoriasis, seborrhoeic dermatitis, scaling and itching, use every 2–3 days

Capasal® (Dermal)

Shampoo, coal tar 1%, coconut oil 1%, salicylic acid 0.5%, net price 250 mL = £4.69

Excipients none as listed in section 13.1.3

Dose scaly scalp disorders including psoriasis, seborrhoeic dermatitis, dandruff, and cradle cap, apply daily as necessary

Ceanel Concentrate® (Alliance)

Shampoo, cetrimide 10%, undecenoic acid 1%, net price 150 mL = £3.40, 500 mL = £9.80

Excipients none as listed in section 13.1.3

Dose seborrhoeic scalp conditions associated with dandruff and scaling, apply as necessary

Psoriderm® (Dermal)

Scalp lotion (= shampoo), coal tar 2.5%, lecithin 0.3%, net price 250 mL = £4.74

Excipients include disodium edetate

Dose seborrhoeic scalp conditions associated with dandruff and scaling, apply twice weekly for 2 weeks then once weekly for 2 weeks and then as necessary. CHILD under 5 years not recommended; pityriasis versicolor, section 13.10.2 [unlicensed indication]

Selsun® (Chattem UK)

Shampoo, selenium sulfide 2.5%, net price 50 mL = £1.44, 100 mL = £1.96, 150 mL = £2.75

Excipients include fragrance

Cautions avoid using 48 hours before or after applying hair colouring, straightening or waving preparations

Dose seborrhoeic scalp conditions, apply 3 times in first week then twice weekly

T/Gel® (K&L)

Shampoo, coal tar extract 2%, net price 125 mL = £3.61, 250 mL = £5.12

Excipients include fragrance, hydroxybenzoates (parabens), imidurea

Dose seborrhoeic scalp disorders including psoriasis, seborrhoeic dermatitis, dandruff, apply 2–3 times weekly

Other scalp preparations

Cocos®

Section 13.5.2

Etrivex®

Section 13.4

Polytar® (GSK)

Liquid, tar blend 1%, net price 250 mL = £2.23

Excipients include arachis (peanut) oil, fragrance, imidurea, polysorbate 80

Dose scalp disorders including psoriasis, seborrhoea, eczema, pruritus, and dandruff, apply 1–2 times weekly

Polytar Plus® (GSK)

Liquid, tar blend 1%, net price 500 mL = £3.91

Excipients include arachis (peanut) oil, fragrance, imidurea, polysorbate 80

Dose scalp disorders including psoriasis, seborrhoea, pruritus, and dandruff, apply 1–2 times weekly

Sebco®

Section 13.5.2
13.10 Anti-infective skin preparations

13.10.1 Antibacterial preparations

13.10.1.1 Antibacterial preparations only used topically

13.10.1.2 Antibacterial preparations also used systemically

Cellulitis, a rapidly spreading deeply seated inflammation of the skin and subcutaneous tissue, requires systemic antibacterial treatment (see Table 1, section 5.1). Lower leg infections or infections spreading around wounds are almost always cellulitis. *Erysipelas*, a superficial infection with clearly defined edges (and often affecting the face), is also treated with a systemic antibacterial (see Table 1, section 5.1).

In the community, acute impetigo on small areas of the skin may be treated by short-term topical application of fusidic acid; *mupirocin* should be used only to treat meticillin-resistant *Staphylococcus aureus*. If the impetigo is extensive or longstanding, an oral antibacterial such as flucloxacillin (or clarithromycin in penicillin-allergy) (Table 1, section 5.1) should be used. Mild antiseptics (section 13.11) can be used to soften crusts. Although many antibacterial drugs are available in topical preparations, some are potentially hazardous and frequently their use is not necessary if adequate hygienic measures can be taken. Moreover, not all skin conditions that are oozing, crusted, or characterised by eruption; less commonly hypotension, changes in hair colour or texture (discontinue if increased hair loss persists for more than 2 weeks)

Dose

- See under preparations below

Regaine® (McNeil)®

Regaine® for Women Regular Strength cutaneous solution, minoxidil 2% in an aqueous alcoholic basis, net price 60 mL bottle with applicator = £14.16

Excipients include propylene glycol

Cautions flammable; wash hands after application

Dose apply 1 mL twice daily to affected areas of scalp; discontinue if no improvement after 1 year

Regaine® for Men Extra Strength cutaneous solution, minoxidil 5% in an aqueous alcoholic basis, net price 60 mL bottle with applicator = £19.84, 3 × 60 mL bottles = £39.71

Excipients include propylene glycol

Cautions flammable; wash hands after application

Dose apply 1 mL twice daily to affected areas of scalp; discontinue if no improvement after 1 year

Regaine® for Men Extra Strength cutaneous foam, minoxidil 5%, net price 60 g = £21.84, 3 × 60 g = £63.69

Excipients include butylated hydroxytoluene. cetyl alcohol, stearyl alcohol, polysorbate 60

Cautions flammable; wash hands after application

Dose apply half a capful twice daily to affected areas of scalp; discontinue if no improvement after 16 weeks

Note Ensure hair and scalp dry before application

13.10.1.1 Antibacterial preparations only used topically

**MUPIROCIN**

Indications bacterial skin infections (see also notes above)

Renal impairment manufacturer advises caution when mupirocin ointment used in moderate or severe
impairment because it contains macrogols (polyethylene glycol)

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk—no information available

Breast-feeding no information available

Side-effects local reactions including irritation, pruritus, burning sensation, rash

Dose

- ADULT and CHILD over 1 year, apply up to 3 times daily for up to 10 days; CHILD under 1 year see BNF for Children

Mupirocin (Non-proprietary) 

Ointment, mupirocin 2%, net price 15 g = £5.36

Bactroban® (GSK) 

Cream, mupirocin (as mupirocin calcium) 2%, net price 15 g = £4.38

Excipients include benzyl alcohol, cetyl alcohol, stearyl alcohol

Ointment, mupirocin 2%, net price 15 g = £4.38

Excipients none as listed in section 13.1.3

Nasal ointment—section 12.2.3

NEOMYCIN SULFATE

Indications bacterial skin infections

Cautions large areas, see below

Large areas If large areas of skin are being treated ototoxicity may be a hazard, particularly in children, in the elderly, and in those with renal impairment

Contra-indications neonates

Renal impairment see Cautions above

Side-effects sensitisation (see also notes above)

Neomycin Cream BPC

Cream, neomycin sulfate 0.5%, cetomacrogol emulsifying ointment 30%, chlorocresol 0.1%, disodium edetate 0.01%, in freshly boiled and cooled purified water, net price 15 g = £2.17

Excipients include cetostearyl alcohol, edetic acid (EDTA)

Dose apply up to 3 times daily (short-term use)

POLYMYXINS

Indications bacterial skin infections

Cautions large areas, see below

Large areas If large areas of skin are being treated nephrotoxicity and neurotoxicity may be a hazard, particularly in children, in the elderly, and in those with renal impairment

Renal impairment see Cautions above

Side-effects sensitisation (see also notes above)

Polyfax® (TEVA UK) 

Ointment, polymyxin B sulfate 10 000 units, bacitracin zinc 500 units/g, net price 4 g = £3.26, 20 g = £4.62

Excipients none as listed in section 13.1.3

Dose apply twice daily or more frequently if required

SILVER SULFADIAZINE

Indications prophylaxis and treatment of infection in burn wounds; as an adjunct to short-term treatment of infection in leg ulcers and pressure sores; as an adjunct to prophylaxis of infection in skin graft donor sites and extensive abrasions; for conservative management of finger-tip injuries

Cautions G6PD deficiency; may inactivate enzymatic debriding agents—concomitant use may be inappropriate; for large amounts see also interactions: Appendix 1 (sulfonamides)

Large areas Plasma-sulfadiazine concentrations may approach therapeutic levels with side-effects and interactions as for sulfonamides (see section 5.1.8) if large areas of skin are treated. Owing to the association of sulfonamides with severe blood and skin disorders, treatment should be stopped immediately if blood disorders or rashes develop—but leucopenia developing 2–3 days after starting treatment of burn patients is reported usually to be self-limiting and silver sulfadiazine need not usually be discontinued provided blood counts are monitored carefully to ensure return to normality within a few days. Argyria may also occur if large areas of skin are treated (or if application is prolonged).

Contra-indications sensitivity to sulfonamides; not recommended for neonates

Hepatic impairment manufacturer advises caution if significant impairment; see also Large Areas, above

Renal impairment manufacturer advises caution if significant impairment; see also Large Areas, above

Pregnancy risk of neonatal haemolysis and methaemoglobinaemia in third trimester

Breast-feeding small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants

Side-effects allergic reactions including burning, itching and rashes; argyria reported following prolonged use; leucopenia reported (monitor blood levels)

Flamazine® (S&N Hlth.) 

Cream, silver sulfadiazine 1%, net price 20 g = £2.91, 50 g = £3.85, 250 g = £10.32, 500 g = £18.27

Excipients include cetyl alcohol, polysorbates, propylene glycol

Dose burns, apply daily or more frequently if very exudative; leg ulcers or pressure sores, apply daily or on alternate days (not recommended if ulcer very exudative); finger-tip injuries, apply every 2–3 days; consult product literature for details

Note Apply with sterile applicator

RETXAPAMULIN

Indications superficial bacterial skin infections (see also notes above)

Contra-indications contact with eyes and mucous membranes

Side-effects local reactions including irritation, erythema, pain, contact dermatitis, and pruritus

Dose

- ADULT over 18 years, apply thinly twice daily for 5 days; max. area of skin treated 10 cm² or lesion length 10 cm; CHILD 9 months–18 years, apply thinly twice daily for 5 days; max. area of skin treated 2% of body surface area

Note Review treatment if no response within 2–3 days

Altargo® (GSK) 

Ointment, retapamulin 1%, net price 5 g = £7.89.

Label: 28

Excipients include butylated hydroxytoluene

13.10.1.2 Antibacterial preparations also used systemically

Sodium fusidate is a narrow-spectrum antibacterial used for staphylococcal infections. For the role of sodium fusidate in the treatment of impetigo see p. 816.

Metronidazole is used topically for rosacea and to reduce the odour associated with anaerobic infections;
oral metronidazole (section 5.1.11) is used to treat wounds infected with anaerobic bacteria.

**Angular cheilitis** An ointment containing sodium fusidate is used in the fissures of angular cheilitis when associated with staphylococcal infection. For further information on angular cheilitis, see section 12.3.2.

### Fusidic Acid

**Indications** staphylococcal skin infections; penicillin-resistant staphylococcal infections (section 5.1.7); staphylococcal eye infections (section 11.3.1)

**Cautions** see notes above; avoid contact with eyes

**Side-effects** rarely hypersensitivity reactions

**Dose**
- Apply 3–4 times daily

**Fucidin**
- Cream, fusidic acid 2%, net price 15 g = £1.92, 30 g = £3.59
- Excipients include butylated hydroxyanisole, cetyl alcohol

**Ointment**, sodium fusidate 2%, net price 15 g = £2.23, 30 g = £3.79
- Excipients include cetyl alcohol, wool fat

**Dental prescribing on NHS**

**Cautions** see notes above; avoid exposure to strong sunlight or UV light

**Side-effects**

**Topical antifungal preparations**

**Fusidic acid**

- **Fucidin**
  - Cream, fusidic acid 2%, net price 15 g = £1.92, 30 g = £3.59
  - Excipients include butylated hydroxyanisole, cetyl alcohol
  - Ointment, sodium fusidate 2%, net price 15 g = £2.23, 30 g = £3.79
  - Excipients include cetyl alcohol, wool fat

- **Fusidate** used in the fissures of angular cheilitis when associated with staphylococcal infection. For further information on angular cheilitis, see section 12.3.2.

**Fusidic acid**

- **Fucidin**
  - Cream, fusidic acid 0.75%, net price 30 g = £6.60, 40 g = £9.88
  - Excipients include benzyl alcohol, isopropyl palmitate
  - Gel, fusidic acid 0.75%, net price 30 g = £6.60, 40 g = £9.88
  - Excipients include disodium edetate, hydroxybenzoates (parabens), propylene glycol
  - Dose inflammatory papules, pustules and erythema of rosacea, apply twice daily for 3–4 months

- **Zyomet®** (AMCo)
  - Gel, fusidic acid 0.75%, net price 30 g = £12.00
  - Excipients include benzyl alcohol, disodium edetate, propylene glycol
  - Dose acute inflammatory exacerbation of rosacea, apply thinly twice daily for 8–9 weeks

**13.10.2 Antifungal preparations**

Most localised fungal infections are treated with topical preparations. To prevent relapse, local antifungal treatment should be continued for 1–2 weeks after the disappearance of all signs of infection. Systemic therapy (section 5.2) is necessary for scalp infection or if the skin infection is widespread, disseminated, or intractable; although topical therapy may be used to treat some nail infections, systemic therapy (section 5.2) is more effective. Skin scrapings should be examined if systemic therapy is being considered or where there is doubt about the diagnosis.

**Dermatophytes** Ringworm infection can affect the scalp (tinea capitis), body (tinea corporis), groin (tinea cruris), hand (tinea manuum), foot (tinea pedis, athlete’s foot), or nail (tinea unguium). Scalp infection requires systemic treatment (section 5.2); additional application of a topical antifungal, during the early stages of treatment, may reduce the risk of transmission. A topical antifungal can also be used to treat asymptomatic carriers of scalp ringworm. Most other local ringworm infections can be treated adequately with topical antifungal preparations (including shampoos, section 13.9). The imidazole antifungals clotrimazole, econazole, ketoconazole, and miconazole are all effective.

**Terbinafine** cream is also effective but it is more expensive. Other topical antifungals include griseofulvin and the undecenoates compound benzoic acid ointment (Whitfield’s ointment) has been used for ringworm infections but it is cosmetically less acceptable than proprietary preparations. Topical preparations for athlete’s foot containing tolnaftate are on sale to the public.

Antifungal dusting powders are of little therapeutic value in the treatment of fungal skin infections and may cause skin irritation; they may have some role in preventing re-infection.

Antifungal treatment may not be necessary in asymptomatic patients with tinea infection of the nails. If treatment is necessary, a systemic antifungal (section 5.2) is more effective than topical therapy. However, topical application of amorolfine or tioconazole may be useful for treating early onychomycosis when involvement is limited to mild distal disease, or for superficial white onychomycosis, or where there are contra-indications to systemic therapy.

**Pityriasis versicolor** Pityriasis (tinea) versicolor can be treated with ketoconazole shampoo (section 13.9). Alternatively, selenium sulfide shampoo [unif-
Loceryl® (Galdamer) NAIL LACQUER, amorolfine (as hydrochloride) 5%, net price 5-mL pack (with nail files, spatulas, and cleansing swabs) = £9.08. Label: 10, patient information leaflet

**BENZOIC ACID**

**Indications** ringworm (tinea), but see notes above

**Benzoin Acid Ointment, Compound, BP** (Whitfield’s ointment)

**Ointment**, benzoic acid 6%, salicylic acid 3%, in emulsifying ointment

**Excipients** include cetostearyl alcohol

**Dose** apply twice daily

**CLOTRIMAZOLE**

**Indications** fungal skin infections; vaginal candidiasis (section 7.2.2); otitis externa (section 12.1.1)

**Cautions** see notes above

**Pregnancy** minimal absorption from skin; not known to be harmful

**Side-effects** see notes above

**Dose**

- Apply 2–3 times daily

Clotrimazole (Non-proprietary)

**Cream**, clotrimazole 1%, net price 20 g = £1.26

Canesten® (Bayer Consumer Care)

**Cream**, clotrimazole 1%, net price 20 g = £2.14, 50 g = £3.50

**Excipients** include benzyl alcohol, cetostearyl alcohol, polysorbate 60

Solution, clotrimazole 1% in macrogol 400 (polyethylene glycol 400), net price 20 mL = £2.30. For hairy areas

**Excipients** none as listed in section 13.1.3

Spray, clotrimazole 1%, in 30% isopropyl alcohol, net price 40-mL atomiser = £4.72. Label: 15. For large or hairy areas

**Excipients** include propylene glycol

**ECONAZOLE NITRATE**

**Indications** fungal skin infections; vaginal candidiasis (section 7.2.2)

**Cautions** see notes above

**Pregnancy** minimal absorption from skin; not known to be harmful

**Side-effects** see notes above

**Dose**

- Skin infections apply twice daily; nail infections, apply once daily under occlusive dressing

Pevaryl® (Janssen)

**Cream**, econazole nitrate 1%, net price 30 g = £3.71

**Excipients** include butylated hydroxyanisole, fragrance

**GRISEOFULVIN**

**Indications** tinea pedis; resistant fungal infections (section 5.2.5)

**Cautions** see notes above

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk

**Breast-feeding** manufacturer advises avoid unless potential benefit outweighs risk
Side-effects see notes above
Dose
- Apply 400 micrograms (1 spray) to an area approx. 13 cm² once daily, increased to 1.2 mg (3 sprays, allowing each spray to dry between applications) once daily if necessary; max. treatment duration 4 weeks
Grisol AF® (Transdermal)
Spray, griseofulvin 400 micrograms/metered spray, net price 20-mL (400-dose) spray = £3.35. Label: 15
Excipients include benzyl alcohol

KETOCONAZOLE
Indications fungal skin infections; vulval candidiasis (section 7.2.2)
Cautions see notes above
Dose
- ADULT over 18 years, tinea pedis, apply twice daily; other fungal infections, apply 1–2 times daily
Nizoral® (Janssen)
Cream, ketoconazole 2%, net price 30 g = £4.24
Excipients include cetyl alcohol, polysorbates, propylene glycol, stearyl alcohol
Note A 15-g tube is available for sale to the public for the treatment of tinea pedis, tinea cruris, and candidal intertrigo
Shampoo—section 13.9

MICONAZOLE NITRATE
Indications fungal skin infections; oral and intestinal fungal infections (section 12.3.2); vaginal candidiasis (section 7.2.2)
Cautions see notes above; interactions: Appendix 1 (antifungals, imidazole)
Pregnancy absorbed from skin in small amounts; manufacturer advises caution
Side-effects see notes above
Dose
- Apply twice daily continuing for 10 days after lesions have healed; nail infections, apply 1–2 times daily
Miconazole (Non-proprietary)
Cream, miconazole nitrate 2%, net price 20 g = £2.05, 45 g = £1.97
Dental prescribing on NHS Miconazole cream may be prescribed
Daktarin® (Janssen)
Cream, miconazole nitrate 2%, net price 30 g = £1.62
Excipients include butylated hydroxyanisole
Note A 15-g tube is on sale to the public
Powder®, miconazole nitrate 2%, net price 20 g = £2.37
Excipients none as listed in section 13.1.3
Aktiv Spray powder, miconazole nitrate 0.16%, in an aerosol basis, net price 100 g = £3.11. Label: 15
Excipients none as listed in section 13.1.3

NYSTATIN
Indications skin infections due to Candida spp.; oral fungal infections (section 12.3.2)
Cautions see notes above
Side-effects see notes above
1. except for seborrhoeic dermatitis and pityriasis versicolor and endorsed ‘SLS’

Nystaform® (Typharm) Cream, nystatin 100 000 units/g, chlorhexidine hydrochloride 1%, net price 30 g = £2.62
Excipients include benzyl alcohol, cetostearyl alcohol, polysorbate 60
Dose apply 2–3 times daily continuing for 7 days after lesions have healed.

SALICYLIC ACID
Indications fungal nail infections, particularly tinea; hyperkeratotic skin disorders (section 13.5.2); warts and calluses (section 13.7)
Cautions avoid broken or inflamed skin
Salicylate toxicity Salicylate toxicity can occur particularly if applied on large areas of skin
Pregnancy avoid
Side-effects see notes above
Dose
- ADULT and CHILD over 5 years, apply twice daily and after washing
Phytex® (Wynlit)
Paint, salicylic acid 1.46% (total combined), tannic acid 4.89% and boric acid 3.12% (as borotannic complex), in a vehicle containing alcohol and ethyl acetate, net price 25 mL (with brush) = £2.97
Excipients none as listed in section 13.1.3
Note Flammable

TERBINAFINE
Indications fungal skin infections
Cautions avoid contact with eyes
Pregnancy manufacturer advises use only if potential benefit outweighs risk—animal studies suggest no adverse effects
Breast-feeding manufacturer advises avoid—present in milk, but less than 5% of the dose is absorbed after topical application of terbinafine; avoid application to mother’s chest
Side-effects see notes above
Dose
- Apply thinly 1–2 times daily for up to 1 week in tinea pedis, 1–2 weeks in tinea corporis and tinea cruris, 2 weeks in cutaneous candidiasis and pityriasis versicolor; review after 2 weeks; CHILD see BNF for Children
2 Terbinafine (Non-proprietary)
Cream, terbinafine hydrochloride 1%, net price 15 g = £1.73, 30 g = £3.46
Lamisil® (Novartis Consumer Health) Cream, terbinafine hydrochloride 1%, net price 15 g = £4.86, 30 g = £8.76
Excipients include benzyl alcohol, cetyl alcohol, polysorbate 60, stearyl alcohol
Tablets—section 5.2.5

TIOCONAZOLE
Indications fungal nail infections
Cautions see notes above
Pregnancy manufacturer advises avoid
2. Preparations of terbinafine hydrochloride (max. 1%) can be sold to the public for external use for the treatment of tinea pedis as a cutaneous solution in a pack containing max. 15 g. or for the treatment of tinea pedis and cruris as a cream in a pack containing max. 15 g, or for the treatment of tinea pedis, cruris, and corporis as a spray in a pack containing max. 30 mL spray or as a gel in a pack containing max. 30 g gel
13.10.3 Antiviral preparations

**Aciclovir** cream is licensed for the treatment of initial and recurrent labial and genital *herpes simplex infections*; treatment should begin as early as possible. Systemic treatment is necessary for buccal or vaginal infections and for *herpes zoster* (shingles) (for details of systemic use see section 5.3.2.1).

**Herpes labialis** Aciclovir cream can be used for the treatment of initial and recurrent labial herpes simplex infections (cold sores). It is best applied at the earliest possible stage, usually when prodromal changes of sensation are felt in the lip and before vesicles appear.

Penciclovir cream is also licensed for the treatment of herpes labialis; it needs to be applied more frequently than aciclovir cream.

Systemic treatment is necessary if cold sores recur frequently or for infections in the mouth (see p. 423).

**ACICLOVIR** *(Acyclovir)*

**Indications** see notes above; herpes simplex and varicella–zoster infections (section 5.3.2.1); eye infections (section 11.3.3)

**Cautions** avoid contact with eyes and mucous membranes

**Pregnancy** not known to be harmful—manufacturers advise use only when potential benefit outweighs risk; limited absorption from topical aciclovir preparations

**Side-effects** transient stinging or burning; occasionally erythema, itching or drying of the skin

**Dose**

- Apply to lesions every 4 hours (5 times daily) for 5–10 days, starting at first sign of attack

**Aciclovir** *(Non-proprietary)*

- **Cream**, aciclovir 5%, net price 2 g = £4.15
- **Dental prescribing on NHS** Aciclovir Cream may be prescribed
  
  **Note** A 2-g tube and a pump pack are on sale to the public for the treatment of cold sores

**Zovirax** *(GSK)*

- **Cream**, aciclovir 5%, net price 2 g = £4.63, 10 g = £13.96
- **Excipients** include cetostearyl alcohol, propylene glycol
- **Eye ointment**—section 11.3.3
- **Tablets**—section 5.3.2.1

**PENCICLOVIR**

**Indications** see notes above

**Cautions** avoid contact with eyes and mucous membranes

**Side-effects** transient stinging, burning, numbness; hypersensitivity reactions also reported

**Vectavir** *(Novartis Consumer Health)*

- **Cream**, penciclovir 1%, net price 2 g = £4.20
- **Excipients** include cetostearyl alcohol, propylene glycol
- **Dose** herpes labialis, apply to lesions every 2 hours during waking hours for 4 days, starting at first sign of attack; **CHILD** under 12 years, not recommended

**Dental prescribing on NHS** May be prescribed as Penciclovir Cream

## Parasiticidal preparations

### Suitable quantities of parasiticidal preparations

<table>
<thead>

</tbody>
</table>

These amounts are usually suitable for an adult for single application.

**Scabies**

Permethrin is used for the treatment of *scabies* (*Sarcoptes scabiei*); *malathion* can be used if permethrin is inappropriate.

Benzy1 benzoate is an irritant and should be avoided in children; it is less effective than malathion and permethrin.

**Ivermectin** *(available on a named patient basis from ‘special-order’ manufacturers or specialist importing*
companies, see p. 1104) in a dose of 200 micrograms/kg by mouth has been used, in combination with topical drugs, for the treatment of hyperkeratotic (crusted or 'Norwegian') scabies that does not respond to topical treatment alone; further doses of 200 micrograms/kg may be required.

**Application** Although acaricides have traditionally been applied after a hot bath, this is not necessary and there is even evidence that a hot bath may increase absorption into the blood, removing them from their site of action on the skin.

All members of the affected household should be treated simultaneously. Treatment should be applied to the whole body including the scalp, neck, face, and ears. Particular attention should be paid to the webs of the fingers and toes and lotion brushed under the ends of nails. It is now recommended that malathion and permethrin should be applied twice, one week apart; in the case of benzyl benzoate up to 3 applications on consecutive days may be needed. It is important to warn users to reapply treatment to the hands if they are washed. Patients with hyperkeratotic scabies may require 2 or 3 applications of acaricide on consecutive days to ensure that enough penetrates the skin crusts to kill all the mites.

**Itching** The itch and eczema of scabies persists for some weeks after the infestation has been eliminated and treatment for pruritus and eczema (section 13.5.1) may be required. Application of crotamiton can be used to control itching after treatment with more effective acaricides. A topical corticosteroid may help to reduce redness and inflammation after scabies has been treated successfully; however, persistent symptoms suggest that scabies eradication was not successful. Oral administration of a sedating antihistamine (section 3.4.1) at night may also be useful.

**Head lice**

**Dimeticone** is effective against head lice (*Pediculus humanus capitis*) and acts on the surface of the organism. **Malathion**, an organophosphorus insecticide, is an alternative, but resistance has been reported. Benzyl benzoate is licensed for the treatment of head lice but it is less effective than other drugs.

Head lice infestation (pediculosis) should be treated using lotion or liquid formulations only if live lice are present. Shampoos are diluted too much in use to be effective. A contact time of 8–12 hours or overnight treatment is recommended for lotions and liquids; a 2-hour treatment is not sufficient to kill eggs.

In general, a course of treatment for head lice should be 2 applications of product 7 days apart to kill lice emerging from any eggs that survive the first application. All affected household members should be treated simultaneously.

**Wet combing methods** Head lice can be mechanically removed by combing wet hair meticulously with a plastic detection comb (probably for at least 30 minutes each time) over the whole scalp at 4-day intervals for a minimum of 2 weeks, and continued until no lice are found on 3 consecutive sessions; hair conditioner or vegetable oil can be used to facilitate the process. Several devices for the removal of head lice such as combs and topical solutions, are available and some are prescribable on the NHS (consult Drug Tariff—see Appliances and Reagents, p. 1092 for links to online Drug Tariffs).

**Crab lice**

**Permethrin** and **malathion** are used to eliminate crab lice (*Pthirus pubis*). An aqueous preparation should be applied, allowed to dry naturally and washed off after 12 hours; a second treatment is needed after 7 days to kill lice emerging from surviving eggs. All surfaces of the body should be treated, including the scalp, neck, and face (paying particular attention to the eyebrows and other facial hair). A different insecticide should be used if a course of treatment fails.

**Benzyl benzoate**

Benzyl benzoate is effective for scabies but is not a first-choice for scabies (see notes above).

**DIMETICONE**

**Indications** head lice

**Cautions** head lice

**Side-effects** skin irritation

**Dose**

- Apply over the whole body; repeat without bathing on the following day and wash off 24 hours later; a third application may be required in some cases

**Note** Not recommended for children—dilution to reduce irritant effect also reduces efficacy. Some manufacturers recommend application to the body but to exclude the head and neck. However, application should be extended to the scalp, neck, face, and ears.

**Hedrin® (Thornton & Ross)**

**Lotion** dimeticone 4%, net price 50 mL = £2.98, 120 mL spray pack = £7.13, 150 mL = £6.92

**Note** Patients should be told to keep hair away from fire and flames during treatment.
Malathion

Malathion is recommended for scabies, head lice and crab lice (for details see notes above). The risk of systemic effects associated with 1–2 applications of malathion is considered to be very low; however, applications of malathion liquid repeated at intervals of less than 1 week or application for more than 3 consecutive weeks should be avoided since the likelihood of eradication of lice is not increased.

Permethrin

Permethrin is effective for scabies and crab lice (for details see notes above). Permethrin is active against head lice but the formulation and licensed methods of application of the current products make them unsuitable for the treatment of head lice.

13.10.5 Preparations for minor cuts and abrasions

Preparations for minor cuts and abrasions are applied as necessary but should be treated again with systemic preparations after 3 days (see also Cautions, Side-effects, and Preparations). Some of the preparations listed are used in minor burns, and abrasions. They are applied as necessary but should not be used on large wounds or for prolonged periods because of the possibility of hypersensitivity. The effervescent effect of hydrogen peroxide (section 13.11.6) is used to clean minor cuts and abrasions. Preparations containing camphor and sulfonamides should be avoided. Preparations such as magnesium sulfate paste are also listed but are now rarely used to treat carbuncles and boils as these are best treated with antibiotics (section 5.1.1.2).

Cetrimide Cream, BP

Cream, cetrimide 0.5% in a suitable water-miscible basis such as cetostearyl alcohol 5%, liquid paraffin 50%, in freshly boiled and cooled purified water, net price 50 g = £1.11

Magnesium Sulfate Paste, BP

Paste, dried magnesium sulfate 45 g, glycerol 55 g, phenol 500 mg, net price 25 g = 97p, 50 g = £1.93

Note

Should be stirred before use

Dose

apply under dressing

Magnesium Sulfate Paste

Brand: BPC® Dermal Paste

Ingredients include beeswax, wool fat 5%, net price 100 mL = £2.40

Cream

For scabies, manufacturer recommends application to the body but not necessarily to the head and neck. However, application should be extended to the scalp, neck, face, and ears

Malathion

Indications see notes above and under preparations

Cautions

avoid contact with eyes; do not use on broken or secondarily infected skin; children under 6 months, medical supervision required

Side-effects

skin irritation and hypersensitivity reactions; chemical burns also reported

Dose

Head lice, rub 0.5% preparation into dry hair and scalp, allow to dry naturally, remove by washing after 12 hours (see also notes above); repeat application after 7 days

Crab lice, apply 0.5% aqueous preparation over whole body, allow to dry naturally, wash off after 12 hours or overnight; repeat application after 7 days

Scabies, apply 0.5% preparation over whole body, and wash off after 24 hours; if hands are washed with soap within 24 hours, they should be retreated; see also notes above; repeat application after 7 days

Note

For scabies, manufacturer recommends application to the body but not necessarily to the head and neck. However, application should be extended to the scalp, neck, face, and ears

Derbac-M® (SSL)

Liquid, malathion 0.5% in an aqueous basis, net price 50 mL = £3.05, 200 mL = £7.33

Excipients include cetostearyl alcohol, fragrance, hydroxybenzoates (parabens)

For crab lice, head lice, and scabies

Dose

Permethrin

Indications see notes above and under Dose

Cautions

avoid contact with eyes; do not use on broken or secondarily infected skin; children under 6 months, medical supervision required for cream rinse (head lice); children aged 2 months–2 years, medical supervision required for dermal cream (scabies)

Side-effects

pruritus, erythema, and stinging; rarely rashes and oedema

Dose

Scabies, apply 5% preparation over whole body and wash off after 8–12 hours; CHILD (see also Cautions, above) apply over whole body including face, neck, scalp and ears; if hands washed with soap within 8 hours of application, they should be treated again with cream (see notes above); repeat application after 7 days

Note

Manufacturer recommends application to the body but to exclude head and neck. However, application should be extended to the scalp, neck, face, and ears

Larger patients may require up to two 30-g packs for adequate treatment

Crab lice, ADULT over 18 years, apply 5% cream over whole body, allow to dry naturally and wash off after 12 hours or after leaving on overnight; repeat application after 7 days

Permethrin (Non-proprietary)

Cream, permethrin 5%, net price 30 g = £6.96

Lyclear® Creme Rinse (Omega Pharma)

Cream rinse, permethrin 1% in basis containing isopropyl alcohol 20%, net price 59 mL = £3.55, 2 x 59-mL pack = £6.40

Excipients include cetyl alcohol

Dose

head lice, not recommended, therefore no dose stated (insufficient contact time)

Lyclear® Dermal Cream (Omega Pharma)

Dermal cream, permethrin 5%, net price 30 g = £5.71. Label: 10, patient information leaflet

Excipients include butylated hydroxytoluene, wool fat derivative

Preparations for boils

Magnesium Sulfate Paste

Brand: BPC® Dermal Paste

Ingredients include beeswax, wool fat 5%, net price 100 mL = £2.40

Excipients include beeswax, wool fat

Note

Stains clothing

Proflavine Cream, BPC

Cream, proflavine hemisulfate 0.1%, yellow beeswax 2.5%, chlorocresol 0.1%, liquid paraffin 67.3%, freshly boiled and cooled purified water 25%, wool fat 5%, net price 100 mL = £2.40

Excipients

include beeswax, wool fat

Note

Stains clothing
Skin tissue adhesive

Tissue adhesives are used for closure of minor skin wounds and for additional suture support. They should be applied by an appropriately trained healthcare professional. Skin tissue adhesives may cause skin sensitisation.

**Dermabond ProPen** (Ethicon)
Topical Skin Adhesive, sterile, octyl 2-cyanoacrylate, net price 0.5 mL = £18.92

**Epiglu** (Schuco)
Tissue adhesive, sterile, ethyl-2-cyanoacrylate 95.45 mg/g, polymethylmethacrylate, net price 4 x 3-g vials = £149.50 (with dispensing pipettes and pallet)

**Histoacryl** (B. Braun)
Tissue adhesive, sterile, enbucrilate, net price 5 x 200-mg unit (blue) = £32.00, 10 x 200-mg unit (blue) = £67.20, 3 x 500-mg unit (clear or blue) = £34.85, 10 x 500-mg unit (blue) = £69.30

**LiquiBand** (MedLogic)
Tissue adhesive, sterile, enbucrilate, net price 0.5-g amp = £5.50

Hydrogen peroxide, an oxidising agent, can be used in solutions of up to 6% for skin disinfection, such as cleansing and deodorising wounds and ulcers; hydrogen peroxide is also available as a cream for superficial bacterial skin infections.

For irrigating ulcers or wounds, lukewarm sterile sodium chloride 0.9% solution is used, but tap water is often appropriate.

**Potassium permanganate** solution 1 in 10,000, a mild antiseptic with astringent properties, can be used for exudative eczematous areas; treatment should be stopped when the skin becomes dry. It can stain skin and nails especially with prolonged use.

---

13.11 Skin cleansers, antiseptics, and desloughing agents

### 13.11.1 Alcohols and saline

#### ALCOHOL

**Indications** skin preparation before injection

**Cautions** flammable; avoid broken skin; patients have suffered severe burns when diathermy has been preceded by application of alcoholic skin disinfectants

**Industrial Methylated Spirit, BP**

| Solution (sterile), sodium chloride 0.9%, net price 25 | £6.36; 10 | 6 |
| Solution (sterile), sodium chloride 0.9%, net price 30 | £13.20; 30 | 6 |

**SODIUM CHLORIDE**

**Indications** see notes above; nebuliser diluent (section 3.1.5); sodium depletion (section 9.2.1.2); electrolyte imbalance (section 9.2.2.1); eye (section 11.8.1); oral hygiene (section 12.3.4)

**Sodium Chloride (Non-proprietary)**

| Solution (sterile), sodium chloride 0.9%, net price 25 x 20-mL unit = £4.95 | 200-mL can = £2.65, 1 litre = 80p
| Flowfusor® (Fresenius Kabi) | Solution (sterile), sodium chloride 0.9%, net price 120-mL Bellows Pack = £1.53
| Irriclens® (Convatec) | Solution in aerosol can (sterile), sodium chloride 0.9%, net price 240-mL can = £3.46
| Irripod® (C D Medical) | Solution (sterile), sodium chloride 0.9%, net price 25 x 20-mL sachet = £5.84
| Miniversol® (Aguettant) | Solution (sterile), sodium chloride 0.9%, net price 30 x 45-mL unit = £13.20; 30 x 100-mL unit = £19.50
| Normasol® (Möllycke) | Solution (sterile), sodium chloride 0.9%, net price 25 x 25-mL sachet = £6.36; 10 x 100-mL sachet = £7.73

Soap or detergent is used with water to cleanse intact skin; emollient preparations such as aqueous cream (section 13.2.1.1) or emulsifying ointment (section 13.2.1) can be used in place of soap or detergent for cleansing dry skin.

An antiseptic is used for skin that is infected or that is susceptible to recurrent infection. Detergent preparations containing chlorhexidine or povidone–iodine, which should be thoroughly rinsed off, are used. Emollients may also contain antiseptics (section 13.2.1).

Antiseptics such as chlorhexidine or povidone–iodine are used on intact skin before surgical procedures; their antiseptic effect is enhanced by an alcoholic solvent. Antiseptic solutions containing cetrimide can be used if a detergent effect is also required.
Stericlen® (C D Medical)
Solution in aerosol can (sterile), sodium chloride 0.9%, net price 100-mL can = £2.06, 240-mL can = £3.13

Steripod® Sodium Chloride (Medlock)
Solution (sterile), sodium chloride 0.9%, net price 25 x 20-mL sachet = £7.84

13.11.2 Chlorhexidine salts

CHLORHEXIDINE

Indications see under preparations; bladder irrigation and catheter patency solutions (see section 7.4.4)

Cautions avoid contact with eyes, brain, meninges and middle ear; not for use in body cavities; alcoholic solutions not suitable before diathermy

Side-effects occasional sensitivity

Chlorhexidine 0.05% (Baxter)

2000 Solution (sterile), pink, chlorhexidine gluconate 0.05%, net price 1000 mL = £77p

For cleansing and disinfecting wounds and burns

Cepton® (LPC)

Skin wash (= solution), red, chlorhexidine gluconate 1%, net price 150 mL = £3.64

For use as skin wash in acne

Lotion, blue, chlorhexidine gluconate 0.1%, net price 150 mL = £2.48

For skin disinfection in acne

ChloraPrep® (CareFusion)

Cutaneous solution, sterile, chlorhexidine gluconate 2% in isopropyl alcohol 70%, net price (all with single applicator) 0.67 mL (with SEPP® applicator) = 30p, 1.5 mL (with FREEPP® applicator) = 55p, 1.5 mL = 55p, 3 mL = 65p, 10.5 mL = £2.92, 26 mL = £6.92; all with single applicator, with tint) 3 mL = 89p, 10.5 mL = £3.07, 26 mL = £6.83

For skin disinfection before invasive procedures; CHILD under 2 months, not recommended

Note Flammable

CX Antiseptic Dusting Powder® (Ecolab)

Dusting powder, sterile, chlorhexidine acetate 1%, net price 15 g = £3.93

For skin disinfection

Hibiscrub® (Möllycke)

Cleansing solution, red, chlorhexidine gluconate 4%, perfumed, in a surfactant solution, net price 250 mL = £4.25, 500 mL = £5.25, 5 litres = £24.00

Excipients include fragrance

Use instead of soap for pre-operative hand and skin preparation and for general hand and skin disinfection

Hibi® Liquid Hand Rub®+ (Möllycke)

Solution, chlorhexidine gluconate 0.5%, in isopropyl alcohol 70%, net price 500 mL = £5.25

To be used undiluted for hand and skin disinfection

Hibitane Obstetric® (Derma UK)

Cream, chlorhexidine gluconate solution 5% (≡ 1% chlorhexidine gluconate), in a pourable water-miscible basis, net price 250 mL = £9.00

For use in obstetrics and gynaecology as an antiseptic and lubricant (for application to skin around vulva and perineum and to hands of midwife or doctor)

Hydrex® (Ecolab)

Solution, chlorhexidine gluconate solution 2.5% (≡ chlorhexidine gluconate 0.5%), in denatured ethanol 70%, net price 600 mL (clear) = £3.49; 600 mL (pink) = £3.49, 200-mL spray = £1.77, 500-mL spray = £3.01

For pre-operative skin disinfection

Note Flammable

Surgical scrub, chlorhexidine gluconate 4% in a surfactant solution, net price 250 mL = £3.39, 500 mL = £3.59

Excipients include fragrance

For pre-operative hand and skin preparation and for general hand disinfection

Unisept® (Medlock)

Solution (sterile), pink, chlorhexidine gluconate 0.05%, net price 25 x 25-mL sachet = £5.54; 10 x 100-mL sachet = £6.83

For cleansing and disinfecting wounds and burns and swabbing in obstetrics

With cetrimide

Tisept® (Medlock)

Solution (sterile), yellow, chlorhexidine gluconate 0.015%, cetrimide 0.15%, net price 25 x 25-mL sachet = £5.33; 10 x 100-mL sachet = £6.85

To be used undiluted for general skin disinfection and wound cleansing

Travasept 100® (Baxter)

Solution (sterile), yellow, chlorhexidine acetate 0.015%, cetrimide 0.15%, net price 500 mL = 72p, 1 litre = 77p

To be used undiluted in skin disinfection such as wound cleansing and obstetrics

13.11.3 Cationic surfactants and soaps

CETRIMIDE

Indications skin disinfection

Cautions avoid contact with eyes; avoid use in body cavities

Side-effects skin irritation and occasionally sensitisation

Preparations skin irritation and occasionally sensitisation

Ingredient of Tisept® and Travasept® 100, see above

13.11.4 Iodine

POVIDONE–IODINE

Indications skin disinfection

Cautions broken skin (see below)

Large open wounds The application of povidone–iodine to large wounds or severe burns may produce systemic adverse effects such as metabolic acidosis, hypernatraemia and impairment of renal function.

Contra-indications corrected gestational age under 32 weeks; avoid regular use in patients with thyroid disorders or those receiving lithium therapy

Renal impairment avoid regular application to inflamed or broken mucosa

Pregnancy sufficient iodine may be absorbed to affect the fetal thyroid in the second and third trimester
13.11.5 Phenolics

Triclosan has been used for disinfection of the hands and wounds, and for disinfection of the skin before surgery.

13.11.6 Oxidisers and dyes

HYDROGEN PEROXIDE

Indications see under preparations below

Cautions large or deep wounds; avoid on healthy skin and eyes; bleaches fabric; incompatible with products containing iodine or potassium permanganate

Hydrogen Peroxide Solution, BP

Solution 6% (20 vols), net price 200 mL = 54p
Solution 3% (10 vols), net price 200 mL = 53p

For skin disinfection, particularly minor wounds and general antisepsis

Important Strong solutions of hydrogen peroxide which contain 27% (90 vols) and 30% (100 vols) are only for the preparation of weaker solutions

Crystacide® (Derma UK)

Cream, hydrogen peroxide 1%, net price 25 g = £8.07, 40 g = £11.62
Excipients include edetic acid (EDTA), propylene glycol

Dose superficial bacterial skin infection, apply 2–3 times daily for up to 3 weeks

Note The BP directs that when hydrogen peroxide is prescribed, hydrogen peroxide solution 6% (20 vols) should be dispensed.

POTASSIUM PERMANGANATE

Indications cleansing and deodorising suppurating eczematous reactions and wounds

Cautions irritant to mucous membranes

Dose • Wet dressings or baths, approx. 0.01% solution

Note Stains skin and clothing

Potassium Permanganate Solution

Solution, potassium permanganate 0.1% (1 in 1000) in water

Dose to be diluted 1 in 10 to provide a 0.01% (1 in 10 000) solution

Permitabs® (Alliance)

Solution tablets, for preparation of topical solution, potassium permanganate 400 mg, net price 30-tab pack = £14.59

Note 1 tablet dissolved in 4 litres of water provides a 0.01% (1 in 10 000) solution

13.11.7 Desloughing agents

Alginate, hydrogel and hydrocolloid dressings (Appendix 5) are effective at wound debridement. Sterile larvae (maggots) (available from BioMonde) are also used for managing sloughing wounds and are prescribed on the NHS.

Desloughing solutions and creams are of little clinical value. Substances applied to an open area are easily absorbed and perilesional skin is easily sensitised; gravitational dermatitis may be complicated by superimposed contact sensitivity to substances such as neomycin or lanolin.

For further information on wound management products see Appendix 5, p. 1061.

13.12 Antiperspirants

Aluminium chloride is a potent antiperspirant used in the treatment of hyperhidrosis. Aluminium salts are also incorporated in preparations used for minor fungal skin infections associated with hyperhidrosis.

In more severe cases specialists use glycopyrronium bromide as a 0.05% solution in the iontophoretic treatment of hyperhidrosis of plantar and palmar areas. Botox® contains botulinum toxin type A complex and is licensed for use intradermally for severe hyperhidrosis of the axillae unresponsive to topical antiperspirant or other antihidrotic treatment (section 4.9.3).

ALUMINIUM SALTS

Indications see under Dose below

Cautions avoid contact with eyes or mucous membranes; avoid use on broken or irritated skin; do not shave axillae or use depilatories within 12 hours of application; avoid contact with clothing

Side-effects skin irritation

Dose

• Hyperhidrosis affecting axillae, hands or feet, apply liquid formulation at night to dry skin, wash off the following morning, initially daily then reduce frequency as condition improves—do not bathe immediately before use

• Hyperhidrosis, bromhidrosis, intertrigo, and prevention of tinea pedis and related conditions, apply powder to dry skin

Anhydrol® Forte (Dermal)

Solution (-application), aluminium chloride hexahydrate 20% in an alcoholic basis, net price 60-mL bottle with roll-on applicator = £2.51. Label: 15

Excipients none as listed in section 13.1.3
Driclor® (Stiefel)
Application, aluminium chloride hexahydrate 20% in an alcoholic basis, net price 75-mL bottle with roll-on applicator = £3.01. Label: 15
Excipients none as listed in section 13.1.3
Note A 30-mL pack is on sale to the public

ZeaSORB® (Stiefel)
Dusting powder, aldioxa 0.22%, chloroxylenol 0.5%, net price 50 g = £2.61
Excipients include fragrance

GLYCOPYRRONIUM BROMIDE

Indications  iontophoretic treatment of hyperhidrosis; drying secretions (see Prescribing in Palliative Care, p. 21); maintenance treatment of chronic obstructive pulmonary disease (section 3.1.2); other indications, see section 15.1.3

Cautions see notes (Antimuscarinics) in section 1.2 (but poorly absorbed and systemic effects unlikely)

Contra-indications see notes (Antimuscarinics) in section 1.2 (but poorly absorbed and systemic effects unlikely); also infections affecting the treatment site

Side-effects see notes (Antimuscarinics) in section 1.2 (but poorly absorbed and systemic effects unlikely); also tingling at administration site

Dose
• Consult product literature; only 1 site to be treated at a time, max. 2 sites treated in any 24 hours, treatment not to be repeated within 7 days

Robinul® (AMCo)
Powder, glycopyrronium bromide, net price 3 g = £266.00

13.13 Topical circulatory preparations

These preparations are used to improve circulation in conditions such as bruising, superficial thrombophlebitis, chilblains and varicose veins but are of little value. Chilblains are best managed by avoidance of exposure to cold; neither systemic nor topical vasodilator therapy is established as being effective. Sclerotherapy of varicose veins is described in section 2.13.

Rubesfaciens are described in section 10.3.2.

Hirudoid® (Genus)
Cream, heparinoid 0.3% in a vanishing-cream basis, net price 50 g = £3.99
Excipients include cetostearyl alcohol, hydroxybenzoates (parabens)
Gel, heparinoid 0.3%, net price 50 g = £3.99
Excipients include propylene glycol, fragrance
Dose apply up to 4 times daily in superficial soft-tissue injuries and superficial thrombophlebitis
14 Immunological products and vaccines

14.1 Active immunity 828
14.2 Passive immunity 831
14.3 Storage and use 831
14.4 Vaccines and antisera 831
14.5 Immunoglobulins 852
14.5.1 Normal immunoglobulin 852
14.5.2 Disease-specific immunoglobulins 854
14.5.3 Anti-D (Rh0) immunoglobulin 856
14.6 International travel 857

14.1 Active immunity
Active immunity can be acquired by natural disease or by vaccination. Vaccines stimulate production of antibodies and other components of the immune mechanism; they consist of either:

1. a live attenuated form of a virus (e.g. measles, mumps and rubella vaccine) or bacteria (e.g. BCG vaccine), or
2. inactivated preparations of the virus (e.g. influenza vaccine) or bacteria, or
3. detoxified exotoxins produced by a micro-organism (e.g. tetanus vaccine), or
4. extracts of a micro-organism, which may be derived from the organism (e.g. pneumococcal vaccine) or produced by recombinant DNA technology (e.g. hepatitis B vaccine).

Live attenuated vaccines usually produce a durable immunity, but not always as long-lasting as that resulting from natural infection.

Inactivated vaccines may require a primary series of injections of vaccine to produce an adequate antibody response, and in most cases booster (reinforcing) injections are required; the duration of immunity varies from months to many years. Some inactivated vaccines are adsorbed onto an adjuvant (such as aluminium hydroxide) to enhance the antibody response.

Advice in this chapter reflects that in the handbook Immunisation against Infectious Disease (2006), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI).

Chapters from the handbook are available at www.immunisation.dh.gov.uk

The advice in this chapter also incorporates changes announced by the Chief Medical Officer and Health Department Updates.

Cautions Most individuals can safely receive the majority of vaccines. Vaccination may be postponed if the individual is suffering from an acute illness; however, it is not necessary to postpone immunisation in patients with minor illnesses without fever or systemic upset. See also Predisposition to Neurological Problems, below. For individuals with bleeding disorders, see Route of Administration, below. If alcohol or disinfectant is used for cleansing the skin it should be allowed to evaporate before vaccination to prevent possible inactivation of live vaccines.

When 2 or more vaccines are required (and are not available as a combined preparation), they should be given simultaneously at different sites, preferably in a different limb; if more than one injection is to be given in the same limb, they should be administered at least 2.5 cm apart (but see also BCG Vaccines, p. 832). When 2 live vaccines cannot be given at the same time, they should be separated by an interval of at least 4 weeks. For interactions see Appendix 1 (vaccines).

See also Cautions under individual vaccines.

Contra-indications Vaccines are contra-indicated in those who have a confirmed anaphylactic reaction to a preceding dose of a vaccine containing the same antigens or vaccine component (such as antibacterials in viral vaccines). The presence of the following excipients in vaccines and immunological products has been noted under the relevant entries:

- Gelatin
- Penicillins
- Gentamicin
- Polymyxin B
- Kanamycin
- Streptomycin
- Neomycin
- Thiomersal

Hypersensitivity to egg Individuals with evidence of previous anaphylactic reaction to egg should not be given tick-borne encephalitis vaccine, and yellow fever vaccine should only be considered under the guidance of a specialist. Individuals with a history of egg allergy can be immunised with either an egg free influenza vaccine, if available, or an influenza vaccine with an Ovalbumin content less than 120 nanograms/mL (facilities should be available to treat anaphylaxis). If an influenza vaccine containing ovalbumin is being considered in those with a history of anaphylaxis to egg or egg allergy with uncontrolled asthma, these individuals should be referred to a specialist in hospital. See also Cautions under MMR vaccine.

See also Vaccines and HIV infection, below.

Live vaccines may be contra-indicated temporarily in individuals who are:
- immunosuppressed (see Impaired Immune Response, below);
- pregnant (see Pregnancy and Breast-feeding, below).

See also Contra-indications under individual vaccines.

Impaired immune response Immune response to vaccines may be reduced in immunosuppressed patients and there is also a risk of generalised infection with live vaccines. Severely immunosuppressed patients should not be given live vaccines (including those with severe primary immunodeficiency). Specialist advice should be sought for those being treated with high doses of corticosteroids (dose equivalents of prednisolone:...
adults, at least 40 mg daily for more than 1 week; 
children, 2 mg/kg daily for at least 1 week or 1 mg/ 
kg daily for 1 month), or other immunosuppressive 
radiotherapy

1. Live vaccines should be postponed until at least 3 
months after stopping high-dose systemic corticosteroids 
and at least 6 months after stopping other immunosuppressive 
other immunosuppressants (follow-

2. Use of normal immunoglobulin should be considered 
after exposure to measles (see p. 853) and varicella– 
immunoglobulin considered after exposure to 
chickenpox or herpes zoster (see p. 855).
Immunisation schedule

Vaccines for the childhood immunisation schedule should be obtained from local health organisations or from ImmForm (www.immform.dh.gov.uk)—not to be prescribed on FP10 (HS21 in Northern Ireland, GP10 in Scotland, WP10 in Wales).

Preterm birth

Babies born preterm should receive all routine immunisations based on their actual date of birth. The risk of apnoea following vaccination is increased in preterm babies, particularly in those born at or before 28 weeks gestational age. If babies at risk of apnoea are in hospital at the time of their first immunisation, they should be monitored for 48 hours after immunisation. If a baby develops apnoea, bradycardia, or desaturation after the first immunisation, the second immunisation should also be given in hospital with similar monitoring. Seroconversion may be unreliable in babies born earlier than 28 weeks' gestation or in babies treated with corticosteroids for chronic lung disease; consideration should be given to testing for antibodies against Haemophilus influenzae type b, meningococcal C, and hepatitis B after primary immunisation.

When to immunise (for preterm infants—see note above)

</tr>
</tbody>
</table>

1. First dose of HPV vaccine will be offered to females aged 12–13 years of age in England, Wales, and Northern Ireland, and 11–14 years of age in Scotland.
2. If a 3-dose course of HPV vaccine has been started under the 2013/2014 programme, where possible, the course should be completed.
3. The two human papillomavirus vaccines are not interchangeable and, ideally, one vaccine product should be used for the entire course. However, for those females who started the schedule with Cervarix® under the national immunisation programme, but did not complete the vaccination course, the course can be completed with Gardasil®.
Vaccines and asplenia

The following vaccines are recommended for asplenic patients or those with splenic dysfunction:

- *Haemophilus influenzae* type b
- Influenza
- Meningococcal A, C, W135, and Y conjugate
- Pneumococcal

For antibiotic prophylaxis in asplenia see p. 357.

**Route of administration**

Vaccines should not be given intravenously. Most vaccines are given by the intramuscular route, although some are given by either the intradermal, deep subcutaneous, or oral route. The intramuscular route should not be used in patients with bleeding disorders such as haemophilia or thrombocytopenia, vaccines usually given by the intramuscular route should be given by deep subcutaneous injection instead.

**Note**

The Department of Health has advised against the use of jet guns for vaccination owing to the risk of transmitting blood-borne infections, such as HIV.

**High-risk groups**

For information on high-risk groups, see section 14.4 under individual vaccines.

**BCG Vaccines**

**Hepatitis A Vaccine**

**Hepatitis B Vaccine**

**Influenza Vaccine**

**Pneumococcal Vaccines**

**Tetanus Vaccines**

**14.2 Passive immunity**

Immunity with immediate protection against certain infective organisms can be obtained by injecting preparations made from the plasma of immune individuals with adequate levels of antibody to the disease for which protection is sought (see under Immunoglobulins, section 14.5). The duration of this passive immunity varies according to the dose and the type of immunoglobulin. Passive immunity may last only a few weeks; when necessary, passive immunisation can be repeated.

Antibodies of human origin are usually termed immunoglobulins. The term *antisera* is applied to material prepared in animals. Because of serum sickness and other allergic-type reactions that may follow injections of antisera, this therapy has been replaced wherever possible by the use of immunoglobulins. Reactions are theoretically possible after injection of human immunoglobulins but reports of such reactions are very rare.

**14.3 Storage and use**

Care must be taken to store all vaccines and other immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. Refrigerated storage is usually necessary; many vaccines and immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Vaccines and immunoglobulins should be protected from light. Reconstituted vaccines and opened multidose vials must be used within the period recommended in the product literature. Unused vaccines should be disposed of by incineration at a registered disposal contractor. Particular attention must be paid to instructions on the use of diluents. Vaccines which are liquid suspensions or are reconstituted before use should be adequately mixed to ensure uniformity of the material to be injected.

**14.4 Vaccines and antisera**

**Availability**

Anthrax and yellow fever vaccines, botulism antitoxin, diphtheria antitoxin, and snake and spider venom antitoxins are available from local designated holding centres.

For antivenom, see Emergency Treatment of Poisoning, p. 43.

Enquiries for vaccines not available commercially can also be made to:

- Vaccines and Countermeasures Response Department
  Public Health England
  Wellington House
  133–155 Waterloo Road
  London, SE1 8UG
  vaccinesupply@phe.gov.uk

In Scotland information about availability of vaccines can be obtained from a Specialist in Pharmaceutical Public Health.

In Wales enquiries for vaccines not available commercially should be directed to:

- Welsh Medicines Information Centre
  University Hospital of Wales
  Cardiff, CF14 4XW
  Tel: (029) 2074 2979
Anthrax vaccine

Anthrax vaccine is made from antigens from _B. anthracis_. Anthrax immunisation is indicated for individuals who handle infected animals, for those exposed to imported infected animal products, and for laboratory staff who work with _Bacillus anthracis_. A 4-dose regimen is used for primary immunisation; booster doses should be given annually to workers at continued risk of exposure to anthrax.

In the event of possible contact with _B. anthracis_, post-exposure immunisation may be indicated, in addition to antimicrobial prophylaxis (section 5.1.12). Advice on the use of anthrax vaccine for post-exposure prophylaxis must be obtained from Public Health England Colindale (tel. 020 8200 4400).

ANTHRAX VACCINE

Indications: pre-exposure immunisation against anthrax; post-exposure immunisation (see notes above).

Cautions: see section 14.1

Pregnancy: see section 14.1

Breast-feeding: see p. 829

Side-effects: see section 14.1

Dose:
- By intramuscular injection in deltoid region, initial course 3 doses of 0.5 mL at intervals of 3 weeks followed by a fourth dose after an interval of 6 months; booster, 0.5 mL every 12 months

Anthrax Vaccine (pH 7.4) Injection, suspension of anthrax antigens (not less than 0.125 mL/0.5 mL dose), sterile filtrate, adsorbed on to aluminium potassium sulfate

Excipients: include thiomersal

Available from Public Health England’s Centre for Emergency Preparedness and Response (Porton Down)

BCG vaccines

BCG (Bacillus Calmette-Guérin) is a live attenuated strain derived from _Mycobacterium bovis_ which stimulates the development of hypersensitivity to _M. tuberculosis_. BCG vaccine should be given intradermally by operators skilled in the technique (see below).

The expected reaction to successful BCG vaccination is induration at the site of injection followed by a local lesion which starts as a papule 2 or more weeks after vaccination; the lesion may ulcerate then subside over several weeks or months, leaving a small, flat scar. A dry dressing may be used if the ulcer discharges, but air should not be excluded.

Apart from children under 6 years, any person being considered for BCG immunisation must first be given a skin test for hypersensitivity to tuberculoprotein (see under Diagnostic Agents, below). A skin test is not necessary for a child under 6 years provided that the child has not stayed for longer than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000, the child has not had contact with a person with tuberculosis, and there is no family history of tuberculosis within the last 5 years.

BCG is recommended for the following groups if BCG immunisation has not previously been carried out:

- neonates with a family history of tuberculosis in the last 5 years;
- all neonates and infants (0–12 months) born in areas where the incidence of tuberculosis is greater than 40 per 100 000;
- neonates, infants, and children under 16 years with a parent or grandparent born in a country with an incidence of tuberculosis greater than 40 per 100 000;
- new immigrants aged 16 years who were born in, or lived for more than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000;
- new immigrants aged 16–35 years from Sub-Saharan Africa or a country with an incidence of tuberculosis greater than 500 per 100 000;
- contacts aged under 36 years of those with active respiratory tuberculosis (for healthcare or laboratory workers who have had contact with clinical materials or patients with tuberculosis, age limit does not apply);
- healthcare workers and laboratory staff (irrespective of age) who are likely to have contact with patients, clinical materials, or derived isolates; other individuals under 35 years at occupational risk including veterinary and other staff who handle animal species susceptible to tuberculosis, and staff working directly with prisoners, in care homes for the elderly, or in hostels or facilities for the homeless or refugees;
- individuals under 16 years intending to live with local people for more than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000 (section 14.6).

BCG vaccine can be given simultaneously with another live vaccine (see also section 14.1), but if they are not given at the same time an interval of 4 weeks should normally be allowed. When BCG is given to infants, there is no need to delay routine primary immunisations. No further vaccination should be given in the arm used for BCG vaccination for at least 3 months because of the risk of regional lymphadenitis.

Bladder instillations of BCG are licensed for the management of bladder carcinoma (section 8.2.4).

For advice on chemoprophylaxis against tuberculosis, see section 5.1.9; for the treatment of infection following vaccination, seek expert advice.

1. List of countries or primary care trusts where the incidence of tuberculosis is greater than 40 cases per 100 000 is available at www.hpa.org.uk
2. There is inadequate evidence of protection by BCG vaccine in adults aged over 35 years; however, vaccination is recommended for healthcare workers irrespective of age because of the increased risk to them or their patients.
**Bacillus Calmette-Guérin Vaccine**

**Indications** immunisation against tuberculosis

**Cautions** see section 14.1

**Contra-indications** see section 14.1; also neonate in household contact with known or suspected case of active tuberculosis; generalised septic skin conditions (for patients with eczema, lesion-free site should be used)

**Pregnancy** see p. 829

**Breast-feeding** see p. 829

**Side-effects** see section 14.1 and notes above; also at the injection site, subcutaneous abscess, prolonged ulceration; rarely disseminated complications such as osteitis or osteomyelitis

**Dose**

- By intradermal injection ADULT and CHILD over 1 year, 0.1 mL; NEONATE and CHILD under 1 year, 0.05 mL. Intradermal injection technique Skin is stretched between thumb and forefinger and needle (size 25G or 26G) inserted (bevel upwards) for about 3 mm into superficial layers of dermis (almost parallel with surface). Needle should be short with short bevel (can usually be seen through epidermis during insertion). Tense raised blanched bleb showing tips of hair follicles is sign of correct injection. 7 mm bleb = 0.1 mL injection. 3 mm bleb = 0.05 mL injection, if considerable resistance not felt, needle too deep and should be removed and reinserted before giving more vaccine.

To be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be avoided.

**Intradermal**

Bacillus Calmette-Guérin Vaccine (BCG Vaccine, Dried/Tub/BCG Injection (powder for suspension), freeze-dried preparation of live bacteria of a strain derived from the bacillus of Calmette and Guérin. Available from health organisations or direct from ImmForm (SSI brand, multidose vial with diluent)

**Diagnostic agents**

The Mantoux test is recommended for tuberculin skin testing, but no licensed preparation is currently available. Guidance for healthcare professionals is available at www.dh.gov.uk/immunisation.

In the Mantoux test, the diagnostic dose is administered by intradermal injection of Tuberculin Purified Protein Derivative (PPD).

The Heaf test (involving the use of multiple-puncture apparatus) is no longer available. Guidance for healthcare professionals is available at www.dh.gov.uk/immunisation.

Response to tuberculin may be suppressed by live viral vaccines, viral infection, sarcoidosis, corticosteroid therapy, or immunosuppression due to disease or treatment. Tuberculin testing should not be carried out within 4 weeks of receiving a live viral vaccine.

Two interferon gamma release assay (IGRA) tests are also available as an aid in the diagnosis of tuberculosis infection: Quantiferon® TB Gold and T-SPOT® TB. Both tests measure T-cell mediated immune response to synthetic antigens. For further information on the use of interferon gamma release assay tests for tuberculosis, see www.hpa.org.uk.

**Tuberculin Purified Protein Derivative (Tuberculin PPD)**

**Injection**, heat-treated products of growth and lysis of appropriate Mycobacterium spp. 20 units/mL (2 units/0.1-mL dose) for routine use, 1.5-mL vial; 100 units/mL (10 units/0.1-mL dose), 1.5-mL vial Dose by intradermal injection, for Mantoux test, 2 units (0.1 mL of 20 units/mL strength) for routine Mantoux test; if first test is negative and a further test is considered appropriate 10 units (0.1 mL of 100 units/mL strength) Available from ImmForm (SSI brand)

**Note** The strength of tuberculin PPD in this product may be different to the strengths of products used previously for the Mantoux test; care is required to select the correct strength

**Botulism antitoxin**

A polyvalent botulism antitoxin is available for the post-exposure prophylaxis of botulism and for the treatment of persons thought to be suffering from botulism. It specifically neutralises the toxins produced by Clostridium botulinum types A, B, and E. It is not reactive against infantile botulism as the toxin (type A) is seldom, if ever, found in the blood in this type of infection.

Hypersensitivity reactions are a problem. It is essential to read the contra-indications, warnings, and details of sensitivity tests on the package insert. Prior to treatment checks should be made regarding previous administration of any antitoxin and history of any allergic condition, e.g. asthma, hay fever, etc. All patients should be tested for sensitivity (diluting the antitoxin if history of allergy).

**Botulinum Antitoxin**

A preparation containing the specific antitoxic globulins that have the power of neutralising the toxins formed by types A, B, and E of Clostridium botulinum. Available from local designated centres, for details see TOXBASE (requires registration) www.toxbase.org. For supplies outside working hours apply to other designated centres or to the Public Health England Colindale duty doctor (Tel (020) 8200 6868). For major incidents, obtain supplies from the local blood bank

**Cholera vaccine**

Cholera vaccine (oral) contains inactivated Inaba (including El-Tor biotype) and Ogawa strains of Vibrio cholerae, serotype O1 together with recombinant B-subunit of the cholera toxin produced in Inaba strains of V. cholerae, serotype O1.

Oral cholera vaccine is licensed for travellers to endemic or epidemic areas on the basis of current recommendations (see also section 14.6). Immunisation should be completed at least 1 week before potential exposure. However, there is no requirement for cholera vaccination for international travel.

Immunisation with cholera vaccine does not provide complete protection and all travellers to a country where cholera exists should be warned that scrupulous attention to food, water, and personal hygiene is essential.

Injectable cholera vaccine provides unreliable protection and is no longer available in the UK.
Diphtheria vaccines

Diphtheria vaccines are prepared from the toxin of Corynebacterium diphtheriae and adsorption on aluminium hydroxide or aluminium phosphate improves antigenicity. The vaccine stimulates the production of the protective antitoxin. The quantity of diphtheria toxoid in a preparation determines whether the vaccine is defined as 'high dose' or 'low dose'. Vaccines containing the higher dose of diphtheria toxoid are used for primary immunisation of children under 10 years of age. Vaccines containing the lower dose of diphtheria toxoid are used for primary immunisation in adults and children over 10 years. Single-antigen diphtheria vaccine is not available and adsorbed diphtheria vaccine is given as a combination product containing other vaccines.

For primary immunisation of children aged between 2 months and 10 years vaccination is recommended usually in the form of 3 doses (separated by 1-month intervals) of diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed) (see Immunisation schedule, section 14.1). In incompletely immunised individuals aged over 10 years the primary course comprises of 3 doses of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine.

A booster dose should be given 3 years after the primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed). Children under 10 years should receive either adsorbed diphtheria, tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine or adsorbed diphtheria [low dose], tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine. Individuals aged over 10 years should receive adsorbed diphtheria [low dose], tetanus, and poliomyelitis (inactivated) vaccine.

A second booster dose, of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine, should be given 10 years after the previous booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed).

Travel

Those intending to travel to areas with a risk of diphtheria infection should be fully immunised according to the UK schedule (see also section 14.6). If more than 10 years have lapsed since completion of the UK schedule, a dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine should be administered.

Contacts

Staff in contact with diphtheria patients or with potentially pathogenic clinical specimens or working directly with C. diphtheriae or C. ulcerans should receive a booster dose if fully immunised (with 5 doses of diphtheria-containing vaccine given at appropriate intervals); further doses should be given at 10-year intervals if risk persists. Individuals at risk who are not fully immunised should complete the primary course; a booster dose should be given after 5 years and then at 10-year intervals. Adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine is used for this purpose; immunity should be checked by antibody testing at least 3 months after completion of immunisation.

Advice on the management of cases, carriers and outbreaks must be sought from health protection units. The immunisation history of infected individuals and their contacts should be determined; those who have been incompletely immunised should complete their immunisation and fully immunised individuals should receive a reinforcing dose. For advice on antibacterial treatment to prevent a secondary case of diphtheria in a non-immune individual, see Table 2, section 5.1.
Diphtheria-containing vaccines for children under 10 years

Important For persons aged 10 years or over see Diphtheria-containing Vaccines for Children over 10 years and Adults, below, and see Diphtheria-containing Vaccines for Immunisation of Pregnant Women Against Pertussis, below

Diphtheria, Tetanus, Pertussis (Acellular, Component), Poliomyelitis (Inactivated) and Haemophilus Type b Conjugate Vaccine (Adsorbed)

Injection, suspension of diphtheria toxoid, tetanus toxoid, acellular pertussis, inactivated poliomyelitis and Haemophilus influenzae type b (conjugated to tetanus protein), net price 0.5-mL prefilled syringe = £32.00
Excipients may include neomycin, polymyxin B and streptomycin
Brands include Pediacel®, available as part of childhood immunisation schedule from health organisations or ImmForm
Dose by intramuscular injection, CHILD 2 months–10 years, primary immunisation, 3 doses each of 0.5 mL separated by intervals of 1 month, see also notes on booster doses, above

Adsorbed Diphtheria, Tetanus, Pertussis (Acellular, Component) and Poliomyelitis (Inactivated) Vaccine

Injection, suspension of diphtheria toxoid, tetanus toxoid, acellular pertussis and inactivated poliomyelitis vaccine components adsorbed on a mineral carrier, net price 0.5-mL prefilled syringe = £17.56
Excipients may include neomycin and polymyxin B
Brands include Infanrix-IPV®, available as part of childhood immunisation schedule from health organisations or ImmForm
Dose by intramuscular injection, CHILD 3–10 years, first booster dose 3 years after primary immunisation, 0.5 mL, see also notes on booster doses, above

Adsorbed Diphtheria [low dose], Tetanus, Pertussis (Acellular, Component) and Poliomyelitis (Inactivated) Vaccine

Injection, suspension of diphtheria toxoid, tetanus toxoid, acellular pertussis and inactivated poliomyelitis vaccine components adsorbed on a mineral carrier, net price 0.5-mL prefilled syringe = £20.00
Excipients may include neomycin, polymyxin B and streptomycin
Brands include Repevax®, available from ImmForm
Dose by intramuscular injection, CHILD 3–10 years, first booster dose 3 years after primary immunisation, 0.5 mL, see also notes on booster doses, above

Diphtheria antitoxin

Diphtheria antitoxin is used for passive immunisation in suspected cases of diphtheria only (without waiting for bacteriological confirmation); tests for hypersensitivity should be first carried out. It is derived from horse serum, and reactions are common after administration; resuscitation facilities should be available immediately.

It is no longer used for prophylaxis because of the risk of hypersensitivity; unimmunised contacts should be promptly investigated and given antibacterial prophylaxis (section 5.1, table 2) and vaccine (see Contacts above).

Diphtheria Antitoxin

Dip/Ser
Dose prophylaxis, not recommended therefore no dose stated (see notes above)
Treatment, consult product literature
Available from Centre for Infections (Tel (020) 8200 6868) or in Northern Ireland from Public Health Laboratory, Belfast City Hospital (Tel (028) 9032 9241)

Haemophilus type b conjugate vaccine

Haemophilus influenzae type b (Hib) vaccine is made from capsular polysaccharide; it is conjugated with a protein such as tetanus toxoid to increase immunogenicity, especially in young children. Haemophilus influenzae type b vaccine immunisation is given in combination with diphtheria, tetanus, pertussis (acellular,
component) and poliomyelitis (inactivated) vaccine, as a component of the primary course of childhood immunisation (see Immunisation schedule, section 14.1) (see under Diphtheria-containing Vaccines). For infants under 1 year, the course consists of 3 doses of a vaccine containing Haemophilus influenzae type b component with an interval of 1 month between doses. A booster dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) should be given at 12–13 months of age.

Children 1–10 years who have not been immunised against Haemophilus influenzae type b need to receive only 1 dose of Haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine). However, if a primary course of immunisation has not been completed, these children should be given 3 doses of diptheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed). The risk of infection falls sharply in older children and the vaccine is not normally required for children over 10 years.

Haemophilus influenzae type b vaccine may be given to those over 10 years who are considered to be at increased risk of invasive H. influenzae type b disease (such as those with sickle-cell disease or complement deficiency, or those receiving treatment for malignancy).

### Invasive Haemophilus influenzae type b disease

After recovery from infection, unimmunised and partially immunised index cases under 10 years of age should complete their age-specific course of immunisation. Previously vaccinated cases under 10 years of age should be given an additional dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) if Hib antibody concentrations are low or if it is not possible to measure antibody concentrations. Index cases of any age with asplenia or splenic dysfunction should complete their immunisation according to the recommendations below; fully vaccinated cases with asplenia or splenic dysfunction should be given an additional dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) if they received their previous dose over 1 year ago.

For use of rifampicin in the prevention of secondary cases of Haemophilus influenzae type b disease, see Table 2, section 5.1.

### Asplenia, splenic dysfunction or complement deficiency

- **under 2 years of age** should be vaccinated according to the Immunisation Schedule (section 14.1). The booster dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine), given at 12–13 months of age, should be followed at least 1 month later by one dose of meningococcal A, C, W135, and Y conjugate vaccine. An additional dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) should be given after the second birthday;

- **over 2 years of age** should receive one dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine), followed 1 month later by one dose of meningococcal A, C, W135, and Y conjugate vaccine.

### HAEMOPHILUS TYPE B CONJUGATE VACCINE

**Indications** see notes above

**Contraindications** see section 14.1

**Pregnancy** see p. 829

**Breast-feeding** see p. 829

**Side-effects** see section 14.1; also atopic dermatitis, hypotonia

**Dose**

- Primary immunisation, see under Diphtheria
- Booster dose, see notes above and under preparation below

**Menitorix® (GSK)**

*Injection*, powder for reconstitution, capsular polysaccharide of Haemophilus influenzae type b and capsular polysaccharide of Neisseria meningitidis group C (both conjugated to tetanus protein), net price single-dose vial (with syringe containing 0.5 mL diluent) = £37.76

**Dose** by intramuscular injection, CHILD 1–10 years, 0.5 mL.

**ADULT** and **CHILD** over 1 year, with asplenia or splenic dysfunction (see notes above), 0.5 mL.

Available as part of the childhood immunisation schedule from ImmForm

### Combined vaccines

See also under Diphtheria-containing Vaccines

**Hepatitis A vaccine**

**Hepatitis A vaccine** is prepared from formaldehyde-inactivated hepatitis A virus grown in human diploid cells.

Immunisation is recommended for:

- laboratory staff who work directly with the virus;
- staff and residents of homes for those with severe learning difficulties;
- workers at risk of exposure to untreated sewage;
- individuals who work with primates;
- patients with haemophilia or other conditions treated with plasma-derived clotting factors;
- patients with severe liver disease;
- travellers to high-risk areas (see p. 857);
- individuals who are at risk due to their sexual behaviour;
- parenteral drug abusers.

Immunisation should be considered for:

- patients with chronic liver disease including chronic hepatitis B or chronic hepatitis C;
- prevention of secondary cases in close contacts of confirmed cases of hepatitis A, within 14 days of exposure to the primary case (within 8 weeks of exposure to the primary case where there is more than 1 contact in the household).

A booster dose is usually given 6–12 months after the initial dose. A second booster dose can be given 20 years after the previous booster dose to those who continue to be at risk. Specialist advice should be sought on re-immunisation of immunocompromised individuals.
For rapid protection against hepatitis A after exposure or during an outbreak, in adults a single dose of a monovalent vaccine is recommended; for children under 16 years, a single dose of the combined vaccine Ambirix® can also be used.

Intramuscular normal immunoglobulin (section 14.5.1) is recommended for use in addition to Hepatitis A vaccine for close contacts (of confirmed cases of hepatitis A) who have chronic liver disease or HIV infection, or who are immunosuppressed or over 50 years of age.

Post-exposure prophylaxis is not required for healthy children under 1 year of age, so long as all those involved in nappy changing are vaccinated against hepatitis A. However, children 2–12 months of age can be given a dose of hepatitis A vaccine if it is not possible to vaccinate their carers, or if the child becomes a source of infection to others [unlicensed use]; in these cases, if the child goes on to require long-term protection against hepatitis A after the first birthday, the full course of 2 doses should be given.

HEPATITIS A VACCINE

Indications immunisation against hepatitis A infection

Cautions see section 14.1

Contra-indications see section 14.1

Pregnancy see p. 829

Breast-feeding see p. 829

Side-effects see section 14.1; for combination vaccines, see also Typhoid vaccine, p. 850

Dose

• See under preparations

Single component

Avaxim® (Sanofi Pasteur)

Injection, suspension of formaldehyde-inactivated hepatitis A virus (GBM grown in human diploid cells) 320 antigen units/mL adsorbed onto aluminium hydroxide, net price 0.5-mL prefilled syringe = £18.10

Excipients include neomycin

Dose by intramuscular injection (see note below), ADULT and CHILD over 16 years, 0.5 mL as a single dose; booster dose 0.5 mL 6–12 months after initial dose.

Note Booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose.

Epaxal® (Crucell)

Injection, suspension of formaldehyde-inactivated hepatitis A virus (RG-5B grown in human diploid cells) at least 48 units/mL, net price 0.5-mL prefilled syringe = £23.81

Dose by intramuscular injection (see note below), ADULT and CHILD over 1 year, 0.5 mL as a single dose; booster dose 0.5 mL 6–12 months after initial dose (1–6 months if spleenectomised)

Note Booster dose may be delayed by up to 4 years in adults if not given after recommended interval following primary dose. The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders

Important Epaxal® contains influenza virus haemagglutinin grown in the allantoic cavity of chick embryos, therefore contra-indicated in those hypersensitive to eggs or chicken protein.

With hepatitis B vaccine

Ambirix® (GSK)

Injection, suspension of inactivated hepatitis A virus (grown in human diploid cells) 720 ELISA units/mL adsorbed onto aluminium hydroxide, net price 1-mL prefilled syringe = £22.14

Excipients include neomycin

Dose CHILD 1–15 years, 0.5 mL 6–12 months after initial dose

Note Primary course should be completed with Ambirix® (single component vaccines given at appropriate intervals may be used for booster dose), the deltoid region is the preferred site of injection in older children, anterolateral thigh is the preferred site in infants; not to be injected into the buttck (vaccine efficacy reduced); subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

Havrix Monodose® (GSK)

Injection, suspension of formaldehyde-inactivated hepatitis A virus (HM 175 grown in human diploid cells) 1440 ELISA units/mL adsorbed onto aluminium hydroxide, net price 1-mL prefilled syringe = £22.14

Excipients include neomycin

Dose by intramuscular injection (see note below), ADULT and CHILD over 16 years, 1 mL as a single dose; booster dose 1 mL 6–12 months after initial dose.

Note Booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose.

Vaqta® Paediatric (Sanofi Pasteur)

Injection, suspension of formaldehyde-inactivated hepatitis A virus (grown in human diploid cells) 50 antigen units/mL adsorbed onto aluminium hydroxypophosphate sulfate, net price 0.5-mL prefilled syringe = £14.74

Excipients include neomycin

Dose by intramuscular injection (see note below), CHILD 1–17 years, 0.5 mL as a single dose; booster dose 0.5 mL 6–18 months after initial dose, under 1 year, not recommended

Note The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders (but immune response may be reduced)

Vaqta® Adult (Sanofi Pasteur)

Injection, suspension of formaldehyde-inactivated hepatitis A virus (grown in human diploid cells) 50 antigen units/mL adsorbed onto aluminium hydroxypophosphate sulfate, net price 1-mL prefilled syringe = £18.10

Excipients include neomycin

Dose by intramuscular injection (see note below), ADULT over 18 years, 1 mL as a single dose; booster dose 1 mL 6–18 months after initial dose.

Note The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders (but immune response may be delayed)

Havrix Junior Monodose®

Injection, suspension of formaldehyde-inactivated hepatitis A virus (HM 175 grown in human diploid cells) 720 ELISA units/mL adsorbed onto aluminium hydroxide, net price 0.5-mL prefilled syringe = £31.18

Excipients include neomycin

Dose CHILD 1–15 years, by intramuscular injection (see note below), primary course, 2 doses of 1 mL, the second 6–12 months after initial dose

Note Primary course should be completed with Ambirix® (single component vaccines given at appropriate intervals may be used for booster dose), the deltoid region is the preferred site of injection in older children, anterolateral thigh is the preferred site in infants; not to be injected into the buttck (vaccine efficacy reduced); subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

Important If not recommended for post-exposure prophylaxis following percutaneous (needle-stick), ocular, or mucous membrane exposure to hepatitis B virus
Hepatitis B vaccine

Hepatitis B vaccine contains inactivated hepatitis B virus surface antigen (HBsAg) adsorbed onto aluminium hydroxide adjuvant. It is made biosynthetically using recombinant DNA technology. The vaccine is used in individuals at high risk of contracting hepatitis B.

In the UK, groups at high-risk of hepatitis B include:

- parenteral drug misusers, their sexual partners, and household contacts; other drug misusers who are likely to ‘progress’ to injecting;
- individuals who change sexual partners frequently;
- close family contacts of a case or individual with chronic hepatitis B infection;
- babies whose mothers have had acute hepatitis B during pregnancy or are positive for hepatitis B surface antigen (regardless of e-antigen markers); hepatitis B vaccination is started immediately on delivery and hepatitis B immunoglobulin (see p. 854) given at the same time (but preferably at a different site). Babies whose mothers are positive for hepatitis B surface antigen and for e-antigen antibody should receive the vaccine only (but babies weighing 1.5 kg or less should also receive the immunoglobulin regardless of the mother’s e-antigen antibody status);
- individuals with haemophilia, those receiving regular blood transfusions or blood products, and carers responsible for the administration of such products;
- patients with chronic renal failure including those on haemodialysis. Haemodialysis patients should be monitored for antibodies annually and re-immunised if necessary. Home carers (of dialysis patients) should be vaccinated;
- individuals with chronic liver disease;
- healthcare personnel (including trainees) who have direct contact with blood or blood-stained body fluids or with patients’ tissues;
- laboratory staff who handle material that may contain the virus;
- other occupational risk groups such as morticians and embalmers;
- staff and patients of day-care or residential accommodation for those with severe learning difficulties;
- staff and inmates of custodial institutions;
- those travelling to areas of high or intermediate prevalence who are at increased risk or who plan to remain there for lengthy periods (see p. 857);
- families adopting children from countries with a high or intermediate prevalence of hepatitis B;
- foster carers and their families.

Different immunisation schedules for hepatitis B vaccine are recommended for specific circumstances (see under individual preparations). Generally, three or four doses are required for primary immunisation; an ‘accelerated schedule’ is recommended for pre-exposure prophylaxis in high-risk groups where rapid protection is required, and for post-exposure prophylaxis (see below).

Immunisation may take up to 6 months to confer adequate protection; the duration of immunity is not known precisely, but a single booster 5 years after the primary course may be sufficient to maintain immunity for those who continue to be at risk.

Immunisation does not eliminate the need for common-sense precautions for avoiding the risk of infection from known carriers by the routes of infection which have been clearly established, consult Guidance for Clinical
Hepatitis B vaccine

Indications: Immunisation against hepatitis B infection

Cautions: See section 14.1

Contra-indications: See section 14.1

Pregnancy: See p. 829

Breastfeeding: See p. 829

Side-effects: See section 14.1

Dose:
- See under preparations

Single component

Engerix B® (GSK) [Pf] Injection, suspension of hepatitis B surface antigen (prepared from yeast cells by recombinant DNA technique) 20 micrograms/mL adsorbed onto aluminium hydroxide, net price 0.5-mL (paediatric) prefilled syringe = £9.67, 1-mL vial = £12.34, 1-mL prefilled syringe = £12.99

Dose by intramuscular injection (see note below), ADULT and CHILD over 18 years, 3 doses of 20 micrograms, the second 1 month and the third 6 months after the first dose; NEONATE (except if born to hepatitis B surface antigen positive mother, see below) and CHILD 1 month–16 years, 3 doses of 10 micrograms

Accelerated schedule (all ages), second dose 1 month after first dose, third dose 2 months after first dose and fourth dose 12 months after first dose; immunisation schedule and booster doses may be required in immunocompromised patients with low antibody concentration: NEONATE born to hepatitis B surface antigen-positive mother (see also notes above), 4 doses of 5 micrograms, first dose at birth with hepatitis B immunoglobulin injection (vaccine efficacy reduced)

Chronic haemodialysis patients, see below) and CHILD 1 month–16 years, 3 doses of 10 micrograms, the second 1 month and the third 6 months after the first dose

Alternative schedule for CHILD 1–15 years, 2 doses of 20 micrograms, the second dose 6 months after the first dose (this schedule not suitable if high risk of infection between doses or if compliance with second dose uncertain): NEONATE born to hepatitis B surface antigen-positive mother (see also notes above), 4 doses of 10 micrograms, first dose at birth with hepatitis B immunoglobulin injection (separate site) the second 1 month, the third 2 months and the fourth 12 months after the first dose

Renal insufficiency (including haemodialysis patients), by intramuscular injection (see note below), ADULT and CHILD over 18 years, 4 doses of 40 micrograms, the second 1 month, the third 2 months and the fourth 6 months after the first dose; immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration: NEONATE (except if born to hepatitis B surface antigen positive mother, see above) and CHILD 1 month–16 years 3 doses of 10 micrograms, second dose 1 month and the third dose 6 months after first dose or accelerated schedule, 4 doses of 10 micrograms, second dose 1 month, third dose 2 months and fourth dose 12 months after first dose; immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration

Note: Deltoid muscle is preferred site of injection in adults and older children; anterolateral thigh is preferred site in neonates, infants and young children; not to be injected into the buttck (vaccine efficacy reduced)

Fendrix® (GSK) [Pf]
Injection, suspension of hepatitis B surface antigen (prepared from yeast cells by recombinant DNA technique) 40 micrograms/mL adsorbed onto aluminium phosphate, net price 0.5-mL prefilled syringe = £38.10

Excipients: include traces of thiomersal

Dose: ADULT and CHILD over 15 years with renal insufficiency (including pre-haemodialysis and haemodialysis patients), by intramuscular injection (see note below) 4 doses of 20 micrograms, the second 1 month, the third 2 months and the fourth 6 months after the first dose; immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration

Note: Deltoid muscle is preferred site of injection, not to be injected into the buttck (vaccine efficacy reduced)

HBvaxPRO® (Sanofi Pasteur) [Pf]
Injection, suspension of hepatitis B surface antigen (prepared from yeast cells by recombinant DNA technique) 10 micrograms/mL adsorbed onto aluminium hydroxyphosphate sulphate, net price 0.5-mL (5-microgram) prefilled syringe = £8.95, 1-mL (10-microgram) prefilled syringe = £12.20, 40 micrograms/mL, 1-mL (40-microgram) vial = £27.60

Dose by intramuscular injection (see note below), ADULT and CHILD over 16 years, 3 doses of 10 micrograms, the second 1 month and the third 6 months after the first dose; CHILD under 16 years, 3 doses of 5 micrograms

Accelerated schedule (all ages), second dose 1 month after first dose, third dose 2 months after first dose and fourth dose 12 months after first dose

Booster doses may be required in immunocompromised patients with low antibody concentration: NEONATE born to hepatitis B surface antigen-positive mother (see also notes above), 4 doses of 5 micrograms, first dose at birth with hepatitis B immunoglobulin injection (see note below) 3 doses of 40 micrograms, the second 1 month and the third 6 months after the first dose; booster doses may be required in those with low antibody concentration

Note: Deltoid muscle is preferred site of injection in adults and older children; anterolateral thigh is preferred site in neonates and infants; not to be injected into the buttck (vaccine efficacy reduced)

With hepatitis A vaccine

See Hepatitis A Vaccine

Human papillomavirus vaccines

Human papillomavirus vaccine is available as a bivalent vaccine (Cervarix®) or a quadrivalent vaccine (Gardasil®). Cervarix® is licensed for use in females for the prevention of cervical cancer and other pre-cancerous lesions caused by human papillomavirus types 16 and 18. Gardasil® is licensed for use in females for the prevention of cervical cancer, genital warts and pre-cancerous lesions caused by human papillomavirus types 6, 11, 16, and 18. The vaccines may also provide limited protection against disease caused by other types of human papillomavirus. The two vaccines are not interchangeable and one vaccine product should be used for an entire course.
Human papillomavirus vaccine will be most effective if given before sexual activity starts. From September 2014, a 2-dose schedule is recommended, as long as the first dose is received before the age of 15 years. The first dose is given to females aged 11 to 14 years, and the second dose is given 6–24 months after the first dose (for the purposes of planning the national immunisation programme, it is appropriate to give the second dose 12 months after the first—see Immunisation schedule, section 14.1). If the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more. Females receiving their first dose aged 15 years or older require a 3-dose schedule (see Cervarix® and Gardasil®), with the second and third doses given 1 and 4–6 months after the first dose; all 3 doses should be given within a 12-month period. If the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses. If a 3-dose course of vaccination has been started before September 2014, then where possible this should be completed; if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses. Under the national programme in England, females remain eligible to receive the vaccine up to the age of 18 years if they did not receive the vaccine when scheduled. Where appropriate, immunisation with human papillomavirus vaccine should be offered to females coming into the UK as they may not have been offered protection in their country of origin. The duration of protection has not been established, but current studies suggest that protection is maintained for at least 6 years after completion of the primary course. As the vaccines do not protect against all strains of human papillomavirus, routine cervical screening should continue.

**HUMAN PAPILLOMAVIRUS VACCINES**

### Indications
See notes above and under preparations

### Contra-indications
See section 14.1

### Pregnancy
Not known to be harmful, but vaccination should be postponed until completion of pregnancy

### Breast-feeding
See p. 829

### Side-effects
See section 14.1

**Dose**

- See notes above and under preparations

**Note**
Avoid confusion, prescribers should specify the brand to be dispensed

**Cervarix®** (GSK)

**Injection**, suspension of virus-like particles of human papillomavirus type 16 (40 micrograms/mL), type 18 (40 micrograms/mL) capsid protein (prepared by recombinant DNA technique using a Baculovirus expression system) in monophosphoryl lipid A adjuvant adsorbed onto aluminium hydroxide, net price 0.5–mL prefilled syringe = £80.50

**Dose**
Prevention of premalignant genital lesions and cervical cancer, by intramuscular injection into deltoid region ADULT and CHILD 0.5 mL. If the second 1–2.5 months, and the third 5–12 months after the first dose; CHILD 9–14 years, 2 doses of 0.5 mL, the second 5–7 months after the first dose (if second dose administered earlier than 5 months after the first, a third dose should be administered)

**Gardasil®** (Sanofi Pasteur)

**Injection**, suspension of virus-like particles of human papillomavirus type 6 (40 micrograms/mL), type 11 (80 micrograms/mL), type 16 (80 micrograms/mL), type 18 (40 micrograms/mL) capsid protein (prepared from yeast cells by recombinant DNA technique) adsorbed onto aluminium hydroxophosphate sulfate, net price 0.5-mL prefilled syringe = £86.50

**Dose**
Prevention of premalignant genital lesions, cervical cancer and genital warts, by intramuscular injection preferably into deltoid region or higher anterolateral thigh, ADULT and CHILD over 9 years, 3 doses of 0.5 mL, the second at least 1 month after the first dose, and the third at least 3 months after the second dose, schedule should be completed within 12 months after the first dose; alternative schedule for CHILD 9–13 years, 2 doses of 0.5 mL, the second 6 months after the first dose (if administered earlier than 6 months, a third dose should be administered)

### Influenza vaccines

While most viruses are antigenically stable, the influenza viruses A and B (especially A) are constantly altering their antigenic structure as indicated by changes in the haemagglutinins (H) and neuraminidases (N) on the surface of the viruses. It is essential that influenza vaccines in use contain the H and N components of the prevalent strain or strains as recommended each year by the World Health Organization.

Seasonal influenza vaccines will not control epidemics—immunisation is recommended for persons at high risk, and to reduce transmission of infection. Annual immunisation is strongly recommended for individuals aged over 6 months with the following conditions:

- chronic respiratory disease (includes asthma treated with continuous or repeated use of inhaled or systemic corticosteroids or asthma with previous exacerbations requiring hospital admission);
- chronic heart disease;
- chronic liver disease;
- chronic renal disease;
- chronic neurological disease;
- diabetes mellitus;
- immunosuppression because of disease (including asplenia or splenic dysfunction) or treatment (including prolonged systemic corticosteroid treatment [for over 1 month at dose equivalents of prednisolone: adult and child over 20 kg, 20 mg or more daily; child under 20 kg, 1 mg/kg or more daily] and chemotherapy);
- HIV infection (regardless of immune status).

Seasonal influenza vaccine is also recommended for all pregnant women, for all persons aged over 65 years, for residents of nursing or residential homes for the elderly and other long-stay facilities, and for carers of persons whose welfare may be at risk if the carer falls ill. Influenza immunisation should also be considered for householder contacts of immunocompromised individuals.

As part of winter planning, NHS employers should offer vaccination to healthcare workers who are directly involved in patient care. Employers of social care workers should consider similar action.

Unless contra-indicated, the live influenza vaccine, *Fluarix Tetra*, is preferred in children aged 2–18 years because it provides a higher level of protection than inactivated influenza vaccine. From 1 September 2014, seasonal influenza vaccine will be offered to all children aged 2–4 years (i.e. those born between 2 September 2009 and 1 September 2012).
Information on pandemic influenza, avian influenza and swine influenza may be found at www.dh.gov.uk/pandemicflu and at www.hpa.org.uk.

**INFLUENZA VACCINES**

**Indications** annual immunisation against seasonal influenza

**Cautions** see section 14.1; increased risk of fever in child under 5 years with *Viroflu*® and *Inflexal V*, and in child 5–9 years with *Enzira*® or preparations marketed by Pfizer or CSL Biotherapies

**Contra-indications** see section 14.1 and also *Fluvarix*® and *Imuvac*® below; see under *Intanza*® below

**Pregnancy** see section 14.1; inactivated vaccines not known to be harmful; avoid *Fluenz Tetra*®

**Breast-feeding** see section 14.1; inactivated vaccines not known to be harmful; avoid *Fluenz Tetra*®

**Side-effects** see section 14.1; also reported febrile convulsions and transient thrombocytopenia; with intranasal spray, rhinorrhoea and less commonly epistaxis

**Dose**
- **By intramuscular injection**, Adult and Child over 9 years, 0.5 mL as a single dose; Child 6 months–9 years, 0.5 mL; for children 6 months to 9 years who have not received seasonal influenza vaccine previously, repeat after at least 4 weeks
- **By intradermal injection**, see under *Intanza*® below
- **Intranasally**, see under *Fluenz Tetra*® below

### Trivalent seasonal influenza vaccines for intramuscular use

**Inactivated Influenza Vaccine (Split Virion)**

- **Flu** injection, suspension of formaldehyde-inactivated influenza virus (split virion grown in fertilised hens’ eggs), net price 0.25–0.5 mL prefilled syringe = £6.59
- **Excipients** may include neomycin and polymyxin B
  - Available from Sanofi Pasteur
- **Cautions** increased risk of fever in child 5–9 years with preparations marketed by Pfizer or CSL Biotherapies—use alternative influenza vaccine if available
- **Contra-indications** avoid preparations marketed by Pfizer or CSL Biotherapies in child under 5 years—increased risk of febrile convulsions

**Inactivated Influenza Vaccine (Surface Antigen)**

- **Flu or Flu(ad)** injection, suspension of propiolactone-inactivated influenza virus (surface antigen, grown in fertilised hens’ eggs), net price 0.5 mL prefilled syringe = £4.15
- **Excipients** may include neomycin and polymyxin B, and traces of thiomersal
  - Available from Novartis Vaccines
  - **Note** Not licensed for children under 4 years

**Agrippal®** (Novartis Vaccines) injection, suspension of formaldehyde-inactivated influenza virus (surface antigen, grown in fertilised hens’ eggs), net price 0.5 mL prefilled syringe = £5.85
- **Excipients** include kanamycin and neomycin

### Tetavalent seasonal influenza vaccine for intramuscular use

- **Fluarix®** (GSK) injection, suspension of formaldehyde-inactivated influenza virus (split virion, grown in fertilised hens’ eggs), net price 0.5 mL prefilled syringe = £5.55
- **Excipients** include neomycin, polymyxin B, and traces of thiomersal
- **Note** Ovabumin content less than 100 nanograms/mL

### Trivalent seasonal influenza vaccine for intradermal use

- **Enzira®** (Pfizer) injection, suspension of inactivated influenza virus (split virion, grown in fertilised hens’ eggs), net price 0.5 mL prefilled syringe = £5.25
- **Excipients** include neomycin and polymyxin B
- **Cautions** child 5–9 years (increased risk of fever)—use alternative influenza vaccine if available
- **Contra-indications** child under 5 years—increased risk of febrile convulsions

- **Fluvarix®** (GSK) injection, suspension of formaldehyde-inactivated influenza virus (surface antigen, grown in fertilised hens’ eggs), net price 0.5 mL prefilled syringe = £5.22
- **Excipients** include gentamicin

### Viroflu® (Janssen) injection, suspension of formaldehyde-inactivated influenza virus (surface antigen, grown in fertilised hens’ eggs), net price 0.5 mL prefilled syringe = £6.59
- **Excipients** include gentamicin

### Imuvac® (Abbott Healthcare) injection, suspension of formaldehyde-inactivated influenza virus (surface antigen, grown in fertilised hens’ eggs), net price 0.5 mL prefilled syringe = £5.55
- **Excipients** include neomycin and polymyxin B
- **Cautions** child under 5 years (increased risk of fever)—use only if a safer alternative influenza vaccine is not available
- **Note** Ovabumin content less than 100 nanograms/mL
- **Note** Also available as *Inflexal V®*

### Tetavalent seasonal influenza vaccine for intradermal use

- **Fluarix Tetra®** (GSK) injection, suspension of formaldehyde-inactivated influenza virus (split virion, grown in fertilised hens’ eggs) net price 0.5 mL prefilled syringe = £9.94
- **Excipients** include gentamicin
- **Note** Ovabumin content less than 100 nanograms/mL
- **Note** Not licensed for use in children under 3 years of age

### Trivalent seasonal influenza vaccine for intradermal use

- **Intanza®** (Sanofi Pasteur) injection, suspension of formaldehyde-inactivated influenza virus (split virion, grown in fertilised hens’ eggs), net price, prefilled syringe, 15 micrograms = £6.59
- **Excipients** include gentamicin
- **Note** Ovabumin content less than 100 nanograms/mL
- **Note** Not licensed for use in children under 3 years of age

### Intanza® (Sanofi Pasteur) injection, suspension of formaldehyde-inactivated influenza virus (split virion, grown in fertilised hens’ eggs) net price, prefilled syringe, 9 micrograms (0.1 mL) = £9.05; prefilled syringe, 15 micrograms (0.1 mL) = £9.05
- **Excipients** include neomycin
- **Dose** by intradermal injection into deltoid region, Adult over 60 years, 9 micrograms as a single dose; Adult over 60 years, 15 micrograms as a single dose
14 Immunological products and vaccines

**14.4 Vaccines and antisera**

**JAPANESE ENCEPHALITIS VACCINE**

**Indications** immunisation against Japanese encephalitis

**Cautions** see section 14.1

**Contra-indications** see section 14.1

**Pregnancy** although manufacturer advises avoid because of limited information, miscarriage has been associated with Japanese encephalitis virus infection acquired during the first 2 trimesters of pregnancy

**Breast-feeding** see

**Side-effects** see section 14.1; also less commonly migraine, vertigo; rarely dyspnoea, palpitation, tachycardia, thrombocytopenia, neuritis

**Dose**

- See under preparation

**Ixaro® (Novartis Vaccines)**

**Injection** suspension, inactivated Japanese encephalitis virus (produced in vero cells), adsorbed onto aluminium hydroxide, net price 0.5 mL (6 micrograms) prefilled syringe = £59.50

**Dose** by intramuscular injection in deltoid region, **ADULT** over 18 years, 2 doses of 0.5 mL separated by interval of 28 days; booster dose 1–2 years after completing primary course, but for those at continued risk the booster dose should be given 1 year after completing the primary course; **CHILD** 2 months–3 years, 2 doses of 0.25 mL separated by interval of 28 days; **CHILD** 3–18 years, 2 doses of 0.5 mL separated by interval of 28 days

**Note** Anterolateral thigh is preferred site in infants. The subcutaneous route may be used for patients with bleeding disorders see section 14.1

**Measles vaccine**

Measles vaccine has been replaced by a combined live measles, mumps and rubella vaccine (MMR vaccine).

MMR vaccine may be used in the control of outbreaks of measles (see under MMR Vaccine).

**Single antigen vaccine**

No longer available in the UK

**Combined vaccines**

See MMR vaccine

**Measles, Mumps and Rubella (MMR) vaccine**

A combined live measles, mumps, and rubella vaccine (MMR vaccine) aims to eliminate measles, mumps, and rubella (and congenital rubella syndrome). Every child should receive two doses of MMR vaccine by entry to primary school, unless there is a valid contra-indication (see section 14.1). MMR vaccine should be given irrespective of previous measles, mumps, or rubella infection or vaccination.

The first dose of MMR vaccine is given to children aged 12–13 months. A second dose is given before starting school at 3 years and 4 months–5 years of age (see Immunisation Schedule, section 14.1).

Children presenting for pre-school booster who have not received the first dose of MMR vaccine should be given a dose of MMR vaccine followed 3 months later by a second dose.

At school-leaving age or at entry into further education, MMR immunisation should be offered to individuals of both sexes who have not received 2 doses during childhood. In those who have received only a single dose of MMR in childhood, a second dose is recommended to achieve full protection. If 2 doses of MMR vaccine are required, the second dose should be given one month after the initial dose. The decision on whether to vaccinate adults should take into consideration their vaccination history, the likelihood of the individual remaining susceptible, and the future risk of exposure and disease.

MMR vaccine should be used to protect against rubella in seronegative women of child-bearing age (see Immunisation Schedule, section 14.1); unimmunised healthcare workers who might put pregnant women and other vulnerable groups at risk of rubella or measles should be vaccinated. MMR vaccine may also be offered to previously unimmunised and seronegative post-partum women (see MMR Vaccine, section 14.5.3)—vaccination a few days after delivery is important because about 60% of congenital abnormalities from rubella infection occur in babies of women who have borne more than one child. Immigrants arriving after the age of school immunisation are particularly likely to require immunisation.

**Contacts** MMR vaccine may also be used in the control of outbreaks of measles and should be offered to susceptible children aged over 6 months who are contacts of a case, within 3 days of exposure to infection. Children immunised before 12 months of age should still receive two doses of MMR vaccine at the recommended ages. If one dose of MMR vaccine has already been given to a child, then the second dose may be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3 years and 4 months–5 years should still be given. Children aged under 9 months for whom avoid-
ance of measles infection is particularly important (such as those with history of recent severe illness) can be given normal immunoglobulin (section 14.5.1) after exposure to measles; routine MMR immunisation should then be given after at least 3 months at the appropriate age.

MMR vaccine is not suitable for prophylaxis following exposure to mumps or rubella since the antibody response to the mumps and rubella components is too slow for effective prophylaxis.

Children and adults with impaired immune response should not receive live vaccines (for advice on HIV see section 14.1). If they have been exposed to measles infection they should be given normal immunoglobulin (section 14.5.1).

**Travel** Unimmunised travellers, including children over 6 months, to areas where measles is endemic or epidemic should receive MMR vaccine. Children immunised before 12 months of age should still receive two doses of MMR vaccine at the recommended ages. If one dose of MMR vaccine has already been given to a child, then the second dose should be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3 years and 4 months–5 years should still be given.

**Side-effects** See section 14.1; also malaise, fever, or a rash can occur after the first dose of MMR vaccine, most commonly about a week after vaccination and lasting about 2 to 3 days. Leaflets are available for parents on advice for reducing fever (including the use of paracetamol). Febrile seizures occur rarely 6 to 11 days after MMR vaccination; the incidence of febrile seizures is lower than that following measles infection. Parotid swelling occurs occasionally, usually in the third week, and rarely, arthropathy 2 to 3 weeks after immunisation. Adverse reactions are considerably less frequent after the second dose of MMR vaccine than after the first dose.

Idiopathic thrombocytopenic purpura has occurred rarely following MMR vaccination, usually within 6 weeks of the first dose. The risk of idiopathic thrombocytopenic purpura after MMR vaccine is much less than the risk after infection with wild measles or rubella virus. Children who develop idiopathic thrombocytopenic purpura within 6 weeks of the first dose of MMR should undergo serological testing before the second dose is due; if the results suggest incomplete immunity against measles, mumps or rubella then a second dose of MMR is recommended. The Specialist and Reference Microbiology Division, Health Protection Agency offers free serological testing for children who develop idiopathic thrombocytopenic purpura within 6 weeks of the first dose of MMR.

Post-vaccination aseptic meningitis was reported (rarely and with complete recovery) following vaccination with MMR vaccine containing Urabe mumps vaccine, which has now been discontinued; no cases have been confirmed in association with the currently used Jeryl Lynn mumps vaccine. Children with post-vaccination symptoms are not infectious.
Meningococcal vaccines

Almost all childhood meningococcal disease in the UK is caused by *Neisseria meningitidis* serogroups B and C. Meningococcal group C conjugate vaccine protects only against infection by serogroup C. The risk of meningococcal disease declines with age—immunisation is not generally recommended after the age of 25 years.

Tetravalent meningococcal vaccines that cover serogroups A, C, W135, and Y are available. Although the duration of protection has not been established, the meningococcal groups A, C, W135, and Y conjugate vaccine is likely to provide longer-lasting protection than the unconjugated meningococcal polysaccharide vaccine. The antibody response to serogroup C in unconjugated meningococcal polysaccharide vaccines in young children may be suboptimal.

A meningococcal group B vaccine, Bexsero®, is licensed in the UK against infection caused by *Neisseria meningitidis* serogroup B. Bexsero® contains 3 recombinant *Neisseria meningitidis* serogroup B proteins and the outer membrane vesicles from the NZ 98/254 strain, in order to achieve broad protection against *Neisseria meningitidis* serogroup B; the proteins are adsorbed onto an aluminium compound to stimulate an enhanced immune response.

**Childhood immunisation** Meningococcal group C conjugate vaccine provides long-term protection against infection by serogroup C of *Neisseria meningitidis*. Immunisation consists of 1 dose given at 3 months of age; 2 booster doses are recommended, the first is given at 12–13 months of age (combined with haemophilus influenzae type b vaccine), and the second at 13–15 years of age (see Immunisation Schedule, section 14.1, p. 830).

Unimmunised children aged 4–12 months should be given 1 dose of meningococcal group C conjugate vaccine and then they should be vaccinated according to the Immunisation Schedule (section 14.1, p. 830).

Unimmunised children aged 1–10 years should be given 1 dose of meningococcal group C conjugate vaccine, followed by a booster dose at 13–15 years of age. Unimmunised individuals aged 10–25 years should be given 1 dose of meningococcal group C conjugate vaccine, but a booster dose is not required.

From August 2014 there will be a catch-up programme for individuals aged under 25 years who are attending university for the first time and who did not receive a dose of meningococcal group C conjugate vaccine at 13–15 years of age.

Patients under 25 years of age with confirmed serogroup C disease, who have previously been immunised with meningococcal group C vaccine, should be offered meningococcal group C conjugate vaccine before discharge from hospital.

**Asplenia, splenic dysfunction, or complement deficiency** See p. 836.

**Travel** Individuals travelling to countries of risk (see below) should be immunised with meningococcal groups A, C, W135, and Y conjugate vaccine, even if they have previously received meningococcal group C conjugate vaccine. If an individual has recently received meningococcal group C conjugate vaccine, an interval of at least 4 weeks should be allowed before administra-

\[\text{tration of the tetravalent (meningococcal groups A, C, W135, and Y) vaccine.}\]

Vaccination is particularly important for those living or working with local people or visiting an area of risk during outbreaks.

Immunisation recommendations and requirements for visa entry for individual countries should be checked before travelling, particularly to countries in Sub-Saharan Africa, Asia, and the Indian sub-continent where epidemics of meningococcal outbreaks and infection are reported. Country-by-country information is available from the National Travel Health Network and Centre (www.nathnac.org).

Proof of vaccination with the tetravalent (meningococcal groups A, C, W135, and Y) vaccine is required for those travelling to Saudi Arabia during the Hajj and Umrah pilgrimages (where outbreaks of the W135 strain have occurred).

**Contacts** For advice on the immunisation of laboratory workers and close contacts of cases of meningococcal disease in the UK and on the role of the vaccine in the control of local outbreaks, consult Guidance for Public Health Management of Meningococcal Disease in the UK at www.hpa.org.uk. See Table 2, section 5.1 for antibacterial prophylaxis for prevention of secondary cases of meningococcal meningitis.

The need for immunisation of laboratory staff who work directly with *Neisseria meningitidis* should be considered.

\textbf{Single antigen vaccine}

No longer available in the UK

\textbf{Combined vaccines}

See MMR Vaccine

\section*{Pertussis vaccine}

Pertussis vaccine is given as a combination preparation containing other vaccines (see Diphtheria containing Vaccines). Acellular vaccines are derived from highly purified components of 	extit{Bordetella pertussis}. Primary immunisation against pertussis (whooping cough) requires 3 doses of an acellular pertussis-containing vaccine (see Immunisation schedule, section 14.1), given at intervals of 1 month from the age of 2 months.

All children up to the age of 10 years should receive primary immunisation with diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed). A booster dose of an acellular pertussis-containing vaccine should ideally be given 3 years after the primary course, although, the interval can be reduced to 1 year if the primary course was delayed.

Children aged 1–10 years who have not received a pertussis-containing vaccine as part of their primary immunisation should be offered 1 dose of a suitable pertussis-containing vaccine; after an interval of at least 1 year, a booster dose of a suitable pertussis-containing vaccine should be given. Immunisation against pertussis is not routinely recommended in individuals over 10 years of age.

\section*{Vaccination of pregnant women against pertussis}

In response to the pertussis outbreak, the UK health departments introduced a temporary programme (October 2012) to vaccinate pregnant women against pertussis, and this programme will continue until further notice. The aim of the programme is to boost the levels of pertussis–specific antibodies that are transferred through the placenta, from the mother to the fetus, so that the newborn is protected before routine immunisation begins at 2 months of age.

Pregnant women should be offered a single dose of acellular pertussis-containing vaccine (as adsorbed diphtheria [low dose], tetanus, pertussis [acellular, component] and poliomyelitis [inactivated vaccine]; Repevax®) between 28 to 38 weeks of pregnancy; the optimal time for vaccination is between 28–32 weeks of pregnancy. Pregnant women should be offered a single dose of acellular pertussis-containing vaccine up to the onset of labour if they missed the opportunity for vaccination at 28–38 weeks of pregnancy. A single dose of acellular pertussis-containing vaccine may also be offered to new mothers, who have never previously been vaccinated against pertussis, until the child receives the first vaccination.

While this programme is in place, women who become pregnant again should be offered vaccination during each pregnancy to maximise transplacental transfer of antibody.

\section*{Contacts}

Vaccination against pertussis should be considered for close contacts of cases with pertussis who have been offered antibacterial prophylaxis (Table 2, section 5.1). Unimmunised or partially immunised contacts under 10 years of age should complete their primary immunisation against pertussis. A booster dose of an acellular pertussis-containing vaccine is recommended for contacts aged over 10 years who have not received a pertussis-containing vaccine in the last 5 years and who have not received adsorbed diphtheria [low dose], tetanus, and poliomyelitis (inactivated) vaccine in the last month.
**Pneumococcal vaccines**

Pneumococcal vaccines protect against infection with *Streptococcus pneumoniae* (pneumococcus); the vaccines contain polysaccharide from capsular pneumococci. **Pneumococcal polysaccharide vaccine** contains purified polysaccharide from 23 capsular types of pneumococci, whereas **pneumococcal polysaccharide conjugate vaccine (adsorbed)** contains polysaccharide from either 10 capsular types (*Synflorix*®) or 13 capsular types (*Prevenar 13®*) and the polysaccharide is conjugated to protein.

The 13-valent conjugate vaccine (*Prevenar 13®*) is used in the childhood immunisation schedule. The recommended schedule consists of 3 doses, the first at 2 months of age, the second at 4 months, and the third at 12–13 months (see Immunisation Schedule, section 14.1).

Pneumococcal vaccination is recommended for individuals at increased risk of pneumococcal infection as follows:

- age over 65 years;
- asplenia or splenic dysfunction (including homozygous sickle cell disease and coeliac disease which could lead to splenic dysfunction);
- chronic respiratory disease (includes asthma treated with continuous or frequent use of a systemic corticosteroid);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- diabetes mellitus requiring insulin or oral hypoglycaemic drugs;
- immune deficiency because of disease (e.g. HIV infection) or treatment (including prolonged systemic corticosteroid treatment for over 1 month at dose equivalents of prednisolone: adult and child over 20 kg, 20 mg or more daily; child under 20 kg, 1 mg/kg or more daily);
- presence of cochlear implant;
- conditions where leakage of cerebrospinal fluid may occur;
- child under 5 years with a history of invasive pneumococcal disease;
- at risk of occupational exposure to metal fume (e.g. welders).

Where possible, the vaccine should be given at least 2 weeks before splenectomy, cochlear implant surgery, chemotherapy, or radiotherapy, patients should be given advice about increased risk of pneumococcal infection. If it is not practical to vaccinate at least 2 weeks before splenectomy, chemotherapy, or radiotherapy, the vaccine should be given at least 2 weeks after the splenectomy or, where possible, at least 3 months after completion of chemotherapy or radiotherapy. Prophylactic antibacterial therapy against pneumococcal infection (Table 2, section 5.1) should not be stopped after immunisation. A patient card and information leaflet for patients with asplenia are available from the Department of Health or in Scotland from the Scottish Executive, Public Health Division 1 (Tel (0131) 244 2501).

**Choice of vaccine** Children under 2 years at increased risk of pneumococcal infection (see list above) should receive the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) at the recommended ages, followed by a single dose of the 23-valent pneumococcal polysaccharide vaccine after their second birthday (see below). Children at increased risk of pneumococcal infection presenting late for vaccination should receive 2 doses (separated by at least 1 month) of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) before the age of 12 months, and a third dose at 12–13 months. Children over 12 months and under 5 years (who have not been vaccinated or not completed the primary course) should receive a single dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) (2 doses separated by an interval of 2 months in the immunocompromised or those with asplenia or splenic dysfunction). All children under 5 years at increased risk of pneumococcal infection should receive a single dose of the 23-valent pneumococcal polysaccharide vaccine after their second birthday and at least 2 months after the final dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

Children over 5 years and adults who are at increased risk of pneumococcal disease should receive a single dose of the 23-valent unconjugated pneumococcal polysaccharide vaccine.

**Revaccination** In individuals with higher concentrations of antibodies to pneumococcal polysaccharides, revaccination with the 23-valent pneumococcal polysaccharide vaccine more commonly produces adverse reactions. Revaccination is therefore not recommended, except every 5 years in individuals in whom the antibody concentration is likely to decline rapidly (e.g. asplenia, splenic dysfunction and nephrotic syndrome). If there is doubt, the need for revaccination should be discussed with a haematologist, immunologist, or microbiologist.
**PNEUMOCOCCAL VACCINE**

**Indications**  
Immunisation against pneumococcal infection

**Cautions**  
see section 14.1

**Contra-indications**  
see section 14.1

**Pregnancy**  
see p. 829

**Breast-feeding**  
see p. 829

**Side-effects**  
see section 14.1; also Revaccination, above

**Dose**

- See under preparations

---

**Pneumococcal polysaccharide vaccine**

Pneumovax® II (Sanofi Pasteur) 

**Injection**, polysaccharide from each of 23 capsular types of pneumococcus, net price 0.5-mL vial = £8.32

**Contra-indications**  
concomitant use with the high potency varicella-zoster vaccine (Zostavax™)

**Dose**  
by intramuscular or subcutaneous injection, ADULT and CHILD over 2 years, 0.5 mL; revaccination, see notes above.

---

**Pneumococcal polysaccharide conjugate vaccine (adsorbed)**

Prevenar 13® (Pfizer)

**Injection**, polysaccharide from each of 13 capsular types of pneumococcus (conjugated to carrier protein) adsorbed onto aluminium phosphate, net price 0.5-mL prefilled syringe = £49.10

**Dose**  
by intramuscular injection, CHILD 2 months–5 years, 0.5 mL (see notes above and Immunisation Schedule, section 14.1)

**Note**  
Deltoid muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants.

The dose in the BNF may differ from that in product literature

Available as part of childhood immunisation schedule from ImmunForm

---

**Synflorix®** (GSK)

**Injection**, polysaccharide from each of 10 capsular types of pneumococcus (conjugated to carrier proteins) adsorbed onto aluminium phosphate, net price 0.5-mL prefilled syringe = £27.60

**Dose**  
by intramuscular injection, CHILD 6 weeks–5 years, consult product literature

**Note**  
Deltoid muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants

---

**Poliomyelitis vaccines**

Two types of poliomyelitis vaccine (containing strains of poliovirus types 1, 2, and 3) are available, inactivated poliomyelitis vaccine (for injection) and live (oral) poliomyelitis vaccine. Inactivated poliomyelitis vaccine, only available in combined preparation (see under Diphtheria Vaccines), is recommended for routine immunisation.

A course of primary immunisation consists of 3 doses of a combined preparation containing inactivated poliomyelitis vaccine, starting at 2 months of age with intervals of 1 month between doses (see Immunisation schedule, section 14.1). A course of 3 doses should also be given to all unimmunised adults; no adult should remain unimmunised against poliomyelitis.

Two booster doses of a preparation containing inactivated poliomyelitis vaccine are recommended, the first before school entry and the second before leaving school (see Immunisation schedule, section 14.1).

---

Further booster doses are only necessary for adults at special risk, such as travellers to endemic areas, or laboratory staff likely to be exposed to the viruses, or healthcare workers in possible contact with cases; booster doses should be given to such individuals every 10 years.

**Live (oral) poliomyelitis vaccine** is no longer available for routine use; its use may be considered during large outbreaks, but advice should be sought from Public Health England. The live (oral) vaccine poses a very rare risk of vaccine-associated paralytic polio because the attenuated strain of the virus can revert to a virulent form. For this reason the live (oral) vaccine must not be used for immunosuppressed individuals or their household contacts. The use of inactivated poliomyelitis vaccine removes the risk of vaccine-associated paralytic polio altogether.

**Travel**  
Unimmunised travellers to areas with a high incidence of poliomyelitis should receive a full 3-dose course of a preparation containing inactivated poliomyelitis vaccine. Those who have not been vaccinated in the last 10 years should receive a booster dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine. Information about countries with a high incidence of poliomyelitis can be obtained from www.travax.nhs.uk or from the National Travel Health Network and Centre (www.nathnac.org).

**Inactivated (Salk) vaccine**

See under Diphtheria-containing vaccines

---

**Rabies vaccine**

Rabies vaccine contains inactivated rabies virus cultivated in either human diploid cells or purified chick embryo cells; vaccines are used for pre- and post-exposure prophylaxis.

**Pre-exposure prophylaxis**  
Immunisation should be offered to those at high risk of exposure to rabies—laboratory staff who handle the rabies virus, those working in quarantine stations, animal handlers, veterinary surgeons and field workers who are likely to be bitten by infected wild animals, certain port officials, and bat handlers. Transmission of rabies by humans has not been recorded but it is advised that those caring for patients with the disease should be vaccinated.

Immunisation against rabies is also recommended where there is limited access to prompt medical care for those living in areas where rabies is enzootic, for those travelling to such areas for longer than 1 month, and for those on shorter visits who may be exposed to unusual risk.
Immunisation against rabies is indicated during pregnancy if there is substantial risk of exposure to rabies and rapid access to post-exposure prophylaxis is likely to be limited.

Up-to-date country-by-country information on the incidence of rabies can be obtained from the National Travel Health Network and Centre (www.nathnac.org) and, in Scotland, from Health Protection Scotland (www.hps.scot.nhs.uk).

Immunisation against rabies requires 3 doses of rabies vaccine, with further booster doses for those who remain at frequent risk. To ensure continued protection in persons at high risk (e.g. laboratory workers), the concentration of antirabies antibodies in plasma is used to determine the intervals between doses.

**Post-exposure management** Following potential exposure to rabies, the wound or site of exposure (e.g. mucous membrane) should be cleansed under running water and washed for several minutes with soapy water as soon as possible after exposure. Disinfector and a simple dressing can be applied, but suturing should be delayed because it may increase the risk of introducing rabies virus into the nerves.

Post-exposure prophylaxis against rabies depends on the level of risk in the country, the nature of exposure, and the individual’s immunity. In each case, expert risk assessment and advice on appropriate management should be obtained from the local Public Health England Centre or Public Health England’s Virus Reference Department, Colindale (tel. (020) 8200 4400) or the PHE Colindale Duty Doctor (tel. (020) 8200 8668), in Wales from the Public Health Wales local Health Protection Team or Public Health Wales Virus Reference Laboratory (tel. (029) 2074 7747), in Scotland from the local on-call infectious diseases consultant, and in Northern Ireland from the Public Health Agency Duty Room (tel (028) 9055 3997 / (028) 9063 2662) or the Regional Virology Service (tel. (028) 9024 0550).

There are no specific contra-indications to the use of rabies vaccine for post-exposure prophylaxis and its use should be considered whenever a patient has been attacked by an animal in a country where rabies is enzootic, even if there is no direct evidence of rabies in the attacking animal. Because of the potential consequences of untreated rabies exposure and because rabies vaccination has not been associated with fetal abnormalities, pregnancy is not considered a contra-indication to post-exposure prophylaxis.

For post-exposure prophylaxis of **fully immunised** individuals (who have previously received pre-exposure or post-exposure prophylaxis with cell-derived rabies vaccine), 2 doses of cell-derived vaccine are likely to be sufficient; the first dose is given on day 0 and the second dose is given between day 3–7. Rabies immunoglobulin is not necessary in such cases.

Post-exposure treatment for **unimmunised individuals** (or those whose prophylaxis is possibly incomplete) comprises 5 doses of rabies vaccine given over 1 month (on days 0, 3, 7, 14, and the fifth dose is given between day 28–30); also, depending on the level of risk (determined by factors such as the nature of the bite and the country where it was sustained), rabies immunoglobulin (section 14.5.2) is given to unimmunised individuals on day 0 or within 7 days of starting the course of rabies vaccine.

The immunisation course can be discontinued if it is proved that the individual was not at risk.

---

**Rotavirus vaccine**

Rotavirus vaccine is a live, oral vaccine that protects young children against gastro-enteritis caused by rotavirus infection. The recommended schedule consists of 2 doses, the first at 2 months of age, and the second at 3 months of age (see Immunisation schedule, section 14.1). The first dose of rotavirus vaccine must be given between 6–15 weeks of age and the second dose should be given after an interval of at least 4 weeks; the vaccine should not be started in children 15 weeks of age or older. Ideally, the full course should be completed before 16 weeks of age to provide protection before the main burden of disease, and to avoid a temporal association between vaccination and intussusception; the course must be completed before 24 weeks of age.

The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; however, vaccination of those with immunosuppressed close contacts may protect the contacts from wild-type rotavirus disease and outweigh any risk from transmission of vaccine virus. Carers of a recently vaccinated baby should be advised of the need to wash their hands after changing the baby’s nappies.
ROTAVIRUS VACCINE

Indications  Immunisation against gastro-enteritis caused by rotavirus

Cautions  See section 14.1; also diarrhoea or vomiting (postpneumococcal vaccination); immunosuppressed close contacts (see notes above)

Contra-indications  See section 14.1; however, with the exception of severe combined immunodeficiency, benefit from vaccination is likely to outweigh the risk in other types of immunosuppression—if there is any doubt, seek specialist advice; also predisposition to, or history of, intussusception

Side-effects  See section 14.1

Dose
- By mouth, CHILD over 6 weeks, 2 doses of 1.5 mL, separated by an interval of at least 4 weeks; first dose must be given between 6–15 weeks of age; course should be completed before 24 weeks of age (preferably before 16 weeks)

Rotarix® (GSK) [HAL]
Oral suspension, live attenuated rotavirus (RIX4414 strain), net price 1.5 mL prefilled oral syringe = £34.76

Rubella vaccine

A combined measles, mumps and rubella vaccine (MMR vaccine) aims to eliminate rubella (German measles) and congenital rubella syndrome. MMR vaccine is used for childhood vaccination as well as for vaccinating adults (including women of child-bearing age) who do not have immunity against rubella (see MMR vaccine, p. 842)

Single antigen vaccine
No longer available in the UK, the combined live measles, mumps and rubella vaccine is a suitable alternative

Combined vaccines
See MMR vaccine

Smallpox vaccine

Limited supplies of smallpox vaccine are held at the Specialist and Reference Microbiology Division, Public Health England Colindale (Tel. (020) 8200 4400) for the exclusive use of workers in laboratories where pox viruses (such as vaccinia) are handled.

If a wider use of the vaccine is being considered, Guidelines for smallpox response and management in the post-eradication era should be consulted at www.hpa.org.uk.

Tetanus vaccines

Tetanus vaccine contains a cell-free purified toxoid of Clostridium tetani adsorbed on aluminium hydroxide or aluminium phosphate to improve antigenicity.

Primary immunisation for children under 10 years consists of 3 doses of a combined preparation containing adsorbed tetanus vaccine (see Diphtheria-containing Vaccines), with an interval of 1 month between doses. Following routine childhood vaccination, 2 booster doses of a preparation containing adsorbed tetanus vaccine are recommended, the first before school entry and the second before leaving school (see Immunisation schedule, section 14.1).

The recommended schedule of tetanus vaccination not only gives protection against tetanus in childhood but also gives the basic immunity for subsequent booster doses. In most circumstances, a total of 5 doses of tetanus vaccine is considered sufficient for long term protection.

For primary immunisation of adults and children over 10 years previously unimmunised against tetanus, 3 doses of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactive) vaccine are given with an interval of 1 month between doses (see Diphtheria-containing Vaccines).

Cautions  See also section 14.1. When an individual presents for a booster dose but has been vaccinated following a tetanus-prone wound, the vaccine preparation administered at the time of injury should be determined. If this is not possible, the booster should still be given to ensure adequate protection against all antigens in the booster vaccine.

Very rarely, tetanus has developed after abdominal surgery; patients awaiting elective surgery should be asked about tetanus immunisation and immunised if necessary.

Parenteral drug abuse is also associated with tetanus; those abusing drugs by injection should be vaccinated if unimmunised—booster doses should be given if there is any doubt about their immunisation status.

All laboratory staff should be offered a primary course if unimmunised.

Travel recommendations see section 14.6.

Contra-indications  See section 14.1.

Pregnancy  See p. 829.

Breast-feeding  See p. 829.

Side effects  See section 14.1.

Wounds  Wounds are considered to be tetanus-prone if they are sustained more than 6 hours before surgical treatment or at any interval after injury and are puncture-type (particularly if contaminated with soil or manure) or show much devitalised tissue or are septic or are compound fractures or contain foreign bodies. All wounds should receive thorough cleansing.

- For clean wounds: fully immunised individuals (those who have received a total of 5 doses of a tetanus-containing vaccine at appropriate intervals) and those whose primary immunisation is complete (with boosters up to date), do not require tetanus vaccine; individuals whose primary immunisation is incomplete or whose boosters are not up to date require a reinforcing dose of a tetanus-containing vaccine (followed by further doses as required to complete the schedule); non-immunised individuals (or those whose immunisation status is not known or who have been fully immunised but are now immunocompromised) should be given a dose of the appropriate tetanus-containing vaccine immediately (followed by completion of the full course of the vaccine if records confirm the need).

- For tetanus-prone wounds: management is as for clean wounds with the addition of a dose of tetanus immunoglobulin (section 14.5.2) given at a different site; in fully immunised individuals and those whose primary immunisation is complete (with boosters up to date) the immunoglobulin is needed only if
the risk of infection is especially high (e.g. contamination with manure). Antibacterial prophylaxis (with benzylpenicillin, co-amoxiclav, or metronidazole) may also be required for tetanus-prone wounds.

**Combined vaccines**

See Diphtheria-containing Vaccines

---

**Tick-borne encephalitis vaccine**

Tick-borne encephalitis vaccine contains inactivated tick-borne encephalitis virus cultivated in chick embryo cells. It is recommended for immunisation of those working in, or visiting, high-risk areas (see International Travel, section 14.6). Those working, walking or camping in warm forested areas of Central and Eastern Europe, Scandinavia, Northern and Eastern China, and some parts of Japan, particularly from April to November when ticks are most prevalent, are at greatest risk of tick-borne encephalitis. For full protection, 3 doses of the vaccine are required; booster doses are required every 3–5 years for those still at risk. Ideally, immunisation should be completed at least one month before travel.

**TICK-BORNE ENCEPHALITIS VACCINE, INACTIVATED**

**Indications** immunisation against tick-borne encephalitis

**Cautions** see section 14.1

**Contra-indications** see section 14.1

**Pregnancy** see p. 829

**Breast-feeding** see p. 829

**Side-effects** see section 14.1

**Dose**

- Initial immunisation, by intramuscular injection in deltoid region or anterolateral thigh in infants, ADULT and CHILD over 16 years, 3 doses each of 0.5 mL, second dose after 1–3 months and third dose after further 5–12 months; CHILD 1–16 years 3 doses of 0.25 mL, second dose after 1–3 months and third dose after further 5–12 months; ELDERLY over 60 years and immunocompromised (including those receiving immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved

**Note** To achieve more rapid protection, second dose may be given 14 days after first dose

- Booster doses, give first dose within 3 years after initial course completed, then every 3–5 years

**TicoVac® (MASTA)**

Injection, suspension, formaldehyde-inactivated Neudorf tick-borne encephalitis virus strain (cultivated in chick embryo cells) adsorbed onto hydrated aluminium hydroxide, net price 0.25 mL prefilled syringe (TicoVac Junior®) = £28.00, 0.5 mL prefilled syringe = £32.00

**Excipients** include gentamicin and neomycin

---

**Typhoid vaccines**

Typhoid vaccine is available as Vi capsular polysaccharide (from Salmonella typhi) vaccine for injection and as live attenuated Salmonella typhi for oral use.

Typhoid immunisation is advised for:

- Travellers to areas where typhoid is endemic, especially if staying with or visiting local people;
- Travellers to endemic areas where frequent or prolonged exposure to poor sanitation and poor food hygiene is likely;
- Laboratory personnel who, in the course of their work, may be exposed to Salmonella typhi.

Typhoid vaccination is not a substitute for scrupulous personal hygiene (see p. 858).

Capsular polysaccharide typhoid vaccine is usually given by intramuscular injection. Children under 2 years may respond suboptimally to the vaccine, but children aged between 1–2 years should be immunised if the risk of typhoid fever is considered high (immunisation is not recommended for infants under 12 months). Revaccination is needed every 3 years on continued exposure.

**Oral typhoid vaccine** is a live attenuated vaccine contained in an enteric-coated capsule. One capsule taken on alternate days for a total of 3 doses, provides protection 7–10 days after the last dose. Protection may persist for up to 3 years in those constantly (or repeatedly) exposed to Salmonella typhi, but those who only occasionally travel to endemic areas require further courses at intervals of 1 year.

**Interactions** Oral typhoid vaccine is inactivated by concomitant administration of antibacterials or antimalarials:

- Antibacterials should be avoided for 3 days before and after oral typhoid vaccination;
- Mefloquine should be avoided for at least 12 hours before or after oral typhoid;
- For other antimalarials vaccination with oral typhoid vaccine should be completed at least 3 days before the first dose of the antimalarial (except proguanil hydrochloride with atovaquone, which may be given concomitantly).

**TYPHOID VACCINE**

**Indications** immunisation against typhoid fever

**Contra-indications** see section 14.1; also for oral vaccine, acute gastro-intestinal illness

**Pregnancy** see p. 829

**Breast-feeding** see p. 829

**Side-effects** see section 14.1

**Dose**

- See under preparations

**Typhoid polysaccharide vaccine for injection**

**Typherix® (GSK)**

Injection, Vi capsular polysaccharide typhoid vaccine, 50 micrograms/mL virulence polysaccharide antigen of Salmonella typhi, net price 0.5–0.5 mL prefilled syringe = £9.93

**Dose** by intramuscular injection, 0.5 mL at least 2 weeks before potential exposure to typhoid infection; CHILD under 2 years (see notes above)

**Note** May be difficult to obtain

**Typhim Vi® (Sanofi Pasteur)**

Injection, Vi capsular polysaccharide typhoid vaccine, 50 micrograms/mL virulence polysaccharide antigen of formaldehyde-inactivated Salmonella typhi, net price 0.5–0.5 mL prefilled syringe = £9.30

**Dose** by intramuscular injection, 0.5 mL, at least 2 weeks before potential exposure to typhoid infection; CHILD under 2 years (see notes above)
### Varicella–zoster vaccines

The live varicella–zoster vaccines, Varilrix® and Varivax®, are licensed for immunisation against varicella (chickenpox) in seronegative individuals. They are not recommended for routine use in children, but can be given to seronegative healthy children over 1 year who come into close contact with individuals at high risk of severe varicella infections. The Department of Health recommends these vaccines for seronegative healthcare workers who come into direct contact with patients. Those with a history of chickenpox or shingles can be considered immune, but healthcare workers with a negative or uncertain history should be tested.

Rarely, the varicella–zoster vaccine virus has been transmitted from the vaccinated individual to close contacts. Therefore, contact with the following should be avoided if a vaccine-related cutaneous rash develops within 4–6 weeks of the first or second dose:

- varicella-susceptible pregnant women;
- individuals at high risk of severe varicella, including those with immunodeficiency or those receiving immunosuppressive therapy.

Healthcare workers who develop a generalised papular or vesicular rash on vaccination should avoid contact with patients until the lesions have crusted. Those who develop a localised rash after vaccination should cover with patients until the lesions have crusted. Those who develop a generalised papular or vesicular rash on vaccination should avoid contact with susceptible individuals (see notes above) and be allowed to continue working unless in close contact with individuals at high risk of severe varicella, including those with a previous history of shingles; ideally the first dose has not been established. Although rare, vaccine-associated adverse effects have been reported, such as viscerotropic disease (yellow fever vaccine-associated viscerotropic disease, YEL-AVD), a syndrome which may include metabolic acidosis, muscle and liver cytolysis, and multi-organ failure.

#### Indications
- **Indications** see notes above and preparations below
- **Cautions** see section 14.1; also post-vaccination close-contact with susceptible individuals (see notes above)
- **Contra-indications** see section 14.1

#### Pregnancy
- **Pregnancy** avoid pregnancy for 3 months after vaccination; see also p. 829

#### Breast-feeding
- **Breast-feeding** see p. 829

#### Side-effects
- **Side-effects** see section 14.1; also conjunctivitis and varicella-like rash; rarely thrombocytopenia

#### Dose
- **Dose** See under preparations

#### Varilrix® (GSK) *(Pf)*

**Injections** for reconstitution, live attenuated varicella–zoster virus (Oka/Merck strain) propagated in human diploid cells, net price 0.5-mL vial (with diluent) = £27.31

**Excipients** include gelatin and neomycin

**Dose** prevention of varicella infection (chickenpox), by subcutaneous injection preferably into deltoid region, ADULT and CHILD over 1 year (see notes above), 2 doses of 0.5 mL separated by an interval of at least 6 weeks (minimum 4 weeks)

**Varivax®** *(Sanofi Pasteur)* *(Pf)*

**Injection** powder for reconstitution, live attenuated varicella–zoster virus (Oka/Merck strain) propagated in human diploid cells, net price 0.5-mL vial (with diluent) = £50.28

**Excipients** include gelatin and neomycin

**Dose** prevention of varicella infection (chickenpox), by intramuscular or subcutaneous injection into deltoid region (or higher anterolateral thigh in children), ADULT and CHILD over 13 years (see notes above), 2 doses of 0.5 mL separated by 4–8 weeks. CHILD 1–13 years (see notes above) 2 doses of 0.5 mL separated by an interval of at least 4 weeks (two doses separated by 12 weeks in children with asymptomatic HIV infection)

**Yellow fever vaccine**

Live yellow fever vaccine is indicated for those traveling or living in areas where infection is endemic (see p. 857) and for laboratory staff who handle the virus or who handle clinical material from suspected cases. Infants under 6 months of age should not be vaccinated because there is a small risk of encephalitis; infants aged 6–9 months should be vaccinated only if the risk of yellow fever is high and unavoidable (seek expert advice). The immunity which probably lasts for life is officially accepted for 10 years starting from 10 days after primary immunisation and for a further 10 years immediately after revaccination.

Very rare, vaccine-associated adverse effects have been reported, such as viscerotropic disease (yellow fever vaccine-associated viscerotropic disease, YEL-AVD), a syndrome which may include metabolic acidosis, muscle and liver cytolysis, and multi-organ failure. Neurological disorders (yellow fever vaccine-associated neurotropic disease, YEL-AND) such as encephalitis have also been reported. These very rare adverse effects usually have occurred after the first dose of yellow fever vaccine in those with no previous immunity.

**Pregnancy** Live yellow fever vaccine should not be given during pregnancy because there is a theoretical
risk of fetal infection. Pregnant women should be advised not to travel to areas at high risk of yellow fever. If exposure cannot be avoided during pregnancy, then the vaccine should be given if the risk from disease in the mother outweighs the risk to the fetus from vaccination.

Breast-feeding Avoid; seek specialist advice if exposure to virus cannot be avoided.

Yellow Fever Vaccine, Live

Indications immunisation against yellow fever

Cautions see section 14.1; also individuals over 60 years—greater risk of vaccine-associated adverse effects, see notes above

Contra-indications see section 14.1 and notes above; also children under 6 months; history of thymus dysfunction

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see section 14.1; also reported neurotropic disease and viscerotropic disease (see notes above)

Dose

* By deep subcutaneous injection, ADULT and CHILD over 9 months, 0.5 mL (see also notes above)

** By intramuscular injection, ADULT over 9 months, 0.5 mL (see also notes above)

** By intramuscular injection, CHILD under 6 months, 0.25 mL (see also notes above)

Yellow Fever Vaccine, Live

Ye(live)

Injection powder for reconstitution, live, attenuated 17D-204 strain of yellow fever virus, cultivated in chick embryos; single dose vial with syringe containing 0.5 mL, diluent

Available (only to designated Yellow Fever Vaccination centres) as Stamaril as Stamaril®

Normal immunoglobulin (containing 0%–18% protein) is administered by intravenous administration for the immediate protection lasting several weeks.

Availability Normal immunoglobulin for intramuscular administration is available from some regional Public Health laboratories for protection of contacts and the control of outbreaks of hepatitis A, measles, and rubella only. For other indications, subcutaneous or intravenous normal immunoglobulin should be purchased from the manufacturer.

Disease-specific immunoglobulins (section 14.5.2) are available from some regional Public Health laboratories, with the exception of tetanus immunoglobulin which is available from BPL, hospital pharmacies, or blood transfusion departments. Rabies immunoglobulin is available from the Specialist and Reference Microbiology Division, Public Health England, Colindale. Hepatitis B immunoglobulin required by transplant centres should be obtained commercially.

In Scotland all immunoglobulins are available from the Scottish National Blood Transfusion Service (SNBTS).

In Wales all immunoglobulins are available from the Welsh Blood Service (WBS).

In Northern Ireland all immunoglobulins are available from the Northern Ireland Blood Transfusion Service (NIBTS).

**Normal immunoglobulin**

Human normal immunoglobulin (‘HNIG’) is prepared from pools of at least 1000 donations of human plasma; it contains immunoglobulin G (IgG) and antibodies to hepatitis A, measles, mumps, rubella, varicella, and other viruses that are currently prevalent in the general population.

Normal immunoglobulin may interfere with the immune response to live virus vaccines which should therefore only be given at least 3 weeks before or 3 months after an injection of normal immunoglobulin (this does not apply to yellow fever vaccine since normal immunoglobulin does not contain antibody to this virus).

Uses Normal immunoglobulin (containing 10%–18% protein) is administered by intramuscular injection for the protection of susceptible contacts against hepatitis A virus (infectious hepatitis), measles and, to a lesser extent, rubella. Injection of immunoglobulin produces immediate protection lasting several weeks.

Normal immunoglobulin (containing 3%–12% protein) for intravenous administration is used as replacement therapy for patients with congenital agammaglobulinaemia and hypogammaglobulinaemia, and for the short-term treatment of idiopathic thrombocytopenic purpura and Kawasaki disease; it is also used for the prophylaxis of infection following bone-marrow transplantation and in children with symptomatic HIV infection who have recurrent bacterial infections. Normal immunoglobulin for replacement therapy may also be given intramuscularly or subcutaneously, but intravenous formulations are normally preferred. Intravenous immunoglobulin is also used in the treatment of Guillain-Barré syndrome as an alternative to plasma exchange.

For guidance on the use of intravenous normal immunoglobulins and alternative therapies for certain conditions, consult Clinical Guidelines for Immunoglobulin Use (www.gov.uk/dh).

####For intramuscular use

**Normal Immunoglobulin**

**Dose**

- See under preparations
- Note Antibody titres can vary widely between normal immunoglobulin preparations from different manufacturers—formulations are not interchangeable; patients should be maintained on the same formulation throughout long-term treatment to avoid adverse effects

**For subcutaneous use**

**Gammanorm**

- Normal immunoglobulin (protein 16.5%) injection, net price 1.85 g (10 mL) = £96.77, 3.3 g (20 mL) = £193.55
- Electrolytes NA + 1.09 mmol/10-mL vial
- Dose by subcutaneous infusion, antibody deficiency syndromes, consult product literature
- Note May be administered by intramuscular injection (if subcutaneous route not possible) but not for patients with thrombocytopenia or other bleeding disorders

**Hizentra**

- Normal immunoglobulin (protein 20%) injection, net price 1 g (5 mL) = £45.90, 2 g (10 mL) = £91.80, 4 g (20 mL) = £183.60
- Note Contains L-proline, contra-indicated in patients with hyperprolinaemia
- Dose by subcutaneous infusion, antibody deficiency syndromes, consult product literature

---

**Hepatitis A**  
Hepatitis A vaccine is preferred for individuals at risk of infection (see p. 836) including those visiting areas where the disease is highly endemic (all countries excluding Northern and Western Europe, North America, Japan, Australia, and New Zealand). In unimmunised individuals, transmission of hepatitis A is reduced by good hygiene. Intramuscular normal immunoglobulin is no longer recommended for routine prophylaxis in travellers, but it may be indicated for immunocompromised patients if their antibody response to the vaccine is unlikely to be adequate.

Intramuscular normal immunoglobulin is recommended for prevention of infection in close contacts (of confirmed cases of hepatitis A) who have chronic liver disease or HIV infection, or who are immunosuppressed or over 50 years of age; normal immunoglobulin should be given as soon as possible, preferably within 14 days of exposure to the primary case. However, normal immunoglobulin can still be given to contacts at risk of severe disease up to 28 days after exposure to the primary case. Hepatitis A vaccine can be given at the same time, but it should be given at a separate injection site.

**Measles**  
Intravenous or subcutaneous normal immunoglobulin may be given to prevent or attenuate an attack of measles in individuals who do not have adequate immunity. Intramuscular normal immunoglobulin should be given as soon as possible, preferably within 14 days of exposure to the primary case. However, normal immunoglobulin can still be given to contacts at risk of severe disease up to 28 days after exposure to the primary case. Measles should receive intravenous or subcutaneous immunoglobulin if given within 6 days. Normal immunoglobulin is not recommended for prophylaxis following exposure to measles.

**Rubella**  
Intramuscular immunoglobulin after exposure to rubella does not prevent infection in non-immune contacts and is not recommended for protection of pregnant women exposed to rubella. It may, however, reduce the likelihood of a clinical attack which may possibly reduce the risk to the fetus. Risk of intrauterine transmission is greatest in the first 11 weeks of pregnancy, between 16 and 20 weeks there is minimal risk of deafness only, after 20 weeks there is no increased risk. Intramuscular normal immunoglobulin should be used only if termination of pregnancy would be unacceptable to the pregnant woman—it should be given as soon as possible after exposure. Serological follow-up of recipients is essential to determine if the woman has become infected despite receiving immunoglobulin.

For routine prophylaxis against Rubella, see MMR vaccine (p. 842).
**14.5.2 Disease-specific immunoglobulins**

Subcutiva® (Baxter) [PN]

Normal immunoglobulin (protein 16%) injection, net price 800 mg (5 mL) = £32.56, 1.6 g (10 mL) = £65.12

**Dose** by subcutaneous injection, ADULT and CHILD over 12 years antibody deficiency syndromes, consult product literature

**Note** May be administered by intramuscular injection (if subcutaneous route not possible) but not for patients with thrombocytopenia or other bleeding disorders

Subgam® (BPL) [PN]

Normal immunoglobulin (protein 14%-18%) injection, net price 250-mg vial = £11.20, 750-mg vial = £34.20, 1.5-g vial = £68.40

**Dose** by subcutaneous injection, antibody deficiency syndromes, consult product literature

By intramuscular injection, Hepatitis A prophylaxis in outbreaks (see notes above), ADULT and CHILD over 10 years, 750 mg, CHILD under 10 years, 500 mg

Rubella, in pregnancy, prevention of clinical attack (see also notes above), 750 mg

**Note** Subgam® is not licensed for prophylactic use, but due to difficulty in obtaining suitable immunoglobulin products, the Health Protection Agency recommends intramuscular use for prophylaxis against Hepatitis A or rubella

For intravenous use

**Note** Dose recommendation for Kawasaki disease, see BNF for Children, other indications—consult product literature for dosage regimens

Aragam® (Oxbridge) [PN]

**Intravenous infusion**, human normal immunoglobulin, protein 5%, net price 2.5 g (50 mL) = £145.00, 5 g (100 mL) = £290.00, 10 g (200 mL) = £580.00, 20 g (400 mL) = £1160.00

**Excipients** include glucose 50 mg/mL

Flebogamma® DIF (Grifols) [PN]

**Intravenous infusion**, human normal immunoglobulin, protein 5%, net price 0.5 g (10 mL) = £30.00, 2.5 g (50 mL) = £150.00, 5 g (100 mL) = £300.00, 10 g (200 mL) = £600.00, 20 g (400 mL) = £1200.00; protein 10%, 5 g (50 mL) = £300.00, 10 g (100 mL) = £600.00, 20 g (200 mL) = £1200.00

**Note** Both strengths contain sorbitol 50 mg/mL; contra-indicated in patients with hereditary fructose intolerance

Gammagard S/D® (Baxter) [PN]

**Intravenous infusion**, (providing protein 5% or 10%), net price 5 g (with diluent) = £200.50, 10 g (with diluent) = £401.00

Gammagard S/D® (BPL) [PN]

**Intravenous infusion**, human normal immunoglobulin, protein 5%, net price 2.5 g (50 mL) = £104.50, 5 g (100 mL) = £209.00, 10 g (200 mL) = £418.00

**Note** Contains sorbitol 50 mg/mL; contra-indicated in patients with hereditary fructose intolerance

Gammagard® (Grifols) [PN]

**Intravenous infusion**, human normal immunoglobulin, protein 10%, net price 5 g (50 mL) = £250.00, 10 g (100 mL) = £500.00, 20 g (200 mL) = £1000.00

**Note** Use Glucose 5% intravenous infusion if dilution prior to infusion is required

Intratect® (Biotest UK) [PN]

**Intravenous infusion**, human normal immunoglobulin, protein 5%, net price 1 g (20 mL) = £45.00, 2.5 g (50 mL) = £112.50, 5 g (100 mL) = £225.00, 10 g (200 mL) = £450.00; protein 10%, 1 g (10 mL) = £45.00, 5 g (50 mL) = £225.00, 10 g (100 mL) = £450.00, 20 g (200 mL) = £900.00

Kiovig® (Baxter) [PN]

**Intravenous infusion**, human normal immunoglobulin, protein 10%, net price 1 g (10 mL) = £49.00, 2.5 g (25 mL) = £122.50, 5 g (50 mL) = £245.00, 10 g (100 mL) = £490.00, 20 g (200 mL) = £980.00, 30 g (300 mL) = £1470.00

**Note** Use Glucose 5% intravenous infusion, if dilution prior to administration is required

Octagam® (Octapharma) [PN]

**Intravenous infusion**, human normal immunoglobulin, protein 5%, net price 2.5 g (50 mL) = £1.02, 5 g (100 mL) = £2.04, 10 g (200 mL) = £4.08; protein 10%, 2 g (20 mL) = £1.17, 5 g (50 mL) = £2.35, 10 g (100 mL) = £5.86, 20 g (200 mL) = £11.73

**Note** Contains maltose (may cause falsely elevated results with blood glucose testing systems)

Privigen® (CSL Behring) [PN]

**Intravenous infusion**, human normal immunoglobulin, protein 10%, net price 2.5 g (25 mL) = £1.14, 5 g (50 mL) = £229.50, 10 g (100 mL) = £459.00, 20 g (200 mL) = £918.00

**Note** Contains L-proline; contra-indicated in patients with hyperprolinaemia

Vigam® (BPL) [PN]

**Intravenous infusion**, human normal immunoglobulin, protein 5%, net price 2.5 g (50 mL) = £95.00, 5 g (100 mL) = £209.00, 10 g (200 mL) = £418.00

**Note** Contains sucrose (see Renal impairment, above)

**14.5.2 Disease-specific immunoglobulins**

Specific immunoglobulins are prepared by pooling the plasma of selected human donors with high levels of the specific antibody required. For further information, see Immunoglobulin Handbook (www.hpa.org.uk).

There are no specific immunoglobulins for hepatitis A, measles, or rubella—normal immunoglobulin, section 14.5.1 is used in certain circumstances. There is no specific immunoglobulin for mumps; neither normal immunoglobulin nor MMR vaccine is effective as post-exposure prophylaxis.

**Hepatitis B**

Disease-specific hepatitis B immunoglobulin (HBIG) is available for use in association with hepatitis B vaccine for the prevention of infection in laboratory and other personnel who have been accidentally inoculated with hepatitis B virus, and in infants born to mothers who have become infected with this virus in pregnancy or who are high-risk carriers (see Hepatitis B Vaccine, p. 838). Hepatitis B immunoglobulin will not inhibit the antibody response when given at the same time as hepatitis B vaccine but should be given at different sites.

An intravenous and subcutaneous preparation of hepatitis B-specific immunoglobulin is licensed for the prevention of hepatitis B recurrence in HBV-DNA negative patients who have undergone liver transplantation for liver failure caused by the virus.

**Hepatitis B IMMUNOglobulin**

**Indications** prophylaxis against hepatitis B infection

**Cautions** IgA deficiency; interference with live virus vaccines see under Normal Immunoglobulin, p. 852.
**Side-effects** injection site reactions; less frequently, buccal ulceration, glossitis, abdominal pain, chest pain, dyspnoea, anaphylaxis, tremor, dizziness, headache, arthralgia; for side-effects associated with intravenous immunoglobulin, see section 14.5.1

**Dose**
- See under preparations and see also notes above

### For intramuscular use

**Hepatitis B Immunoglobulin**

Injection, hepatitis B-specific immunoglobulin, 100 units/mL. Vials containing 200 units or 500 units, available from selected Health Protection Agency and NHS laboratories (except for Transplant Centres, see p. 852), also available from BPL.

**Dose** by intramuscular injection (as soon as possible after exposure, ideally within 12–48 hours, but no later than 7 days after exposure), ADULT and CHILD over 10 years 500 units, CHILD under 5 years 200 units, 5–9 years 300 units, NEONATE 200 units

Prevention of transmitted infection at birth, NEONATE 200 units as soon as possible after birth; for full details consult Immunisation Against Infectious Disease (www.dh.gov.uk)

### For intravenous use

**Hepatex® CP** (Biotest UK)

Intravenous infusion, hepatitis B-specific immunoglobulin 50 units/mL, net price 500 units (10 mL) = £300.00, 2000 units (40 mL) = £1100.00, 5000 units (100 mL) = £3000.00

**Dose** by intravenous infusion, after exposure to hepatitis B virus-contaminated material—consult product literature

Prevention of transmitted infection at birth—consult product literature

Prevention of hepatitis B in haemodialysed patients, prophylaxis against re-infection of transplanted liver—consult product literature

### For subcutaneous use

**Zutectra®** (Biotest UK)

Injection, hepatitis B-specific immunoglobulin, 500 units/mL, net price 5 × 1 mL prefilled syringes = £1500.00

**Dose** prevention of hepatitis B re-infection more than 6 months after liver transplantation in stable HBV-DNA negative patients starting 2–3 weeks after last dose of intravenous hepatitis B immunoglobulin, by subcutaneous injection, ADULT body-weight under 75 kg 500 units once weekly, increased if necessary up to 1000 units once weekly; body-weight over 75 kg 1000 units once weekly

**Note** May be difficult to obtain

### Rabies

Following exposure of an unimmunised individual to an animal in or from a country where the risk of rabies is high the site of the bite should be washed with soapy water and specific rabies immunoglobulin of human origin administered. All of the dose should be injected around the site of the wound; if this is difficult or the wound has completely healed it can be given in the anterolateral thigh (remote from the site used for vaccination).

Rabies vaccine should also be given intramuscularly at a different site (for details see Rabies vaccine p. 847). If there is delay in giving the rabies immunoglobulin, it should be given within 7 days of starting the course of rabies vaccine.

### Varicella—zoster

Varicella–zoster immunoglobulin (VZIG) is recommended for individuals who are at increased risk of severe varicella and who have no antibodies to vari...
cella–zoster virus and who have significant exposure to chickenpox or herpes zoster. Those at increased risk include:

- neonates whose mothers develop chickenpox in the period 7 days before to 7 days after delivery;
- susceptible neonates exposed in the first 7 days of life;
- susceptible neonates or infants exposed whilst requiring intensive or prolonged special care nursing;
- susceptible women exposed at any stage of pregnancy (but when supplies of VZIG are short, may only be issued to those exposed in the first 20 weeks’ gestation or to those near term) providing VZIG is given within 10 days of contact;
- immunocompromised individuals including those who have received corticosteroids in the previous 3 months at the following dose equivalents of prednisolone: "CHILD" 2 mg/kg daily for at least 1 week or 1 mg/kg daily for 1 month; "ADULT" about 40 mg daily for more than 1 week.

Important: for full details consult Immunisation against Infectious Disease. Varicella–zoster immunoglobulin is available—see section 14.4. For treatment of varicella–zoster infections, see section 5.3.2.1

**VARICELLA–ZOSTER IMMUNOGLOBULIN**

**Indications** prophylaxis against varicella infection

**Cautions** IgA deficiency; interference with live virus vaccines—see p. 852

**Side-effects** injection site swelling and pain; rarely anaphylaxis

**Dose**

- By intramuscular injection, prophylaxis (as soon as possible—not later than 10 days after exposure), "ADULT" and "CHILD" over 14 years, 1 g; "NEONATE", "INFANT" and "CHILD" up to 5 years 250 mg, 5–10 years 500 mg, 10–14 years 750 mg; give second dose if further exposure occurs more than 3 weeks after first dose

**Note** No evidence that effective in treatment of severe disease. Normal immunoglobulin for intravenous use (section 14.5.1) may be used in those unable to receive intramuscular injections

**Varicella–Zoster Immunoglobulin (VARIZIG)** (Antivacellula–zoster Immunoglobulin) Available from selected Health Protection Agency and NHS laboratories; (see section 14.5 under Availability); also from BPL

**14.5.3 Anti-D (Rh0) immunoglobulin**

Anti-D (Rh0) immunoglobulin is prepared from plasma taken from rhesus-negative donors who have been immunised against the anti-D-antigen. Anti-D (Rh0) immunoglobulin is used to prevent a rhesus-negative mother from forming antibodies to fetal rhesus-positive cells which may pass into the maternal circulation. The objective is to protect any subsequent child from the hazard of haemolytic disease of the newborn.

Anti-D immunoglobulin should be administered to the mother following any sensitising episode (e.g. abortion, miscarriage and birth); it should be injected within 72 hours of the episode but even if a longer period has elapsed it may still give protection and should be administered. Anti-D (Rh0) immunoglobulin is also given when significant feto-maternal haemorrhage occurs in rhesus-negative women during delivery. The dose of anti-D immunoglobulin is determined according to the level of exposure to rhesus-positive blood.

For routine antenatal prophylaxis NICE recommends that two doses of either 500 units or 1000–1650 units of anti-D immunoglobulin should be given, the first at 28 weeks’ gestation and the second at 34 weeks; alternatively a single dose of 1500 units given between 28 and 30 weeks gestation can be used (see also NICE guidance below).

Use of routine antenatal anti-D prophylaxis should be given irrespective of previous anti-D prophylaxis for a sensitising event early in the same pregnancy. Similarly, postpartum anti-D prophylaxis should be given irrespective of previous routine antenatal anti-D prophylaxis or antenatal anti-D prophylaxis for a sensitising event in the same pregnancy.

**NICE guidance**

Routine antenatal anti-D prophylaxis for rhesus-negative women (August 2008)

Routine antenatal anti-D prophylaxis should be offered to all non-sensitised pregnant women who are rhesus negative.

www.nice.org.uk/TA156

**MMR vaccine**

MMR vaccine may be given in the postpartum period with anti-D (Rh0) immunoglobulin injection provided that separate syringes are used and the products are administered into different limbs. If blood is transfused, the antibody response to the vaccine may be inhibited—measure rubella antibodies after 6–8 weeks and revaccinate if necessary.

Anti-D (Rh0) immunoglobulin is also given to women of child-bearing potential after the inadvertent transfusion of rhesus-incompatible blood components and is used for the treatment of idiopathic thrombocytopenia purpura.

**ANTI-D (Rh0) IMMUNOGLOBULIN**

**Indications** see notes above

**Cautions** immunoglobulin A deficiency; possible interference with live virus vaccines, see under p. 852, but see notes above about administration with MMR vaccine

**Contra-indications** treatment of idiopathic thrombocytopenia purpura in rhesus negative or splenectomised patients

**Side-effects** nausea, vomiting, diarrhoea, abdominal pain, hypotension, hypertension, headache, fever, malaise, asthenia, drowsiness, dizziness, back pain, arthralgia, myalgia, pruritus, rash, sweating, injection site pain; rarely tachycardia, anaphylaxis, dyspnoea, hypotension, and urticaria; (for side-effects associated with intravenous immunoglobulins, see section 14.5.1)

**Dose**

- See preparations below
1. There is inadequate evidence of protection by BCG vaccine in adults aged over 35 years; however, vaccination is recommended for healthcare workers irrespective of age because of the increased risk to them or their patients contact with the local population) in countries with an incidence of tuberculosis greater than 40 per 100 000; it should preferably be given 3 months or more before departure.

Yellow fever immunisation (see p. 851) is recommended for travel to the endemic zones of Africa and South America. Many countries require an International Certificate of Vaccination from individuals arriving from, or who have been travelling through, endemic areas; other countries require a certificate from all entering travellers (consult the Department of Health handbook, Health Information for Overseas Travel, www.dh.gov.uk).

Immunisation against meningococcal meningitis is recommended for a number of areas of the world (for details, see p. 844).

Protection against hepatitis A is recommended for travellers to high-risk areas outside Northern and Western Europe, North America, Japan, Australia and New Zealand. Hepatitis A vaccine (see p. 836) is preferred and it is likely to be effective even if given shortly before departure; normal immunoglobulin is no longer given routinely but may be indicated in the immunocompromised (see p. 853). Special care must also be taken with food hygiene (see below).

Hepatitis B vaccine (see p. 838) is recommended for those travelling to areas of high or intermediate prevalence who intend to seek employment as healthcare workers or who plan to remain there for lengthy periods and who may therefore be at increased risk of acquiring infection as the result of medical or dental procedures carried out in those countries. Short-term tourists or business travellers are not generally at increased risk of infection but may put themselves at risk by their sexual behaviour when abroad.

Prophylactic immunisation against rabies (see p. 847) is recommended for travellers to enzootic areas on long journeys or to areas out of reach of immediate medical attention.

Travellers who have not had a tetanus booster in the last 10 years and are visiting areas where medical attention may not be accessible should receive a booster dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine (see p. 834), even if they have received 5 doses of a tetanus-containing vaccine previously.

Typhoid vaccine (see p. 850) is indicated for travellers to countries where typhoid is endemic, but the vaccine is no substitute for personal precautions (see below).

There is no requirement for cholera vaccination as a condition for entry into any country, but oral cholera vaccine (see p. 833) should be considered for backpackers and those travelling to situations where the risk is greatest (e.g. refugee camps). Regardless of vaccination, travellers to areas where cholera is endemic should take special care with food hygiene (see below).

Advice on diphtheria, on Japanese encephalitis (see p. 842), and on tick-borne encephalitis (see p. 850) is included in Health Information for Overseas Travel, see below.

Note: For advice on malaria chemoprophylaxis, see section 5.4.1.

No special immunisation is required for travellers to the United States, Europe, Australia, or New Zealand, although all travellers should have immunity to tetanus and poliomyelitis (and childhood immunisations should be up to date); see also Tick-borne Encephalitis, p. 850. Certain special precautions are required in non-European areas surrounding the Mediterranean, in Africa, the Middle East, Asia, and South America.

Travellers to areas that have a high incidence of poliomyelitis or tuberculosis should be immunised with the appropriate vaccine; in the case of poliomyelitis previously immunised adults may be given a booster dose of a preparation containing inactivated poliomyelitis vaccine (see p. 847). BCG immunisation (see p. 832) is recommended for travellers aged under 16 years proposing to stay for longer than 3 months (or in close proximity to the local population) in countries with an incidence of tuberculosis greater than 40 per 100 000; it should preferably be given 3 months or more before departure.

**Yellow fever immunisation (see p. 851)** is recommended for travel to the endemic zones of Africa and South America. Many countries require an International Certificate of Vaccination from individuals arriving from, or who have been travelling through, endemic areas; other countries require a certificate from all entering travellers (consult the Department of Health handbook, Health Information for Overseas Travel, www.dh.gov.uk).

**Immunisation against meningococcal meningitis** is recommended for a number of areas of the world (for details, see p. 844).

**Protection against hepatitis A** is recommended for travellers to high-risk areas outside Northern and Western Europe, North America, Japan, Australia and New Zealand. Hepatitis A vaccine (see p. 836) is preferred and it is likely to be effective even if given shortly before departure; normal immunoglobulin is no longer given routinely but may be indicated in the immunocompromised (see p. 853). Special care must also be taken with food hygiene (see below).

**Hepatitis B vaccine** (see p. 838) is recommended for those travelling to areas of high or intermediate prevalence who intend to seek employment as healthcare workers or who plan to remain there for lengthy periods and who may therefore be at increased risk of acquiring infection as the result of medical or dental procedures carried out in those countries. Short-term tourists or business travellers are not generally at increased risk of infection but may put themselves at risk by their sexual behaviour when abroad.

Prophylactic immunisation against rabies (see p. 847) is recommended for travellers to enzootic areas on long journeys or to areas out of reach of immediate medical attention.

Travellers who have not had a tetanus booster in the last 10 years and are visiting areas where medical attention may not be accessible should receive a booster dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine (see p. 834), even if they have received 5 doses of a tetanus-containing vaccine previously.

**Typhoid vaccine** (see p. 850) is indicated for travellers to countries where typhoid is endemic, but the vaccine is no substitute for personal precautions (see below).

There is no requirement for cholera vaccination as a condition for entry into any country, but **oral cholera vaccine** (see p. 833) should be considered for backpackers and those travelling to situations where the risk is greatest (e.g. refugee camps). Regardless of vaccination, travellers to areas where cholera is endemic should take special care with food hygiene (see below).

**Advice on diphtheria**, on **Japanese encephalitis** (see p. 842), and on **tick-borne encephalitis** (see p. 850) is included in Health Information for Overseas Travel, see below.

---

**Anti-D (Rh(D)) Immunoglobulin**

Injection, anti-D (Rh(D)) immunoglobulin, net price 250-unit vial = £23.75, 500-unit vial = £33.75, 1500-unit vial = £58.00, 2500-unit vial = £94.40

**Dose** by deep intramuscular injection, to rhesus-negative woman for prevention of Rh(D) sensitisation.

Following birth of rhesus-positive infant, 1000 units immediately or within 72 hours; for large transplacental bleed, extra 100 units per mL fetal red cells (preferably by intravenous injection)

Following any potentially sensitising episode (e.g. abortion, amnioncensis) up to 12 weeks' gestation 250 units per episode (after 20 weeks, 500 units) immediately or within 72 hours

**Note** Subcutaneous route used for patients with bleeding disorders

Available from Blood Centres and from BPL (D-Gam®)

**Rhoophylac® (CSL Behring)**

Injection, anti-D (Rh(D)) immunoglobulin 750 units/mL (150 micrograms/mL), net price 2 mL (1500-unit) prefilled syringe = £39.52.

Dose by intramuscular or intravenous injection, to rhesus-negative woman for prevention of Rh(D) sensitisation.

Following birth of rhesus-positive infant, 1000–1500 units immediately or within 72 hours; for large transplacental bleed, extra 100 units per mL fetal red cells (preferably by intravenous injection)

Following any potentially sensitising episode (e.g. abortion, amnioncensis, chorionic villous sampling) up to 12 weeks' gestation 1000 units per episode (after 12 weeks, higher doses may be required) immediately or within 72 hours

Antenatal prophylaxis, 1500 units given between weeks 28–30 of pregnancy, if infant rhesus-positive, a further dose is still needed immediately or within 72 hours of delivery

Following Rh(D) incompatible blood transfusion, by intravenous injection, 50 units per mL transfused rhesus-positive blood (or 100 units per mL of erythrocyte concentrate)

**Note** Intravenous route recommended for patients with bleeding disorders.
Food hygiene  In areas where sanitation is poor, good food hygiene is important to help prevent hepatitis A, typhoid, cholera, and other diarrhoeal diseases (including travellers’ diarrhoea). Food should be freshly prepared and hot, and uncooked vegetables (including green salads) should be avoided; only fruits which can be peeled should be eaten. Only suitable bottled water, or tap water that has been boiled or treated with sterilising tablets, should be used for drinking.

Information on health advice for travellers

Health professionals and travellers can find the latest information on immunisation requirements and precautions for avoiding disease while travelling from: www.nathnac.org

The handbook, Health Information for Overseas Travel (2010), which draws together essential information for healthcare professionals regarding health advice for travellers, can also be obtained from this website.

Immunisation requirements change from time to time, and information on the current requirements for any particular country may be obtained from the embassy or legation of the appropriate country or from:

15 Anaesthesia

15.1 General anaesthesia

15.1.1 Intravenous anaesthetics
15.1.2 Inhalational anaesthetics
15.1.3 Antimuscarinic drugs
15.1.4 Sedative and analgesic peri-operative drugs

15.1.4.1 Benzodiazepines
15.1.4.2 Non-opioid analgesics
15.1.4.3 Opioid analgesics
15.1.4.4 Other drugs for sedation

15.1.5 Neuromuscular blocking drugs
15.1.6 Drugs for reversal of neuromuscular blockade

15.1.7 Antagonists for central and respiratory depression

15.1.8 Drugs for malignant hyperthermia

15.2 Local anaesthesia

Important

The drugs in section 15.1 should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

Several different types of drug are given together during general anaesthesia. Anaesthesia is induced with either a volatile drug given by inhalation (section 15.1.2) or with an intravenously administered drug (section 15.1.1); anaesthesia is maintained with an intravenous or inhalational anaesthetic. Analgesics (section 15.1.4), usually short-acting opioids, are also used. The use of neuromuscular blocking drugs (section 15.1.5) necessitates intermittent positive-pressure ventilation. Following surgery, anticholinesterases (section 15.1.6) can be given to reverse the effects of neuromuscular blocking drugs; specific antagonists (section 15.1.7) can be used to reverse central and respiratory depression caused by some drugs used in surgery. A local topical anaesthetic (section 15.2) can be used to reduce pain at the injection site.

Individual requirements vary considerably and the recommended doses are only a guide. Smaller doses are indicated in ill, shocked, or debilitated patients and in significant hepatic impairment, while robust individuals may require larger doses. The required dose of induction agent may be less if the patient has been premedicated with a sedative agent or if an opioid analgesic has been used.

Surgery and long-term medication The risk of losing disease control on stopping long-term medication before surgery is often greater than the risk posed by continuing it during surgery. It is vital that the anaesthetist knows about all drugs that a patient is (or has been) taking.

Patients with adrenal atrophy resulting from long-term corticosteroid use (section 6.3.2) may suffer a precipitous fall in blood pressure unless corticosteroid cover is provided during anaesthesia and in the immediate post-operative period. Anaesthetists must therefore know whether a patient is, or has been, receiving corticosteroids (including high-dose inhaled corticosteroids).
Other drugs that should normally not be stopped before surgery include antiplatelet drugs, antiparkinsonian drugs, antipsychotics, anxiolytics, bronchodilators, cardiovascular drugs (but see potassium-sparing diuretics, angiotensin-converting enzyme inhibitors, and angiotensin-II receptor antagonists below), glaucoma drugs, immunosuppressants, drugs of dependence, and thyroid or antithyroid drugs. Expert advice is required for patients receiving antivirals for HIV infection. For general advice on surgery in diabetic patients see section 6.1.1, p. 457.

Patients taking antplatelet medication or an oral anticoagulant present an increased risk for surgery. In these circumstances, the anaesthetist and surgeon should assess the relative risks and decide jointly whether the antplatelet or the anticoagulant drug should be stopped or replaced with unfractionated or low molecular weight heparin therapy.

Drugs that should be stopped before surgery include combined oral contraceptives (see Surgery, section 7.3.1 for details); for advice on hormone replacement therapy, see section 6.4.1.1. If antidepressants need to be stopped, they should be withdrawn gradually to avoid withdrawal symptoms. MAOIs can have important interactions with some drugs used during surgery, such as pethidine (for interactions of MAOIs, see Appendix 1). Tricyclic antidepressants need not be stopped, but there may be an increased risk of arrhythmias and hypotension (and dangerous interactions with vasopressor drugs); therefore, the anaesthetist should be informed if they are not stopped. Lithium should be stopped 24 hours before major surgery but the normal dose can be continued for minor surgery (with careful monitoring of fluids and electrolytes). Potassium-sparing diuretics may need to be withheld on the morning of surgery because hyperkalaemia may develop if renal perfusion is impaired or if there is tissue damage. Angiotensin-converting enzyme (ACE) inhibitors and angiotensin-II receptor antagonists can be associated with severe hypotension after induction of anaesthesia; these drugs may need to be discontinued 24 hours before surgery. Herbal medicines may be associated with adverse effects when given with anaesthetic drugs and consideration should be given to stopping them before surgery.

Anaesthesia and driving Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving afterwards. For intravenous benzodiazepines and for a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

Prophylaxis of acid aspiration Regurgitation and aspiration of gastric contents (Mendelson’s syndrome) can be an important complication of general anaesthesia, particularly in obstetrics and during emergency surgery, and requires prophylaxis against acid aspiration. Prophylaxis is also needed in those with gastrooesophageal reflux disease and in circumstances where gastric emptying may be delayed.

A H₂-receptor antagonist (section 1.3.1) can be used before surgery to increase the pH and reduce the volume of gastric fluid. It does not affect the pH of fluid already in the stomach and this limits its value in emergency procedures; an oral H₂-receptor antagonist can be given 1–2 hours before the procedure. Antacids are frequently used to neutralise the acidity of the fluid already in the stomach; ‘clear’ (non-particulate) antacids such as sodium citrate are preferred. Sodium citrate 300 mmol/litre (88.2 mg/mL) oral solution is licensed for use before general anaesthesia for caesarean section (available from Viridian).

### Anaesthesia, sedation, and resuscitation in dental practice

For details see *A Conscious Decision: A review of the use of general anaesthesia and conscious sedation in primary dental care*, report by a group chaired by the Chief Medical Officer and Chief Dental Officer, July 2000 and associated documents. Further details can also be found in *Conscious Sedation in the Provision of Dental Care*, report of an Expert Group on Sedation for Dentistry (commissioned by the Department of Health, 2003).

Guidance is also included in *Conscious Sedation in Dentistry: Dental Clinical Guidance*, Scottish Dental Clinical Effectiveness Programme, June 2012 (www.sdcep.org.uk).

#### 15.1.1 Intravenous anaesthetics

**Important**

The drugs in this section should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

Intravenous anaesthetics may be used either to induce anaesthesia or for maintenance of anaesthesia throughout surgery. Intravenous anaesthetics nearly all produce their effect in one arm-brain circulation time and can cause apnoea and hypotension, and so adequate resuscitative facilities must be available. They are contra-indicated if the anaesthetist is not confident of being able to maintain the airway (e.g. in the presence of a tumour in the pharynx or larynx). Extreme care is required in surgery of the mouth, pharynx, or larynx and in patients with acute circulatory failure (shock) or fixed cardiac output.

To facilitate tracheal intubation, induction is usually followed by a neuromuscular blocking drug (section 15.1.5) or a short-acting opioid (section 15.1.4.3).

The doses of all intravenous anaesthetic drugs should be titrated to effect (except when using ‘rapid sequence induction’). The doses and rates of administration should be reduced in the elderly, and particularly in those with hypovolaemia or cardiovascular disease; lower doses may also be required in premedicated patients.

**Total intravenous anaesthesia** This is a technique in which major surgery is carried out with all drugs given intravenously. Respiration can be spontaneous, or controlled with oxygen-enriched air. Neuromuscular blocking drugs can be used to provide relaxation and prevent reflex muscle movements. The main problem to be overcome is the assessment of depth of anaesthesia. Target Controlled Infusion (TCI) systems can be used to titrate intravenous anaesthetic infusions to predicted plasma-drug concentrations in ventilated adult patients.

**Anaesthesia and driving** See section 15.1.
Drugs used for intravenous anaesthesia

**Propofol**, the most widely used intravenous anaesthetic, can be used for induction or maintenance of anaesthesia in adults and children, but it is not commonly used in neonates. Propofol is associated with rapid recovery and less hangover effect than other intravenous anaesthetics. It causes a rapid onset of anaesthesia, which can be reduced by intravenous lidocaine. Significant extra-neous muscle movements can occur. Rarely, convulsions, anaphylaxis, and delayed recovery from anaesthesia can occur after propofol administration; the onset of convulsions can be delayed. Propofol is associated with bradycardia, occasionally profound; intravenous administration of an antimuscarinic drug is used to treat this.

Propofol can be used for sedation during diagnostic procedures. In adults, it can be used for sedation in intensive care, but it is contra-indicated in children under 16 years receiving intensive care because of the risk of propofol infusion syndrome (potentially fatal effects, including metabolic acidosis, arrhythmias, cardiac failure, rhabdomyolysis, hyperlipidaemia, hyperkalaemia, hepatomegaly, and renal failure).

**Thiopental sodium** is a barbiturate that is used for induction of anaesthesia, but has no analgesic properties. Induction is generally smooth and rapid, but dose-related cardiovascular and respiratory depression can occur. Awakening from a moderate dose of thiopental is rapid because the drug redistributes into other tissues, particularly fat. However, metabolism is slow and sedative effects can persist for 24 hours. Repeated doses have a cumulative effect and recovery is much slower.

**Etomidate** is an intravenous agent associated with rapid recovery without a hangover effect. Etomidate causes less hypotension than thiopental and propofol during induction. It produces a high incidence of extra-neous muscle movements, which can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction. Pain on injection can be reduced by injecting into a larger vein or by giving an opioid analgesic just before induction. Etomidate suppresses adrenocortical function, particularly during continuous administration, and it should not be used for maintenance of anaesthesia. It should be used with caution in patients with underlying adrenal insufficiency, for example, those with sepsis.

**Ketamine** is used rarely. Ketamine causes less hypoten-sion than thiopental and propofol during induction. It is used mainly for paediatric anaesthesia, particularly when repeated administration is required (such as for serial burns dressings); recovery is relatively slow and there is a high incidence of extraneous muscle movements. The main disadvantage of ketamine is the high incidence of hallucinations, nightmares, and other tranquil psychotic effects; these can be reduced by a benzodiazepine such as diazepam or midazolam.

**ETomidate**

**Indications** induction of anaesthesia

**Cautions** see under Intravenous Anaesthetics and notes above; avoid in acute porphyria (section 9.8.2); interactions: Appendix 1 (anaesthetics, general)

**Contra-indications** see under Intravenous Anaesthetics and notes above

### KETAMINE

**Indications** induction and maintenance of anaesthesia (but rarely used)

**Cautions** see under Intravenous Anaesthetics and notes above; dehydration; hypotension; respiratory tract infection; increased cerebrospinal fluid pressure; predisposition to seizures, hallucinations, or nightmares; psychotic disorders; head injury or intracranial mass lesions; thyroid dysfunction; raised intra-ocular pressure; interactions: Appendix 1 (anaesthetics, general)

**Contra-indications** see under Intravenous Anaesthetics; hypertension, pre-eclampsia or eclampsia, severe cardiac disease, stroke; raised intracranial pressure; head trauma; acute porphyria (section 9.8.2)

**Hepatic impairment** consider dose reduction

**Pregnancy** may depress neonatal respiration if used during delivery

**Breast-feeding** avoid for at least 12 hours after last dose

**Side-effects** see notes above; also nausea, vomiting, hypotension, apnoea, hyperventilation, stridor, rash; less commonly hyperalimentation, arrhythmias, hypertension, hiccup, cough, phlebitis; AV block, cardiac arrest, respiratory depression, seizures, shivering, and Stevens-Johnson syndrome also reported

**Dose**

- ADULT, by slow intravenous injection over 30–60 seconds, 150–300 micrograms/kg (max. total dose 60 mg); ELDERLY 150–200 micrograms/kg (max. total dose 60 mg); CHILD see BNF for Children

*Note. Administer over 60 seconds in patients in whom hypotension might be hazardous*

**Etomidate-Lipuro® (B. Braun) [Prf]**

**Injection** (emulsion), etomidate 2 mg/mL, net price 10-mL amp = £1.56

**Hypnomidate® (Lanssen) [Prf]**

**Injection**, etomidate 2 mg/mL, net price 10-mL amp = £1.38

**Excipients** include propylene glycol (see Excipients, p. 2)

### Hepatic impairment

reduce dose in liver cirrhosis

**Pregnancy** may depress neonatal respiration if used during delivery

**Breast-feeding** breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

**Side-effects** see notes above; also nausea, vomiting, hypotension, apnoea, hyperventilation, stridor, rash; less commonly hyperalimentation, arrhythmias, hypertension, hiccup, cough, phlebitis; AV block, cardiac arrest, respiratory depression, seizures, shivering, and Stevens-Johnson syndrome also reported

**Dose**

- BY INTRAMUSCULAR INJECTION, short procedures, ADULT, initially 6.5–13 mg/kg, adjusted according to response (10 mg/kg usually produces 12–25 minutes of surgical anaesthesia); CHILD under 18 years see BNF for Children

Diagnostic manoeuvres and procedures not involving intense pain, initially 4 mg/kg

- BY INTRAVENOUS INJECTION over at least 60 seconds, short procedures, ADULT, initially 1–4.5 mg/kg, adjusted according to response (2 mg/kg usually produces 5–10 minutes of surgical anaesthesia); CHILD under 18 years see BNF for Children
Induction of anaesthesia using 0.5% dose see notes above; also hypotension, side-effects may depress neonatal respiration if used.

Renal impairment: use with caution; see under Intravenous Anaesthetics and Cautions.

Indications: see Appendix 1 (anaesthetics, general).

Contra-indications: see under Intravenous Anaesthetics and notes above.

Hepatic impairment: use with caution.

Renal impairment: use with caution.

Pregnancy: may depress neonatal respiration if used during delivery. max. dose for maintenance of anaesthesia 6 mg/kg/hour.

Breast-feeding: breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

Side-effects: see notes above; also hypotension, tachycardia, transient apnoea, headache, less common thrombosis, phlebitis; rarely arrhythmia, euphoria; very rarely pancreatitis, pulmonary oedema, sexual disinhibition, and discoloration of urine; propofol infusion syndrome (potentially fatal effects, including metabolic acidosis, arrhythmias, cardiac failure, rhabdomyolysis, hyperlipidaemia, hyperkalaemia, hepatomegaly, and renal failure) reported with prolonged infusion of doses exceeding 4 mg/kg/hour.

Dose:

Induction of anaesthesia using 0.5% or 1% injection, by slow intravenous injection or infusion, ADULT under 55 years, 1.5–2.5 mg/kg at a rate of 20–40 mg every 10 seconds until response; ADULT over 55 years or debilitated, 1–1.5 mg/kg at a rate of 20 mg every 10 seconds until response; CHILD 1 month–18 years see BNF for Children.

Induction of anaesthesia using 2% injection, by intravenous injection, ADULT under 55 years, 1.5–2.5 mg/kg at a rate of 20–40 mg every 10 seconds until response; ADULT over 55 years or debilitated, 1–1.5 mg/kg at a rate of 20 mg every 10 seconds until response; CHILD 1 month–18 years see BNF for Children.

Induction of anaesthesia using 2% injection, by intravenous injection, ADULT under 55 years, 1.5–4.5 mg/kg/hour; dose and rate of administration adjusted according to desired level of sedation and response (additionally, if rapid increase in sedation required, by slow intravenous injection, 10–20 mg); patients over 55 years or debilitated may require lower dose and rate of administration; CHILD 17–18 years see BNF for Children.

Induction of anaesthesia using 2% injection, by intravenous infusion, ADULT, 1.5–4.5 mg/kg/hour; dose and rate of administration adjusted according to desired level of sedation and response (additionally, if rapid increase in sedation required, by slow intravenous infusion, 10–20 mg); patients over 55 years or debilitated may require lower dose and rate of administration; CHILD 1 month–18 years see BNF for Children.

Induction of anaesthesia using 2% injection, by intravenous infusion, ADULT, 1.5–4.5 mg/kg/hour; dose and rate of administration adjusted according to desired level of sedation and response (additionally, if rapid increase in sedation required, by slow intravenous infusion, 10–20 mg); patients over 55 years or debilitated may require lower dose and rate of administration; CHILD 1 month–18 years see BNF for Children.

Propofol (Non-proprietary) 0.5% injection (emulsion), propofol 5 mg/mL, net price 20-mL amp = £3.46.

Brands include Propofol-Lipuro® 1% injection (emulsion), propofol 10 mg/mL, net price 20-mL amp = £4.18, 50-mL bottle = £10.10, 100-mL bottle = £19.40.

Brands include Propofol-Lipuro®, Propoven® 2% injection (emulsion), propofol 20 mg/mL, net price 50-mL vial = £21.30.

Brands include Propofol-Lipuro®, Propoven® 2% injection (emulsion), propofol 20 mg/mL, net price 50-mL vial = £21.30.

Diprivan® (AstraZeneca) 1% injection (emulsion), propofol 10 mg/mL, net price 20-mL amp = £3.07, 50-mL prefilled syringe (for use with Diprivan® TCI system) = £10.68.

2% injection (emulsion), propofol 20 mg/mL, net price 50-mL vial = £21.30.

Brands include Propofol-Lipuro®, Propoven®

Diprivan® (AstraZeneca) 1% injection (emulsion), propofol 10 mg/mL, net price 20-mL amp = £3.07, 50-mL prefilled syringe (for use with Diprivan® TCI system) = £10.68.

2% injection (emulsion), propofol 20 mg/mL, net price 50-mL prefilled syringe (for use with Diprivan® TCI system) = £15.16.

Thiopental sodium (Thiopentone sodium) 50 mg/mL, net price 50-mL vial = £15.16.

Indications: induction of general anaesthesia; anaesthesia of short duration; reduction of raised intracranial pressure if ventilation controlled; status epilepticus (see also section 4.8.2).

Cautions: see under Intravenous Anaesthetics and notes above; cardiovascular disease; reconstituted solution is highly alkaline—extravasation causes tissue necrosis and severe pain; avoid intra-arterial injection.

Interactions: Appendix 1 (anaesthetics, general).
Inhalational anaesthetics include gases and volatile liquids. Gaseous anaesthetics require suitable equipment for storage and administration. Volatile liquid anaesthetics are administered using calibrated vaporisers, using air, oxygen, or nitrous oxide-oxygen mixtures as the carrier gas. To prevent hypoxia, the inspired gas mixture should contain a minimum of 25% oxygen at all times. Higher concentrations of oxygen (greater than 30%) are usually required during inhalational anaesthesia when nitrous oxide is being administered, see Nitrous Oxide, p. 864.

**Anaesthesia and driving** See section 15.1.

**Volatile liquid anaesthetics**

Volatile liquid anaesthetics can be used for induction and maintenance of anaesthesia, and following induction with an intravenous anesthetic (section 15.1.1). Volatile liquid anaesthetics can trigger malignant hyperthermia (section 15.1.8) and are contra-indicated in those susceptible to malignant hyperthermia. They can increase cerebrospinal pressure and should be used with caution in those with raised intracranial pressure. They can also cause hepatotoxicity in those sensitised to halogenated anaesthetics. In children with neuromuscular disease, inhalational anaesthetics are very rarely associated with hyperkalaemia, resulting in cardiac arrhythmias and death. Cardiorespiratory depression, hypotension, and arrhythmias are common side-effects of volatile liquid anaesthetics; convulsions have also been reported. They may also cause mood changes that can last for several days.

**Isoflurane** is a volatile liquid anaesthetic. Heart rhythm is generally stable during isoflurane anaesthesia, but heart-rate can rise, particularly in younger patients. Systemic arterial pressure and cardiac output can fall, owing to a decrease in systemic vascular resistance. Muscle relaxation occurs and the effects of muscle relaxant drugs are potentiated. Isoflurane can irritate mucous membranes, causing cough, breath-holding, and laryngospasm. Isoflurane is the preferred inhalational anesthetic for use in obstetrics.

**Desflurane** is a rapid acting volatile liquid anaesthetic; it is reported to have about one-fifth the potency of isoflurane. Emergence and recovery from anaesthesia are particularly rapid because of its low solubility. Desflurane is not recommended for induction of anaesthesia as it is irritant to the upper respiratory tract; cough, breath-holding, apnoea, laryngospasm, and increased secretions can occur.

**Sevoflurane** is a rapid acting volatile liquid anaesthetic and is more potent than desflurane. Emergence and recovery are particularly rapid, but slower than desflurane. Sevoflurane is non-irritant and is therefore often used for inhalational induction of anaesthesia; it has little effect on heart rhythm compared with other volatile liquid anaesthetics. Sevoflurane can interact with carbon dioxide absorbents to form compound A, a potentially nephrotoxic vinyl ether. However, in spite of extensive use, no cases of sevoflurane-induced permanent renal injury have been reported and the carbon dioxide absorbents used in the UK produce very low concentrations of compound A, even in low-flow anaesthetic systems.

**DESFLURANE**

**Indications** see notes above

**Cautions** see notes above; **interactions**: Appendix 1 (anaesthetics, general)

**Contra-indications** see notes above

**Pregnancy** may depress neonatal respiration if used during delivery

**Breast-feeding** breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

**Side-effects** see notes above

**Dose**

- Induction of anaesthesia (but not recommended—see notes above), by inhalation through specifically calibrated vaporiser, **ADULT** 4–11%
- Maintenance of anaesthesia, by inhalation through specifically calibrated vaporiser, **ADULT** 2–6% in nitrous oxide—oxygen; 2.5–8.5% in oxygen or oxygen-enriched air; **CHILD** 1 month–18 years see **BNF for Children**

**ISOFLURANE**

**Indications** see notes above

**Cautions** see notes above; **interactions**: Appendix 1 (anaesthetics, general)
Contra-indications see notes above
Pregnancy may depress neonatal respiration if used during delivery
Breast-feeding breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia
Side-effects see notes above
Dose
- Induction of anaesthesia, by inhalation using specifically calibrated vaporiser, in oxygen or nitrous oxide–oxygen, increased gradually according to response from 0.5% to 3%
- Maintenance of anaesthesia, by inhalation using specifically calibrated vaporiser, 1–2.5% in nitrous oxide–oxygen; an additional 0.5–1% may be required when given with oxygen alone; caesarean section, 0.5–0.75% in nitrous oxide–oxygen

SEVOFLURANE
Indications see notes above
Cautions see notes above; susceptibility to QT-interval prolongation; interactions: Appendix 1 (anaesthetics, general)
Contra-indications see notes above
Renal impairment use with caution
Pregnancy may depress neonatal respiration if used during delivery
Breast-feeding breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia
Side-effects see notes above; also urinary retention, leucopenia, agitation in children; cardiac arrest, torsade de pointes, and dystonia also reported
Dose
- Induction of anaesthesia, by inhalation using a specifically calibrated vaporiser, in oxygen or nitrous oxide–oxygen, adjusted according to response, ADULT and CHILD over 1 month initially 0.5–1% then increased gradually up to 6%
- Maintenance of anaesthesia, by inhalation using a specifically calibrated vaporiser, in oxygen or nitrous oxide–oxygen, adjusted according to response, ADULT and CHILD over 1 month 0.5–3%

Nitrous oxide is used for maintenance of anaesthesia and, in sub-anaesthetic concentrations, for analgesia. For anaesthesia, nitrous oxide is commonly used in a concentration of 50 to 66% in oxygen as part of a balanced technique in association with other inhalational or intravenous agents. Nitrous oxide is unsatisfactory as a sole anaesthetic owing to lack of potency, but is useful as part of a combination of drugs since it allows a significant reduction in dosage.

For analgesia (without loss of consciousness), a mixture of nitrous oxide and oxygen containing 50% of each gas (Entonox®, Equinox®) is used. Self-administration using a demand valve is popular in obstetric practice, for changing painful dressings, as an aid to postoperative physiotherapy, and in emergency ambulances.

Nitrous oxide may have a deleterious effect if used in patients with an air-containing closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in conditions such as pneumothorax, which may enlarge to compromise respiration, or in the presence of intracranial air after head injury, entrapped air following recent underwater dive, or recent intra-ocular gas injection.

Hypoxia can occur immediately following the administration of nitrous oxide; additional oxygen should always be given for several minutes after stopping the flow of nitrous oxide.

Exposure of patients to nitrous oxide for prolonged periods, either by continuous or by intermittent administration, may result in megaloblastic anaemia owing to interference with the action of vitamin B12; neurological toxic effects can occur without preceding overt haematological changes. For the same reason, exposure of theatre staff to nitrous oxide should be minimised. Depression of white cell formation may also occur.

Assessment of plasma-vitamin B12 concentration should be considered in those at risk of deficiency, including the elderly, those who have a poor, vegetarian, or vegan diet, and those with a history of anaemia. Nitrous oxide should not be given continuously for longer than 24 hours or more frequently than every 4 days without close supervision and haematological monitoring.

NITROUS OXIDE
Indications see notes above
Cautions see notes above; interactions: Appendix 1 (anaesthetics, general)
Pregnancy may depress neonatal respiration if used during delivery
Breast-feeding breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia
Side-effects see notes above
Dose
- Maintenance of anaesthesia in conjunction with other anaesthetic agents, by inhalation using suitable anaesthetic apparatus, 50–66% in oxygen
- Analgesia, by inhalation using suitable apparatus, up to 50% in oxygen, according to the patient’s needs

Nitrous oxide
Nitrous oxide is used for maintenance of anaesthesia and, in sub-anaesthetic concentrations, for analgesia. For anaesthesia, nitrous oxide is commonly used in a concentration of 50 to 66% in oxygen as part of a balanced technique in association with other inhalational or intravenous agents. Nitrous oxide is unsatisfactory as a sole anaesthetic owing to lack of potency, but is useful as part of a combination of drugs since it allows a significant reduction in dosage.

For analgesia (without loss of consciousness), a mixture of nitrous oxide and oxygen containing 50% of each gas (Entonox®, Equinox®) is used. Self-administration using a demand valve is popular in obstetric practice, for changing painful dressings, as an aid to postoperative physiotherapy, and in emergency ambulances.

Nitrous oxide may have a deleterious effect if used in patients with an air-containing closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in conditions such as pneumothorax, which may enlarge to compromise respiration, or in the presence of intracranial air after head injury, entrapped air following recent underwater dive, or recent intra-ocular gas injection.

Hypoxia can occur immediately following the administration of nitrous oxide; additional oxygen should always be given for several minutes after stopping the flow of nitrous oxide.

Exposure of patients to nitrous oxide for prolonged periods, either by continuous or by intermittent administration, may result in megaloblastic anaemia owing to interference with the action of vitamin B12; neurological toxic effects can occur without preceding overt haematological changes. For the same reason, exposure of theatre staff to nitrous oxide should be minimised. Depression of white cell formation may also occur.

Assessment of plasma-vitamin B12 concentration should be considered in those at risk of deficiency, including the elderly, those who have a poor, vegetarian, or vegan diet, and those with a history of anaemia. Nitrous oxide should not be given continuously for longer than 24 hours or more frequently than every 4 days without close supervision and haematological monitoring.

Antimuscarinic drugs are used (less commonly nowadays) as premedicants to dry bronchial and salivary secretions which are increased by intubation, upper airway surgery, or some inhalational anaesthetics. They are also used before or with neostigmine (section 15.1.6) to prevent bradycardia, excessive salivation, and other muscarinic actions of neostigmine. They also prevent bradycardia and hypotension associated with drugs such as propofol and suxamethonium.

Atropine sulfate is now rarely used for premedication but still has an emergency role in the treatment of vagotonic side-effects. For its role in acute arrhythmias after myocardial infarction, see section 2.3.1.

Hyoscine hydrobromide reduces secretions and also provides a degree of amnesia, sedation, and anti-emesis. Unlike atropine it may produce bradycardia rather than
tachycardia. In some patients, especially the elderly, hyoscyamine may cause the central anticholinergic syndrome (excitement, ataxia, hallucinations, behavioural abnormalities, and drowsiness).

Glycopyrronium bromide reduces salivary secretions. When given intravenously it produces less tachycardia than atropine. It is widely used with neostigmine for reversal of non-depolarising neuromuscular blocking drugs (section 15.1.5).

Phenoxythiazines do not effectively reduce secretions when used alone.

ATROPINE SULFATE

Indications premedication; intra-operative bradycardia; with anticholinesterases for reversal of non-depolarising neuromuscular block; antidote to organophosphorous poisoning (see Emergency Treatment of Poisoning p. 42); symptomatic relief of gastrointestinal disorders characterised by smooth muscle spasm (section 1.2); bradycardia (section 2.3.1); cardiodiaphragmatic resuscitation (section 2.7.3); cycloplegia, anterior uveitis (section 11.5).

Cautions see notes in section 1.2 Duration of action Since atropine has a shorter duration of action than neostigmine, late unopposed bradycardia may result; close monitoring of the patient is necessary.

Contra-indications see notes in section 1.2

Pregnancy not known to be harmful; manufacturer advises caution.

Breast-feeding small amount present in milk—man not known to be harmful; manufacturer advises caution.

Side-effects see notes in section 1.2

Dose
- Premedication, by intravenous injection, 300–600 micrograms immediately before induction of anaesthesia; CHILD under 12 years see BNF for Children By subcutaneous or intramuscular injection, 300–600 micrograms 30–60 minutes before induction of anaesthesia; CHILD under 12 years see BNF for Children
- Intra-operative bradycardia, by intravenous injection, 300–600 micrograms (larger doses in emergencies); CHILD under 12 years see BNF for Children
- Control of muscarinic side-effects of neostigmine in reversal of competitive neuromuscular block, by intravenous injection, 0.6–1.2 mg; CHILD under 12 years see BNF for Children
- Arrhythmias after myocardial infarction, see section 2.3.1

Atropine (Non-proprietary) (Ph)

Injection, atropine sulfate 600 micrograms/mL, net price 1-mL amp = 86p

Note Other strengths also available.

Injection, prefilled disposable syringe, atropine sulfate 100 micrograms/mL, net price 5 mL = £4.58, 10 mL = £5.39, 30 mL = £8.95

Injection, prefilled disposable syringe, atropine sulfate 200 micrograms/mL, net price 5 mL = £6.78; 300 micrograms/mL, 10 mL = £6.47; 600 micrograms/mL, 1 mL = £6.78

Minijet® Atropine (UCB Pharma) (Ph)

Injection, atropine sulfate 100 micrograms/mL, net price 5 mL = £0.34, 10 mL = £0.71, 30 mL = £1.19

GLYCOPHYRRONIUM BROMIDE

(Glycopyrrolate)

Indications drying secretions (see Prescribing in Palliative Care, p. 21); premedication; intra-operative bradycardia; with neostigmine for reversal of non-depolarising neuromuscular block; maintenance treatment of chronic obstructive pulmonary disease (section 3.1.2); hyperhidrosis (section 13.12).

Cautions see notes in section 1.2 (Antimuscarinics).

Contra-indications see notes in section 1.2 (Antimuscarinics).

Side-effects see notes in section 1.2 (Antimuscarinics).

Dose
- Premedication, by intramuscular or intravenous injection, 200–400 micrograms or 4–5 micrograms/kg (max. 400 micrograms); CHILD 1 month–12 years, 4–8 micrograms/kg (max. 200 micrograms)
- Intra-operative bradycardia, by intravenous injection, 200–400 micrograms or 4–5 micrograms/kg (max. 400 micrograms), repeated if necessary; CHILD 1 month–18 years, 4–8 micrograms/kg (max. 200 micrograms), repeated if necessary.
- Control of muscarinic side-effects of neostigmine in reversal of non-depolarising neuromuscular block, by intravenous injection, 200 micrograms per 1 mg of neostigmine, or 10–15 micrograms/kg; CHILD 1 month–12 years, 10 micrograms/kg (max. 500 micrograms).

Glycopyrronium bromide (Non-proprietary) (Ph)

Injection, glycopyrronium bromide 200 micrograms/mL, net price 1-mL amp = 54p, 3-mL amp = £1.50

With neostigmine metilsulfate

Section 15.1.6

HYOSCINE HYDROBROMIDE

(Scopolamine hydrobromide)

Indications premedication, motion sickness, hyper-salivation associated with clozapine therapy (section 4.6); excessive respiratory secretions (see Prescribing in Palliative Care, p. 21).

Cautions see notes in section 1.2 and notes above; also epilepsy.

Contra-indications see notes in section 1.2

Hepatic impairment use with caution.

Renal impairment use with caution.

Pregnancy use only if potential benefit outweighs risk; injection may depress neonatal respiration.

Breast-feeding amount too small to be harmful.

Side-effects see notes in section 1.2

Dose
- Premedication, by subcutaneous or intramuscular injection, 200–600 micrograms 30–60 minutes before induction of anaesthesia; CHILD 15 micrograms/kg.

Hyoscine (Non-proprietary) (Ph)

Injection, hyoscine hydrobromide 400 micrograms/mL, net price 1-mL amp = £2.88, 600 micrograms/mL, 1-mL amp = £2.53

With papaveretum

Section 4.7.2
15.1.4 Sedative and analgesic peri-operative drugs

15.1.4.1 Benzodiazepines

Benzodiazepines may occasionally cause marked respiratory depression and facilities for its treatment are essential; flumazenil (section 15.1.7) is used to antagonise the effects of benzodiazepines.

Diazepam is used to produce mild sedation with amnesia. It is a long-acting drug with active metabolites and a second period of drowsiness can occur several hours after its administration. Peri-operative use of diazepam in children is not recommended; its effect and timing of response are unreliable and paradoxical effects may occur.

Diazepam is relatively insoluble in water and preparations formulated in organic solvents are painful on intravenous injection and give rise to a high incidence of venous thrombosis (which may not be noticed for several days after the injection). Intramuscular injection of diazepam is painful and absorption is erratic. An emulsion formulated for intravenous injection is less irritant and reduces the risk of venous thrombosis; it is not suitable for intramuscular injection.

Temazepam is given by mouth for premedication and has a shorter duration of action and a more rapid onset than oral diazepam; anxiolytic and sedative effects last about 90 minutes although there may be residual drowsiness.

Lorazepam produces more prolonged sedation than temazepam and it has marked amnesic effects.

Midazolam is a water-soluble benzodiazepine that is often used in preference to intravenous diazepam; recovery is faster than from diazepam, but may be significantly longer in the elderly, in patients with a low cardiac output, or after repeated dosing. Midazolam is associated with profound sedation when high doses are given intravenously or when it is used with certain other drugs.

Overdosage with midazolam

There have been reports of overdosage when high strength midazolam has been used for conscious sedation. The use of high-strength midazolam (5 mg/mL in 2 mL and 10 mL ampoules, or 2 mg/mL in 5 mL ampoules) should be restricted to general anaesthesia, intensive care, palliative care, or other situations where the risk has been assessed. It is advised that flumazenil (section 15.1.7) is available when midazolam is used, to reverse the effects if necessary.

15.1.4.2 Non-opioid analgesics

15.1.4.3 Opioid analgesics

15.1.4.4 Other drugs for sedation

Important

The drugs in this section should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

Premedication

Fear and anxiety before a procedure (including the night before) can be minimised by using a sedative drug, usually a benzodiazepine. Premedication may also augment the action of anaesthetics and provide some degree of pre-operative amnesia.

The choice of drug depends on the individual, the nature of the procedure, the anaesthetic to be used, and other prevailing circumstances such as outpatients, obstetrics, and availability of recovery facilities. Sedative premedication with benzodiazepines should be avoided in patients with a compromised airway, CNS depression, or a history of sleep apnoea.

Premedicants can be given the night before major surgery; a further, smaller dose may be required before surgery. Alternatively, the first dose may be given on the day of the procedure.

Premedication in children

Oral administration is preferred; the rectal route should only be used in exceptional circumstances. For further details, consult BNF for Children.

Conscious sedation for clinical procedures

Sedation of patients during diagnostic and therapeutic procedures is used to reduce fear and anxiety, to control pain, and to minimise excessive movement. The choice of sedative drug will depend upon the intended procedure; some procedures are safer and more successful under anaesthesia. The patient should be monitored carefully; monitoring should begin as soon as the sedative is given or when the patient becomes drowsy, and should be continued until the patient wakes up.

For details on sedation for clinical procedures in children, see BNF for Children.

Dental procedures

Sedation for dental procedures should be limited to conscious sedation. Diazepam and temazepam are effective anxiolytics for dental treatment in adults. For further information on hypnotics used for dental procedures, see section 4.1.1.

For details on sedation for dental procedures in children, see BNF for Children.

Anaesthesia and driving

See section 15.1.

15.1.4.1 Benzodiazepines

Benzodiazepines possess useful properties for premedication including relief of anxiety, sedation, and amnesia; short-acting benzodiazepines taken by mouth are the most common premedicants. Benzodiazepines are also used in intensive care units for sedation, particularly in those receiving assisted ventilation.
**LORAZEPAM**

**Indications**
conscious sedation for procedures; premedication; short-term use in anxiety or insomnia (section 4.1.2); status epilepticus (section 4.8.2)

**Cautions**
see notes above and section 4.1.2

**Contra-indications**
see Diazepam, section 4.1.2

**Hepatic impairment**
see Benzodiazepines, section 4.1.2

**Renal impairment**
see Benzodiazepines, section 4.1.2

**Pregnancy**
see Diazepam, section 4.1.2

**References**
2.1.1.1.8

**Side-effects**
see notes above; gastro-intestinal disturbances, dry mouth, hiccups, increased appetite, jaundice; hypotension, cardiac arrest, heart rate changes, anaphylaxis, thrombosis; laryngospasm, bronchospasm, respiratory depression and respiratory arrest (particularly with high doses or on rapid injection); drowsiness, confusion, ataxia, amnesia, headache, euphoria, hallucinations, convulsions (more common in neonates), dizziness, vertigo, involuntary movements, paradoxical excitement and aggression (especially in children and elderly), dysarthria; urinary retention, incontinence, changes in libido; blood disorders; muscle weakness; visual disturbances; salivation changes; skin reactions; injection-site reactions

**Dose**

- **By mouth**
  - ADULT over 18 years, 5–10 mg 1–2 hours before procedure (up to max. 20 mg for dental procedures carried out in hospital); ELDERLY (or debilitated), half adult dose
  - CHILD 1 month–18 years see BNF for Children

- **By intravenous injection**
  - into a large vein (emulsion preparation preferred), sedative cover for minor surgical and medical procedures, ADULT over 18 years, 10–20 mg over 2–4 minutes, immediately before procedure; premedication 100–200 micrograms/kg

**Preparations**
Section 4.1.2

**MIDAZOLAM**

**Indications**
conscious sedation for procedures; sedation in intensive care; sedation in anaesthesia; premedication; induction of anaesthesia; status epilepticus (section 4.8.2)

**Cautions**
see notes above; cardiac disease; respiratory disease; myocardia gravis; neonates; children (particularly if cardiovascular impairment); risk of airways obstruction and hypoventilation in children under 6 months (monitor respiratory rate and oxygen saturation); history of drug or alcohol abuse; reduce dose in elderly and debilitated; risk of severe hypotension in hypovolaemia, vasoconstriction, hypothermia; avoid prolonged use (and abrupt withdrawal thereafter); concentration of midazolam in children under 15 kg not to exceed 1 mg/mL; **interactions**: Appendix 1 (anxiolytics and hypnotics)

**Contra-indications**
marked neuromuscular respiratory weakness including unstable myocardia gravis; severe respiratory depression; acute pulmonary insufficiency; sleep apnoea syndrome

**Hepatic impairment**
use with caution; can precipitate coma

**Renal impairment**
use with caution in chronic renal failure—increased cerebral sensitivity

**Pregnancy**
avoid regular use (risk of neonatal withdrawal symptoms); use only if clear indication such as seizure control (high doses during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression)

**Breast-feeding**
small amount present in milk—avoid breast-feeding for 24 hours after administration (although amount probably too small to be harmful after single doses)

**Side-effects**
see notes above; gastro-intestinal disturbances, dry mouth, hiccups, increased appetite, jaundice; hypotension, cardiac arrest, heart rate changes, anaphylaxis, thrombosis; laryngospasm, bronchospasm, respiratory depression and respiratory arrest (particularly with high doses or on rapid injection); drowsiness, confusion, ataxia, amnesia, headache, euphoria, hallucinations, convulsions (more common in neonates), dizziness, vertigo, involuntary movements, paradoxical excitement and aggression (especially in children and elderly), dysarthria; urinary retention, incontinence, changes in libido; blood disorders; muscle weakness; visual disturbances; salivation changes; skin reactions; injection-site reactions

**Dose**

- **By mouth**
  - ELDERLY or debilitated 70–100 micrograms/kg (max. 3.5 mg) every 2 minutes if needed)
  - CHILD 1 month–18 years see BNF for Children

- **By buccal administration**
  - CHILD 1 month–18 years see BNF for Children

- **By intravenous injection**
  - approx. 2 mg/minute 5–10 minutes before procedure, initially 2–2.5 mg (ELDERLY 0.5–1 mg), increased if necessary in steps of 1 mg (ELDERLY 0.5–1 mg); usual total dose 3.5–5 mg (max. 7.5 mg), ELDERLY max. 3.5 mg; CHILD 1 month–18 years see BNF for Children

  **By rectum**
  - CHILD 1 months–18 years see BNF for Children

- **By deep intramuscular injection**
  - ELDERLY over 18 years, 5–20 mg (max. 7.5 mg) at intervals of 2 minutes; max. total dose 15–20 micrograms/kg/hour (ELDERLY lower doses needed); CHILD not recommended

  **Premedication**
  - by slow intramuscular injection
    - ELDERLY over 18 years, 50–100 micrograms/kg repeated as required or by continuous intravenous infusion, 30–100 micrograms/kg/hour (ELDERLY lower doses needed); CHILD not recommended

  **By intravenous injection**
  - ELDERLY over 18 years, 1–2 mg 5–30 minutes before procedure, repeated as required (ELDERLY or debilitated 0.5 mg, repeat dose slowly as required)

  **By rectum**
  - CHILD 6 months–12 years see BNF for Children

- **By mouth**
  - CHILD 1 month–18 years see BNF for Children

- **Induction (but rarely used)**
  - by slow intravenous injection, 150–200 micrograms/kg (ELDERLY or debilitated 50–150 micrograms/kg) given in divided doses (max. 5 mg) at intervals of 2 minutes; max. total dose 600 micrograms/kg; CHILD 7–18 years initially 150 micrograms/kg (max. 7.5 mg) given in steps of 50 micrograms/kg (max. 2.5 mg) over 2–5 minutes; wait for 2–5 minutes then give additional doses of 50 micrograms/kg (max. 2.5 mg) every 2 minutes if necessary; max. total dose 500 micrograms/kg (not exceeding 25 mg)
Sedation of patients receiving intensive care, by slow intravenous injection, initially 30–300 micrograms/kg given in steps of 1–2.5 mg every 2 minutes, then by slow intravenous injection or by continuous intravenous infusion, 30–200 micrograms/kg/hour; reduce dose (or reduce or omit initial dose) in hypovolaemia, vasoconstriction, or hypothermia; lower doses may be adequate if opioid analgesic also used; CHILD under 12 years see BNF for Children.

Midazolam (Non-proprietary) (Roche)
Injection, midazolam (as hydrochloride) 1 mg/mL, net price 2-mL amp = £0.63, 10-mL amp = £2.50

Hypnovel® (Roche) (Roche)
Injection, midazolam (as hydrochloride) 5 mg/mL, 2-mL amp = £1.71

**TEMAZEPAM**

*Indications* premedication before surgery or investigatory procedures; conscious sedation for dental procedures [unlicensed]; hypnotic (section 4.1.1).

*Cautions* see notes above and Diazepam, section 4.1.1; interactions: Appendix 1 (anxiolytics and hypnotics).

*Contra-indications* see Diazepam, section 4.1.2.

*Hepatic impairment* see Benzodiazepines, section 4.1.1.

*Renal impairment* see Benzodiazepines, section 4.1.1.

*Pregnancy* see Benzodiazepines, section 4.1.1.

*Breast-feeding* see Benzodiazepines, section 4.1.1.

*Side-effects* see notes above and Diazepam, section 4.1.2.

*Dose* (Non-proprietary)

- By mouth, premedication, ADULT, 10–20 mg (up to 30 mg in exceptional circumstances) 1–2 hours before procedure; ELDERLY 10 mg (up to 20 mg in exceptional circumstances); CHILD 12–18 years see BNF for Children.

- By mouth, conscious sedation for dental procedures, ADULT over 18 years, 15–30 mg 30–60 minutes before procedure.

*Note* Temazepam doses in BNF may differ from those in previous editions.

**Preparations**

Section 4.1.1

15.1.4.2 Non-opioid analgesics

Since non-steroidal anti-inflammatory drugs (NSAIDs) do not depress respiration, do not impair gastro-intestinal motility, and do not cause dependence, they may be useful alternatives or adjuncts to opioids for the relief of postoperative pain. NSAIDs may be inadequate for the relief of severe pain.

Acemetacin, diclofenac, flurbiprofen, ibuprofen, ketoprofen (section 10.1.1), paracetamol (section 4.7.1), parecoxib, and ketroxolac are licensed for postoperative use. Diclofenac and paracetamol can be given by injection as well as by mouth. Diclofenac can be given by intravenous infusion for the treatment or prevention of postoperative pain. Intramuscular injections of diclofenac and ketoprofen are rarely used; they are given deep into the gluteal muscle to minimise pain and tissue damage. Ketroxolac is less irritant on intramuscular injection but pain has been reported; it can also be given by intravenous injection.

Parecoxib (a selective inhibitor of cyclo-oxygenase-2) can be given by intramuscular or intravenous injection (but see also NSAIDs and Cardiovascular Events, section 10.1.1). The Scottish Medicines Consortium (p. 4) has advised (January 2003) that parecoxib is not recommended for use within NHS Scotland.

Suppositories of diclofenac and ketoprofen may be effective alternatives to the parenteral use of these drugs.

**KETOROLAC TROMETAMOL**

*Indications* short-term management of moderate to severe acute postoperative pain only.

*Caution* section 10.1.1; interactions: Appendix 1 (NSAIDs).

*Contra-indications* section 10.1.1; also complete or partial syndrome of nasal polyps; haemorrhagic diatheses (including coagulation disorders) and following operations with high risk of haemorrhage or incomplete haemostasis; confirmed or suspected cerebrovascular bleeding; hypervolaemia or dehydration.

*Hepatic impairment* section 10.1.1.

*Renal impairment* max. 60 mg daily by intramuscular or intravenous injection; avoid if serum creatinine greater than 160 micromol/litre; see also section 10.1.1.

*Pregnancy* section 10.1.1.

*Breast-feeding* amount too small to be harmful.

*Side-effects* section 10.1.1; also gastrointestinal disturbances, taste disturbances, dry mouth; flushing, bradycardia, palpitation, chest pain, hypertension, pallor; dyspnoea, asthma; malaise, euphoria, psychosis, paraesthesia, convulsions, abnormal dreams, hyperkinesia, confusion, hallucinations; urinary frequency, thirst, sweating; hyponatraemia, hyperkalaemia, myalgia; visual disturbances (including optic neuritis); purpura, pain at injection site.

*Dose* 

- ADULT and CHILD over 16 years, by intramuscular injection or by intravenous injection over at least 15 seconds, initially 10 mg, then 10–30 mg every 4–6 hours as required (up to every 2 hours during initial postoperative period); max. 90 mg daily (ELDERLY and patients weighing less than 50 kg max. 60 mg daily); max. duration of treatment 2 days; CHILD 6 months–16 years see BNF for Children.

**Ketorolac** (Non-proprietary) (Roche)
Injection, ketorolac trometamol 30 mg/mL, net price 1-mL amp = £1.09.

**Tordol® (Roche)** (Roche)
Injection, ketorolac trometamol 30 mg/mL, net price 1-mL amp = £1.07.

**PARECOXIB**

*Indications* short-term management of acute postoperative pain.

*Caution* section 10.1.1; dehydration; following coronary artery bypass graft surgery; interactions: Appendix 1 (NSAIDs).

*Contra-indications* section 10.1.1; also history of allergic drug reactions including sulfonamide hypersensitivity; inflammatory bowel disease.

*Hepatic impairment* halve dose in moderate impairment (max. 40 mg daily); see also section 10.1.1.
Renal impairment section 10.1.1
Pregnancy section 10.1.1
Breast-feeding avoid—present in milk

Side-effects section 10.1.1; also flatulence, hypotension, hypoaesthesia, alveolar osteitis, postoperative anaemia, hypokalaemia, sweating, less commonly bradycardia, cardiovascular events, pulmonary embolism, anorexia, malaise, hyperglycaemia, arthralgia, ecchymosis; also reported tachycardia, circulatory collapse

Dose
• By deep intramuscular injection or by intravenous injection, initially 40 mg, then 20–40 mg every 6–12 hours when required for up to 3 days; max. 80 mg daily; ELDERLY weighing less than 50 kg, initially 20 mg, then max. 40 mg daily; CHILD under 18 years, not recommended

Dynastat® (Pharmacia)® injection, powder for reconstitution, parecoxib (as sodium salt), net price 40-mg vial = £4.96, 40-mg vial (with solvent) = £5.67

15.1.4 Sedative and analgesic peri-operative drugs

Opioid analgesics are now rarely used as premedicants; they are more likely to be administered at induction. Pre-operative use of opioid analgesics is generally limited to those patients who require control of existing pain. The main side-effects of opioid analgesics are respiratory depression, cardiovascular depression, nausea, and vomiting; for general notes on opioid analgesics and their use in postoperative pain, see section 4.7.2. For the management of opioid-induced respiratory depression, see section 15.1.7.

Intra-operative analgesia Opioid analgesics given in small doses before or with induction reduce the dose requirement of some drugs used during anaesthesia.

Alfentanil, fentanyl, and remifentanil are particularly useful because they act within 1–2 minutes and have short durations of action. The initial doses of alfentanil or fentanyl are followed either by successive intravenous injections or by an intravenous infusion; prolonged infusions increase the duration of effect. Repeated intra-operative doses of alfentanil or fentanyl should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive. Alfentanil, fentanyl, and remifentanil can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.

In contrast to other opioids which are metabolised in the liver, remifentanil undergoes rapid metabolism by non-specific blood and tissue esterases; its short duration of action allows prolonged administration at high dosage, without accumulation, and with little risk of residual postoperative respiratory depression. Remifentanil should not be given by intravenous injection intra-operatively, but it is well suited to continuous infusion; a supplementary analgesic is given before stopping the infusion of remifentanil.

ALFENTANIL

Indications analgesia especially during short operative procedure and outpatient surgery; enhancement of anaesthesia; analgesia and suppression of respiratory activity in patients receiving intensive care, with assisted ventilation, for up to 4 days

Cautions section 4.7.2 and notes above

Contra-indications section 4.7.2

Hepatic impairment section 4.7.2

Renal impairment section 4.7.2

Pregnancy section 4.7.2

Breast-feeding present in milk— withhold breast-feeding for 24 hours

Side-effects section 4.7.2 and notes above; also hypertension, myoclonic movements; less commonly arrhythmias, hiccup, laryngospasm; rarely epistaxis; also reported cardiac arrest, cough, convulsions, and pyrexia

Dose

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

• Spontaneous respiration: analgesia and enhancement of anaesthesia for short procedures, by intravenous injection, ADULT, initially up to 500 micrograms over 30 seconds; supplemental doses 250 micrograms

• Assisted ventilation: analgesia and enhancement of anaesthesia for short procedures, by intravenous injection, ADULT, initially 30–50 micrograms/kg; supplemental doses 15 micrograms/kg; CHILD under 18 years see BNF for Children

• Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia for longer procedures, by intravenous infusion, ADULT, initially 50–100 micrograms/kg over 10 minutes or as a bolus, followed by maintenance of 30–60 micrograms/kg/hour; CHILD under 18 years see BNF for Children

• Assisted ventilation: analgesia and suppression of respiratory activity during intensive care, by intravenous infusion, ADULT over 18 years, initially 2 mg/hour subsequently adjusted according to response (usual range 0.5–10 mg/hour); more rapid initial control may be obtained with an intravenous dose of 5 mg given in divided portions over 10 minutes (reduce rate of administration if hypotension or bradycardia occur); additional doses of 0.5–1 mg may be given by intravenous injection during short painful procedures

Alfentanil (Non-proprietary) (92)
Injection, alfentanil (as hydrochloride) 500 micrograms/mL, net price 2-mL amp = 70p, 10-mL amp = £3.20
Injection, alfentanil (as hydrochloride) 5 mg/mL, net price 1-mL amp = £2.50
Note To be diluted before use

Rapifen® (Lanssens) (91)
Injection, alfentanil (as hydrochloride) 500 micrograms/mL, net price 2-mL amp = 63p, 10-mL amp = £2.90
Intensive care injection, alfentanil (as hydrochloride) 5 mg/mL, net price 1-mL amp = £2.32
Note To be diluted before use
15.1.4 Sedative and analgesic peri-operative drugs

**FENTANYL**

**Indications** analgesia during operation, enhancement of anaesthesia; analgesia and respiratory depression in assisted respiration in intensive care; analgesia in other situations (section 4.7.2).

**Cautions** see section 4.7.2 and notes above.

**Contra-indications** see notes in section 4.7.2.

**Hepatic impairment** see notes in section 4.7.2.

**Renal impairment** see notes in section 4.7.2.

**Pregnancy** see notes in section 4.7.2.

**Breast-feeding** see Fentanyl, section 4.7.2 and notes above; also myoclonic movements; less commonly laryngospasm; rarely asystole and insomnia

**Dose**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- Spontaneous respiration: analgesia and enhancement of anaesthesia during operation, by slow intravenous injection, ADULT, initially 50–100 micrograms (max. 200 micrograms on specialist advice), then 25–50 micrograms as required, by intravenous infusion, ADULT, 3–4.8 micrograms/kg/hour adjusted according to response; CHILD 1 month–18 years see BNF for Children

- Assisted ventilation: analgesia and enhancement of anaesthesia during operation, anaesthesia and respiratory depression in intensive care, by slow intravenous injection, ADULT, initially 300–3500 micrograms, then 100–200 micrograms as required, by intravenous infusion, ADULT, initially 10 micrograms/kg over 10 minutes, then 6 micrograms/kg/hour adjusted according to response; may require up to 180 micrograms/kg/hour during cardiac surgery; CHILD under 18 years see BNF for Children

**Fentanyl** (Non-proprietary) (£2)

*Injection,* fentanyl (as citrate) 50 micrograms/mL, net price 2-mL amp = 30p, 10-mL amp = 75p

**Sublimaze®** (Jansen) (£2)

*Injection,* fentanyl (as citrate) 50 micrograms/mL, net price 10-mL amp = £1.31

**REMIFENTANIL**

**Indications** analgesia and enhancement of anaesthesia during induction and maintenance of anaesthesia (consult product literature for use in patients undergoing cardiac surgery); analgesia and sedation in ventilated, intensive care patients

**Cautions** section 4.7.2 (but no dose adjustment necessary in renal impairment) and notes above.

**Contra-indications** section 4.7.2 and notes above; analgesia in conscious patients

**Hepatic impairment** section 4.7.2.

**Pregnancy** no information available: see also section 4.7.2.

**Breast-feeding** avoid breast-feeding for 24 hours after administration—present in milk in animal studies

**Side-effects** section 4.7.2 and notes above; also hypertension; less commonly hypoxia; rarely asystole; AV block and convulsions also reported

**Dose**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- Analgesia and enhancement of anaesthesia at induction, by intravenous infusion, ADULT, 30–60 micrograms/kg/hour, with or without an initial dose by intravenous injection of 0.25–1 micrograms/kg over at least 30 seconds; CHILD 12–18 years see BNF for Children

**Note** If patient to be intubated more than 8 minutes after start of intravenous infusion, initial intravenous injection dose is not necessary

- Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia, by intravenous infusion, ADULT, 3–120 micrograms/kg/hour, with or without an initial dose by intravenous injection of 0.25–1 micrograms/kg over at least 30 seconds, according to anaesthetic technique and adjusted according to response; in light anaesthesia supplemental doses by intravenous injection every 2–5 minutes; CHILD under 18 years see BNF for Children

- Spontaneous respiration: analgesia and enhancement of anaesthesia during maintenance of anaesthesia, by intravenous infusion, ADULT, initially 2.4 micrograms/kg/hour adjusted according to response, usual range 1.5–6 micrograms/kg/hour; CHILD 12–18 years see BNF for Children

- Assisted ventilation: analgesia and sedation in intensive-care patients, for max. 3 days, by intravenous infusion, ADULT over 18 years, initially 6–9 micrograms/kg/hour adjusted according to response in steps of 1.5 micrograms/kg/hour (allow at least 5 minutes between dose adjustments); usual range 0.36–44.4 micrograms/kg/hour; if an infusion rate of 12 micrograms/kg/hour does not produce adequate sedation add another sedative (consult product literature for details)

- Assisted ventilation: additional analgesia during stimulating or painful procedures in intensive-care patients, by intravenous infusion, ADULT over 18 years, maintain infusion rate of at least 6 micrograms/kg/hour for at least 5 minutes before procedure and adjust every 2–5 minutes according to requirements, usual range 15–45 micrograms/kg/hour

- Cardiac surgery, consult product literature

**Note** Remifentanil doses in BNF may differ from those in product literature

**Remifentanil** (Non-proprietary) (£2)

*Injection,* powder for reconstitution, remifentanil (as hydrochloride), net price 1-mg vial = £4.61; 2-mg vial = £9.21; 5-mg vial = £23.02

**Ultiva®** (GSK) (£2)

*Injection,* powder for reconstitution, remifentanil (as hydrochloride), net price 1-mg vial = £5.12; 2-mg vial = £10.23; 5-mg vial = £25.58

**15.1.4.4 Other drugs for sedation**

Dexmedetomidine and clonidine (section 2.5.2) are α₂-adrenergic agonists with sedative properties. Dexmedetomidine is licensed for the sedation of patients receiving intensive care who need to remain responsive to verbal stimulation. Clonidine [unlicensed indication] can be used by mouth or by intravenous injection as a sedative agent when adequate sedation cannot be achieved with standard treatment.
Neuromuscular blocking drugs

Neuromuscular blocking drugs used in anaesthesia are also known as muscle relaxants. By specific blockade of the neuromuscular junction they enable light anaesthesia to be used with adequate relaxation of the muscles of the abdomen and diaphragm. They also relax the vocal cords and allow the passage of a tracheal tube. Their action differs from the muscle relaxants used in anaesthesia and airway management.

Patients who have received a neuromuscular blocking drug should always have their respiration assisted or controlled until the drug has been inactivated or antagonised (section 15.1.6). They should also receive sufficient concomitant inhalational or intravenous anaesthetic or sedative drugs to prevent awareness.

Note

To be diluted before use

BNF 68 15.1.5 Neuromuscular blocking drugs 871

Non-depolarising neuromuscular blocking drugs

Non-depolarising neuromuscular blocking drugs (also known as competitive muscle relaxants) compete with acetylcholine for receptor sites at the neuromuscular junction and their action can be reversed with anticholinesterases such as neostigmine (section 15.1.6). Non-depolarising neuromuscular blocking drugs can be divided into the aminosteroid group, comprising pancuronium, rocuronium, and vecuronium, and the benzylisoquinolinium group, comprising atracurium, cisatracurium, and mivacurium.

Non-depolarising neuromuscular blocking drugs have a slower onset of action than suxamethonium. These drugs can be classified by their duration of action as short-acting (15–30 minutes), intermediate-acting (30–40 minutes), and long-acting (60–120 minutes), although duration of action is dose-dependent. Drugs with a shorter or intermediate duration of action, such as atracurium and vecuronium, are more widely used than those with a longer duration of action, such as pancuronium.

Non-depolarising neuromuscular blocking drugs have no sedative or analgesic effects and are not considered to trigger malignant hyperthermia.

For patients receiving intensive care and who require tracheal intubation and mechanical ventilation, a non-depolarising neuromuscular blocking drug is chosen according to its onset of effect, duration of action, and side-effects. Rocuronium, with a rapid onset of effect, may facilitate intubation. Atracurium or cisatracurium may be suitable for long-term neuromuscular blockade since their duration of action is not dependent on elimination by the liver or the kidneys.

Cautions

Allergic cross-reactivity between neuromuscular blocking drugs has been reported; caution is advised in cases of hypersensitivity to these drugs. Their activity is prolonged in patients with myasthenia gravis and in hypothermia, and lower doses are required. Non-depolarising neuromuscular blocking drugs should be used with great care in those with other neuromuscular disorders and those with fluid and electrolyte disturbances, as response is unpredictable. Resistance can develop in patients with burns, who may require increased doses; low plasma cholinesterase activity in these patients requires dose titration for mivacurium.

The rate of administration of neuromuscular blocking drugs should be reduced in patients with cardiovascular disease. Interactions: Appendix 1 (muscle relaxants).

Pregnancy

Non-depolarising neuromuscular blocking drugs are highly ionised at physiological pH and are therefore unlikely to cross the placenta in significant amounts.

Breast-feeding

Because they are ionised at physiological pH, non-depolarising neuromuscular blocking drugs are unlikely to be present in milk in significant amounts. Breast-feeding may be resumed once the mother has recovered from neuromuscular block.

Side-effects

Benzylisoquinolinium non-depolarising neuromuscular blocking drugs (except cisatracurium) are associated with histamine release, which can cause skin flushing, hypotension, tachycardia, bronchospasm, and very rarely anaphylactoid reactions. Most aminosteroid neuromuscular blocking drugs produce minimal histamine release. Drugs with vagolytic activity
can counteract any bradycardia that occurs during surgery. Acute myopathy has also been reported after prolonged use in intensive care.

**Atracurium**, a mixture of 10 isomers, is a benzylisoquinolinium neuromuscular blocking drug with an intermediate duration of action. It undergoes non-enzymatic metabolism which is independent of liver and kidney function, thus allowing its use in patients with hepatic or renal impairment. Cardiovascular effects are associated with significant histamine release; histamine release can be minimised by administering slowly or in divided doses over at least 1 minute.

**Cisatracurium** is a single isomer of atracurium. It is more potent and has a slightly longer duration of action than atracurium and provides greater cardiovascular stability because cisatracurium lacks histamine-releasing effects.

**Mivacurium**, a benzylisoquinolinium neuromuscular blocking drug, has a short duration of action. It is metabolised by plasma cholinesterase and muscle paralysis is prolonged in individuals deficient in this enzyme. It is not associated with vagolytic activity or ganglionic blockade although histamine release can occur, particularly with rapid injection.

**Pancuronium**, an aminosteroid neuromuscular blocking drug, has a long duration of action and is often used in patients receiving long-term mechanical ventilation in intensive care units. It lacks a histamine-releasing effect, but vagolytic and sympathomimetic effects can cause tachycardia and hypertension.

**Rocuronium** exerts an effect within 2 minutes and has the most rapid onset of any of the non-depolarising neuromuscular blocking drugs. It is an aminosteroid neuromuscular blocking drug with an intermediate duration of action. It is reported to have minimal cardiovascular effects; high doses produce mild vagolytic activity.

**Vecuronium**, an aminosteroid neuromuscular blocking drug, has an intermediate duration of action. It does not generally produce histamine release and lacks cardiovascular effects.

### Atracurium Besylate (Atracurium besylate)

**Indications** neuromuscular blockade (short to intermediate duration) for surgery or during intensive care

**Cautions** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; seizures also reported

**Dose**

- To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

  - Intubation and surgery, ADULT, by intravenous injection, initially 300–600 micrograms/kg; then 100–200 micrograms/kg as required or initially by intravenous injection, 300–600 micrograms/kg followed by intravenous infusion, 300–600 micrograms/kg/hour; CHILD under 18 years see BNF for Children

- Intensive care, ADULT, by intravenous injection, initially 300–600 micrograms/kg (optional) then by intravenous infusion 270–1770 micrograms/kg/hour (usual dose 650–780 micrograms/kg/hour); CHILD under 18 years see BNF for Children

### Cisatracurium

**Indications** neuromuscular blockade (intermediate duration) for surgery or during intensive care

**Cautions** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also bradycardia

**Dose**

- To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

  - Intubation and surgery, ADULT, by intravenous injection, initially 150 micrograms/kg; maintenance, by intravenous injection, 30 micrograms/kg approx. every 20 minutes or by intravenous infusion, initially 180 micrograms/kg/hour, then after stabilisation, 60–120 micrograms/kg/hour; CHILD 1 month–18 years see BNF for Children

  - Intensive care, ADULT, by intravenous injection, initially 150 micrograms/kg (optional), then by intravenous infusion 180 micrograms/kg/hour adjusted according to response (usual range 30–600 micrograms/kg/hour)

### Mivacurium

**Indications** neuromuscular blockade (short duration) for surgery

**Cautions** see notes above; low plasma cholinesterase activity; elderly

**Hepatic impairment** reduce dose in severe impairment

**Renal impairment** clinical effect prolonged in renal failure—reduce dose according to response

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

**Dose**

- To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

  - Intubation and surgery, ADULT, by intravenous injection, 70–250 micrograms/kg; maintenance, by intravenous injection, 100 micrograms/kg every 15 minutes or by intravenous infusion, 8–10 micrograms/kg/minute, adjusted if necessary every 3 minutes by
### 15.1.5 Neuroromuscular blocking drugs

**Rocuronium** (Non-proprietary) *(®)*

**Injection**, rocuronium bromide 10 mg/mL, net price
- 5-mL vial = £3.00, 10-mL vial = £6.00

**Depolarising neuroromuscular blocking drugs**

Suxamethonium has the most rapid onset of action of any of the neuroromuscular blocking drugs and is ideal if fast onset and brief duration of action are required, e.g. with tracheal intubation.

Suxamethonium acts by mimicking acetylcholine at the neuroromuscular junction but hydrolysis is much slower than for acetylcholine; depolarisation is therefore prolonged, resulting in neuroromuscular blockade. Unlike the non-depolarising neuroromuscular blocking drugs, its action cannot be reversed and recovery is spontaneous; anticholinesterases such as neostigmine potentiate the neuroromuscular block.

Suxamethonium should be given after anaesthetic induction because paralysis is usually preceded by painful muscle fasciculations. While tachycardia occurs with single use, bradycardia may occur with repeated doses in adults and with the first dose in children. Premedication with atropine reduces bradycardia as well as the excessive salivation associated with suxamethonium as a result of the non-depolarising action cannot be reversed and recovery is spontaneous; anticholinesterases such as neostigmine potentiate the neuroromuscular block.

Prolonged paralysis may occur in dual block, which occurs with high or repeated doses of suxamethonium and is caused by the development of a non-depolarising block following the initial depolarising block. Individuals with myasthenia gravis are resistant to suxamethonium but can develop dual block resulting in delayed recovery. Prolonged paralysis may also occur in those with low or atypical plasma cholinesterase. Assisted ventilation should be continued until muscle function is restored.
Suxamethonium chloride

(Succinylcholine chloride)

**Indications**
neuromuscular blockade (short duration) for surgery

**Cautions**
see notes above; hypersensitivity to other neuromuscular blocking drugs; patients with cardiac, respiratory, or neuromuscular disease; raised intraocular pressure (avoid in penetrating eye injury); severe sepsis (risk of hyperkalaemia); severe burns, neurological disease involving acute wasting of major muscle, prolonged immobilisation—risk of hyperkalaemia, personal or family history of congenital myotonic disease, Duchenne muscular dystrophy, low plasma-cholinesterase activity (including severe liver disease, see Hepatic Impairment)

**Hepatic impairment**
prolonged apnoea may occur in severe liver disease because of reduced hepatic synthesis of pseudocholinesterase

**Pregnancy**
mildly prolonged maternal neuromuscular blockade may occur

**Breast-feeding**
unlikely to be present in breast milk in significant amounts (ionised at physiological pH); breast-feeding may be resumed once the mother recovered from neuromuscular block

**Side-effects**
see notes above; also increased gastric pressure; hyperkalaemia; postoperative muscle pain, rhabdomyolysis

**Dose**
- Intubation and surgery, ADULT, by intravenous injection, 1–1.5 mg/kg; CHILD under 18 years, see *BNF for Children*

**Note**
Doses of suxamethonium in BNF may differ from those in product literature

Suxamethonium Chloride (Non-proprietary) (†)

Injection, suxamethonium chloride 50 mg/mL, net price 2-mL amp = 58p, 2-mL prefilled syringe = £8.45

Anectine® (GSK) (‡)

Injection, suxamethonium chloride 50 mg/mL, net price 2-mL amp = 71p

15.1.6 Drugs for reversal of neuromuscular blockade

**Important**
The drugs in this section should only be administered by, or under the direct supervision of, personnel experienced in their use.

Anticholinesterases

Anticholinesterases reverse the effects of the non-depolarising (competitive) neuromuscular blocking drugs such as pancuronium but they prolong the action of the depolarising neuromuscular blocking drug suxamethonium.

Neostigmine is used specifically for reversal of non-depolarising (competitive) blockade. It acts within one minute of intravenous injection and its effects last for 20 to 30 minutes; a second dose may then be necessary. Glycopyrronium or alternatively atropine (section 15.1.5), given before or with neostigmine, prevent bradycardia, excessive salivation, and other muscarinic effects of neostigmine.

**NEOSTIGMINE METILSULFATE**

(Neostigmine methylsulfate)

**Indications**
see under Dose

**Cautions**
section 10.2.1 and notes above; glycopyrronium or atropine should also be given

**Contra-indications**
section 10.2.1 and notes above

**Renal impairment**
section 10.2.1

**Pregnancy**
section 10.2.1

**Breast-feeding**
section 10.2.1

**Side-effects**
section 10.2.1 and notes above

**Dose**
- Reversal of non-depolarising neuromuscular blockade, by intravenous injection over 1 minute, ADULT over 18 years, 2.5 mg repeated if necessary (max. 5 mg) after or with glycopyrronium or atropine; CHILD under 18 years see *BNF for Children*

- Myasthenia gravis, see section 10.2.1

Neostigmine (Non-proprietary) (†)

Injection, neostigmine metilsulfate 2.5 mg/mL, net price 1-mL amp = 50p

**With glycopyrronium bromide**

Glycopyrronium–Neostigmine (Non-proprietary) (‡)

Injection, neostigmine metilsulfate 2.5 mg, glycopyrronium bromide 500 micrograms/mL, net price 1-mL amp = £1.15

**Dose**
- Reversal of non-depolarising neuromuscular blockade, by intravenous injection over 10–30 seconds, 1–2 mL or 0.02 mL/kg, dose may be repeated if required (total max. 2 mL); CHILD 0.02 mL/kg (or 0.2 mL/kg of a 1 in 10 dilution using water for injections or sodium chloride injection 0.9%), dose may be repeated if required (total max. 2 mL)

**Other drugs for reversal of neuromuscular blockade**

Sugammadex is a modified gamma cyclodextrin that can be used for rapid reversal of neuromuscular blockade induced by rocuronium or vecuronium (section 15.1.5). In practice, sugammadex is used mainly for rapid reversal of neuromuscular blockade in an emergency.

The Scottish Medicines Consortium, p. 4 has advised (February 2013) that sugammadex (Bridion®) is accepted for restricted use within NHS Scotland for the routine reversal of neuromuscular blockade in high-risk patients only, or where prompt reversal of neuromuscular block is required.

Sugammadex (Sugamade®)

**Indications**
reversal of neuromuscular blockade induced by rocuronium or vecuronium

**Cautions**
recurrence of neuromuscular blockade—monitor respiratory function until fully recovered; recovery may be delayed in cardiovascular disease and elderly; pre-existing coagulation disorders or use of anticoagulants (unrelated to surgery); wait 24 hours
before re-administering rocuronium or vecuronium; 
in interactions: Appendix 1 (sugammadex) 
Renal impairment avoid if eGFR less than 30 mL/ minute/1.73 m² 
Pregnancy use with caution—no information available 
Side-effects bradycardia, cardiac arrest, hypersensitivity reactions 

Dose 
- Routine reversal of neuromuscular blockade induced by rocuronium or vecuronium, by intravenous injection, ADULT over 18 years, 2–4 mg/kg (consult product literature); a further dose of 4 mg/kg may be required if recurrence of neuromuscular blockade occurs 
- Routine reversal of neuromuscular blockade induced by rocuronium, by intravenous injection, CHILD 2–18 years, 2 mg/kg (consult product literature) 
- Intermediate reversal of neuromuscular blockade induced by rocuronium, by intravenous injection, ADULT over 18 years, 16 mg/kg (consult product literature) 

Bridion® (MSD) Injection, sugammadex (as sodium salt) 100 mg/mL, net price 2-mL amp = £59.64, 5-mL amp = £149.10 
Electrolytes Na⁺ 0.42 mmol/mL 

15.1.7 Antagonists for central and respiratory depression 

Important 
The drugs in this section should only be administered by, or under the direct supervision of, personnel experienced in their use. 

Respiratory depression is a major concern with opioid analgesics and it may be treated by artificial ventilation or be reversed by naloxone. Naloxone will immediately reverse opioid-induced respiratory depression but the dose may have to be repeated because of the short duration of action of naloxone; however, naloxone will also antagonise the analgesic effect. 

Flumazenil is a benzodiazepine antagonist for the reversal of the central sedative effects of benzodiazepines after anaesthetic and similar procedures. Flumazenil has a shorter half-life and duration of action than diazepam or midazolam so patients may become resevoiced 

Contra-indications life-threatening condition (e.g. raised intracranial pressure, status epilepticus) controlled by benzodiazepines 
Hepatic impairment carefully titrate dose 

Pregnancy not known to be harmful 
Breast-feeding avoid breast-feeding for 24 hours 

Dose 
- Anaesthesia and clinical procedures, by intravenous injection, 200 micrograms over 15 seconds, then 100 micrograms at 60-second intervals if required; usual dose range, 300–600 micrograms; max. total dose 1 mg; CHILD 1 month–18 years see BNF for Children 
- Intensive care, by intravenous injection, 300 micrograms over 15 seconds, then 100 micrograms at 60-second intervals if required; max. total dose 2 mg; then if drowsiness recurs either, by intravenous injection, 300 micrograms, or by intravenous infusion, 100–400 micrograms/hour, adjusted according to response; CHILD 1 month–18 years see BNF for Children 

Flumazenil (Non-proprietary) Injection, flumazenil 100 micrograms/mL, net price 5-mL amp = £13.50 

NALOXONE HYDROCHLORIDE 
Indications see under Dose 
Cautions cardiovascular disease or those receiving cardiotoxic drugs (serious adverse cardiovascular effects reported); physical dependence on opioids (precipitates withdrawal); pain (see also under Titration of Dose, below); has short duration of action (repeated doses or infusion may be necessary to reverse effects of opioids with longer duration of action) 
Titrator of dose In postoperative use, the dose should be titrated for each patient in order to obtain sufficient respiratory response; however, naloxone antagonises analgesia 

Pregnancy use only if potential benefit outweighs risks 

Breast-feeding not orally bioavailable 

Side-effects nausea, vomiting, hypotension, hypertension, tachycardia, headache, dizziness; less commonly diarrhea, dry mouth, bradycardia, arrhythmia, hyperventilation, tremor, sweating; rarely seizures; very rarely ventricular fibrillation, cardiac arrest, pulmonary oedema, erythema multiforme, and hypersensitivity reactions including anaphylaxis; also reported agitation 

Dose 
- Reversal of postoperative respiratory depression, ADULT and CHILD over 12 years, by intravenous injection, 100–200 micrograms (1.5–3 micrograms/kg); if response inadequate, give subsequent dose of 100 micrograms every 2 minutes; alternatively, subsequent doses can be given by intramuscular injection every 1–2 hours; CHILD 1 month–12 years see BNF for Children 
- Reversal of respiratory and CNS depression resulting from opioid administration to mother during labour, NEONATE, by intramuscular injection, 200 micrograms (60 micrograms/kg) as a single dose at birth; alter-
Malignant hyperthermia is a rare but potentially lethal complication of anaesthesia. It is characterised by a rapid rise in temperature, increased muscle rigidity, tachycardia, and acidosis. The most common triggers of malignant hyperthermia are the volatile anaesthetics. Succinylcholine has also been implicated, but malignant hyperthermia is more likely if it is given following a volatile anaesthetic. Volatile anaesthetics and suxamethonium should be avoided during anaesthesia in patients at high risk of malignant hyperthermia.

Dantrolene is used in the treatment of malignant hyperthermia. It acts on skeletal muscle cells by interfering with calcium efflux, thereby stopping the contractile process.

**DANTROLENE SODIUM**

**Indications** malignant hyperthermia; chronic severe spasticity of voluntary muscle (section 10.2.2)

**Cautions** avoid extravasation (risk of tissue necrosis); interactions: Appendix 1 (muscle relaxants)

**Pregnancy** use only if potential benefit outweighs risk

**Breast-feeding** present in milk—use only if potential benefit outweighs risks

**Side-effects** hepatotoxicity, pulmonary oedema, dizziness, weakness, and injection-site reactions including erythema, rash, swelling, and thrombophlebitis

**Dose** By rapid intravenous injection, ADULT, initially 2–3 mg/kg, then 1 mg/kg repeated as required to a cumulative max. of 10 mg/kg; CHILD 1 month–18 years see BNF for Children

Dantrium Intravenous® (SpePharm) FOM Injection, powder for reconstitution, dantrolene sodium, net price 20-mg vial = £51.00 (hosp. only)

The use of local anaesthetics by injection or by application to mucous membranes to produce local analgesia is discussed in this section.

See also section 1.7 (anus), section 11.7 (eye), section 12.3 (oropharynx), and section 13.3 (skin).

**Use of local anaesthetics** Local anaesthetic drugs act by causing a reversible block to conduction along nerve fibres. They vary widely in their potency, toxicity, duration of action, stability, solubility in water, and ability to penetrate mucous membranes. These factors determine their application, e.g. topical (surface), infiltration, peripheral nerve block, intravenous regional anaesthesia (Bier’s block), plexus, epidural (extradural), or spinal (intrathecal or subarachnoid) block. Local anaesthetics may also be used for postoperative pain relief, thereby reducing the need for analgesics such as opioids.

**Administration** The dose of local anaesthetic depends on the injection site and the procedure used. In determining the safe dosage, it is important to take account of the rate of absorption and excretion, and of the potency. The patient’s age, weight, physique, and clinical condition, and the vascularity of the administration site and the duration of administration, must also be considered.

Uptake of local anaesthetics into the systemic circulation determines their duration of action and produces toxicity.

Great care must be taken to avoid accidental intravascular injection; local anaesthetic injections should be given slowly in order to detect inadvertent intravascular administration. When prolonged analgesia is required, a long-acting local anaesthetic is preferred to minimise the likelihood of cumulative systemic toxicity. Local anaesthesia around the oral cavity may impair swallowing and therefore increases the risk of aspiration.

Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects (see Toxicity and Side-effects, p. 877) is necessary during the first 30 minutes after injection.

Epidual anaesthesia is commonly used during surgery, often combined with general anaesthesia, because of its protective effect against the stress response of surgery. It is often used when good postoperative pain relief is essential (e.g. major thoracic or intra-abdominal surgery).

**Use of vasoconstrictors** Local anaesthetics cause dilatation of blood vessels. The addition of a vasoconstrictor such as adrenaline (epinephrine) to the local anaesthetic preparation diminishes local blood flow, slowing the rate of absorption and thereby prolonging the anaesthetic effect. Great care should be taken to avoid inadvertent intravenous administration of a preparation containing adrenaline, and it is not advisable to give adrenaline with a local anaesthetic injection in digits or appendages because of the risk of ischaemic necrosis.

Adrenaline must be used in a low concentration when administered with a local anaesthetic (but see also Dental Anaesthesia, p. 877). The total dose of adrenaline should not exceed 500 micrograms and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture
A single application of a local anaesthetic involves the central nervous and cardiovascular systems. CNS effects include a feeling of inebriation and lightheadedness followed by drowsiness, respiratory failure, unconsciousness, and coma. Effects on the cardiovascular system include myocardial depression and peripheral vasodilatation resulting in hypotension and bradycardia; arrhythmias and cardiac arrest can occur. Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

Management of severe local anaesthetic-induced cardiovascular toxicity

After injection of a bolus of local anaesthetic, toxicity may develop at any time in the following hour. In the event of signs of toxicity during injection, the administration of the local anaesthetic must be stopped immediately.

Cardiovascular status must be assessed and cardiopulmonary resuscitation procedures must be followed, see section 2.7.3 (Cardiopulmonary Resuscitation).

In the event of local anaesthetic-induced cardiac arrest, standard cardiopulmonary resuscitation should be initiated immediately. Lidocaine must not be used as anti-arrhythmic therapy.

If the patient does not respond rapidly to standard procedures, 20% lipid emulsion such as Intralipid® [unlicensed indication] should be given intravenously at an initial bolus dose of 1.5 mL/kg over 1 minute, followed by an infusion of 15 mL/kg/hour. After 5 minutes, if cardiovascular stability has not been restored or circulation deteriorates, give a maximum of two further bolus doses of 1.5 mL/kg over 1 minute, 5 minutes apart, and increase the infusion rate to 30 mL/kg/hour. Continue infusion until cardiovascular stability and adequate circulation are restored or maximum cumulative dose of 12 mL/kg is given.

Standard cardiopulmonary resuscitation must be maintained throughout lipid emulsion treatment. Propofol is not a suitable alternative to lipid emulsion.

Further advice on ongoing treatment should be obtained from the National Poisons Information Service, p. 33.

Detailed treatment algorithms and accompanying notes are available at www.toxbase.org or www.aagbi.org (search site for: local anaesthetic toxicity).

Articaine

Articaine is an amide-type local anaesthetic used for dental anaesthesia (see Dental Anaesthesia, above). It is available in a preparation that also contains adrenaline (see Use of Vasoconstrictors, p. 876).
Contra-indications see Contra-indications of Local Anaesthetics, p. 877 and Adrenaline, section 2.7.3

Hepatic impairment use with caution; increased risk of side-effects in severe impairment

Renal impairment see Adrenaline, section 2.7.3

Pregnancy use only if potential benefit outweighs risk—no information available

Breast-feeding avoid breast-feeding for 48 hours after administration

Side-effects see Toxicity and Side-effects, p. 877 and Adrenaline, section 2.7.3; also methaemoglobinemia (see Prilocaine (p. 882) for treatment)

Dose

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

● ADULT and CHILD over 4 years, consult expert dental sources; important: see also Administration, p. 876

Septanest® (Septodont) (H)
Injection, articaine hydrochloride 40 mg/mL, adrenaline 1 in 200 000 (5 micrograms/mL), net price 2.2-mL cartridge = 41p

Excipients include sulfites

Injection, articaine hydrochloride 40 mg/mL, adrenaline 1 in 100 000 (10 micrograms/mL), net price 2.2-mL cartridge = 41p

Excipients include sulfites

Bupivacaine

Bupivacaine has a longer duration of action than other local anaesthetics. It has a slow onset of action, taking up to 30 minutes for full effect. It is often used in lumbar epidural blockade and is particularly suitable for continuous epidural analgesia in labour, or for postoperative pain relief. It is the principal drug used for spinal anaesthesia. Hyperbaric solutions containing glucose may be used for spinal block.

Bupivacaine HYDROCHLORIDE

Indications see under Dose

Cautions see Cautions of Local Anaesthetics, p. 877; myocardial depression may be more severe and more resistant to treatment; cardiovascular disease; hypertension; hypotension; cerebral atheroma; interactions: Appendix 1 (bupivacaine)

Contra-indications see Contra-indications of Local Anaesthetics, p. 877

Hepatic impairment use with caution in severe impairment

Renal impairment use with caution in severe impairment

Pregnancy large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block; use lower doses for intrathecal use during late pregnancy

Breast-feeding amount too small to be harmful

Side-effects see Toxicity and Side-effects, p. 877

Dose

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

Note Doses should be adjusted according to patient’s physical status and nature of procedure—important: see also under Administration, p. 876

● Surgical anaesthesia

Lumbar epidural block, ADULT and CHILD over 12 years, 75–150 mg using a 5 mg/mL (0.5%) solution

Thoracic epidural block, ADULT and CHILD over 12 years, 12.5–50 mg using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

Caudal epidural block, ADULT and CHILD over 12 years, 50–150 mg using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

Major nerve block, ADULT and CHILD over 12 years, 50–175 mg using a 5 mg/mL (0.5%) solution

Field block, ADULT and CHILD over 12 years, up to max. 150 mg using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

Intrathecal injection, see Marcain Heavy®

● Acute pain

Lumbar epidural block, ADULT and CHILD over 12 years, by intermittent injection, 15–37.5 mg using a 2.5 mg/mL (0.25%) solution, repeated when required (at intervals of at least 30 minutes) or by continuous epidural infusion, 12.5–18.8 mg/hour using a 1.25 mg/mL (0.125%) or 2.5 mg/mL (0.25%) solution; labour pain, by continuous epidural infusion, 6.25–12.5 mg/hour using a 1.25 mg/mL (0.125%) solution; max. 400 mg in 24 hours

Thoracic epidural block, ADULT and CHILD over 12 years, by continuous epidural infusion, 6.3–18.8 mg/hour using a 1.25 mg/mL (0.125%) or 2.5 mg/mL (0.25%) solution; max. 400 mg in 24 hours

Intra-articular block, ADULT and CHILD over 12 years, up to max. 100 mg using a 2.5 mg/mL (0.25%) solution; when co-administered with bupivicaine by another route, total max. 150 mg

Field block, ADULT and CHILD over 12 years, up to max. 150 mg using a 2.5 mg/mL (0.25%) solution

With fentanyl, see Buffy®

Important

The licensed doses stated above may not be appropriate in some settings and expert advice should be sought

Bupivacaine (Non-proprietary) (Por)
Injection, anhydrous bupivacaine hydrochloride 2.5 mg/mL (0.25%), net price 10 mL = 88p; 5 mg/mL (0.5%), 10 mL = 92p

Infusion ( epidural), anhydrous bupivacaine hydrochloride 1 mg/mL (0.1%), net price 100 mL = £9.41, 250 mL = £10.59; 1.25 mg/mL (0.125%), 250 mL = £10.80

Marcain® (AstraZeneca) (Por)
Injection, anhydrous bupivacaine hydrochloride 2.5 mg/mL (Marcain® 0.25%), net price 10-mL Polyamp® = £1.06; 5 mg/mL (Marcain® 0.5%), 10-mL Polyamp® = £1.21
Marcain Heavy\textsuperscript{\textregistered} (AstraZeneca) \textsuperscript{\textregistered}

Injection, anhydrous bupivacaine hydrochloride 5 mg/mL (0.5%), glucose 80 mg/mL, net price 4-mL amp = £1.45

Dose ADULT and CHILD over 12 years, intrathecal anaesthesia for surgery, 10–20 mg bupivacaine hydrochloride, dose may need to be reduced in elderly and in late pregnancy

\textbf{With adrenaline}

For prescribing information on adrenaline, see section 2.7.3; also see Use of Vasocostricers, p. 876.

Bupivacaine and Adrenaline (Non-proprietary) \textsuperscript{\textregistered}

Injection, anhydrous bupivacaine hydrochloride 2.5 mg/mL (0.25%), adrenaline 1 in 200,000 (5 micrograms/mL), net price 10-mL amp = £1.40

Injection, anhydrous bupivacaine hydrochloride 5 mg/mL (0.5%), adrenaline 1 in 200,000 (5 micrograms/mL), net price 10-mL amp = £2.10

\textbf{With fentanyl}

For prescribing information on fentanyl, see section 15.1.4.3

Bufl\textsuperscript{\textregistered} (AMCo) \textsuperscript{\textregistered}

Injection (epidural), bupivacaine hydrochloride 1 mg/mL (0.1%), fentanyl (as citrate) 2 micrograms/mL, net price 250 mL = £8.50, 500 mL = £9.20

Injection (epidural), bupivacaine hydrochloride 1.25 mg/mL (0.125%), fentanyl (as citrate) 2 micrograms/mL, net price 250 mL = £9.05, 500 mL = £9.20

Electrolytes Na\textsuperscript{+} < 0.5 mmol/mL

Dose ADULT, continuous lumbar epidural infusion during labour (once epidural block established), 10–18.75 mg/hour bupivacaine, 16–30 micrograms/hour fentanyl; continuous thoracic, upper abdominal, or lower abdominal epidural infusion for postoperative pain (once epidural block established), 4–18.75 mg/hour bupivacaine, 8–30 micrograms/hour fentanyl, max. 400 mg bupivacaine or 720 micrograms fentanyl in 24 hours; not recommended for use in children

Chloroprocaine

Chloroprocaine, a para-aminobenzoic acid ester, is used for spinal anaesthesia in adults where the planned procedure should not exceed 40 minutes.

\section*{CHLOROPROCAINE HYDROCHLORIDE}

\textbf{Indications} intrathecal anaesthesia for surgical procedures lasting up to 40 minutes

\textbf{Cautions} see Cautions of Local Anaesthetics, p. 877; also acute porphyria (section 9.8.2); \textbf{interactions}: Appendix 1 (chloroprocaine)

\textbf{Contra-indications} see Contra-indications of Local Anaesthetics, p. 877; also severe anaemia

\textbf{Hepatic impairment} use with caution in severe impairment

\textbf{Renal impairment} use with caution in severe impairment

\textbf{Pregnancy} avoid—no information available

\textbf{Breast-feeding} avoid—no information available

\textbf{Side-effects} see Toxicity and Side-effects, p. 877; also less commonly hypertension

Dose To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

\textbf{Note} Doses should be adjusted according to patient’s physical status and nature of the procedure—\textbf{important}: see also under Administration, p. 876

\begin{itemize}
  \item ADULT over 18 years, by slow intrathecal injection, 40–50 mg depending on desired length of block
\end{itemize}

\section*{Important}

The licensed doses stated above may not be appropriate in some settings and expert advice should be sought

Ampres\textsuperscript{\textregistered} (AMCo) \textsuperscript{\textregistered}

Injection, chloroprocaine hydrochloride 10 mg/mL, net price 5-mL amp = £8.75

\section*{Levobupivacaine}

Levobupivacaine, an isomer of bupivacaine, has anaesthetic and analgesic properties similar to bupivacaine, but is thought to have fewer adverse effects.

\section*{LEVOBUPIVACAINE}

\textbf{Note} Levobupivacaine is an isomer of bupivacaine

\textbf{Indications} see under Dose

\textbf{Cautions} see Cautions of Local Anaesthetics, p. 877; cardiovascular disease; \textbf{interactions}: Appendix 1 (levobupivacaine)

\textbf{Contra-indications} see Contra-indications of Local Anaesthetics, p. 877

\textbf{Hepatic impairment} use with caution

\textbf{Pregnancy} large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block; avoid if possible in the first trimester—toxicity in animal studies; may cause fetal distress syndrome; do not use for paracervical block in obstetrics; do not use 7.5 mg/mL strength in obstetrics

\textbf{Breast-feeding} amount too small to be harmful

\textbf{Side-effects} see Toxicity and Side-effects, p. 877; also sweating, pyrexia, anaemia

\section*{Dose}

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

\textbf{Note} Doses should be adjusted according to patient’s physical status and nature of procedure—\textbf{important}: see also under Administration, p. 876

\begin{itemize}
  \item Surgical anaesthesia Lumbar epidural, ADULT, 50–150 mg using a 5 mg/mL (0.5%) or 7.5 mg/mL (0.75%) solution, given over 5 minutes; caesarean section, 75–150 mg using a 5 mg/mL (0.5%) solution, given over 15–20 minutes
  \item Intrathecal injection, ADULT, 15 mg using a 5 mg/mL (0.5%) solution
  \item Peripheral nerve block, ADULT, 2.5–150 mg using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution
  \item Peribulbar block, ADULT, 37.5–112.5 mg using a 7.5 mg/mL (0.75%) solution
\end{itemize}
15.2 Local anaesthesia

Local infiltration, **ADULT**, 2.5–150 mg using a 2.5 mg/mL (0.25%) solution

- **Acute pain**
- **Lumbar epidural, ADULT**, labour pain, by intermittent injection, 15–25 mg using a 2.5 mg/mL (0.25%) solution, repeated as required at intervals of at least 15 minutes or by **continuous epidural infusion**, 5–12.5 mg/hour using a 1.25 mg/mL (0.125%) solution; postoperative pain, by **continuous epidural infusion**, 12.5–18.75 mg/hour using a 1.25 mg/mL (0.125%) or 2.5 mg/mL (0.25%) solution; max. 400 mg in 24 hours

**Important**
The licensed doses stated above may not be appropriate in some settings and expert advice should be sought

**Chirocaine**® (AbbVie)  
**Injection**, levobupivacaine (as hydrochloride) 2.5 mg/mL, net price 10-mL amp = £1.41; 5 mg/mL, 10-mL amp = £1.62; 7.5 mg/mL, 10-mL amp = £2.42  
**Note** For 1.25 mg/mL concentration dilute standard solutions with sodium chloride 0.9%.

**Epidural infusion**, levobupivacaine (as hydrochloride) 1.25 mg/mL, net price 100 mL = £7.26, 200 mL = £12.20

**Lidocaine**

Lidocaine is effectively absorbed from mucous membranes and is a useful surface anaesthetic in concentrations up to 10%. Except for surface anaesthesia and dental anaesthesia, solutions should not usually exceed 1% in strength. The duration of the block (with adrenaline) is about 90 minutes.

**LIDOCAINE HYDROCHLORIDE** (Lignocaine hydrochloride)

- **Indications** see under Dose; ventricular arrhythmias (section 2.3.2); eye (section 11.7); oral lesions (section 12.3.1)
- **Cautions** See Cautions of Local Anaesthetics, p. 877 and section 2.3.2; hypertension; topical preparations can damage plastic cuffs of endotracheal tubes
- **Contra-indications** see notes above, Contra-indications of Local Anaesthetics, p. 877, and section 2.3.2
- **Hepatic impairment** section 2.3.2
- **Renal impairment** section 2.3.2
- **Pregnancy** large doses can cause fetal bradycardia; large doses during delivery can cause neonatal respiratory depression, hypotonia, or bradycardia after paracervical or epidural block
- **Breast-feeding** section 2.3.2
- **Side-effects** see Toxicity and Side-effects, p. 877 and section 2.3.2; also methaemoglobinemia (see under Prilocaine (p. 882) for treatment), nystagmus, rash; hypoglycaemia also reported following intrathecal or extradural administration
- **Dose**

  - To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body weight
  - Infiltration anaesthesia, **ADULT**, according to patient’s weight and nature of procedure, max. 200 mg (or 500 mg if given in solutions containing adrenaline)—see also Administration, p. 876 and important warning below; **CHILD** under 18 years see **BNF for Children**
  - **Intravenous regional anaesthesia** and nerve blocks, seek expert advice
  - **Surface anaesthesia**, see preparations below

**Important**
The licensed doses stated above may not be appropriate in some settings and expert advice should be sought

- **Lidocaine hydrochloride injections**
  - **Lidocaine** (Non-proprietary)  
    **Injection**, lidocaine hydrochloride 5 mg/mL (0.5%), net price 10-mL amp = 50p; 10 mg/mL (1%), 2-mL amp = 27p, 5-mL amp = 27p, 10-mL amp = 40p, 10-mL prefilled syringe = £8.48; 20-mL amp = 76p; 20 mg/mL (2%), 2-mL amp = 31p, 5-mL amp = 31p

- **With adrenaline**
  - For prescribing information on adrenaline see section 2.7.3; see also Use of Vasoconstrictors, p. 876.

- **Xylocaine**® (AstraZeneca)  
  **Injection**, anhydrous lidocaine hydrochloride 10 mg/mL (1%), adrenaline 1 in 200 000 (5 micrograms/mL), net price 20-mL vial = £1.93
  **Excipients** include sulfates
  **Injection**, anhydrous lidocaine hydrochloride 20 mg/mL (2%), adrenaline 1 in 200 000 (5 micrograms/mL), net price 20-mL vial = £1.77
  **Excipients** include sulfates

- **Lidocaine injections for dental use**
  A variety of lidocaine injections with adrenaline is available in dental cartridges; brands include *Lignospan Special*®, *Rexocaine*®, and *Xylocaine*®.

  For prescribing information on adrenaline see section 2.7.3; see also Use of Vasoconstrictors, p. 876.

  **Note** Consult expert dental sources for specific advice in relation to dose of lidocaine for dental anaesthesia

- **Lidocaine for surface anaesthesia**
  - **Lidocaine** (Non-proprietary)
    - **Ointment**, lidocaine 5%, net price 15 g = £6.18
    - **Dose** dental practice, rub gently into dry gum
    - Sore nipples from breast-feeding, apply using gauge and wash off immediately before next feed
    - Pain relief (in anal fissures, haemorrhoids, pruritus ani, pruritus vulvae, herpes zoster, or herpes labialis), lubricant in cystoscopy or proctoscopy, apply 1–2 mL when necessary; avoid long-term use
    - **Dental prescribing on NHS** Lidocaine Ointment, 5% may be prescribed

- **Instillagel**® (CliniMed)
  - **Gel**, lidocaine hydrochloride 2%, chlorhexidine gluconate solution 0.25%, in a sterile lubricant basis in disposable syringe, net price 6-mL syringe = 23p, 11-mL syringe = 48p
  **Excipients** include hydroxybenzoates (parabens)
  **Dose** urethral sounding and catheterisation, 6–11 mL into urethra
  Cystoscopy, 11 mL (a further instillation of 6–11 mL may be required)
Lignylojet® (UCB Pharma)  

**Solution**, lidocaine hydrochloride 40 mg/mL (4%), net price per unit (4-mL vial and disposable sterile cannula with cover and vial injector) = £5.10

**Note** May be difficult to obtain

- Dose anaesthesia of mucous membranes of oropharynx, trachea, or respiratory tract, 40–200 mg (1–5 mL) as a single dose sprayed, instilled (if a cavity), or applied with a swab (reduce dose according to size, age and condition of patient), usual dose 160 mg (4 mL); CHILD up to 3 mg/kg

**LMX 4®** (Fremdale)  

**Cream**, lidocaine 4%, net price 5-g tube = £2.98; 30- g tube = £14.90; 12 × 5-g tube with 24 waterproof dressings = £38.16

**Excipients** include benzyl alcohol and propylene glycol

- **Dose** ADULT and CHILD over 1 month, anaesthesia before ventous cannulation or venepuncture, apply thick layer (1–2.5 g; CHILD under 1 year max. 1 g) to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 5 hours (CHILD 1–3 months, 60 minutes; CHILD 3 months–1 year, 4 hours); remove cream with gauge and perform procedure after approximately 5 minutes

**Versatis®** (Grunenthal)  

**Plasters**, lidocaine 5% (700 mg/medicated plaster), net price 50 g tube = £72.40

**Excipients** include hydroxybenzoates (parabens), propylene glycol

- **Dose** postherpetic neuralgia, ADULT over 18 years, apply to intact, dry, non-bony, non-irritated skin once daily for up to 12 hours, followed by a 12-hour plaster-free period; discontinue if no response after 4 weeks

**Note** Up to 3 plasters may be used to cover large areas; plasters may be cut

- **Note** The Scottish Medicines Consortium (p. 4) has advised (July 2008) that Versatis® is accepted for restricted use within NHS Scotland for the treatment of postherpetic neuralgia in patients who are intolerant of first-line systemic therapies or when they have been ineffective

**Xylocaine®** (AstraZeneca)  

**Spray**, lidocaine 10% (100 mg/g) supplying 10 mg lidocaine/dose; 500 spray doses per container, net price 50-mL bottle = £6.29

**Dose** dental practice, 1–5 doses

- **Maxillary sinus puncture, 3 doses**
- **During delivery in obstetrics, up to 20 doses**
- **Bronchoscopy, laryngoscopy, oesophagoscopy, endotracheal intubation, up to 20 doses; CHILD up to 3 mg/kg**

**With prilocaine**

- **For prescribing information on prilocaine, see p. 882**

**Lidocaine with prilocaine** (Non-proprietary)

**Cream**, lidocaine 2.5%, prilocaine 2.5%, net price 5-g tube = £2.25; 30-g tube (surgical pack) = £12.30; 5 × 5-g tube with 12 occlusive dressings (premedication pack) = £11.70

**Contra-contraindications** use in child less than 37 weeks corrected gestational age

- **Dose** ADULT and CHILD over 1 year, anaesthesia before minor skin procedures including venepuncture, apply thick layer under occlusive dressing 1–5 hours before procedure (2–5 hours before procedures on large areas e.g. split skin grafting); max. 2 doses in 24 hours for CHILD 1–12 years, CHILD under 3 months, max. 1 g under occlusive dressing 1–5 hours before procedure; max. 1 dose in 24 hours, CHILD 3–12 months, apply max. 2 g under occlusive dressing 1–5 hours before procedure; max. 2 doses in 24 hours

**Note** Shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca)

Anaesthesia on genital skin before injection of local anaesthetics, apply under occlusive dressing for 15 minutes (in adult men) and 60 minutes (in adult women)

Anaesthesia before surgical treatment of lesions on genital mucosa in adults, apply up to 10 g 5–10 minutes before procedure

Anaesthesia before cervical curettage in adults, administer 10 g in lateral vaginal fornices for 10 minutes

Anaesthesia before mechanical cleansing or debriement of leg ulcer in adults, apply up to 10 g under occlusive dressing for 30–60 minutes

**With tetracaine**

For prescribing information on tetracaine, see p. 883

**Pliaglis®** (Galderma)  

**Cream**, lidocaine 7% (70 mg/g), tetracaine 7% (70 mg/g), net price 15-g tube = £22.95

**Excipients** include hydroxybenzoates (parabens)

- **Dose** ADULT anaesthesia before dermatological procedures and venepuncture, apply 1 mm layer using a spatula 30 minutes before procedure, then peel off immediately before procedure; max. application area 400 cm²

**Note** Application time of 60 minutes indicated for certain procedures, such as laser-assisted tattoo removal and laser leg vein ablation

**Lidocaine for ear, nose, and oropharyngeal use**

For prescribing information on phenylephrine, see section 2.7.2

**Lidocaine with phenylephrine** (Non-proprietary)

**Topical solution**, lidocaine hydrochloride 5%, phenylephrine hydrochloride 0.5%, net price 2.5 mL (with nasal applicator) = £11.48

- **Dose** anaesthesia before nasal surgery, endoscopy, laryngoscopy, or removal of foreign bodies from the nose, ADULT and CHILD over 12 years, up to max. 8 sprays
Mepivacaine

Mepivacaine is an amide-type local anaesthetic used for dental anaesthesia (see Dental Anaesthesia, p. 877).

**MEPIVACAINE HYDROCHLORIDE**

**Indications** infiltration anaesthesia and nerve block in dentistry

**Cautions** see Cautions of Local Anaesthetics, p. 877

**Contra-indications** see Contra-indications of Local Anaesthetics, p. 877

**Hepatic impairment** use with caution; increased risk of side-effects in severe impairment

**Renal impairment** use with caution; increased risk of side-effects

**Pregnancy** use with caution in early pregnancy

**Breast-feeding** use with caution

**Side-effects** see Toxicity and Side-effects, p. 877

**Dose**

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

- ADULT and CHILD over 3 years, consult expert dental sources; important: see also Administration, p. 876

**Scandonest® 3% Plain** (Septodont) 

**Injection** mepivacaine hydrochloride 30 mg/mL, net price 2.2-mL cartridge = 36 p

**With adrenaline**

For prescribing information on adrenaline, see section 2.7.3; see also Use of Vasoconstrictors, p. 876.

**Scandonest® 2% Special** (Septodont)

**Injection** mepivacaine hydrochloride 20 mg/mL, adrenaline 1 in 100 000 (10 micrograms/mL), net price 2.2-mL cartridge = 36 p

**Excipients** include sulfites

Prilocaine

Prilocaine is a local anaesthetic of low toxicity which is similar to lidocaine. If used in high doses, methaemoglobinemia may occur, which can be treated with an intravenous injection of methylthioninium chloride (see Emergency Treatment of Poisoning, p. 34). Infants under 6 months are particularly susceptible to acquired methaemoglobinemia. A hyperbaric solution of prilocaine (containing glucose) may be used for spinal anaesthesia.

**PRILOCAIN HYDROCHLORIDE**

**Indications** see under preparations

**Cautions** see Cautions of Local Anaesthetics, p. 877; severe or untreated hypertension; concomitant use of drugs that cause methaemoglobinemia; acute porphyria (section 9.8.2); 

**Interactions** Appendix 1 (prilocaine)

**Contra-indications** see Contra-indications of Local Anaesthetics, p. 877; anaemia or congenital or acquired methaemoglobinemia

**Hepatic impairment** use with caution; lower doses may be required for intrathecal anaesthesia

**Renal impairment** use with caution; lower doses may be required for intrathecal anaesthesia

Pregnancy

large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block; avoid paracervical or pudendal block in obstetrics (neonatal methaemoglobinemia reported); use lower doses for intrathecal use during late pregnancy

Breast-feeding

present in milk but not known to be harmful

**Side-effects** see notes above and Toxicity and Side-effects, p. 877; also hypertension

**Dose**

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

- See under preparations—important: see also Administration, p. 876

**Citane 1%** (Astra Zeneca)

**Injection** prilocaine hydrochloride 10 mg/mL, net price 50-mL multidose vial = £5.06

**Dose** infiltration anaesthesia and nerve block, adjusted according to site of administration and response, 100–200 mg/minute, or in incremental doses, to max. total dose 400 mg (dose may need to be adjusted in ELDERLY or debilitated patients); CHILD over 6 months up to 5 mg/kg

**Prilotekal®** (AMCO)

**Injection** prilocaine hydrochloride 20 mg/mL (2%), glucose 60 mg/mL, net price 5-mL amp = £7.88

**Dose** spinal anaesthesia, by intrathecal injection, ADULT over 18 years, usually 40–60 mg, max. 80 mg (dose may need to be reduced in ELDERLY or debilitated patients, or in late pregnancy)

**Note** The Scottish Medicines Consortium (p. 4) has advised (December 2010) that prilocaine 2% hyperbaric solution for injection (Prilotekal®) is accepted for restricted use within NHS Scotland for use in spinal anaesthesia in ambulatory surgery settings.

**With lidocaine**

See Lidocaine, p. 881

**For dental use**

**Note** Consult expert dental sources for specific advice in relation to dose of prilocaine for dental anaesthesia.

**Citane 3% with Octapressin®** (Dentsply)

**Injection** prilocaine hydrochloride 30 mg/mL, felypressin 0.03 unit/mL, net price 2.2-mL cartridge and self-aspiring cartridge (both) = 47p

Ropivacaine

Ropivacaine is an amide-type local anaesthetic agent similar to bupivacaine. It is less cardiotoxic than bupivacaine, but also less potent.

**ROPICNAINE HYDROCHLORIDE**

**Indications** see under Dose

**Cautions** see Cautions of Local Anaesthetics, p. 877; also acute porphyria (section 9.8.2); 

**Interactions** Appendix 1 (ropivacaine)

**Contra-indications** see Contra-indications of Local Anaesthetics, p. 877

**Hepatic impairment** use with caution in severe impairment

**Renal impairment** caution in severe impairment; increased risk of systemic toxicity in chronic renal failure
Pregnancy not known to be harmful; do not use for paracervical block in obstetrics

Breast-feeding not known to be harmful

Side-effects see Toxicity and Side-effects, p. 877; also hypertension, pyrexia; less commonly syncope and hypothermia

Dose

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

Note Doses should be adjusted according to patient’s physical status and nature of procedure—important see also under Administration, p. 876

● Surgical anaesthesia

Lumbar epidural block, ADULT and CHILD over 12 years, 113–200 mg using a 7.5 mg/mL (0.75%) or 10 mg/mL (1%) solution, caesarean section, 113–150 mg in incremental doses using a 7.5 mg/mL (0.75%) solution

Thoracic epidural block (to establish block for postoperative pain), ADULT and CHILD over 12 years, 38–113 mg using a 7.5 mg/mL (0.75%) solution

Major nerve block (brachial plexus block), ADULT and CHILD over 12 years, 225–300 mg using a 7.5 mg/mL (0.75%) solution

Field block, ADULT and CHILD over 12 years, 7.5–225 mg using a 7.5 mg/mL (0.75%) solution

● Acute pain, using a 2 mg/mL (0.2%) solution

Lumbar epidural block, ADULT and CHILD over 12 years, 20–40 mg followed by 20–30 mg at intervals of at least 30 minutes; or as a continuous epidural infusion (labour pain) 12–20 mg/hour (up to 28 mg/hour for postoperative pain)

Thoracic epidural block (for postoperative pain), ADULT and CHILD over 12 years, 12–28 mg/hour as a continuous epidural infusion

Field block, ADULT and CHILD over 12 years, 2–200 mg

Peripheral nerve block, ADULT and CHILD over 12 years, 10–20 mg/hour as a continuous infusion or by intermittent injection

Ropivacaine (Non-proprietary) (Th)

Injection, ropivacaine hydrochloride 2 mg/mL, net price 10 mL = £1.65; 7.5 mg/mL, 10 mL = £2.50; 10 mg/mL, 10 mL = £3.00

Infusion, ropivacaine hydrochloride 2 mg/mL, net price 200 mL = £13.70

Naropin® (AstraZeneca) (Th)

Injection, ropivacaine hydrochloride 2 mg/mL, net price 10-mL Polyamp® = £1.37; 7.5 mg/mL, 10-mL Polyamp® = £2.65; 10 mg/mL, 10-mL Polyamp® = £3.20

Electrolytes Na+ <0.5 mmol/mL

Infusion, ropivacaine hydrochloride 2 mg/mL, net price 200-mL Polybag® = £17.34

Electrolytes Na+ <0.5 mmol/mL

Tetracaine

Tetracaine, a para-aminobenzoic acid ester, is an effective local anaesthetic for topical application; a 4% gel is indicated for anaesthesia before venepuncture or venous cannulation. It is rapidly absorbed from mucous membranes and should never be applied to inflamed, traumatised, or highly vascular surfaces. It should never be used to provide anaesthesia for bronchoscopy or cystoscopy because lidocaine is a safer alternative.
Interactions

Two or more drugs given at the same time may exert their effects independently or may interact. The interaction may be potentiation or antagonism of one drug by another, or occasionally some other effect. Adverse drug interactions should be reported to the Medicines and Healthcare products Regulatory Agency (MHRA), through the Yellow Card Scheme (see Adverse Reactions to Drugs, p. 12), as for other adverse drug reactions.

Drug interactions may be pharmacodynamic or pharmacokinetic.

Pharmacodynamic interactions

These are interactions between drugs which have similar or antagonistic pharmacological effects or side-effects. They may be due to competition at receptor sites, or occur between drugs acting on the same physiological system. They are usually predictable from a knowledge of the pharmacology of the interacting drugs; in general, those demonstrated with one drug are likely to occur with related drugs. They occur to a greater or lesser extent in most patients who receive the interacting drugs.

Pharmacokinetic interactions

These occur when one drug alters the absorption, distribution, metabolism, or excretion of another, thus increasing or reducing the amount of drug available to produce its pharmacological effects. They are not easily predicted and many of them affect only a small proportion of patients taking the combination of drugs. Pharmacokinetic interactions occurring with one drug cannot be assumed to occur with related drugs unless their pharmacokinetic properties are known to be similar.

Pharmacokinetic interactions are of several types:

**Affecting absorption** The rate of absorption or the total amount absorbed can both be altered by drug interactions. Delayed absorption is rarely of clinical importance unless high peak plasma concentrations are required (e.g. when giving an analgesic). Reduction in the total amount absorbed, however, may result in ineffective therapy.

**Due to changes in protein binding** To a variable extent most drugs are loosely bound to plasma proteins. Protein-binding sites are non-specific and one drug can displace another thereby increasing its proportion free to diffuse from plasma to its site of action. This only produces a detectable increase in effect if it is an extensively bound drug (more than 90%) that is not widely distributed throughout the body. Even so displacement rarely produces more than transient potentiation because this increased concentration of free drug results in an increased rate of elimination.

Displacement from protein binding plays a part in the potentiation of warfarin by sulfonamides and tolbutamide but the importance of these interactions is due mainly to the fact that warfarin metabolism is also inhibited.

**Affecting metabolism** Many drugs are metabolised in the liver. Induction of the hepatic microsomal enzyme system by one drug can gradually increase the rate of metabolism of another, resulting in lower plasma concentrations and a reduced effect. On withdrawal of the inducer plasma concentrations increase and toxicity may occur. Barbiturates, griseofulvin, many antiepileptics, and rifampicin are the most important enzyme inducers. Drugs affected include warfarin and the oral contraceptives. Conversely when one drug inhibits the metabolism of another higher plasma concentrations are produced, rapidly resulting in an increased effect with risk of toxicity. Some drugs which potentiate warfarin and phenytoin do so by this mechanism.

**Isoenzymes of the hepatic cytochrome P450 system interact with a wide range of drugs.** Drugs may be substrates, inducers or inhibitors of the different isoenzymes. A great deal of in-vitro information is available on the effect of drugs on the isoenzymes; however, since drugs are eliminated by a number of different metabolic routes as well as renal excretion, the clinical effects of interactions cannot be predicted accurately from laboratory data on the cytochrome P450 isoenzymes. Except where a combination of drugs is specifically contra-indicated, the BNF presents only interactions that have been reported in clinical practice. In all cases the possibility of an interaction must be considered if toxic effects occur or if the activity of a drug diminishes.

**Affecting renal excretion** Drugs are eliminated through the kidney both by glomerular filtration and by active tubular secretion. Competition occurs between those which share active transport mechanisms in the proximal tubule. For example, salicylates and some other NSAIDs delay the excretion of methotrexate; serious methotrexate toxicity is possible.

**Relative importance of interactions**

Many drug interactions are harmless and many of those which are potentially harmful only occur in a small proportion of patients; moreover, the severity of an interaction varies from one patient to another. Drugs with a small therapeutic ratio (e.g. phenytoin) and those which require careful control of dosage (e.g. anticoagulants, antihypertensives, and antidiabetics) are most often involved.

Patients at increased risk from drug interactions include the elderly and those with impaired renal or liver function.

**Serious interactions** The symbol ● has been placed against interactions that are potentially serious and where concomitant administration of the drugs involved should be avoided (or only undertaken with caution and appropriate monitoring).
Interactions that have no symbol do not usually have serious consequences.

List of drug interactions

The following is an alphabetical list of drugs and their interactions; to avoid excessive cross-referencing each drug or group is listed twice: in the alphabetical list and also against the drug or group with which it interacts. For explanation of symbol see above

Abacavir
Analgesics: abacavir possibly reduces plasma concentration of methadone
Antibacterials: plasma concentration of abacavir possibly reduced by rifampicin
Antiepileptics: plasma concentration of abacavir possibly reduced by phenobarbital and phenytoin
Antituberculars: abacavir possibly reduces effects of rifabutin; plasma concentration of abacavir reduced by rifabutin
Orlistat: absorption of abacavir possibly reduced by orlistat

Abatacept
Adalimumab: increased risk of side-effects when abatacept given with adalimumab
Certolizumab pegol: avoid concomitant use of abatacept with certolizumab pegol
Etanercept: avoid concomitant use of abatacept with etanercept
Golimumab: avoid concomitant use of abatacept with golimumab
Infliximab: avoid concomitant use of abatacept with infliximab
Vaccines: avoid concomitant use of abatacept with live vaccines (see p. 828)

Abiraterone
alpha-blockers: plasma concentration of abiraterone possibly reduced by alfuzosin—manufacturer of abiraterone advises avoid concomitant use; plasma concentration of abiraterone reduced by alfuzosin—manufacturer of abiraterone advises avoid concomitant use
Antidepressants: plasma concentration of abiraterone possibly reduced by St John’s wort—manufacturer of abiraterone advises avoid concomitant use
Antiepileptics: plasma concentration of abiraterone possibly reduced by carbamazepine, phenobarbital and phenytoin—manufacturer of abiraterone advises avoid concomitant use
Anticoagulants: increased risk of anaemia when abiraterone given with warfarin

Acabarose see Antidiabetics

ACE Inhibitors
Alcohol: enhanced hypotensive effect when ACE inhibitors given with alcohol
Aldesleukin: enhanced hypotensive effect when ACE inhibitors given with aldesleukin
Aliskiren: avoid concomitant use of ACE inhibitors with aliskiren (see also under Renin inhibitors, p. 128)
Allopurinol: manufacturers state possible increased risk of leucopenia and hypersensitivity reactions when ACE inhibitors given with allopurinol especially in renal impairment
Alpha-blockers: enhanced hypotensive effect when ACE inhibitors given with alpha-blockers
Antiepileptics: General: enhanced hypotensive effect when ACE inhibitors given with general anaesthetics
Analgesics: increased risk of renal impairment when ACE inhibitors given with NSAIDs, also hypotensive effect antagonised
Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when ACE inhibitors given with angiotensin-II receptor antagonists
Antibacterials: plasma concentration of active metabolite of imidapril reduced by rifampicin (reduced antihypertensive effect); quinapril tablets reduce absorption of tetracyclines (quinapril tablets contain magnesium carbonate); possible increased risk of hyperkalaemia when ACE inhibitors given with trimethoprim
Anticoagulants: increased risk of hyperkalaemia when ACE inhibitors given with heparins
Antidepressants: hypertensive effect of ACE inhibitors possibly enhanced by MAOIs
Antidiabetic: ACE inhibitors possibly enhance hypoglycaemic effect of insulin, metformin and sulphonylureas
Antipsychotics: enhanced hypotensive effect when ACE inhibitors given with antipsychotics
Anxiolytics and Hypnotics: enhanced hypotensive effect when ACE inhibitors given with anxiolytics and hypnotics
Avanafil: enhanced hypotensive effect when ACE inhibitors given with avanafil
Azathioprine: increased risk of anaemia or leucopenia when captopril given with azathioprine especially in renal impairment; increased risk of anaemia when enalapril given with azathioprine especially in renal impairment
Beta-blockers: enhanced hypotensive effect when ACE inhibitors given with beta-blockers
Calcium-channel Blockers: enhanced hypotensive effect when ACE inhibitors given with calcium-channel blockers
Cardiac Glycosides: captopril possibly increases plasma concentration of digoxin
Ciclosporin: increased risk of hyperkalaemia when ACE inhibitors given with ciclosporin
Clonidine: enhanced hypotensive effect when ACE inhibitors given with clonidine; antihypertensive effect of captopril possibly delayed by previous treatment with clonidine
Corticosteroids: hypertensive effect of ACE inhibitors antagonised by corticosteroids
Diazoxide: enhanced hypotensive effect when ACE inhibitors given with diazoxide
Diuretics: enhanced hypotensive effect when ACE inhibitors given with diuretics; increased risk of severe hyperkalaemia when ACE inhibitors given with potassium-sparing diuretics and aldosterone antagonists
Dopaminergics: enhanced hypotensive effect when ACE inhibitors given with levodopa
Gold: flushing and hypotension reported when ACE inhibitors given with sodium aurothiomalate
Lithium: ACE inhibitors reduce excretion of lithium (increased plasma concentration) when used with lithium
Methylpiperazine: enhanced hypotensive effect when ACE inhibitors given with methylpiperazine
Minoxidil: enhanced hypotensive effect when ACE inhibitors given with minoxidil
Moxonidine: enhanced hypotensive effect when ACE inhibitors given with moxonidine
Muscle Relaxants: enhanced hypotensive effect when ACE inhibitors given with baclofen or tizanidine
Nitrates: enhanced hypotensive effect when ACE inhibitors given with nitrates
Oestrogens: hypotensive effect of ACE inhibitors antagonised by oestrogens
Potassium Salts: increased risk of severe hyperkalaemia when ACE inhibitors given with potassium salts
Probenecid: excretion of captopril reduced by probenecid
Appendix 1: Interactions

ACE Inhibitors (continued)
Prostaglandins: enhanced hypotensive effect when ACE inhibitors given with alprostadil
 Vasodilator Antihypertensives: enhanced hypotensive effect when ACE inhibitors given with hydralazine, minoxidil or sodium nitroprusside

Acetohexamidine see Alpha-blockers
Adrenergic Neurone Blockers (continued)
Alpha-blockers: enhanced hypotensive effect when adrenergic neurone blockers given with alpha-blockers
• Anesthetics, General: enhanced hypotensive effect when adrenergic neurone blockers given with general anesthetics
 Analgesics: hypotensive effect of adrenergic neurone blockers antagonised by NSAIDs
 Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when adrenergic neurone blockers given with angiotensin-II receptor antagonists
 Antidepressants: enhanced hypotensive effect when adrenergic neurone blockers given with MAOIs; hypotensive effect of adrenergic neurone blockers antagonised by tricyclics
 Antipsychotics: hypotensive effect of adrenergic neurone blockers antagonised by haloperidol; hypotensive effect of adrenergic neurone blockers antagonised by higher doses of chlorpromazine; enhanced hypotensive effect when adrenergic neurone blockers given with phenothiazines
 Anxiolytics and Hypnotics: enhanced hypotensive effect when adrenergic neurone blockers given with anxiolytics and hypnotics
 Beta-blockers: enhanced hypotensive effect when adrenergic neurone blockers given with beta-blockers
 Calcium-channel Blockers: enhanced hypotensive effect when adrenergic neurone blockers given with calcium-channel blockers
 Clonidine: enhanced hypotensive effect when adrenergic neurone blockers given with clonidine
 Corticosteroids: hypotensive effect of adrenergic neurone blockers antagonised by corticosteroids
 Diltiazem: enhanced hypotensive effect when adrenergic neurone blockers given with diltiazem
 Diazoxide: enhanced hypotensive effect when adrenergic neurone blockers given with diazoxide
 Diuretics: enhanced hypotensive effect when adrenergic neurone blockers given with diuretics
 Dopaminergics: enhanced hypotensive effect when adrenergic neurone blockers given with Dopaminergics
 Hydroxybenzylamine: enhanced hypotensive effect when adrenergic neurone blockers given with hydroxybenzylamine
 Hydralazine: enhanced hypotensive effect when adrenergic neurone blockers given with hydralazine
 Isosorbide Mononitrate: enhanced hypotensive effect when adrenergic neurone blockers given with isosorbide Mononitrate
 Labetalol: enhanced hypotensive effect when adrenergic neurone blockers given with labetalol
 Minoxidil: enhanced hypotensive effect when adrenergic neurone blockers given with minoxidil
 Moxisylyte: enhanced hypotensive effect when adrenergic neurone blockers given with moxisylyte
 Methylphenidate: enhanced hypotensive effect when adrenergic neurone blockers given with methylphenidate
 Moexipril: enhanced hypotensive effect when adrenergic neurone blockers given with moexipril
 Nifedipine: enhanced hypotensive effect when adrenergic neurone blockers given with nifedipine
 Nitrates: enhanced hypotensive effect when adrenergic neurone blockers given with nitrates
 Oestrogens: hypotensive effect of adrenergic neurone blockers antagonised by oestrogens
 Pizotifen: hypotensive effect of adrenergic neurone blockers antagonised by pizotifen
 Prazosin: enhanced hypotensive effect when adrenergic neurone blockers given with prazosin
 Prostaglandins: enhanced hypotensive effect when adrenergic neurone blockers given with alprostadil
• Sympathomimetics: hypotensive effect of guanethidine antagonised by dexametanamine and skelaxate
• Vasodilator Antihypertensives: enhanced hypotensive effect when adrenergic neurone blockers given with vasodilator Antihypertensives
 Adosorbents see Kaolin
Afinil
Antithyroid: plasma concentration of atafinil possibly increased by amiodarone—manufacturer of atafinil advises separating administration of amiodarone by 6 to 12 hours
Antibacterials: plasma concentration of atafinil possibly increased by erythromycin—manufacturer of
Afinib
Antibacterial: (continued)
Afinib advises separating administration of erythromycin by 6 to 12 hours; plasma concentration of afinib reduced by rifampicin.
Antifungals: plasma concentration of afinib possibly increased by itaconazole—manufacturer of afinib advises separating administration of itaconazole by 6 to 12 hours.
Antivirals: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis).
Antivirals: plasma concentration of afinib increased by ritonavir—manufacturer of afinib advises separating administration of ritonavir by 6 to 12 hours; plasma concentration of afinib possibly increased by saquinavir—manufacturer of afinib advises separating administration of saquinavir by 6 to 12 hours.
Calcium-channel Blockers: plasma concentration of afinib possibly increased by verapamil—manufacturer of afinib advises separating administration of verapamil by 6 to 12 hours.
Ciclosporin: plasma concentration of afinib possibly increased by ciclosporin—manufacturer of afinib advises separating administration of ciclosporin by 6 to 12 hours.
Tacrolimus: plasma concentration of afinib possibly increased by tacrolimus—manufacturer of afinib advises separating administration of tacrolimus by 6 to 12 hours.
Agalsidase Alfa and Beta
Anti-arhytmics: effects of agalsidase alfa and beta possibly inhibited by amiodarone (manufacturers of agalsidase alfa and beta advise avoid concomitant use).
Antibacterial: effects of agalsidase alfa and beta possibly inhibited by gentamicin (manufacturers of agalsidase alfa and beta advise avoid concomitant use).
Antimalarial: effects of agalsidase alfa and beta possibly inhibited by chloroquine and hydroxychloroquine (manufacturers of agalsidase alfa and beta advise avoid concomitant use).
Agomelatine
• Antibacterial: manufacturer of agomelatine advises avoid concomitant use with ciprofloxacin.
• Antidepressant: metabolism of agomelatine inhibited by bupropion (increased plasma concentration).
• Antimalarial: avoidance of antidepressants advised by manufacturer of artemether with lumefantrine and piperazine with arteminol.
• Atomoxetine: possible increased risk of convulsions when antidepressants given with atomoxetine.
Alcohol
ACE inhibitors: enhanced hypotensive effect when alcohol given with ACE inhibitors.
Adrenergic Neurone Blockers: enhanced hypotensive effect when alcohol given with alpha-blockers.
Alpha blockers: increased sedative effect when alcohol given with indoramin; enhanced hypotensive effect when alcohol given with alpha-blockers.
Analgesics: enhanced hypotensive and sedative effects when alcohol given with opioid analgesics.
Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when alcohol given with angiotensin-II receptor antagonists.
• Antibacterial: disulfiram-like reaction when alcohol given with metronidazole; possibility of disulfiram-like reaction when alcohol given with tindazole; increased risk of convulsions when alcohol given with cycloserine.
• Anticoagulants: major changes in consumption of alcohol may affect anticoagulant control with coumarins or phenindione.
Alcohol (continued)
• Antidepressants: some beverages containing alcohol and some dealkoholised beverages contain tyramine which interacts with MAOIs (hypertensive crisis)—if no tyramine, enhanced hypotensive effect; sedative effects possibly increased when alcohol given with SSRIs; increased sedative effect when alcohol given with emtricitabine, 5-minute-related anti depressants or tricyclics.
Antidiabetics: alcohol enhances hypoglycaemic effect of antidiabetics; increased risk of lactic acidosis when alcohol given with metformin.
Antiepileptics: alcohol possibly increases CNS side-effects of carbamazepine; increased sedative effect when alcohol given with phenobarbital; chronic heavy consumption of alcohol possibly reduces plasma concentration of phenytoin; increased risk of blurred vision when alcohol given with retigabine.
Antifungals: effects of alcohol possibly enhanced by griesefulin.
Antihistamines: increased sedative effect when alcohol given with antihistamines (possibly less effect with non-sedating antihistamines).
Antimuscarinics: increased sedative effect when alcohol given with hyoscine.
Antipsychotics: increased sedative effect when alcohol given with antipsychotics.
Anxiolytics and Hypnotics: increased sedative effect when alcohol given with anxiolytics and hypnotics.
• Avanafil: possible enhanced hypotensive effect when alcohol given with avanafil.
• Beta-blockers: enhanced hypotensive effect when alcohol given with beta-blockers.
Calcium-channel Blockers: enhanced hypotensive effect when alcohol given with calcium-channel blockers; plasma concentration of alcohol possibly increased by verapamil.
Clonidine: enhanced hypotensive effect when alcohol given with clonidine.
Cytotoxic: disulfiram-like reaction when alcohol given with disulfiram.
• Dipexetine: increased sedative effect when alcohol given with dapoxetine.
Diazoxide: enhanced hypotensive effect when alcohol given with diazoxide.
Disulfiram: disulfiram reaction when alcohol given with disulfiram (see p. 334).
Diatrics: enhanced hypotensive effect when alcohol given with diatrics.
Dopaminergics: alcohol reduces tolerance to bromocriptine.
Levamisole: possibility of disulfiram-like reaction when alcohol given with levamisole.
Lipid-regulating Drugs: avoidance of alcohol advised by manufacturer of lomitapide.
Lofestidine: increased sedative effect when alcohol given with lofestidine.
Methyldopa: enhanced hypotensive effect when alcohol given with methyldopa.
Metoclopramide: absorption of alcohol possibly increased by metoclopramide.
Moxonidine: enhanced hypotensive effect when alcohol given with moxonidine.
Muscle Relaxants: increased sedative effect when alcohol given with baclofen, methocarbamol or tizanidine.
Nicorandil: alcohol possibly enhances hypotensive effect of nicorandil.
Nitrites: enhanced hypotensive effect when alcohol given with nitrites.
Paraldehyde: increased sedative effect when alcohol given with paraldehyde.
Retinoids: presence of alcohol causes etretinate to be formed from isotretin (increased risk of teratogenicity in women of child-bearing potential).
Appendix 1: Interactions

Alcohol (continued)
Sympathomimetics: alcohol possibly enhances effects of methylphenidate
Vasodilator Antihypertensives: enhanced hypotensive effect when alcohol given with hydralazine, minoxidil or sodium nitroprusside

Aldesleukin
ACE Inhibitors: enhanced hypotensive effect when aldesleukin given with ACE inhibitors
Alpha-blockers: enhanced hypotensive effect when aldesleukin given with alpha-blockers
Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when aldesleukin given with angiotensin-II receptor antagonists
Antivirals: aldesleukin possibly increases plasma concentration of indinavir
Beta-blockers: enhanced hypotensive effect when aldesleukin given with beta-blockers
Calcium-channel Blockers: enhanced hypotensive effect when aldesleukin given with calcium-channel blockers
Clonidine: enhanced hypotensive effect when aldesleukin given with clonidine
Corticosteroids: manufacturer of aldesleukin advises avoid concomitant use with corticosteroids
Cytoxics: manufacturer of aldesleukin advises avoid concomitant use with cisplatin, dacarbazine and vinblastine
Diazoxide: enhanced hypotensive effect when aldesleukin given with diazoxide
Diuretics: enhanced hypotensive effect when aldesleukin given with diuretics
Methyldopa: enhanced hypotensive effect when aldesleukin given with methyldopa
Moxonidine: enhanced hypotensive effect when aldesleukin given with moxonidine
Nitrates: enhanced hypotensive effect when aldesleukin given with nitrates
Vasodilator Antihypertensives: enhanced hypotensive effect when aldesleukin given with hydralazine, minoxidil or sodium nitroprusside

Aletuzumab
Vaccines: avoid concomitant use of aletuzumab with live vaccines (see p. 828)
Alendronic Acid see Bisphosphonates
Alfentanil see Opioid Analgesics
Alfuzosin see Alpha-blockers
Alimemazine see Antihistamines
Aliskiren
ACE Inhibitors: avoid concomitant use of aliskiren with ACE inhibitors (see also under Renin inhibitors, p. 128)
Analgesics: hypotensive effect of aliskiren possibly antagonised by NSAIDs
Angiotensin-II Receptor Antagonists: avoid concomitant use of aliskiren with angiotensin-II receptor antagonists (see also under Renin inhibitors, p. 128); plasma concentration of aliskiren possibly reduced by ibesartan
Antibacterials: plasma concentration of aliskiren reduced by rifampicin
Anticoagulants: increased risk of hyperkalaemia when aliskiren given with heparin
Anti-arrhythmias: plasma concentration of aliskiren increased by encainide—avoid concomitant use with verapamil
Ciclosporin: plasma concentration of aliskiren increased by ciclosporin—avoid concomitant use
Diuretics: aliskiren reduces plasma concentration of furosemide; increased risk of hyperkalaemia when aliskiren given with potassium-sparing diuretics and aldosterone antagonists
Grapefruit Juice: plasma concentration of aliskiren reduced by grapefruit juice—avoid concomitant use

Alopecurin (continued)
ACE Inhibitors: manufacturers state possible increased risk of leucopenia and hypersensitivity reactions when alopecurin given with ACE inhibitors especially in renal impairment
Antibacterials: increased risk of rash when alopecurin given with amoxicillin or ampicillin
Anticoagulants: alopecurin possibly enhances anti-coagulant effect of coumarins
Antivirals: alopecurin increases plasma concentration of didanosine (risk of toxicity)—avoid concomitant use
Azathioprine: alopecurin enhances effects and increases toxicity of azathioprine (reduce dose of azathioprine to one quarter of usual dose)
Ciclosporin: alopecurin possibly increases plasma concentration of ciclosporin (risk of nephrotoxicity)
Cytoxics: alopecurin enhances effects and increases toxicity of mercaptopurine (reduce dose of mercaptopurine to one quarter of usual dose); avoidance of alopecurin advised by manufacturer of methotrexate
Diuretics: increased risk of hypersensitivity when alopecurin given with thiazides and related diuretics especially in renal impairment
Theophylline: alopecurin possibly increases plasma concentration of theophylline

Almotriptan see SHT-receptor Agonists (under HT)
Alogliptin see Antidiabetics
Alpha-2-adrenoceptor Stimulants see Apaclonidine, Brimonidine, Clonidine, and Methyldopa
Alpha-blockers
ACE Inhibitors: enhanced hypotensive effect when alpha-blockers given with ACE inhibitors
Adrenergic Neurone Blockers: enhanced hypotensive effect when alpha-blockers given with adrenergic neurone blockers
Alcohol: enhanced hypotensive effect when alpha-blockers given with alcohol; increased sedative effect when indoram given with alcohol
Aldesleukin: enhanced hypotensive effect when alpha-blockers given with aldesleukin
Antidepressants, General: enhanced hypotensive effect when alpha-blockers given with general anaesthetics
Analgesics: hypotensive effect of alpha-blockers antagonised by NSAIDs
Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when alpha-blockers given with angiotensin-II receptor antagonists
Antidepressants: manufacturer of indoramin advises avoid concomitant use with MAOIs; enhanced hypotensive effect when alpha-blockers given with MAOIs
Antipsychotics: enhanced hypotensive effect when alpha-blockers given with antipsychotics
Antivirals: enhanced hypotensive effect when alpha-blockers given with antivirals; possibly increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
Alpha-blockers (continued)
- Calcium-channel Blockers: enhanced hypotensive effect when alpha-blockers given with calcium-channel blockers, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin; plasma concentration of tamsulosin increased by verapamil
- Cardiac Glycosides: prazosin increases plasma concentration of digoxin
- Clonidine: enhanced hypotensive effect when alpha-blockers given with clonidine
- Cobicistat: plasma concentration of alfuzosin possibly increased by cobicistat—manufacturer of cobicistat advises avoid concomitant use
- Corticosteroids: hypotensive effect of alpha-blockers antagonised by corticosteroids
- Diazoxide: enhanced hypotensive effect when alpha-blockers given with diazoxide
- Diazepam: enhanced hypotensive effect when alpha-blockers given with diazepam, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
- Dopaminergics: enhanced hypotensive effect when alpha-blockers given with levodopa
- Methyldopa: enhanced hypotensive effect when alpha-blockers given with methyldopa
- Moxisylyte: possible severe postural hypotension when alpha-blockers given with moxisylyte
- Moxonidine: enhanced hypotensive effect when alpha-blockers given with moxonidine
- Muscle Relaxants: enhanced hypotensive effect when alpha-blockers given with levodopa
- Sildenafil: enhanced hypotensive effect when alpha-blockers given with sildenafil—also see p. 558
- Sympathomimetics: avoid concomitant use of tolazoline with adrenaline (epinephrine) or dopamine
- Tadalafil: enhanced hypotensive effect when alpha-blockers given with tadalafil
- Tolazoline: increased risk of side-effects when amantadine given with tolazoline

Amantadine (continued)
- Tetrabenazine: increased risk of extrapyramidal side-effects when amantadine given with tetrabenazine

Ambisentan
- Antibacterials: plasma concentration of ambisentan possibly increased by rifampicin

Amikacin see Aminoglycosides

Aminophylline see Diuretics

Aminoglycosides
- Agalsidase Alfa and Beta: gentamicin possibly inhibits effects of agalsidase alfa and beta (manufacturers of agalsidase alfa and beta advise avoid concomitant use)
- Analgesics: plasma concentration of amikacin and gentamicin in neonates possibly increased by indomethacin
- Antibacterials: neomycin reduces absorption of phenoxymethylpenicillin; increased risk of nephrotoxicity when aminoglycosides given with colistimethate sodium or polymyxins; increased risk of nephrotoxicity and otoxicity when aminoglycosides given with capreomycin or amikacin; possible increased risk of nephrotoxicity when aminoglycosides given with cephalexin
- Anticoagulants: experience in anticoagulant clinics suggests that INR possibly altered when neomycin (given for local action on gut) is given with coumarins or phenindione
- Antidiabetics: neomycin possibly enhances hypoglycaemic effect of acarbose, also severity of gastrointestinal effects increased
- Antifungals: increased risk of nephrotoxicity when aminoglycosides given with amphotericin
- Bisphosphonates: increased risk of hypocalcaemia when aminoglycosides given with bisphosphonates
- Cardiac Glycosides: gentamicin possibly increases plasma concentration of digoxin; neomycin reduces absorption of digoxin
- Ciclosporin: increased risk of nephrotoxicity when aminoglycosides given with ciclosporin
- Cytotoxics: neomycin possibly reduces absorption of methotrexate; neomycin reduces bioavailability of sorafenib; increased risk of nephrotoxicity and possibly of otoxicity when aminoglycosides given with platinum compounds
- Diuretics: increased risk of otoxicity when aminoglycosides given with loop diuretics
- Mannitol: manufacturer of tobramycin advises avoid concomitant use with mannitol
- Muscle Relaxants: aminoglycosides enhance effects of non-depolarising muscle relaxants and succinylcholine
- Parasympathomimetics: aminoglycosides antagonise effects of neostigmine and pyridostigmine
- Tacrolimus: increased risk of nephrotoxicity when aminoglycosides given with tacrolimus
- Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850
- Vitamins: neomycin possibly reduces absorption of vitamin A

Aminophylline see Theophylline

Aminosalylicates
- Azathioprine: possible increased risk of leucopenia when aminosalylicates given with azathioprine
- Cardiac Glycosides: sulphasalazine possibly reduces absorption of digoxin
- Cytotoxics: possible increased risk of leucopenia when aminosalylicates given with mercaptopurine
- Vitamins: neomycin possibly reduces absorption of folic acid
Appendix 1: Interactions

Amiodarone

Note Amiodarone has a long half-life; there is a potential for drug interactions to occur for several weeks (or even months) after treatment with it has been stopped. Agalsidase Alfa and Beta: amiodarone possibly inhibits effects of agalsidase alfa and beta (manufacturers of agalsidase alfa and beta advise avoid concomitant use).

Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with bupivacaine, levobupivacaine, prilocaine or ropivacaine.

Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other anti-arrhythmics; increased risk of ventricular arrhythmias when amiodarone given with disopyramide or droterodarone—avoid concomitant use; amiodarone increases plasma concentration of flecainide (halve dose of flecainide).

Antibacterials: increased risk of ventricular arrhythmias when amiodarone given with parenteral erythromycin—avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with levofloxacin or moxifloxacin—avoid concomitant use; possible increased risk of ventricular arrhythmias when amiodarone given with sul-famethoxazole and trimethoprim (as co-trimoxazole)—manufacturer of amiodarone advises avoid concomitant use of co-trimoxazole; possible increased risk of ventricular arrhythmias when amiodarone given with etilithromycin.

Anticoagulants: amiodarone inhibits metabolism of coumarins and phenindione (enhanced anti-coagulant effect); amiodarone increases plasma concentration of dabigatran (see Dose under Dabigatran, p. 154).

Antidepressants: avoidance of amiodarone advised by manufacturer of citalopram and escitalopram (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when amiodarone given with tricyclics—avoid concomitant use.

Antiepileptics: amiodarone inhibits metabolism of phenytoin (increased plasma concentration).

Antihistamines: increased risk of ventricular arrhythmias when amiodarone given with amisulpride—avoid concomitant use.

Antimalarials: avoidance of amiodarone advised by manufacturer of piperaquine with artemisin (possible risk of ventricular arrhythmias); avoidance of amiodarone advised by manufacturer of arte-mether with lumefantrine (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when amiodarone given with chloroquine and hydroxychloroquine, mefloquine or quinine—avoid concomitant use.

Antimuscarinics: increased risk of ventricular arrhythmias when amiodarone given with tolterodine.

Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with antipsychotics that prolong the QT interval; increased risk of ventricular arrhythmias when amiodarone given with benperidol; manufacturer of benperidol advises avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with amisulpride, droperidol, haloperidol, phenothiazines, pimozide or zuclopenthixol—avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with sulpiride.

Antivirals: plasma concentration of amiodarone possibly increased by stavudine; plasma concentration of amiodarone possibly increased by fosamprenavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of amiodarone possibly increased by indinavir—avoid concomitant use; plasma concentration of amidarone increased by ritonavir (increased risk of ventricular arrhythmias—avoid concomitant use); increased risk of ventricular arrhythmias when amiodarone given with aminoglycosides or polyoxymethylene.

Amiodarone (continued)

Antivirals: increased risk of ventricular arrhythmias when amiodarone given with aminoglycosides or polyoxymethylene.

Beta-blockers: increased risk of bradycardia, AV block and myocardial depression when amiodarone given with beta-blockers; increased risk of ventricular arrhythmias when anti-arrhythmics given with beta-blockers; increased risk of ventricular arrhythmias when amiodarone given with tosotrol—avoid concomitant use.

Calcium-channel Blockers: increased risk of bradycardia, AV block and myocardial depression when amiodarone given with beta-blockers.

Cardiac Glycosides: amiodarone increases plasma concentration of digoxin (halve dose of digoxin).

Ciclosporin: amiodarone possibly increases plasma concentration of ciclosporin.

Cobicistat: plasma concentration of amiodarone possibly increased by cobicistat—manufacturer of cobicistat advises avoid concomitant use.

Coldchain: amiodarone possibly increases risk of coldchain toxicity.

Cytotoxics: amiodarone possibly increases the plasma concentration of afatinib—manufacturer of afatinib advises separating administration of amiodarone by 6 to 12 hours; possible increased risk of ventricular arrhythmias when amiodarone given with erlotinib; possible increased risk of ventricular arrhythmias when amiodarone given with vandetanib—avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with arsenic trioxide.

Diarretics: increased cardiac toxicity with amiodarone if hypokalaemia occurs with acetazolamide, loop diuretics or thiazides and related diuretics; amiodarone increases plasma concentration of epelene (reduce dose of epelene).

Fidaxomicin: avoidance of amiodarone advised by manufacturer of fidaxomicin.

Fingolimod: possible increased risk of bradycardia when amiodarone given with fingolimod.

Grapefruit Juice: plasma concentration of amiodarone increased by grapefruit juice.

Ivabradine: increased risk of ventricular arrhythmias when amiodarone given with ivabradine.

Lipid-regulating Drugs: increased risk of myopathy when amiodarone given with simvastatin (see Dose under Simvastatin, p. 173).

Lithium: manufacturer of amiodarone advises avoid concomitant use with lithium (risk of ventricular arrhythmias).

Orlistat: plasma concentration of amiodarone possibly reduced by orlistat.

Pentamidine Isetionate: increased risk of ventricular arrhythmias when amiodarone given with pentamidine isetionate—avoid concomitant use.

Thyroid Hormones: for concomitant use of amiodarone and thyroid hormones see p. 97.

Ulcer-healing Drugs: plasma concentration of amiodarone increased by cinetidine.

Amisulpride see Antipsychotics.

Amiptyline see Antidepressants, Tricyclic.

Amiodopidine see Calcium-channel Blockers.

Amoxicillin see Penicillins.

Amphotericin

Note Close monitoring required with concomitant administration of nephrotoxic or cytotoxic drugs.

Antibacterials: increased risk of nephotoxicity when amphotericin given with aminoglycosides or poly-
Amphotericin
Antibacterials (continued) mycoses; possible increased risk of nephrotoxicity when amphotericin given with vancomycin
Antifungal: amphotericin reduces renal excretion and increases cellular uptake of fluconazole (toxicity possibly increased); effects of amphotericin possibly antagonised by imidazoles and triazoles; plasma concentration of amphotericin possibly increased by micafungin
● Cardiac Glycosides: hypokalaemia caused by amphotericin increases cardiac toxicity with cardiac glycosides
● Ciclosporin: increased risk of nephrotoxicity when amphotericin given with ciclosporin
● Corticosteroids: increased risk of hypokalaemia when amphotericin given with corticosteroids—avoid concomitant use unless corticosteroids needed to control reactions
● Cytostatics: increased risk of ventricular arrhythmias when amphotericin given with arsenic trioxide
Diuretics: increased risk of hypokalaemia when amphotericin given with loop diuretics or thiazides and related diuretics
Pentamidine isetionate: possible increased risk of nephrotoxicity when amphotericin given with pentamidine isetionate
● Sodium Stibogluconate: possible increased risk of arhythmias when amphotericin given after sodium stibogluconate—manufacturer of sodium stibogluconate advises giving 14 days apart
● Tacrolimus: increased risk of nephrotoxicity when amphotericin given with tacrolimus
Ampicillin see Penicillins
Anabolic Steroids
● Anticoagulants: anabolic steroids enhance anticoagulant effect of coumarins and phenindione
Antidiabetics: anabolic steroids possibly enhance glycosylated haemoglobin effect of antidiabetics
Anaesthetics, General
Note See also Surgery and Long-term Medication, p. 859
ACE Inhibitors: enhanced hypotensive effect when general anaesthetics given with ACE inhibitors
● Adrenergic Neurone Blockers: enhanced hypotensive effect when general anaesthetics given with adrenergic neurone blockers
● Alpha-blockers: enhanced hypotensive effect when general anaesthetics given with alpha-blockers
Analgesics: metabolism of etomidate inhibited by fentanyl (consider reducing dose of etomidate): effects of thiopental possibly enhanced by aspirin; effects of intravenous general anaesthetics and volatile liquid general anaesthetics possibly enhanced by opioid analgesics
Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when general anaesthetics given with angiotensin-II receptor antagonists
Antibacterials: increased risk of hepatotoxicity when isoflurane given with isoniazid; effects of thiopental enhanced by sulfonamides; hypersensitivity-like reactions can occur when general anaesthetics given with intravenous vancomycin
Antidepressants: increased risk of arrhythmias and hypotension when general anaesthetics given with tricyclics
● Antipsychotics: enhanced hypotensive effect when general anaesthetics given with antipsychotics: effects of thiopental enhanced by droperidol
Anxiolytics and Hypnotics: increased sedative effect when general anaesthetics given with anxiolytics and hypnotics
Beta-blockers: enhanced hypotensive effect when general anaesthetics given with beta-blockers
● Calcium-channel Blockers: enhanced hypotensive effect when general anaesthetics or isoflurane given with calcium-channel blockers; general anaesthetics

Anaesthetics, General
● Calcium-channel Blockers (continued) enhance hypotensive effect of verapamil (also AV delay)
Clonidine enhances hypotensive effect when general anaesthetics given with clonidine
● Cytotoxics: nitrous oxide increases antifolate effect of methotrexate—avoid concomitant use
Diazoxide: enhanced hypotensive effect when general anaesthetics given with diazoxide
Diuretics: enhanced hypotensive effect when general anaesthetics given with diuretics
● Dopaminergics: increased risk of arrhythmias when volatile liquid general anaesthetics given with levodopa
Doxapram: increased risk of arrhythmias when volatile liquid general anaesthetics given with doxapram (avoid doxapram for at least 10 minutes after volatile liquid general anaesthetics)
● Memantine: increased risk of CNS toxicity when ketamine given with memantine (manufacturer of memantine advises avoid concomitant use) Methylprednisolone: enhanced hypotensive effect when general anaesthetics given with methylprednisolone
Metoclopramide: effects of thiopental enhanced by metoclopramide
Moxonidine: enhanced hypotensive effect when general anaesthetics given with moxonidine
● Muscle Relaxants: increased risk of myocardial depression and bradycardia when propofol given with suxamethonium; volatile liquid general anaesthetics enhance effects of non-depolarising muscle relaxants and suxamethonium; ketamine enhances effects of atracurium
Nitrate: enhanced hypotensive effect when general anaesthetics given with nitrates
Oxycocin: oxytocic effect possibly reduced, also enhanced hypotensive effect and risk of arrhythmias when volatile liquid general anaesthetics given with oxytocin
Probenecid: effects of thiopental possibly enhanced by probenecid
● Symptomimetics: manufacturer of isoflurane advises avoid concomitant use with sympatomimetics (risk of ventricular arrhythmias); increased risk of arrhythmias when volatile liquid general anaesthetics given with adrenaline (epinephrine) or noradrenaline (norepinephrine); increased risk of hypertension when volatile liquid general anaesthetics given with norepinephrine
Theophylline: increased risk of convulsions when ketamine given with theophylline
Vasodilator Antihypertensives: enhanced hypotensive effect when general anaesthetics given with hydralazine, minoxidil or sodium nitroprusside

Anaesthetics, General (intravenous) see Anaesthetics, General
Anaesthetics, General (volatile liquids) see Anaesthetics, General
Anaesthetics, Local see Bupivacaine, Chloroprocaine, Levobupivacaine, Lidocaine, Prilocaine, and Ropivacaine
Anagrelide
● Clozatol: manufacturer of anagrelide advises avoid concomitant use with clozatol
● Phosphodiesterase Type-3 Inhibitors: manufacturer of anagrelide advises avoid concomitant use with enoximone and emilironone
Anakinra
● Adalimumab: avoid concomitant use of anakinra with adalimumab
● Certolizumab pegol: avoid concomitant use of anakinra with certolizumab pegol
Etanercept: avoid concomitant use of anakinra with etanercept
Appendix 1: Interactions

Anakinra (continued)
- Golimumab: avoid concomitant use of anakinra with *golimumab*
- Infliximab: avoid concomitant use of anakinra with *infliximab*
- Vaccines: avoid concomitant use of anakinra with live *vaccines* (see p. 828)

Algesics see Aspirin, Nefopam, NSAIDs, Opioid Analgesics, and Paracetamol

Angiotensin-II Receptor Antagonists
- ACE inhibitors: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with *ACE inhibitors*
- Adrenergic Neurone Blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with *alpha-blockers*
- Alcohol: enhanced hypotensive effect when angiotensin-II receptor antagonists given with alcohol
- Aldesleukin: enhanced hypotensive effect when angiotensin-II receptor antagonists given with aldesleukin
- Ailskiren: avoid concomitant use of angiotensin-II receptor antagonists with *ailskiren* (see also under Renin inhibitor, p. 126); benfotiamin possibly reduces plasma concentration of ailskiren
- Alpha-blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with *alpha-blockers*
- Anaesthetics, General: enhanced hypotensive effect when angiotensin-II receptor antagonists given with *general anaesthetics*
- Analgesics: increased risk of renal impairment when angiotensin-II receptor antagonists given with NSAIDs, also hypotensive effect antagonised
- Antibacterials: plasma concentration of losartan and its active metabolite reduced by *rifampicin*; possible increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with *trimethoprim*
- Anticoagulants: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with *heparins*
- Antidepressants: hypotensive effect of angiotensin-II receptor antagonists possibly enhanced by MAOIs
- Antipsychotics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with antipsychotics
- Anxiolytics and Hypnotics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with anxiolytics and hypnotics
- Beta-blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with *beta-blockers*
- Calcium-channel Blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with calcium-channel blockers
- Ciclosporin: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with *ciclosporin*
- Clonidine: enhanced hypotensive effect when angiotensin-II receptor antagonists given with clonidine
- Corticosteroids: hypotensive effect of angiotensin-II receptor antagonists antagonised by corticosteroids
- Diazoxide: enhanced hypotensive effect when angiotensin-II receptor antagonists given with diazoxide
- Diuretics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with *diuretics*; increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with potassium-sparing diuretics and aldosterone antagonists
- Dopaminergics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with *levodopa*
- Lithium: angiotensin-II receptor antagonists reduce excretion of *lithium* (increased plasma concentration)

Angiotensin-II Receptor Antagonists (continued)
- Methyldopa: enhanced hypotensive effect when angiotensin-II receptor antagonists given with *methyldopa*
- Moxisylyte: enhanced hypotensive effect when angiotensin-II receptor antagonists given with *moxisylyte*
- Moxonidine: enhanced hypotensive effect when angiotensin-II receptor antagonists given with *moxonidine*
- Muscle Relaxants: enhanced hypotensive effect when angiotensin-II receptor antagonists given with *baclofen* or *tizanidine*
- Nitrates: enhanced hypotensive effect when angiotensin-II receptor antagonists given with *nitrates*
- Oestrogens: hypotensive effect of angiotensin-II receptor antagonists antagonised by oestrogens
- Alpha-blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with *alpha-blockers*
- Calcium-channel Blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with calcium-channel blockers
- Clonidine: enhanced hypotensive effect when angiotensin-II receptor antagonists given with clonidine
- Corticosteroids: hypotensive effect of angiotensin-II receptor antagonists antagonised by corticosteroids
- Diazoxide: enhanced hypotensive effect when angiotensin-II receptor antagonists given with diazoxide
- Diuretics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with *diuretics*; increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with potassium-sparing diuretics and aldosterone antagonists
- Dopaminergics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with *levodopa*
- Lithium: angiotensin-II receptor antagonists reduce excretion of *lithium* (increased plasma concentration)
Antacids (continued)
Cardiac Glycosides: antacids possibly reduce absorption of digoxin
Corticosteroids: antacids reduce absorption of deflazacort

• Cytotoxics: aluminium hydroxide and oral magnesium salts possibly reduce absorption of estramustine—manufacturer of estramustine advises avoid concomitant administration; separating administration with antacids by about 12 hours advised by manufacturer of busulfan; antacids possibly reduce plasma concentration of erlotinib—give antacids at least 4 hours before or 2 hours after erlotinib
Deferasirox: antacids containing aluminium possibly reduce absorption of deferasirox (manufacturer of deferasirox advises avoid concomitant use)
Deferriprone: antacids containing aluminium possibly reduce absorption of deferriprone (manufacturer of deferriprone advises avoid concomitant use)
Dipyridamole: antacids possibly reduce absorption of dipyridamole
Eltrombopag: antacids reduce absorption of eltrombopag (give at least 4 hours apart)
Iron: oral magnesium salts (as magnesium trisilicate) reduce absorption of iron
Lipid-regulating Drugs: antacids reduce absorption of rosvuastatin
Lithium: sodium bicarbonate increases excretion of lithium (reduced plasma concentration)
Mycophenolate: antacids reduce absorption of mycophenolate
Penicillamine: antacids reduce absorption of penicillamine
Polystyrine Sulfonate Resins: risk of intestinal obstruction when aluminium hydroxide given with polysyrine sulfonate resins; risk of metabolic alkalosis when oral magnesium salts given with polysyrine sulfonate resins
Riociguat: antacids reduce absorption of riociguat (give at least 2 hours before or 1 hour after riociguat)
Symptomomimetics: aluminium hydroxide possibly increases absorption of pseudoephedrine
Thyroid Hormones: antacids possibly reduce absorption of levothyroxine
Ulcner-healing Drugs: antacids possibly reduce absorption of lanoprazole

• Ulipristal: avoidance of antacids advised by manufacturer of high-dose ulipristal (contraceptive effect of ulipristal possibly reduced)
Antazoline see Antihistamines
Anti-arrrhythmics see Adenosine, Amiodarone, Disopyramide, Dronedaron, Flecaainide, Lidocaine, and Propafenone
Antibacterials see individual drugs
Antibiotics (cystotox) see Bleomycin, Doxorubicin, Epirubicin, Ifosfamide, Mitomycin, and Mitoxantrone
Anticoagulants see Apixaban, Cumarin, Dabigatran, Heparins, Phenindione, and Rivaroxaban
Antidepressants see Agomelatin, Antidepressants, SSRIs, Antidepressants, Tricyclic, Antidepressants, Tricyclic (related); MAOIs; Mirtazapine; Moclobemide; Reboxetine; St John’s Wort; Venlafaxine
Antidepressants, Noradrenaline Re-uptake Inhibitors see Reboxetine
Antidepressants, SSRI
Note see also Dapoxetine
Alcohol: sedative effects possibly increased when SSRIs given with alcohol
Anaesthetics, Local: fluoxetine inhibits metabolism of ropivacaine—avoid prolonged administration of ropivacaine
• Analgesics: increased risk of bleeding when SSRIs given with NSAIDs or aspirin; possible increased

Antidepressants, SSRIs (continued)

• Analgesics (continued)
serotonergic effects when SSRIs given with fentanyl; fluoxetine, fluvoxamine, paroxetine and sertraline possibly increase plasma concentration of methadone; increased risk of CNS toxicity when SSRIs given with tramadol

• Anti-arrrhythmics: manufacturer of citalopram and escitalopram advises avoid concomitant use with amiodarone (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with disopyramide (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with dronedarone (risk of ventricular arrhythmias); fluoxetine increases plasma concentration of flecainide; fluoxetine and paroxetine possibly inhibit metabolism of propafenone

• Antiarrrhythmics: manufacturer of citalopram and escitalopram advises avoid concomitant use with intravenous erythromycin (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with moxifloxacin (risk of ventricular arrhythmias); possible increased risk of ventricular arrhythmias when citalopram given with metformin

• Anticoagulants: SSRIs possibly enhance anticoagulant effect of coumarins; possible increased risk of bleeding when SSRIs given with dabigatran

• Antidepressants: avoidance of fluvoxamine advised by manufacturer of reboxetine; possible increased serotonergic effects when SSRIs given with duloxetine; fluvoxamine inhibits metabolism of duloxetine—avoid concomitant use; citalopram, escitalopram, fluvoxamine, paroxetine or sertraline should not be started until 2 weeks after stopping MAOIs, also MAOIs should not be started until at least 1 week after stopping citalopram, escitalopram, fluvoxamine, paroxetine or sertraline; fluoxetine should not be started until 2 weeks after stopping MAOIs, also MAOIs should not be started until at least 5 weeks after stopping fluoxetine; CNS effects of SSRIs increased by MAOIs (risk of serious toxicity); increased risk of CNS toxicity when escitalopram given with moclobemide, preferably avoid concomitant use; after stopping citalopram, fluvoxamine, paroxetine or sertraline do not start moclobemide for at least 1 week; after stopping fluoxetine do not start moclobemide for 5 weeks; increased serotonergic effects when SSRIs given with St John’s Wort; avoid concomitant use; fluvoxamine inhibits metabolism of omeprazoline (increased plasma concentration); possible increased serotonergic effects when fluoxetine or fluvoxamine given with mirtazapine; SSRIs increase plasma concentration of some tricyclics; manufacturer of citalopram and escitalopram advises avoid concomitant use with tricyclics (risk of ventricular arrhythmias)

• Antiepileptics: SSRIs antagonise anti convulsant effect of antiepileptics (convulsive threshold lowered); fluoxetine and fluvoxamine increase plasma concentration of carbamazepine; plasma concentration of paroxetine reduced by phenobarbital and phenytoin; fluoxetine and fluvoxamine increase plasma concentration of phenytoin; plasma concentration of sertraline possibly reduced by phenytoin, also plasma concentration of phenytoin possibly increased

Antifungals: plasma concentration of paroxetine possibly increased by terbinafine

• Antihistamines: manufacturer of citalopram and escitalopram advises avoid concomitant use with nizatidine (risk of ventricular arrhythmias); anti depressant effect of SSRIs possibly antagonised by cyproheptadine
Antidepressants, SSRI (continued)
- Antimalarials: manufacturer of citalopram and escitalopram advises avoid concomitant use with antimalarials (risk of ventricular arrhythmias); avoidance of antidepressants advised by manufacturer of artemether with lumefantrine and piperaquine with artemether.
- Antipsychotics: avoidance of fluoxetine, fluvoxamine and sertraline advised by manufacturer of aripiprazole (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with haloperidol (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with haloperidol and risperidone; fluoxetine possibly increases plasma concentration of asenapine and haloperidol; paroxetine inhibits metabolism of perphenazine (reduce dose of perphenazine); fluoxetine and paroxetine possibly increase plasma concentration of aripiprazole (reduce dose of aripiprazole—consult aripiprazole product literature); plasma concentration of paroxetine possibly increased by asenapine; fluvoxamine, paroxetine and sertraline increase plasma concentration of clozapine; citalopram possibly increases plasma concentration of clozapine (increased risk of toxicity); fluvoxamine increases plasma concentration of olanzapine; manufacturer of citalopram advises avoid concomitant use with phenothiazines (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with ziprasidone (risk of ventricular arrhythmias; SSRIs possibly increase plasma concentration of ziprasidone; fluoxetine possibly increased by ziprasidone; plasma concentration of paroxetine possibly reduced by fluoxetine and fluvoxamine; increased risk of hypertension and CNS excitation when paroxetine given with selegiline (selegiline should not be started until at least 5 weeks after stopping fluoxetine); increased risk of hypertension and CNS excitation when fluvoxamine given with selegiline (selegiline should not be started until 1 week after stopping fluvoxamine or sertraline, avoid fluvoxamine or sertraline for 2 weeks after stopping selegiline); increased risk of hyperactivity and CNS excitation when fluvoxamine or sertraline given with selegiline (selegiline should not be started until 1 week after stopping fluvoxamine or sertraline, avoid fluvoxamine or sertraline for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when fluvoxamine given with selegiline (selegiline should not be started until 5 weeks after stopping fluoxetine, avoid fluvoxamine for 2 weeks after stopping selegiline); avoidance of citalopram and escitalopram advised by manufacturer of selegiline.

Grapefruit Juice: plasma concentration of sertraline possibly increased by grapefruit juice.
- Hormone Antagonists: fluoxetine and paroxetine possibly inhibit metabolism of testosterone to active metabolite (avoid concomitant use).
- SHT1-receptor Agonists: increased risk of CNS toxicity when citalopram given with 5HT1-receptor agonists (manuscript linked to citalopram and escitalopram); citalopram possibly increases plasma concentration of clonazepam; manufacturer of citalopram advises avoid concomitant use with clonazepam; fluvoxamine increases plasma concentration of clonazepam; increased risk of ventricular arrhythmias when SSRIs given with clonazepam; increased risk of toxicity and CNS excitation when fluvoxamine or paroxetine given with clonazepam; increased risk of toxicity when paroxetine given with clonazepam; fluoxetine and paroxetine possibly inhibit metabolism of clonazepam.

Antidepressants, SSRI (continued)
- Antidepressants, SSRI (continued)
- Antiviral: plasma concentration of paroxetine and sertraline possibly reduced by darunavir; plasma concentration of paroxetine possibly reduced by ritonavir; plasma concentration of SSRIs possibly increased by ritonavir.
- Antiholitics and Hypnotics: fluoxetine increases plasma concentration of alprazolam; fluvoxamine increases plasma concentration of some benzodiazepines; fluvoxamine increases plasma concentration of melatonin—avoid concomitant use; sedative effects possibly increased by fluoxetine; increased risk of toxicity when antidepressants given with atomoxetine; fluoxetine and paroxetine possibly inhibit metabolism of atomoxetine.
- Beta-blockers: citalopram and escitalopram increase plasma concentration of metoprolol; paroxetine possibly increases the plasma concentration of metoprolol—increased risk of AV block (manufacturer of paroxetine advises avoid concomitant use in cardiac insufficiency); fluvoxamine increases plasma concentration of propranolol; manufacturer of escitalopram advises avoid concomitant use with sotalol (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when citalopram given with sotalol—avoid concomitant use.
- Supplementation: plasma concentration of citalopram possibly increased by bupropion.
- Calcium-channel Blockers: fluoxetine possibly inhibits metabolism of nifedipine (increased plasma concentration).
- Clotidogrel: fluoxetine and fluvoxamine possibly reduce antiplatelet effect of clotidogrel.
- Dapoxetine: possible increased risk of serotonergic effects when SSRIs given with dapoxetine (manufacturer of dapoxetine advises SSRIs should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping SSRIs).
- Dopaminergics: increased risk of CNS toxicity when SSRIs given with rasagiline; fluvoxamine should not be started until 2 weeks after stopping rasagiline; fluvoxamine should not be started until 2 weeks after stopping rasagiline, also rasagiline should not be started until at least 5 weeks after stopping fluoxetine; increased risk of hypertension and CNS excitation when paroxetine given with selegiline (selegiline should not be started until 2 weeks after stopping paroxetine, avoid paroxetine for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when fluvoxamine or sertraline given with selegiline (selegiline should not be started until 1 week after stopping fluvoxamine or sertraline, avoid fluvoxamine or sertraline for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when fluvoxamine given with selegiline (selegiline should not be started until 5 weeks after stopping fluoxetine, avoid fluoxetine for 2 weeks after stopping selegiline); avoidance of citalopram and escitalopram advised by manufacturer of selegiline.
- Muscle Relaxants: fluvoxamine increases plasma concentration of sumatriptan; CNS toxicity reported when SSRIs given with sumatriptan; CNS toxicity reported when sertraline given with sumatriptan; fluvoxamine possibly inhibits metabolism of zolmitriptan (reduce dose of zolmitriptan).
- Lithium: increased risk of CNS effects when SSRIs given with lithium (lithium toxicity reported).
- Methylthioninium: risk of CNS toxicity when SSRIs given with methylthioninium—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for at least 4 hours after last dose); increased risk of toxicity and CNS excitation when fluvoxamine or sertraline given with methylthioninium—avoid concomitant use.
- Metoclopramide: CNS toxicity reported when SSRIs given with metoclopramide.
- Pentamidine Isetionate: manufacturer of citalopram and escitalopram advises avoid concomitant use with pentamidine isetionate (risk of ventricular arrhythmias).
- Pirfenidone: fluvoxamine increases plasma concentration of pirfenidone manufacture of pirfenidone advises avoid concomitant use.
- Pomalidomide: fluvoxamine increases plasma concentration of pomalidomide.
- Ranolazine: paroxetine increases plasma concentration of ranolazine.
- Roflumilast: fluvoxamine inhibits the metabolism of roflumilast.
- Sympathomimetics: metabolism of SSRIs possibly inhibited by methylphenidate.
- Theophylline: fluvoxamine increases plasma concentration of theophylline (concomitant use should usually be avoided, but where not possible halve
Antidepressants, SSRI
- Theophylline (continued)
  theophylline dose and monitor plasma-theophylline concentration)
Ticagrelor: possible increased risk of bleeding when
citalopram, paroxetine or sertraline given with ticagrelor
Ulcrer-healing Drugs: plasma concentration of citalopram,
escitalopram and sertraline increased by cinemidine; fluvoxamine possibly increases plasma concentration
of escitalopram; plasma concentration of sertraline increased by omeprozole

Antidepressants, SSRI (related) see Duloxetine and Venlafaxine

Antidepressants, Tricyclic
Adrenergic Neurone Blockers: tricyclics antagonise
hypotensive effect of adrenergic neurone blockers
- Alcohol: increased sedative effect when tricyclics
given with alcohol
Alpha1-adrenoceptor Stimulants: avoidance of tricyclics
advised by manufacturer of apraclonidine and brimonidine
Anaesthetics, General: increased risk of arrhythmias
and hypotension when tricyclics given with general anaesthetics
- Analgesics: increased risk of CNS toxicity when tricyclics
given with tramadol; side-effects possibly increased when tricyclics given with nefopam; sedative
effects possibly increased when tricyclics given with opioid analgesics
- Anti-arrhythmics: increased risk of ventricular arrhythmias
when tricyclics given with amiodarone—
  avoid concomitant use; increased risk of ventricular arrhythmias when tricyclics given with disopyramide
- or flecaïnide; avoidance of tricyclics advised by manufacturer of droxidopa, (risk of ventricular
  arrhythmias); increased risk of arrhythmias when tricyclics given with propafenone
- Antibacterials: increased risk of ventricular arrhythmias
when tricyclics given with moxifloxacin—
  avoid concomitant use; possible increased risk of ventricular arrhythmias when tricyclics given with ethromycin
- Anti-coagulants: tricyclics may enhance or reduce anti-
  coagulant effect of eculizumab
- Antidepressants: avoidance of tricyclics advised by manufacturer of citalopram and escitalopram—
  risk of ventricular arrhythmias; possible increased serotonergic effects when amitriptyline or clomipramine
  given with duloxetine; increased risk of hyper
tension and CNS excitation when tricyclics given with MAOIs, tricyclics should not be started until 2 weeks after stopping MAOIs (3 weeks if starting clomipramine or imipramine); after stopping tricyclics do not start moclobemide for at least 1 week; plasma concentration of some tricyclics increased by SSRI; plasma concentration of amitriptyline reduced by St John’s wort
- Antiepileptics: tricyclics antagonise convulsant effect of antiepileptics (convulsive threshold lowered);
  metabolism of tricyclics accelerated by carbamazepine (reduced plasma concentration and reduced effect); metabolism of tricyclics possibly accelerated by phenobarbital (reduced plasma concentration); plasma concentration of tricycles possibly reduced by phenytoin
Antifungals: plasma concentration of amitriptyline and nortriptyline possibly increased by fluconazole; plasma concentration of tricycles possibly increased by terbinafine
Antihistamines: increased antimuscarinic and sedative
effects when tricycles given with antihistamines

Antidepressants, Tricyclic (continued)
- Antimalarials: avoidance of antidepressants advised by manufacturer of artemether with lumefantrine and eperaquin with artemol
- Antimuscarinics: increased risk of antimuscarinic side-
effects when tricycles given with antimuscarinics
- Antipsychotics: avoidance of tricycles advised by manufacturer of doperdol, oluphenazin, haloperidol, sulpiride and zaleplon (risk of ventricular arrhythmias); possible increased anti-
muscarinic side-effects when tricycles given with clozapine; increased risk of antimuscarinic side-
effects when tricycles given with phenothiazines; possible increased risk of ventricular arrhythmias
  when tricycles given with eperidine
- Antivirals: plasma concentration of tricycles possibly increased by ritonavir; increased risk of ventricular arrhythmias when tricycles given with saquinavir—avoid concomitant use
- Anxiolytics and Hypnotics: increased sedative effect when tricycles given with anxiolytics and hypnotics
- Atomoxetine: increased risk of ventricular arrhythmias
  when tricycles given with atomoxetine; possible increased risk of convulsions when antidepressants given with atomoxetine
- Beta-blockers: plasma concentration of imipramine
  increased by labetalol and pranopanol; increased risk of ventricular arrhythmias when tricycles given with sotalol
- Bupropion: plasma concentration of tricycles possibly increased by bupropion (possible increased risk of convulsions)
- Calcium-channel Blockers: plasma concentration of tricycles possibly increased by diltiazem and verapamil; plasma concentration of imipramine increased by diltiazem and verapamil
- Cannabis Extract: possible increased risk of hyper
tension and tachycardia when tricycles given with cannabis extract
- Clonidine: tricyclics antagonise hypotensive effect of clonidine, also increased risk of hypotension on clonidine withdrawal
- Cytoxics: increased risk of ventricular arrhythmias
  when amitriptyline or clomipramine given with arsenic trioxide
- Dapoxetine: possible increased risk of serotonin
effects when tricycles given with dapoxetine (manufacturer of dapoxetine advises tricycles should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping tricycles)
- Disulfiram: metabolism of tricycles inhibited by disulfiram (increased plasma concentration); concomitant
  amitriptyline reported to increase disulfiram reaction
  with alcohol
- Diuretics: increased risk of postural hypotension when tricycles given with diuretics
- Dopaminergics: caution with tricycles advised by manufacturer of entacapone; increased risk of CNS toxicity when tricycles given with erasagline; CNS toxicity reported when tricycles given with methylphenidate
- Histamine: tricycles theoretically antagonise effects of histamine—manufacturer of histamine advises avoid concomitant use
- Lithium: risk of toxicity when tricycles given with lithium
- Methylthioninium: risk of CNS toxicity when clomipramine given with methylthioninium—avoid concomi-
tant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)
- Moxonidine: tricycles possibly antagonise hypoten-
sive effect of moxonidine (manufacturer of moxonidine advises avoid concomitant use)
Appendix 1: Interactions

Antidepressants, Tricyclic (continued)

Muscle Relaxants: tricyclics enhance muscle relaxant effect of baclofen

Nicardipine: tricyclics possibly enhance hypotensive effect of nicardipine

Nitrites: tricyclics reduce effects of sublingual tablets of nitrates (failure to dissolve under tongue owing to dry mouth)

Oestrogens: antidepressant effect of tricyclics antagonised by oestrogens (but side-effects of tricyclics possibly increased due to increased plasma concentration)

Pentamidine Isetionate: increased risk of ventricular arrhythmias when tricyclics given with pentamidine

Sodium Oxbate: increased risk of side-effects when tricyclics given with sodium oxbate

Sympathomimetics: increased risk of hypertension and arrhythmias when tricyclics given with adrenaline (epinephrine) (but local anaesthetics with adrenaline appear to be safe); metabolism of tricyclics possibly inhibited by methyldopa; increased risk of hypertension and arrhythmias when tricyclics given with noradrenaline (norepinephrine) or phenylephrine

Thyroid Hormones: effects of tricyclics possibly enhanced by thyroid hormones; effects of amitriptyline and imipramine enhanced by thyroid hormones

Ulcer-Healing Drugs: plasma concentration of tricyclics possibly increased by cimetidine; metabolism of amitriptyline, doxepin, imipramine and nortriptyline inhibited by cimetidine (increased plasma concentration)

Antidepressants, Tricyclic (related)

Alcohol: increased sedative effect when tricyclic-related antidepressants given with alcohol

Alpha2-adrenoceptor Stimulants: avoidance of tricyclic-related antidepressants advised by manufacturer of apraclonidine and brimonidine

Antibacterials: plasma concentration of trazodone possibly increased by clarithromycin

Anticoagulants: plasma concentration of trazodone possibly increased by warfarin

Antidepressants: tricyclic-related antidepressants should not be started until 2 weeks after stopping

MAOIs, also MAOIs should not be started until at least 1–2 weeks after stopping tricyclic-related antidepressants; after stopping tricyclic-related antidepressants do not start moclobemide for at least 1 week

Antipsychotics: tricyclic-related antidepressants possibly by antagonise anticonvulsant effect of antipsychotics (convulsive threshold lowered); plasma concentration of mianserin and trazodone reduced by carbamazepine; metabolism of mianserin accelerated by phenobarbital (reduced plasma concentration); plasma concentration of mianserin reduced by phenytoin

Antihistamines: possible increased antimuscarinic and sedative effects when tricyclic-related antidepressants given with antihistamines

Antimalarias: avoidance of antidepressants advised by manufacturer of arteether with lumefantrine and arteparaquine with artesunate

Antimuscarinics: possible increased antimuscarinic side-effects when tricyclic-related antidepressants given with antimuscarinics

Antivirals: plasma concentration of trazodone increased by ritonavir (increased risk of toxicity); increased risk of ventricular arrhythmias when trazodone given with saquinavir—avoid concomitant use; plasma concentration of trazodone possibly increased by telaprevir

Axiolytics and Hypnotics: increased sedative effect when tricyclic-related antidepressants given with anxiolytics and hypnotics

Antidepressants, Tricyclic (related) (continued)

Atomoxetine: possible increased risk of convulsions when antidepressants given with atomoxetine

Diazoxide: enhanced hypotensive effect when tricyclic-related antidepressants given with diazoxide

Nitrites: tricyclic-related antidepressants possibly reduce effects of sublingual tablets of nitrates (failure to dissolve under tongue owing to dry mouth)

Vasoconstrictors: hypotensive effect when tricyclic-related antidepressants given with hydralazine or sodium nitroprusside

Antidiabetics

Note Other drugs administered orally may need to be taken at least 1 hour before or 4 hours after lixisenatide injection, or taken with a meal when lixisenatide is not administered, to minimise possible interference with absorption

Note Other drugs administered orally may need to be taken at the least 1 hour before or 4 hours after exenatide injection, or taken with a meal when exenatide is not administered, to minimise possible interference with absorption

ACE inhibitors: hypoglycaemic effect of insulin, metformin and sulfonylureas possibly enhanced by ACE inhibitors

Alcohol: hypoglycaemic effect of antidiabetics enhanced by alcohol; increased risk of lactic acidosis when metformin given with alcohol

Anabolic Steroids: hypoglycaemic effect of antidiabetics possibly enhanced by anabolic steroids

Analgesics: effects of sulfonylureas possibly enhanced by NSAIDs; lixisenatide possibly reduces the absorption of paracetamol when given 1 to 4 hours before paracetamol

Anti-arrhythmics: hypoglycaemic effect of glitazide, insulin and metformin possibly enhanced by disopyramide

Antibacterials: hypoglycaemic effect of acarbose possibly enhanced by neomycin, also severity of gastrointestinal effects increased; effects of repaglinide enhanced by clarithromycin; effects of glibenclamide possibly enhanced by norfloxacin; plasma concentration of canagliflozin and nateglinide reduced by rifampicin; effects of linagliptin possibly reduced by rifampicin; hypoglycaemic effect of repaglinide possibly antagonised by rifampicin; effects of sulfonylureas enhanced by enalapril; metabolism of tolbutamide accelerated by rifampicins (reduced effect); metabolism of sulfonylureas possibly accelerated by rifampicins (reduced effect); effects of sulfonylureas rarely enhanced by sulfonylureas and metformin; hypoglycaemic effect of sulfonylureas possibly enhanced by tetracyclines; hypoglycaemic effect of repaglinide possibly enhanced by trimethoprim—manufacturer advises avoid concomitant use

Anticoagulants: extended possibly enhances anti-thrombotic effect of warfarin; hypoglycaemic effect of sulfonylureas possibly enhanced by coumarins, also possible changes to anticoagulant effect

Antidepressants: hypoglycaemic effect of antidepressants possibly enhanced by MAOIs; hypoglycaemic effect of insulin, metformin and sulfonylureas enhanced by MAOIs

Antidiabetics: manufacturer of dapagliflozin advises avoid concomitant use with pioglitazone

Antipsychotics: tolbutamide transiently increases plasma concentration of phenytoin (possibility of toxicity); plasma concentration of metformin possibly increased by topiramate; plasma concentration of glibenclamide possibly reduced by topiramate

Antifungals: plasma concentration of sulfonylureas increased by fluconazole and miconazole; hypoglycaemic effect of glitazide and glipizide enhanced by miconazole—avoid concomitant use; hypoglycaemic effect of nateglinide possibly enhanced by fluconazole; hypoglycaemic effect of repaglinide possibly enhanced by itraconazole; hypoglycaemic effect of glipizide possibly enhanced by posaconazole.
Antidiabetics (continued)

- Sulfinpyrazone: plasma concentration of sulfonylureas possibly increased by voriconazole
- Antithrombin: thrombocyte count depressed when metformin given with ketotifen (manufacturer of ketotifen advises avoid concomitant use)
- Antipsychotics: hypoglycaemic effect of sulfonylureas possibly antagonised by phenothiazines
- Antifungals: plasma concentration of tolbutamide possibly increased by ritonavir
- Aprepitant: plasma concentration of tolbutamide reduced by aprepitant

Beta-blockers: warning signs of hypoglycaemia (such as tremor) with antidiabetics may be masked when given with beta-blockers; hypoglycaemic effect of insulin enhanced by beta-blockers.

- Bosentan: increased risk of hepatotoxicity when glibenclamide given with - Bosentan—avoid concomitant use.

Calcium-channel Blockers: glucose tolerance occasionally impaired when insulin given with nifedipine
- Cardiac Glycosides: canagliflozin and sitagliptin increase plasma concentration of digoxin; acarbose possibly reduces plasma concentration of digoxin
- Ciclosporin: hypoglycaemic effect of repaglinide possibly enhanced by ciclosporin
- Corticosteroids: plasma concentration of repaglinide possibly increased by prednisolone
- Diazoxide: hypoglycaemic effect of antidiabetics antagonised by diazoxide
- Diuretics: canagliflozin possibly enhances diuretic effect of diuretics; manufacturer of canagliflozin advises avoid concomitant use with loop diuretics; hypoglycaemic effect of antidiabetics antagonised by loop diuretics and thiazides and related diuretics; dapagliflozin possibly enhances diuretic effect of thiazides and related diuretics
- Hormone Antagonists: requirements for antidiabetics possibly reduced by lanreotide, octreotide and pasireotide
- Leflunomide: hypoglycaemic effect of tolbutamide possibly enhanced by leflunomide.

- Lipid-regulating Drugs: absorption of glibenclamide and glipizide reduced by colesevelam; absorption of glimepiride reduced by colesevelam—manufacturer of glimepiride advises give at least 4 hours before colesevelam; hypoglycaemic effect of acarbose possibly enhanced by colestipol; hypoglycaemic effect of nateglinide possibly enhanced by gemfibrozil; increased risk of severe hypoglycaemia when repaglinide given with gemfibrozil—avoid concomitant use; plasma concentration of glibenclamide possibly increased by fluvastatin; manufacturer of canagliflozin advises give at least 1 hour before or 4—6 hours after bile acid sequestrants; may be improved glucose tolerance and an additive effect when insulin or sulfonylureas given with fibrates

- Oestrogens: hypoglycaemic effect of antidiabetics antagonised by oestrogens
- Orlistat: avoidance of acarbose advised by manufacturer of orlistat
- Pancreatin: hypoglycaemic effect of acarbose antagonised by pancreatin
- Progestogens: hypoglycaemic effect of antidiabetics antagonised by progestogens
- Sulfinpyrazone: effects of sulfonylureas enhanced by sulfinpyrazone
- Teriflunomide: plasma concentration of repaglinide increased by teriflunomide

Antidiabetics (continued)

- Testosterone: hypoglycaemic effect of antidiabetics possibly enhanced by testosterone

Ulcer-healing Drugs: excretion of metformin reduced by cimetidine (increased plasma concentration); hypoglycaemic effect of sulfonylureas enhanced by cimetidine

Antiepileptics see Carbamazepine, Salsalazine, Ethosuximide, Gabapentin, Lacosamide, Lamotrigine, Levetiracetam, Oxcarbazepine, Perampanel, Phenytoin, Primidone, Retigabine, Rufinamide, Strigentin, Tegretol, Topiramate, Valproate, Vigabatrin, and Zonisamide

Antifungals see Amphotericin; Antifungals, Imidazole; Antifungals, Triazole; Caspofungin; Flucytosine; Griseofulvin, Miconafung; Terbinafine

Antifungals, Imidazole

- Antiinflammtatories: miconazole enhances anticoagulant effect of warfarin
- Antidepressants: avoidance of imidazoles advised by manufacturer of reboxetine
- Antidiabetics: miconazole enhances hypoglycaemic effect of glimepiride and glipizide—avoid concomitant use; miconazole increases plasma concentration of sulfonylureas
- Antiepileptics: miconazole possibly increases plasma concentration of carbamazepine; miconazole enhances anticonvulsant effect of phenytoin (plasma concentration of phenytoin increased); Antifungals: imidazoles possibly antagonise effects of amphotericin
- Antithrombins: imidazoles possibly inhibit metabolism of miconazole (avoid concomitant use)
- Antimalarial: increased risk of imidazoles advised by manufacturer of piperaquine with artesunate (possible risk of ventricular arrhythmias); avoidance of imidazoles advised by manufacturer of artesether
- Antipsychotics: increased risk of ventricular arrhythmias when miconazole given with pimozide—avoid concomitant use; imidazoles possibly increase plasma concentration of etretinate—manufacturer of etretinate advises avoid concomitant use
- Antivirals: imidazoles possibly increase plasma concentration of saquinavir
- Ciclosporin: miconazole possibly inhibits metabolism of ciclosporin (increased plasma concentration)
- Ergot Alkaloids: increased risk of ergotism when imidazoles given with ergotamine—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when miconazole given with atorvastatin; possible increased risk of myopathy when miconazole given with simvastatin
- Oestrogens: anecdotal reports of contraceptive failure when miconazole given with oestrogens
- Sirolimus: miconazole increases plasma concentration of sirolimus
- Tacrolimus: miconazole oral gel possibly increases plasma concentration of tacrolimus

Antifungals, Polypeptide see Amphotericin

Antifungals, Triazole

Note: In general, fluconazole interactions relate to multiple-dose treatment.

- Alikiren: iraconazole increases plasma concentration of alikiren—avoid concomitant use
- Analgesics: fluconazole increases plasma concentration of celecoxib (halve dose of celecoxib); voriconazole increases plasma concentration of diconfenac, ibuprofen and oxycodone; fluconazole increases plasma concentration of flurbiprofen, ibuprofen and methadone; fluconazole increases plasma concentration of parecoxib (reduce dose of parecoxib); voriconazole increases plasma concentration of alfenilam and methadone (consider
### Appendix 1: Interactions

#### Antifungals, Triazole

- **Analgesics** *(continued)*
  - Reducing dose of alfentanil and methadone; fluconazole inhibits metabolism of alfentanil *(risk of prolonged or delayed respiratory depression)*; itraconazole possibly inhibits metabolism of alfentanil; triazoles possibly increase plasma concentration of ketanylen; itraconazole possibly increases plasma concentration of methadone *(increased risk of ventricular arrhythmias)*; voriconazole increases plasma concentration of oxycodone.

- **Antacids**: Absorption of itraconazole reduced by antacids.

- **Anti-arrhythmics**: Manufacturer of itraconazole advises avoid concomitant use with diclofenac, avoidance of itraconazole, posaconazole, and voriconazole advised by manufacturer of droxidolbone.

- **Antibacterials**: Plasma concentration of itraconazole increased by clarithromycin; manufacturer of fluconazole advises avoid concomitant use with erythromycin; triazoles possibly increase plasma concentration of rifabutin *(increased risk of uveitis—reduce rifabutin dose)*; posaconazole increases plasma concentration of rifabutin *(also plasma concentration of posaconazole reduced)*; voriconazole increases plasma concentration of rifabutin; rifabutin reduces plasma concentration of voriconazole *(increase dose of voriconazole and also monitor for rifabutin toxicity)*; fluconazole increases plasma concentration of rifabutin *(increased risk of uveitis—reduce rifabutin dose)*; plasma concentration of itraconazole reduced by rifabutin and rifampicin—manufacturer of itraconazole advises avoid concomitant use; plasma concentration of posaconazole reduced by rifampicin; plasma concentration of voriconazole reduced by rifampicin; avoid concomitant use; metabolism of fluconazole accelerated by rifampicin *(reduced plasma concentration)*.

- **Anticoagulants**: Avoidance of itraconazole, posaconazole, and voriconazole advised by manufacturer of apixaban; fluconazole, itraconazole, and voriconazole enhance anticoagulant effect of coumarins; avoidance of itraconazole advised by manufacturer of dabigatran and rivaroxaban; avoidance of posaconazole and voriconazole advised by manufacturer of rivaroxaban.

- **Antidepressants**: Avoidance of triazoles advised by manufacturer of reboxetine; fluconazole possibly increases plasma concentration of amitriptyline and nortriptyline; plasma concentration of voriconazole reduced by St John’s wort—avoid concomitant use.

- **Antidiabetics**: Posaconazole possibly enhances hypoglycaemic effect of repaglinide; voriconazole possibly increases plasma concentration of sulfonylureas; fluconazole increases plasma concentration of sulfonylureas.

- **Antiepileptics**: Fluconazole possibly increases plasma concentration of carbamazepine; plasma concentration of voriconazole possibly reduced by carbamazepine and phenobarbital—avoid concomitant use; plasma concentration of itraconazole and posaconazole possibly reduced by carbamazepine; voriconazole increases plasma concentration of phenytoin, also phenytoin reduces plasma concentration of voriconazole *(increase dose of voriconazole and also monitor for phenytoin toxicity)*; plasma concentration of posaconazole reduced by *phenytoin*; plasma concentration of itraconazole reduced by *phenytoin*—avoid concomitant use; fluconazole increases plasma concentration of phenytoin *(consider reducing dose of phenytoin)*.

- **Antifungals, Triazole** *(continued)*
  - Increases plasma concentration of *phenytoin* *(consider reducing dose of phenytoin)*.

- **Antifungals, Triazoles** *(continued)*
  - Antifungals: Triazoles possibly antagonise effects of amphotericin; monitoring for increased voriconazole side effects advised by manufacturer of fluconazole if voriconazole given after fluconazole; plasma concentration of voriconazole increased by macafungin (consider reducing dose of itraconazole); plasma concentration of fluconazole increased by terbinafine.

- **Antihistamines**: Itraconazole inhibits metabolism of *mizolastine*—avoid concomitant use.

- **Antimutagens**: Avoidance of triazoles advised by manufacturer of *piperazine with arteminol* *(possible risk of ventricular arrhythmias)*; avoidance of triazoles advised by manufacturer of *artemether with lumefantrine*.

- **Antimycotins**: Avoidance of itraconazole advised by manufacturer of darifenacin and tolterodine; manufacturer of fezoterodine advises dose reduction when itraconazole given with *fezoterodine*—consult fezoterodine product literature; voriconazole possibly increases plasma concentration of solifenacin—see Dose under Solifenacin, p. 553.

- **Antipsychotics**: Itraconazole possibly increases plasma concentration of haloperidol; voriconazole possibly increases plasma concentration of *amiprazole* *(reduce dose of amiprazole—consult amiprazole product literature)*; increased risk of ventricular arrhythmias when triazoles given with *pimozone*—avoid concomitant use; triazoles possibly increase plasma concentration of *quetiapine*—manufacturer of quetiapine advises avoid concomitant use; voriconazole possibly increases side-effects of *risperidone*.

- **Antivirals**: Posaconazole increases plasma concentration of *atazanavir*; plasma concentration of voriconazole increased or decreased by *atazanavir* and plasma concentration of atazanavir also reduced; plasma concentration of voriconazole reduced by efavirenz, also plasma concentration of elavirenz increased *(increase voriconazole dose and reduce efavirenz dose)*; plasma concentration of itraconazole and posaconazole reduced by efavirenz; plasma concentration of both drugs may increase when itraconazole given with *fosamprenavir*; plasma concentration of posaconazole possibly reduced by *fosamprenavir*; itraconazole increases plasma concentration of *indinavir* *(consider reducing dose of indinavir)*; fluconazole increases plasma concentration of *nevirapine, ritonavir* and *tipranavir*; plasma concentration of itraconazole possibly reduced by *nevirapine*—consider increasing dose of itraconazole; plasma concentration of voriconazole reduced by ritonavir—avoid concomitant use; combination of itraconazole with *ritonavir* may increase plasma concentration of either drug *(or both)*; triazoles possibly increase plasma concentration of *saquinavir*; plasma concentration of itraconazole possibly increased by *nevirapine, ritonavir* and *tipranavir*—consider increasing dose of itraconazole; plasma concentration of voriconazole possibly increased by *telaprevir*; plasma concentration of voriconazole possibly increased by *telaprevir* *(possible increased risk of ventricular arrhythmias)*; plasma concentration of posaconazole possibly increased by *telaprevir* *(increased risk of ventricular arrhythmias)*; fluconazole increases plasma concentration of *zidovudine* *(increased risk of toxicity)*.

- **Anxiolytics and Hypnotics**: Itraconazole increases plasma concentration of *alprazolam*; fluconazole and voriconazole increase plasma concentration of *diazepam* *(risk of prolonged sedation)*; fluconazole, itraconazole, posaconazole and voriconazole increase plasma concentration of *midazolam* *(risk of prolonged sedation)*; itraconazole increases
Antifungals, Triazole

- Azole Antifungals (continued)
  - Itraconazole: see Dose under itraconazole.
  - Fluconazole: increases plasma concentration of dihydropyridines.

Calcium-channel Blockers: negative inotropic effect possible increased when itraconazole given with calcium-channel blockers.

Cardiac Glycosides: increased plasma concentration of eplerenone.

Diuretics: itraconazole possibly increases plasma concentration of amiodarone.

- Lipid-regulating Drugs
  - Atorvastatin: reduction in plasma concentration of itraconazole.

Corticosteroids: see Dose under corticosteroids.

Cytotoxic Chemotherapy: increased risk of myelosuppression when itraconazole given with taxol or docetaxel.

Ergot Alkaloids: see Dose under ergot alkaloids.

Ergotamine: increased risk of ergotism.

Ergometrine: increased risk of ergotism.

Leukotriene Receptor Agonists: see Dose under leukotriene receptor agonists.

Lipid-regulating Drugs: increased risk of myopathy.

Lipid-regulating Drugs: increased risk of myopathy.

Mirabegron: use with caution.

Oestrogens: see Dose under oestrogens.

Progestogens: see Dose under progestogens.

Ranolazine: see Dose under ranolazine.

Temsirolimus: increased risk of myelosuppression.

Temsirolimus: increased risk of myelosuppression.

Vinflunine: increased risk of myelosuppression.

Voriconazole: increased risk of myelosuppression.

Vinorelbine: increased risk of myelosuppression.

Vincristine: increased risk of myelosuppression.

With the exception of mirabegron, the following drugs are indicated to increase plasma concentration of itraconazole:

- Cobicistat: see Dose under cobicistat.
- Cilostazol: see Dose under cilostazol.
- Domperidone: see Dose under domperidone.
- Eplerenone: see Dose under eplerenone.
- Ivacaftor: see Dose under ivacaftor.
- Mirabegron: see Dose under mirabegron.
- Ranolazine: see Dose under ranolazine.
Appendix 1: Interactions

Antifungals, Triazole (continued)
- Antihistamines: possibly antagonises antidepressant effect of SSRIs; possible increased antimuscarinic and sedative effects when antihistamines given with tricyclic-related antidepressants
- Antidiabetics: thrombocyte count depressed when ketotifen given with metformin (manufacturer of ketotifen advises avoid concomitant use)
- Antifungals: metabolism of mizolastine inhibited by itraconazole—avoid concomitant use; metabolism of mizolastine possibly inhibited by amidazoles (avoid concomitant use)
- Antimarial: avoidance of mizolastine by manufacturer of efavirenz with artemisinin (possible risk of ventricular arrhythmias)
- Antimuscarinic: increased risk of antimuscarinic side-effects when antihistamines given with antimuscarinics
- Antiretroviral: plasma concentration of chlorphenamine possibly increased by riociguat; increased risk of ventricular arrhythmias when mizolastine given with saquinavir—avoid concomitant use
- Anxiolytics and Hypnotics: increased sedative effect when antihistamines given with anxiolytics and hypnotics
- Beta-blockers: increased risk of ventricular arrhythmias when mizolastine given with atorvastatin—avoid concomitant use
- Betahistine: antihistamines theoretically antagonise effect of betahistine
- Cytotoxics: possible increased risk of ventricular arrhythmias when mizolastine given with citalopram and escitalopram—avoid concomitant use
- Ulipristal: manufacturer of ulipristal advises give fexofenadine at least 1.5 hours before or after ulipristal
- Analgesics: possible increased risk of antimuscarinic side-effects when antihistamines given with paracetamol (risk of ventricular arrhythmias); manufacturer of promethazine advises avoid for 2 weeks after stopping MAOIs; manufacturer of hydroxyzine advises avoid concomitant use with MAOIs increased antimuscarinic and sedative effects when antihistamines given with MAOIs or tricyclics; cyproheptadine
Antimuscarinics (continued)

Antibacterials: manufacturer of fesoterodine advises dose reduction when fesoterodine given with clarithromycin and telithromycin—consult fesoterodine product literature; manufacturer of tolterodine advises avoid concomitant use with clarithromycin and erythromycin; plasma concentration of darifenacin possibly increased by erythromycin; plasma concentration of active metabolite of fesoterodine reduced by rifampicin.

Antidepressants: plasma concentration of darifenacin and procyclidine increased by paroxetine; increased risk of antimuscarinic side-effects when antimuscarinics given with MAOIs or tricyclics; possible increased antimuscarinic side-effects when antimuscarinics given with tricyclic-related antidepressants.

Antifungals: manufacturer of fesoterodine advises dose reduction when fesoterodine given with itraconazole—consult fesoterodine product literature; manufacturer of darifenacin and tolterodine advises avoid concomitant use with itraconazole; plasma concentration of solifenacin possibly increased by itraconazole—see Dose under Solifenacin, p. 553

Antihistamines: increased risk of antimuscarinic side-effects when antimuscarinics given with antihistamines.

Antipsychotics: antimuscarinics possibly reduce effects of haloperidol; increased risk of antimuscarinic side-effects when antimuscarinics given with clozapine; antimuscarinics reduce plasma concentration of phenothiazines, but risk of antimuscarinic side-effects increased.

Antivirals: manufacturer of fesoterodine given with itraconazole—consult fesoterodine product literature; manufacturer of darifenacin and tolterodine advises avoid concomitant use with itraconazole; plasma concentration of solifenacin possibly increased by itraconazole—see Dose under Solifenacin, p. 553

Calcium-channel Blockers: plasma concentration of solifenacin increased by verapamil; manufacturer of darifenacin advises avoid concomitant use with verapamil.

Cardiac Glycosides: darifenacin possibly increases plasma concentration of digoxin.

Ciclosporin: manufacturer of darifenacin advises avoid concomitant use with ciclosporin.

Domperidone: antimuscarinics antagonise effects of domperidone on gastro-intestinal activity.

Dopaminergics: antimuscarinics possibly reduce absorption of levodopa.

Hormone Antagonists: possible increased risk of bradycardia when ipratropium or oxybutynin given with pasireotide.

Mexitelone: effects of antimuscarinics possibly enhanced by memantine.

Metoclopramide: antimuscarinics antagonise effects of metoclopramide on gastro-intestinal activity.

Nitrites: antimuscarinics possibly reduce effects of sublingual tablets of nitrates (failure to dissolve under tongue owing to dry mouth).

Parasympathomimetics: antimuscarinics antagonise effects of parasympathomimetics.

Antipsychotics

Note: Increased risk of toxicity with myelopressor drugs

Note: Avoid concomitant use of clozapine with drugs that have a substantial potential for causing agranulocytosis.

ACE Inhibitors: enhanced hypotensive effect when antipsychotics given with ACE inhibitors.
Appendix 1: Interactions

Antiepileptics (continued)
- by carbamazepine (reduced plasma concentration), also avoid concomitant use of drugs with substantial potential for causing agranulocytosis; plasma concentration of aripiprazole reduced by carbamazepine (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of aripiprazole possibly reduced by carbamazepine and phenytoin (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); metabolism of haloperidol accelerated by phenobarbital (reduced plasma concentration of haloperidol); both drugs reduced when chlorpromazine given with phenobarbital; plasma concentration of clozapine possibly reduced by phenobarbital; plasma concentration of haloperidol reduced by phenytoin; chlorpromazine possibly increases plasma concentration of phenytoin; metabolism of clozapine and quetiapine accelerated by phenytoin (reduced plasma concentration); increased risk of side-effects including neutropenia when olanzapine given with valproate; plasma concentration of clozapine possibly increased or decreased by valproate.

Antifungals: plasma concentration of aripiprazole possibly increased by itraconazole (reduce dose of aripiprazole—consult aripiprazole product literature); side-effects of risperidone possibly increased by imidazoles and triazoles—manufacturer of quetiapine advises avoid concomitant use; increased risk of ventricular arrhythmias when pimozide given with imidazoles or triazoles—avoid concomitant use.

Antimalarials: avoidance of droperidol, haloperidol, phenothiazines and pimozide advised by manufacturer of citalopram (risk of ventricular arrhythmias); avoidance of haloperidol, phenothiazines and pimozide advised by manufacturer of escitalopram (risk of ventricular arrhythmias); plasma concentration of aripiprazole possibly increased by escitalopram (reduce dose of irapiprazole—consult aripiprazole product literature); plasma concentration of clozapine, haloperidol and risperidone increased by fluvoxamine; manufacturer of droperidol advises avoid concomitant use with fluvoxamine, escitalopram, sertraline and tricyclics (risk of ventricular arrhythmias); plasma concentration of aripiprazole reduced by fluvoxamine, escitalopram and sertraline; plasma concentration of risperidone possibly increased by paroxetine (increase risk of ventricular arrhythmias); plasma concentration of haloperidol increased by venlafaxine; clozapine possibly increases CNS effects of MAOIs; plasma concentration of pimozide possibly increased by SSRIs (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of aripiprazole possibly reduced by St John’s wort (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); possible increased risk of ventricular arrhythmias when risperidone given with tricyclics; possible increased antimuscarinic side-effects when clozapine given with tricyclics; manufacturer of fluoxetine, haloperidol, sulpride and zuclopenthixol advises avoid concomitant use with tricyclics (risk of ventricular arrhythmias); increased risk of anti-muscarinic side-effects when phenothiazines given with tricyclics.

Antidiabetics: phenothiazines possibly antagonise hypoglycaemic effect of sulfonylureas.

Antiepileptics: antiepileptics antagonise anticonvulsant effect of antiepileptics (convulsive threshold lowered); plasma concentration of paliperidone reduced by carbamazepine; metabolism of haloperidol, olanzapine, quetiapine and risperidone accelerated by carbamazepine (reduced plasma concentration); metabolism of clozapine accelerated.

Antipsychotics (continued)
- Antidepressants: plasma concentration of clozapine possibly increased by citalopram (increased risk of toxicity); avoidance of haloperidol, phenothiazines and pimozide advised by manufacturer of citalopram (risk of ventricular arrhythmias); avoidance of haloperidol, phenothiazines and pimozide advised by manufacturer of escitalopram (risk of ventricular arrhythmias); plasma concentration of aripiprazole possibly increased by escitalopram and paroxetine (reduce dose of irapiprazole—consult aripiprazole product literature); plasma concentration of clozapine, haloperidol and risperidone increased by fluvoxamine; manufacturer of droperidol advises avoid concomitant use with fluvoxamine, escitalopram, sertraline and tricyclics (risk of ventricular arrhythmias); plasma concentration of aripiprazole reduced by fluvoxamine, escitalopram and sertraline; plasma concentration of risperidone possibly increased by paroxetine (increase risk of ventricular arrhythmias); metabolism of pimozide inhibited by paroxetine (reduce dose of perphenazine); plasma concentration of haloperidol increased by venlafaxine; clozapine possibly increases CNS effects of MAOIs; plasma concentration of pimozide possibly increased by SSRIs (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of aripiprazole possibly reduced by St John’s wort (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); possible increased risk of ventricular arrhythmias when risperidone given with tricyclics; possible increased antimuscarinic side-effects when clozapine given with tricyclics; manufacturer of fluoxetine, haloperidol, sulpride and zuclopenthixol advises avoid concomitant use with tricyclics (risk of ventricular arrhythmias); increased risk of anti-muscarinic side-effects when phenothiazines given with tricyclics.

Antidiabetics: phenothiazines possibly antagonise hypoglycaemic effect of sulfonylureas.
Antipsychotics

- Antipsychotics (continued)
of ventricular arrhythmias when droperidol given with haloperidol—avoid concomitant use; increased risk of ventricular arrhythmias when pimozide given with phenothiazines—avoid concomitant use; possible increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with risperidone; increased risk of ventricular arrhythmias when pimozide given with sulpiride

- Antivirals: plasma concentration of pimozide possibly increased by atazanavir—avoid concomitant use; plasma concentration of aripiprazole possibly increased by atazanavir; plasma concentration of quetiapine possibly increased by atazanavir, darunavir, osampravir, indinavir, saquinavir, etopiravir, and rilpivirine (reduce dose of aripiprazole—consult aripiprazole product literature); plasma concentration of quetiapine possibly increased by etopiravir and rilpivirine; plasma concentration of quetiapine advises avoid concomitant use; avoidance of pimozide advised by manufacturer of etopiravir and rilpivirine; plasma concentration of aripiprazole possibly reduced by efavirenz and nevirapine (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of pimozide possibly increased by efavirenz, etopiravir and saquinavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of pimozide increased by etopiravir and rilpivirine (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of pimozide increased by etopiravir and rilpivirine (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of aripiprazole possibly reduced by efavirenz and nevirapine (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of pimozide possibly increased by efavirenz, etopiravir and saquinavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of pimozide increased by etopiravir and rilpivirine (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of aripiprazole possibly reduced by efavirenz and nevirapine (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of pimozide possibly increased by efavirenz, etopiravir and saquinavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of pimozide increased by etopiravir and rilpivirine (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of aripiprazole possibly reduced by efavirenz and nevirapine (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of pimozide possibly increased by efavirenz, etopiravir and saquinavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of pimozide increased by etopiravir and rilpivirine (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of aripiprazole possibly reduced by efavirenz and nevirapine (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of pimozide possibly increased by efavirenz, etopiravir and saquinavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of pimozide increased by etopiravir and rilpivirine (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of aripiprazole possibly reduced by efavirenz and nevirapine (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of pimozide possibly increased by efavirenz, etopiravir and saquinavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of pimozide increased by etopiravir and rilpivirine (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of aripiprazole possibly reduced by efavirenz and nevirapine (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of pimozide possibly increased by efavirenz, etopiravir and saquinavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of pimozide increased by etopiravir and rilpivirine (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of aripiprazole possibly reduced by efavirenz and nevirapine (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of pimozide possibly increased by efavirenz, etopiravir and saquinavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of pimozide increased by etopiravir and rilpivirine (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of aripiprazole possibly reduced by efavirenz and nevirapine (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of pimozide possibly increased by efavirenz, etopiravir and saquinavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of pimozide increased by etopiravir and rilpivirine (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of aripiprazole possibly reduced by efavirenz and nevirapine (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of pimozide possibly increased by efavirenz, etopiravir and saquinavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of pimozide increased by etopiravir and rilpivirine (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of aripiprazole possibly reduced by efavirenz and nevirapine (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of pimozide possibly increased by efavirenz, etopiravir and saquinavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of pimozide increased by etopiravir and rilpivirine (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of aripiprazole possibly reduced by efavirenz and nevirapine (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of pimozide possibly increased by efavirenz, etopiravir and saquinavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of pimozide increased by etopiravir and rilpivirine (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of aripiprazole possibly reduced by efavirenz and nevirapine (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of pimozide possibly increased by efavirenz, etopiravir and saquinavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of pimozide increased by etopiravir and rilpivirine (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of aripiprazole possibly reduced by efavirenz and nevirapine (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of pimozide possibly increased by efavirenz, etopiravir and saquinavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of pimozide increased by etopiravir and rilpivirine (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of aripiprazole possibly reduced by efavirenz and nevirapine (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of pimozide possibly increased by efavirenz, etopiravir and saquinavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of pimozide increased by etopiravir and rilpivirine (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of aripiprazole possibly reduced by efavirenz and nevirapine (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of pimozide possibly increased by efavirenz, etopiravir and saquinavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of pimozide increased by etopiravir and rilpivirine (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of aripiprazole possibly reduced by efavirenz and nevirapine (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of pimozide possibly increased by efavirenz, etopiravir and saquinavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of pimozide increased by etopiravir and rilpivirine (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of aripiprazole possibly reduced by efavirenz and nevirapine (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of pimozide possibly increased by efavirenz, etopiravir and saquinavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of pimozide increased by etopiravir and rilpivirine (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of aripiprazole possibly reduced by efavirenz and nevirapine (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of pimozide possibly increased by efavirenz, etopiravir and saquinavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of pimozide increased by etopiravir and rilpivirine (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of aripiprazole possibly reduced by efavirenz and nevirapine (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripipra
Antipsychotics (continued)
- Penicillamine: avoid concomitant use of clozapine with penicillamine (increased risk of agranulocyto-
sis)
- Pentamidine isethionate: increased risk of ventricular arrhythmias when amilsupride or droperidol given with pentamidine isethionate—avoid concomitant use; increased risk of ventricular arrhythmias when phenothiazines given with pentamidine isethionate
- Sodium Benzolate: haloperidol possibly reduces effects of sodium benzate
- Sodium Oxybate: antipsychotics possibly enhance effects of sodium oxybate
- Sodium Phenylbutyrate: haloperidol possibly reduces effects of sodium phenylbutyrate

Symptomametics: antipsychotics antagonise hyper-
tensive effect of sympathomimetics; antipsychotic effects of chlorpromazine possibly antagonised by dexamfetamine; chlorpromazine possibly reduces effects of lidocaine; side-effects of risperidone possibly increased by methylphenidate
- Tacrolimus: manufacturer of droperidol advises avoid concomitant use with tacrolimus (risk of ventri-
cular arrhythmias)
- Tetrabenazine: increased risk of extrapyramidal side-
effects when antipsychotics given with tetraben-
azine

Ulcer-healing Drugs: effects of antipsychotics, chlor-
promazine and clozapine possibly enhanced by cimetidine; plasma concentration of clozapine pos-
sibly reduced by omeprazole; absorption of sul-
pride reduced by sucralfate
- Vasodilator Antihypertensives: enhanced hypotensive effect when phenothiazines given with hydralazine, minoxidil or sodium nitroprusside

Antivirals see individual drugs

Anxiolytics and Hypnotics

ACE Inhibitors: enhanced hypotensive effect when anxiolytics and hypnotics given with ACE inhibitors
- Adrenergic Neurone Blockers: enhanced hypotensive effect when anxiolytics and hypnotics given with adrenergic neurone blockers
- Alcohol: increased sedative effect when anxiolytics and hypnotics given with alcohol
- Alpha-blockers: enhanced hypotensive and sedative effects when anxiolytics and hypnotics given with alpha-blockers
- Aanaesthetics, General: increased sedative effect when anxiolytics and hypnotics given with general anaes-
thetics
- Analgesics: metabolism of midazolam possibly inhibited by fentanyl; increased sedative effect when anxiolytics and hypnotics given with opioid anal-
gesics
- Angiotensin-II Receptor Antagonists: enhanced hypo-
tensive effect when anxiolytics and hypnotics given with angiotensin-II receptor antagonists
- Antibacterials: metabolism of midazolam inhibited by clarithromycin, erythromycin and telithromycin (increased plasma concentration with increased sedation); plasma concentration of buspiron increased by erythromycin (reduce dose of buspir-
one); metabolism of zopiclone inhibited by erythromycin; metabolism of benzodiazepines possibly accelerated by rifampicin (reduced plasma concentra-
tion); metabolism of diazepam and zaleplon acelerated by rifampicin (reduced plasma concentra-
tion); metabolism of buspiron possibly accelerated by rifampicin; metabolism of zolpidem accelerated by rifampicin (reduced plasma concentration and reduced effect); plasma concentration of zopiclone significantly reduced by rifampicin; metab-
olism of diazepam inhibited by ironiazid
- Anticoagulants: chloral may transiently enhance anti-
coagulant effect of coumarins

Antidepressants: plasma concentration of alprazolam increased by fluoxetine; plasma concentration of melatonin increased by fluvoxamine—avoid con-
comitant use; plasma concentration of some benzodiazepines increased by fluvoxamine; sedative effects possibly increased when zolpidem given with sertraline; manufacturer of buspiron advises avoid concomitant use with MAOIs; avoidance of buspiron for 14 days after stopping tranyl-
cypromine avoided by manufacturer of tranyl-
cypromine; plasma concentration of oral midazolam possibly reduced by St John’s wort; increased seda-
tive effect when anxiolytics and hypnotics given with mirtazapine, tricyclic-related antidepressants or tricyclics

Antiepileptics: plasma concentration of clonazepam often reduced by carbamazepine, phenobarbital and phencytoin; plasma concentration of midazolam reduced by carbamazepine and phenytoin; increased sedative effect when anxiolytics and hypnotics given with phenobarbital; benzodiazepines possibly increase or decrease plasma concentration of phenytoin; plasma concentration of clobazam increased by strazol; increased risk of side-effects when clonazepam given with valproate; clobazam possibly increases plasma concentration of valproate; plasma concen-
tration of diazepam and lorazepam possibly increased by valproate
- Antifungals: plasma concentration of diazepam and midazolam increased by fluconazole (risk of pro-
longed sedation); plasma concentration of alprazolam increased by itraconazole; plasma concentra-
tion of midazolam increased by triclabonazole; plasma concentra-
tion of midazolam possibly increased by voriconazole; plasma concentration of midazolam increased by voriconazole (risk of prolonged sedation)
- Antihistamines: increased sedative effect when anxioly-
lytics and hypnotics given with antihistamines
- Antipsychotics: increased sedative effect when anxioly-
lytics and hypnotics given with antipsychotics; alprazolam possibly increases plasma concentration of haloperidol; buspiron increases plasma concen-
tration of haloperidol; serious adverse events reported with concomitant use of benzodiazepines and clonazepam (causality not established); increased risk of hypotension, bradycardia and respiratory depression when parenteral benzodiazepines given with intramuscular clonazepam
- Antivirals: plasma concentration of midazolam possi-
bly increased by stavudine—avoid concomitant use of oral midazolam; plasma concentration of oral midazolam increased by becviewrit—manufacturer of becviewrit advises avoid concomitant use; increased risk of prolonged sedation when mid-
azolam given with fenofate—avoid concomitant use; plasma concentration of midazolam possibly increased by foscarnet—avoid concomitant use; plasma concentration of midazolam increased by indinavir—avoid concomitant use; plasma concentra-
tion of anxiolytics and hypnotics possibly increased by ritonavir; plasma concentration of alprazolam, diazepam, flurazepam and zolpidem possibly increased by ritonavir (risk of extreme sedation and respiratory depression—avoid con-
comitant use); plasma concentration of buspiron increased by ritonavir; plasma concentration of midazolam increased by saquinavir (risk of prolonged sedation—avoid con-
comitant use of oral midazolam)
Anxiolytics and Hypnotics (continued)

Aprepitant: plasma concentration of midazolam increased by aprepitant (risk of prolonged sedation) Beta-blockers: enhanced hypotensive effect when anxiolytics and hypnotics given with beta-blockers Calcium-channel Blockers: enhanced hypotensive effect when anxiolytics and hypnotics given with calcium-channel blockers; midazolam increases absorption of lercanidipine; plasma concentration of buspirone increased by diltiazem and verapamil (reduce dose of buspirone); metabolism of midazolam inhibited by diltiazem and verapamil (increased plasma concentration with increased sedation)

Cardiac Glycosides: alprazolam increases plasma concentration of digoxin (increased risk of toxicity)

Clonidine: enhanced hypotensive effect when anxiolytics and hypnotics given with clonidine
● Cocain: avoidance of oral midazolam advised by manufacturer of cobicistat
● Cytotoxics: plasma concentration of midazolam increased by etrolitinib and nilotinib

Deferasirox: plasma concentration of midazolam possibly reduced by deferasirox

Diazoxide: enhanced hypotensive effect when anxiolytics and hypnotics given with diazoxide

Disulfiram: metabolism of benzodiazepines inhibited by disulfiram (increased sedative effects); increased risk of temazepam toxicity when given with disulfiram

Diuretics: enhanced hypotensive effect when anxiolytics and hypnotics given with diuretics; administration of chloral with parenteral furosemide may displace thyroid hormone from binding sites

Dopaminergics: benzodiazepines possibly antagonise effects of levodopa

Grapefruit Juice: plasma concentration of oral midazolam possibly increased by grapefruit juice; plasma concentration of buspirone increased by grapefruit juice

Ivacafort: plasma concentration of midazolam increased by ivacafort

Lipid-regulating Drugs: plasma concentration of midazolam possibly increased by statins

Lithium: increased risk of neurotoxicity when clonazepam given with lithium

Lofexidine: increased sedative effect when anxiolytics and hypnotics given with lofexidine

Methyldopa: enhanced hypotensive effect when anxiolytics and hypnotics given with methyldopa
● Methylthioninium: possible risk of CNS toxicity when buspirone given with methylthioninium;—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)

Moxonidine: enhanced hypotensive effect when anxiolytics and hypnotics given with moxonidine; sedative effects possibly increased when benzodiazepines given with moxonidine

Muscle Relaxants: increased sedative effect when anxiolytics and hypnotics given with baclofen or tizanidine

Nitrazide: enhanced hypotensive effect when anxiolytics and hypnotics given with nitrazide

Oestrogens: plasma concentration of melatonin increased by oestrogens; plasma concentration of chlordiazepoxide, diazepam and nitrazepam possibly reduced by oestrogens

Probeneicid: excretion of lorazepam reduced by probeneicid (increased plasma concentration)

Progestogens: plasma concentration of chlordiazepoxide, diazepam and nitrazepam possibly increased by probeneicid (increased plasma concentration)

Appendix 1: Interactions

905
Appendix 1: Interactions

Arrest錢 (continued)
Anticoagulants: arrest钱 possibly reduces anti-
coagulant effect of warfarin
Antidepressants: manufacturer of arrest钱 advises
avoid concomitant use with St. John’s wort
Antidiabetics: arrest钱 reduces plasma concentra-
tion of tolbutamide
Antiepileptics: plasma concentration of arrest
possibly reduced by carbamazepine, phenobarbital
and phenytoin
Antipsychotics: manufacturer of arrest钱 advises
avoid concomitant use with pimozide
Antivirals: plasma concentration of arrest possibly
increased by ritonavir
Antioxidants and Hypnotics: arrest possibly increases
plasma concentration of midazolam (risk of pro-
longed sedation)
Calcium-channel Blockers: arrest lapse concentration
of both drugs may increase when arrestMoney with
diltiazem
Corticosteroids: arrestMoney inhibits metabolism of
dexamethasone and methylprednisolone (reduce
dose of dexamethasone and methylprednisolone)
Cytotoxics: arrestMoney possibly increases the plasma
concentration of bosutinib—manufacturer of bosu-
tinib advises avoid or consider reducing dose of
bosutinib
Dapoxetine: manufacturer of dapoxetine advises dose
reduction when arrestMoney given with dapoxetine
(see Dose under Dapoxetine, p. 560)
Lipid-regulating Drugs: manufacturer of lomitapide
advises dose reduction when fosaparin given with
lomitapide (see Dose under Lomitapide, p. 177)
Dostogens: arrestMoney possibly causes contraceptive
failure of hormonal contraceptives containing
eostrogen (alternative contraception recom-
meded)
Progestogens: arrestMoney possibly causes contracep-
tive failure of hormonal contraceptives containing
progestogen (alternative contraception recom-
meded)
Arpillaz 抬 see Antipsychotics
Arsenic Trioxide
Anti-arhythmis: increased risk of ventricular arrhyth-
mias when arsenic trioxide given with amiodarone
or dipyridamole
AntiBacterials: increased risk of ventricular arrhyth-
mias when arsenic trioxide given with
erythromycin, levofoxacin or moxifloxacin
Antidepressants: increased risk of ventricular arrhyth-
mias when arsenic trioxide given with
tripteline or escitalopram
AntiinflamMals: increased risk of ventricular arrhyth-
mias when arsenic trioxide given with
eflornithine
AntiBacterial: increased risk of ventricular arrhyth-
mias when arsenic trioxide given with
oral typhoid vaccine—see p. 850
Ascorbic acid 抬 see Vitamins
Asenapine 抬 see Antipsychotics
Aspirin
Adsorvents: absorption of aspirin possibly reduced by
kaolin
Anasthetics, General: aspirin possibly enhances effects
of thiopental
Analgesics: avoid concomitant use of aspirin with
NSAIDs (increased side-effects); antiplatelet effect
of aspirin possibly reduced by Buprenorphine
Antacids: excretion of aspirin increased by alkaline
urine due to some antacids
Anticoagulants: increased risk of bleeding when
aspirin given with coumarins or warfarin (due
to antiplatelet effect); aspirin enhances anti-
coagulant effect of heparin
Antidepressants: increased risk of bleeding when
aspirin given with SSRIs or venlafaxine
Antiepileptics: aspirin enhances effects of phenytoin
and valproate
Clopodigrel: increased risk of bleeding when aspirin
given with clopidogrel
Antidepressants: increased risk of gastro-intestinal bleeding and ulceration when aspirin given with corticosteroids, also corticosteroids reduce plasma concentration of salicylate.

- Cytotoxics: aspirin reduces excretion of methotrexate (increased risk of toxicity)—but for concomitant use in rheumatic disease see p. 718; aspirin possibly reduces renal excretion of pemetrexed—consult product literature.

- Diuretics: increased risk of toxicity when high-dose aspirin given with acetazolamide; aspirin antagonises diuretic effect of spironolactone; possible increased risk of toxicity when high-dose aspirin given with loop diuretics (also possible reduced effect of loop diuretics).

Ilprost: increased risk of bleeding when aspirin given with ilprost.

Leukotriene Receptor Antagonists: aspirin increases plasma concentration of zafirlukast.

Metoclopramide: rate of absorption of aspirin increased by metoclopramide (enhanced effect).

Probenecid: aspirin antagonises effects of probenecid.

Sulfinpyrazone: aspirin antagonises effects of sulfinpyrazone.

Atazanavir

Antacids: absorption of atazanavir reduced by antacids (give at least 2 hours before or 1 hour after antacids).

- Antiarhythmics: atazanavir possibly increases plasma concentration of amiodarone and lidocaine.

- Antibacterials: plasma concentration of both drugs increased when atazanavir given with clarithromycin; atazanavir increases plasma concentration of rifampin (reduce dose of rifabutin); plasma concentration of atazanavir reduced by rifampicin—avoid concomitant use; avoidance of concomitant atazanavir in severe renal and hepatic impairment advised by manufacturer of elvitegravir.

Anticoagulants: atazanavir may enhance or reduce anticoagulant effect of warfarin; avoidance of atazanavir advised by manufacturer of apixaban and rivaroxaban.

- Antidepressants: plasma concentration of atazanavir reduced by St John’s wort—avoid concomitant use.

- Antifungals: plasma concentration of atazanavir increased by posaconazole; atazanavir increases or decreases the plasma concentration of voriconazole and plasma concentration of atazanavir also reduced.

- Antimalarials: caution with atazanavir advised by manufacturer of artemether with lumefantrine; atazanavir possibly increases plasma concentration of quinine (increased risk of toxicity). Antimuscarinics: avoidance of atazanavir advised by manufacturer of darifenacin; manufacturer of fesoterodine advises dose reduction when atazanavir given with fesoterodine—consult fesoterodine product literature.

- Antipsychotics: atazanavir possibly increases plasma concentration of aripiprazole (reduce dose of aripiprazole—consult aripiprazole product literature); atazanavir possibly increases plasma concentration of pimozide—avoid concomitant use; atazanavir possibly increases plasma concentration of quetiapine—manufacturer of quetiapine advises avoid concomitant use.

- Antivirals: plasma concentration of atazanavir reduced by boceprevir; absorption of atazanavir reduced by didanosine tablets (give at least 2 hours before or 1 hour after didanosine tablets); manufacturer of atazanavir advises avoid concomitant use with efavirenz (plasma concentration of atazanavir reduced); atazanavir boosted with ritonavir increases plasma concentration of elvitegravir (reduce dose of elvitegravir).

Atazanavir

- Antivirals (continued) tegradivir; avoid concomitant use of atazanavir with indinavir; atazanavir increases plasma concentration of maraviroc (consider reducing dose of maraviroc); plasma concentration of atazanavir possibly reduced by nevirapine—avoid concomitant use; increased risk of ventricular arrhythmias when atazanavir given with saquinavir—avoid concomitant use; atazanavir possibly reduces plasma concentration of telaprevir, also plasma concentration of atazanavir possibly increased, plasma concentration of atazanavir reduced by tenofovir, also plasma concentration of tenofovir possibly increased; atazanavir increases plasma concentration of abacavir (also plasma concentration of atazanavir reduced).

- Anxiolytics and Hypnotics: atazanavir possibly increases plasma concentration of emidazolam—avoid concomitant use of oral midazolam.

- Avanafil: atazanavir possibly increases plasma concentration of avanafil—manufacturer of avanafil advises avoid concomitant use.

- Calcium-channel Blockers: atazanavir increases plasma concentration of nilvadipin (reduce dose of nilvadipin—manufacturer of apixaban and rivaroxaban increases plasma concentration of nilvadipin; atazanavir possibly increases plasma concentration of everolimus—manufacturer of crizotinib and everolimus advises avoid concomitant use; atazanavir possibly increases plasma concentration of pazopanib (reduce dose of pazopanib), avoidance of atazanavir advised by manufacturer of cabazitaxel; atazanavir possibly inhibits metabolism of astemizole (increased risk of toxicity).

- Dapoxetine: avoidance of atazanavir advised by manufacturer of dapoxetine (increased risk of toxicity).

- Ergot Alkaloids: atazanavir possibly increases plasma concentration of ergot alkaloids—avoid concomitant use.

- Lipid-regulating Drugs: possible increased risk of myopathy when atazanavir given with atorvastatin or pravastatin; atazanavir increases plasma concentration of rosuvastatin—adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when atazanavir given with simvastatin (avoid concomitant use).

- Oestrogens: atazanavir increases plasma concentration of ethinylestradiol.

- Orlistat: absorption of atazanavir possibly reduced by orlistat.

- Progestogens: atazanavir increases plasma concentration of norethisterone.

- Ranolazine: atazanavir possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use.

- Sildenafil: atazanavir possibly increases side-effects of sildenafil.

- Sirolimus: atazanavir possibly increases plasma concentration of sirolimus.

- Ticagrelor: atazanavir possibly increases plasma concentration of ticagrelor—manufacturer of ticagrelor advises avoid concomitant use.
Appendix 1: Interactions

**Atazanavir (continued)**
- Ulcer-healing Drugs: manufacturer of atazanavir advises adjust doses of both drugs when atazanavir given with *cimetidine* and *nizatidine*—consult atazanavir product literature; plasma concentration of atazanavir reduced by *famotidine* and *ranitidine* (adjust doses of both drugs—consult atazanavir product literature); plasma concentration of atazanavir reduced by *proton pump inhibitors*—avoid or adjust dose of both drugs (consult product literature)

**Atenolol** see Beta-blockers

**Atropine** see

**Antibacterials:**
- *Atovaquone*—possibly increases plasma concentration of atovaquone when atovaquone given with *rifampicin* and *erythromycin*—manufacturer of atovaquone advises avoid concomitant use; plasma concentration of atovaquone increased by *erythromycin*—see Dose under Avanafil, p. 559; plasma concentration of avanafil possibly reduced by *rifampicin*—manufacturer of avanafil advises avoid concomitant use

**Antifungals:** plasma concentration of avanafil possibly increased by *itraconazole*—see Dose under Avanafil, p. 559; plasma concentration of avanafil possibly increased by *fluconazole*—manufacturer of avanafil advises avoid concomitant use

**Antivirals:** plasma concentration of avanafil possibly increased by *atazanavir*, *indinavir*, and *saquinavir*—manufacturer of avanafil advises avoid concomitant use; plasma concentration of avanafil possibly reduced by *efavirenz*—manufacturer of avanafil advises avoid concomitant use; plasma concentration of avanafil possibly increased by *losaprenavir*—see Dose under Avanafil, p. 559; plasma concentration of avanafil significantly increased by *ritonavir*—avoid concomitant use

**Aprepitant:** plasma concentration of avanafil possibly increased by *aprepitant*—see Dose under Avanafil, p. 559

**Bosentan:** plasma concentration of avanafil possibly reduced by *bosentan*—manufacturer of avanafil advises avoid concomitant use

**Calcium-channel Blockers:** plasma concentration of avanafil possibly increased by *lithium* and *verapamil*—see Dose under Avanafil, p. 559

**Grapefruit Juice:** plasma concentration of avanafil possibly increased by *grapefruit juice*—manufacturer of avanafil advises avoid grapefruit juice for 24 hours before avanafil

**Nicorandil:** avanafil significantly enhances hypotensive effect of *nicorandil* (avoid concomitant use)

**Nitricates:** avanafil significantly enhances hypotensive effect of *nitricates* (avoid concomitant use)

**Riociguat:** possible enhanced hypotensive effect when avanafil given with *riociguat*—avoid concomitant use

**Avanafil**

**ACE Inhibitors**: avanafil possibly enhances hypotensive effect of *enalapril*:
- Alcohol: possible enhanced hypotensive effect when avanafil given with alcohol

**Alpha-blockers**: enhanced hypotensive effect when avanafil given with *alpha-blockers*—see also p. 558

**Antibacterials**: plasma concentration of avanafil possibly increased by *clarithromycin* and *telithromycin*—manufacturer of avanafil advises avoid concomitant use; plasma concentration of avanafil increased by *erythromycin*—see Dose under Avanafil, p. 559; plasma concentration of avanafil possibly reduced by *rifampicin*—manufacturer of avanafil advises avoid concomitant use

**Antiepileptics**: plasma concentration of avanafil possibly reduced by *carbamazepine* and *phenobarbital*—manufacturer of avanafil advises avoid concomitant use

**Antifungals**: plasma concentration of avanafil possibly increased by *itraconazole* and *posaconazole*—manufacturer of avanafil advises avoid concomitant use

**Antivirals**: plasma concentration of avanafil possibly increased by *atazanavir*, *indinavir* and *saquinavir*—manufacturer of avanafil advises avoid concomitant use; plasma concentration of avanafil possibly reduced by *efavirenz*—manufacturer of avanafil advises avoid concomitant use; plasma concentration of avanafil possibly increased by *losaprenavir*—see Dose under Avanafil, p. 559; plasma concentration of avanafil significantly increased by *ritonavir*—avoid concomitant use

**Apexitant**: plasma concentration of avanafil possibly increased by *aprepitant*—see Dose under Avanafil, p. 559

**Bosentan**: plasma concentration of avanafil possibly reduced by *bosentan*—manufacturer of avanafil advises avoid concomitant use

**Calcium-channel Blockers**: plasma concentration of avanafil possibly increased by *lithium* and *verapamil*—see Dose under Avanafil, p. 559

**Grapefruit Juice**: plasma concentration of avanafil possibly increased by *grapefruit juice*—manufacturer of avanafil advises avoid grapefruit juice for 24 hours before avanafil

**Nicorandil**: avanafil significantly enhances hypotensive effect of *nicorandil* (avoid concomitant use)

**Nitricates**: avanafil significantly enhances hypotensive effect of *nitricates* (avoid concomitant use)

**Riociguat**: possible enhanced hypotensive effect when avanafil given with *riociguat*—avoid concomitant use

**Avitini**

**Antibacterials**: plasma concentration of avitinin possibly increased by *clarithromycin*, *erythromycin* and *telithromycin* (reduce dose of avitinin—consult avitinib product literature); plasma concentration of avitinin possibly decreased by *rifampicin* (increase dose of avitinin—consult avitinib product literature); plasma concentration of avitinin possibly decreased by *rifampicin* (increase dose of avitinin—consult avitinib product literature)

**Antidepressants**: plasma concentration of avitinin possibly reduced by *St John’s Wort*—consider increasing dose of avitinin

**Antiepileptics**: plasma concentration of avitinin possibly decreased by *carbamazepine*, *phenobarbital* and *phenytoin* (increase dose of avitinin—consult avitinib product literature)

**Antifungals**: plasma concentration of avitinin possibly increased by *itraconazole* (reduce dose of avitinin—consult avitinib product literature)

**Avitinin**

**ACE Inhibitors**
- *Enalapril*—consult avitinib product literature
Antipsychotics: avoid concomitant use of cytoxics with clozapine (increased risk of agranulocytosis)
Antivirals: plasma concentration of metoprolol and propranolol increased by rifampicin (plasma concentration significantly reduced); plasma concentration of metoprolol and propranolol increased by fluvoxamine; plasma concentration of metoprolol possibly increased by paroxetine—increased risk of AV block (manufacturer of paroxetine advises concomitant use in cardiac insufficiency); labetalol and propranolol increase plasma concentration of imipramine; increased hypotensive effect when beta-blockers given with MAOIs; increased risk of ventricular arrhythmias when sotalol given with org 31031; increased risk of hypoglycaemia when sotalol given with insulin; increased risk of ventricular arrhythmias when sotalol given with insulin; increased risk of arrhythmias when sotalol given with clozapine (increased risk of agranulocytosis)

Azathioprine

ACE Inhibitors: increased risk of anaemia or leucopenia when azathioprine given with captopril especially in renal impairment; increased risk of anaemia when azathioprine given with enalapril especially in renal impairment
Allopurinol: enhanced effects and increased toxicity of azathioprine when given with allopurinol (reduce dose of azathioprine to one quarter of usual dose)
Aminosalicylates: possible increased risk of leucopenia when azathioprine given with aminosalicylates
Antibacterials: increased risk of haematological toxicity when azathioprine given with sulfamethoxazole (as co-trimoxazole); increased risk of haematological toxicity when azathioprine given with ciprofloxacin (also with co-trimoxazole)
Anticoagulants: azathioprine possibly reduces anti-coagulant effect of warfarin
Antivirals: myelosuppressive effects of azathioprine possibly enhanced by ribavirin
Aldesleukin: avoid of azathioprine advised by manufacturer of rHuEpo
Axitinib see Angiogenesis-Receptor Antagonists
Azithromycin see Macrolides
Aztreonam
Anticoagulants: aztreonam possibly enhances anti-coagulant effect of warfarin
Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850
Baclofen see Muscle Relaxants
Balsalazide see Aminosalicylates
Bambuterol see sympathomimetics, Beta2
Beclometasone see Corticosteroids
Belimumab
Vaccines: avoid concomitant use of belimumab with live vaccines (see p. 828)
Bendamustine
Antipsychotics: avoid concomitant use of cytoxics with clozapine (increased risk of agranulocytosis)
Bendroflumethiazide see Diuretics
Benperidol see Antipsychotics
Benzodiazepines see Anxiolytics and Hypnotics
Benzthiazide see Diuretics
Benzylenepicillin see Penicillins
Beta-blockers
Note: Since systemic absorption may follow topical application of beta-blockers to the eye the possibility of interactions, in particular, with drugs such as verapamil should be borne in mind
ACE Inhibitors: enhanced hypotensive effect when beta-blockers given with ACE inhibitors
Adrenergic Neurone Blockers: enhanced hypotensive effect when beta-blockers given with adrenergic neurone blockers
Alcohol: enhanced hypotensive effect when beta-blockers given with alcohol
Aldesleukin: enhanced hypotensive effect when beta-blockers given with aldesleukin
Alpha-blockers: enhanced hypotensive effect when beta-blockers given with alpha-blockers, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
Appendix 1: Interactions

Beta-blockers (continued)
Anaesthetics, General: enhanced hypotensive effect when beta-blockers given with general anaesthetics
Anaesthetics, Local: propranolol increases risk of local anaesthetics toxicity
Analgescics: hypotensive effect of beta-blockers antagonised by NSAIDs; plasma concentration of esmolol possibly increased by morphine
Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when beta-blockers given with angiotensin-II receptor antagonists
Anti-arrhythmics: increased myocardial depression when beta-blockers given with anti-arrhythmic; increased risk of ventricular arrhythmias when sotalol given with anti-arrhythmic; plasma concentration of metoprolol and propranolol possibly increased; avoidance of sotalol advised by manufacturer of sotalol; increased risk of myocardial depression and Bradycardia when beta-blockers given with flecainide; propranolol increases risk of lidocaine toxicity; nadolol possibly increases risk of lidocaine toxicity; plasma concentration of metoprolol and propranolol increased by propafenone
Antibacterials: increased risk of ventricular arrhythmias when sotalol given with moxifloxacin—avoid concomitant use; risk of ventricular arrhythmias when sotalol given with moxifloxacin; possibly increased by grapefruit juice; increased risk of ventricular arrhythmias when sotalol given with moxifloxacin; possibly increased by grapefruit juice
Angiotensin-II Receptor Antagonists: increased by citalopram and escitalopram; plasma concentration of metoprolol increased by citalopram and escitalopram; increased risk of ventricular arrhythmias when sotalol given with citalopram and escitalopram; possibly increased by dexamethasone (increase dose of sotalol)
Anticoagulants: possibly increased by dronedarone; increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
Amitriptyline: plasma concentration of propranolol possibly reduced by phenobarbital
Antihistamines: increased risk of ventricular arrhythmias when sotalol given with mizolastine—avoid concomitant use
Antimalarials: avoidance of sotalol advised by manufacturer of piperaquine with artezinol (possible risk of ventricular arrhythmias); avoidance of metoprolol and sotalol advised by manufacturer of arteether with lumefantrine; increased risk of Bradycardia when beta-blockers given with methoquine
Antimuscarinics: increased risk of ventricular arrhythmias when sotalol given with cimetidine
Antipsychotics: increased risk of ventricular arrhythmias when sotalol given with droperidol or zuclopenthixol—avoid concomitant use; possible increased risk of ventricular arrhythmias when sotalol given with haloperidol—avoid concomitant use; plasma concentration of both drugs may increase when propranolol given with chlorpromazine; increased risk of ventricular arrhythmias when sotalol given with amisulpride, ophenothiazines,
Beta-blockers

- Antipsychotics (continued)
  - pimozide or sulpiride; enhanced hypotensive effect when beta-blockers given with phenothiazines; possible increased risk of venous arrhythmias when sotalol given with esperidone

- Antivirals: increased risk of venous arrhythmias when sotalol given with efavirenz—avoid concomitant use; avoidance of sotalol advised by manufacturer of etravirine (risk of venous arrhythmia); avoidance of metoprolol for heart failure advised by manufacturer of etravirine

- Anxiolytics and Hypnotics: enhanced hypotensive effect when beta-blockers given with anxiolytics

- Atomoxetine: increased risk of venous arrhythmias when sotalol given with atomoxetine

- Calcium-channel Blockers: enhanced hypotensive effect when beta-blockers given with calcium-channel blockers; possible severe hypotension and heart failure when beta-blockers given with mifepridine; increased risk of AV block and bradycardia when beta-blockers given with diltiazem; asystole, severe hypotension and heart failure when beta-blockers given with verapamil (see p. 137)

- Cardiac Glycosides: increased risk of AV block and bradycardia when beta-blockers given with cardiac glycosides

- Ciclopenthiazide: increased plasma concentration of ciclosporin

- Clonidine: increased risk of withdrawal hypertension when beta-blockers given with clonidine (withdraw beta-blockers several days before slowly withdrawing clonidine)

- Corticosteroids: hypotensive effect of beta-blockers antagonised by corticosteroids

- Cytotoxics: possible increased risk of venous arrhythmias when sotalol given with doxorubicin; possible increased risk of venous arrhythmias when sotalol given with crizotinib; possible increased risk of venous arrhythmias when sotalol given with Vandetanib—avoid concomitant use; increased risk of venous arrhythmias when sotalol given with arsenic trioxide

- Diazoxide: enhanced hypotensive effect when beta-blockers given with diazoxide

- Diuretics: enhanced hypotensive effect when beta-blockers given with diuretics; risk of venicular arrhythmias with sotalol increased by high calcium caused by loop diuretics or thiazides and related diuretics

- Dopaminergics: enhanced hypotensive effect when beta-blockers given with levodopa

- Ergot Alkaloids: increased peripheral vasoconstriction when beta-blockers given with ergotamine

- Fingolimod: possible increased risk of bradycardia when beta-blockers given with fingolimod

- Hormone Antagonists: possible increased risk of bradycardia when carteolol, metoprolol, propranolol or sotalol given with pasireotide

- SH2, receptor Agonists: propranolol increases plasma concentration of rizatRIPTAN (manufacturer of rizatriptan advises half dose and avoid within 2 hours of propranolol)

- Ivabradine: increased risk of venicular arrhythmias when sotalol given with ivabradine

- Methyldopa: enhanced hypotensive effect when beta-blockers given with methyldopa

- Mirabegron: plasma concentration of metoprolol increased by mirabegron

- Moxisylyte: possible severe postural hypotension when beta-blockers given with moxisylyte

- Moxonidine: enhanced hypotensive effect when beta-blockers given with moxonidine

- Muscle Relaxants: propranolol enhances effects of muscle relaxants; enhanced hypotensive effect when beta-blockers given with alprostadil

Beta-blockers

- Muscle Relaxants (continued)
  - when beta-blockers given with baclofen; possible enhanced hypotensive effect and bradycardia when beta-blockers given with tizanidine

- Nitrites: enhanced hypotensive effect when beta-blockers given with nitrites

- Oestrogens: hypotensive effect of beta-blockers antagonised by oestrogens

- Parasympathomimetics: propranolol antagonises effects of neostigmine and pyridostigmine; increased risk of arrhythmias when beta-blockers given with pilocarpine

- Prostaglandins: enhanced hypotensive effect when beta-blockers given with alprostadil

- Ranolazine: avoidance of sotalol advised by manufacturer of ranolazine

- Sympathomimetics: increased risk of severe hypertension and bradycardia when non-cardioselective beta-blockers given with adrenaline (epinephrine), also reponse to adrenaline (epinephrine) may be reduced; increased risk of severe hypertension and bradycardia when non-cardioselective beta-blockers given with Nebutalamine; possible increased risk of severe hypertension and bradycardia when non-cardioselective beta-blockers given with Noradrenaline (norepinephrine)

- Thyroid Hormones: metabolism of propranolol accelerated by levothyrooxine

- Ulcer-healing Drugs: plasma concentration of labetalol, metoprolol and propranolol increased by cimetidine

- Vasodilator Antihypertensives: enhanced hypotensive effect when beta-blockers given with hydralazine, minoxidil or sodium nitroprusside

Betalistine

- Antihistamines: effect of betalisteine theoretically antagonised by antihistamines

- Betamethasone see Corticosteroids

- Betaxolol see Beta-blockers

- Bethanechol see Parasympathomimetics

- Bevacizumab
  - Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)

- Bexarotene
  - Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)

- Lipid-regulating Drugs: plasma concentration of bexarotene increased by gemfibrozil—avoid concomitant use

- Bezafibrate see Fibrates

- Bicalutamid
  - Anticoagulants: bicalutamid possibly enhances anti-coagulant effect of coumarins

- Biguanides see Antidiabetics

- Bilastine see Antihistamines

- Bile Acid Sequestrants see Colesevelam, Colestipol, and Colestyramine

- Bile Acids
  - Antacids: absorption of bile acids possibly reduced by antacids

- Citiclol: ursodeoxycholic acid increases absorption of ciclosporin

- Lipid-regulating Drugs: absorption of bile acids possibly reduced by colestipol and colestyramine

- Bisoprolol see Beta-blockers

- Bisphosphonates
  - Antacids: absorption of bisphosphonates reduced by antacids

- Anticholesteremics: increased risk of hypercalcaemia when bisphosphonates given with aluminum hydroxide

- Calcium Salts: absorption of bisphosphonates reduced by calcium salts

- Cytotoxics: sodium clodronate increases plasma concentration of estramustine
Bisphosphonates (continued)
Iron: absorption of bisphosphonates reduced by oral iron

Bleomycin
- Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis); cardiac glycosides: bleomycin possibly reduces absorption of digoxin tablets
- Cytotoxics: increased pulmonary toxicity when bleomycin given with cisplatin; increased risk of pulmonary toxicity when bleomycin given with ocrevusimab vedotin—avoid concomitant use

Boceprevir
Analgesics: possible increased risk of prolonged sedation and respiratory depression when boceprevir given with buprenorphine; boceprevir possibly affects plasma concentration of methadone
- Antibacterials: manufacturer of boceprevir advises avoid concomitant use with trimethoprim (plasma concentration of boceprevir possibly reduced)
- Anticoagulants: avoidance of boceprevir advised by manufacturer of apixaban
- Antiepileptics: manufacturer of boceprevir advises avoid concomitant use with carbamazepine, phenobarbital and phenytion (plasma concentration of boceprevir possibly reduced)
- Antimalarials: manufacturer of boceprevir advises avoid concomitant use with artether with lumefantrine
- Antipsychotics: manufacturer of boceprevir advises avoid concomitant use with pimozide; boceprevir possibly increases plasma concentration of equetiapine—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: boceprevir reduces plasma concentration of atazanavir; avoid concomitant use of boceprevir with darunavir; effects of both drugs possibly reduced when boceprevir given with etravirine; avoidance of boceprevir advised by manufacturer of fosamprenavir and nevirapine; manufacturers advise avoid concomitant use of boceprevir with lopinavir; boceprevir increases plasma concentration of maraviroc (consider reducing dose of maraviroc); plasma concentration of both drugs reduced when boceprevir given with ritonavir
- Antiadrenergics: plasma concentration of oral midazolam—manufacturer of boceprevir advises avoid concomitant use
- Antiarrhythmics: avoid concomitant use of boceprevir with amiodarone and disopyramide; plasma concentration of amiodarone possibly increased by boceprevir; boceprevir possibly reduces plasma concentration of telaprevir, also plasma concentration of bosentan possibly increased by boceprevir

Bosentan
- Analgesics: avoid avoidance of bosentan advised by manufacturer of elvitegravir and tipranavir; bosentan possibly reduces plasma concentration of indinavir; bosentan reduces plasma concentration of boceprevir possibly increased
- Anticoagulants: manufacturer of bosentan advises monitoring anticoagulant effect of coumarins
- Antidiabetics: increased risk of hepatotoxicity when bosentan given with glibenclamide—avoid concomitant use
- Antifungals: plasma concentration of bosentan possibly increased by itraconazole
- Antivirals: avoidance of bosentan advised by manufacturer of cobicistat
- Antiarrhythmics: bosentan possibly reduces plasma concentration of ritonavir; bosentan possibly reduces plasma concentration of simvastatin; bosentan possibly reduces plasma concentration of telaprevir, also plasma concentration of bosentan possibly increased by boceprevir
- Anticoagulants: bosentan possibly reduces plasma concentration of warfarin; bosentan possibly reduces plasma concentration of atorvastatin; manufacturers advise avoid concomitant use of boceprevir with warfarin; boceprevir possibly increased by bosentan
- Antihypertensives: bosentan possibly increases plasma concentration of atorvastatin; boceprevir reduces plasma concentration of atorvastatin; boceprevir possibly increased by bosentan

Bosutinib
- Analgesics: possible increased risk of ventricular arrhythmias when bosutinib given with methadone
- Anticancer: manufacturer of bosutinib advises separating administration with anticancer by about 12 hours
- Antiarrhythmics: possible increased risk of ventricular arrhythmias when bosutinib given with amiodarone and disopyramide; plasma concentration of bosutinib possibly increased by dronedarone; manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Antibacterials: plasma concentration of bosutinib possibly increased by ciprofloxacin, clarithromycin,
Appendix 1: Interactions

Bosutinib

- Antibacterials (continued)
  - erythromycin and telithromycin—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; possible increased risk of ventricular arrhythmias when bosutinib given with rifampicin
  - moxifloxacin—plasma concentration of bosutinib possibly reduced by rifabutin—manufacturer of bosutinib advises avoid concomitant use
- Antidepressants: plasma concentration of bosutinib possibly reduced by carbamazepine, phenobarbital and phenytoin—manufacturer of bosutinib advises avoid concomitant use
- Antifungals: plasma concentration of bosutinib possibly reduced by voriconazole—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Antimalarials: increased risk of ventricular arrhythmias when bosutinib given with chloroquine and hydroxychloroquine
- Antipsychotics: increased risk of agranulocytosis
- Antivirals: plasma concentration of bosutinib possibly increased by atazanavir, boceprevir, darunavir, fosamprenavir, indinavir, ritonavir, saquinavir and telaprevir—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Anti-arrhythmics: plasma concentration of bosutinib possibly reduced by efavirenz and estravine—manufacturer of bosutinib advises avoid concomitant use
- Aprepitant: plasma concentration of bosutinib possibly increased by aprepitant—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Beta-blockers: possible increased risk of ventricular arrhythmias when bosutinib given with metoprolol; avoid concomitant use of cytotoxics with citalopram (increased risk of agranulocytosis)
- Calcium-channel Blockers: plasma concentration of bosutinib possibly increased by diltiazem and verapamil—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Cytotoxics: plasma concentration of bosutinib possibly increased by matinib—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Domperidone: manufacturer of bosutinib advises avoid concomitant use with domperidone (risk of ventricular arrhythmias)
- Grapefruit juice: plasma concentration of bosutinib possibly increased by grapefruit juice—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Modafinil: plasma concentration of bosutinib possibly reduced by modafinil—manufacturer of bosutinib advises avoid concomitant use
- Ulcer-Healing Drugs: plasma concentration of bosutinib reduced by lansoprazole

Brentuximab vedotin

Antibacterials: effects of brentuximab vedotin possibly reduced by rifampicin

- Antipsychotics: avoid concomitant use of cytotoxics with bleomycin (increased risk of agranulocytosis)
- Cytoxotics: increased risk of pulmonary toxicity when brentuximab vedotin given with bleomycin—avoid concomitant use

Brimonidine

Antidepressants: manufacturer of brimonidine advises avoid concomitant use with MAOIs, tricyclic-related antidepressants and tricyclics

Brimonidine see Diuretics

Bromocriptine

Alcohol: tolerance of bromocriptine reduced by alcohol

Antibacterials: plasma concentration of bromocriptine increased by erythromycin (increased risk of toxicity); plasma concentration of bromocriptine possibly increased by macrolides (increased risk of toxicity)

Antipsychotics: hypoprolactinaemic and anti-parkinsonian effects of bromocriptine antagonised by antipsychotics

Domperidone: hypoprolactinaemic effect of bromocriptine possibly antagonised by domperidone

Hormone Antagonists: plasma concentration of bromocriptine increased by octreotide

Meteonine: effects of dopaminergics possibly reduced by meteonine

Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa

Metoclopramide: hypoprolactinaemic effect of bromocriptine antagonised by metoclopramide

Symptomatherapeutics: risk of toxicity when bromocriptine given with isomethyepine

Buclizine see Antihistamines

Budesonide see Corticosteroids

Bumetanide see Diuretics

Buvacaine

Anti-arrhythmics: increased myocardial depression when bupivacaine given with anti-arrhythmics

Beta-blockers: increased risk of bupivacaine toxicity when given with propranolol

Buprenorphine see Opioid Analgesics

Bupropion

- Antidepressants: bupropion possibly increases plasma concentration of citalopram; manufacturer of bupropion advises avoid for 2 weeks after stopping MAOIs; manufacturer of bupropion advises avoid concomitant use with moclobemide; bupropion possibly increases plasma concentration of tricyclics (possible increased risk of convulsions)

Antilipiemics: plasma concentration of bupropion reduced by carbamazepine and phenytoin; metabolism of bupropion inhibited by valproate

Antivirals: metabolism of bupropion accelerated by efavirenz—manufacturer of bupropion advises avoid for 2 weeks after stopping MAOIs; manufacturer of bupropion advises avoid concomitant use with moclobemide; bupropion possibly increases plasma concentration of tricyclics (possible increased risk of convulsions)

Antiparkinsonians: increased risk of side-effects when bupropion given with amantadine or levodopa

- Hormone Antagonists: bupropion possibly inhibits metabolism of tamoxifen to active metabolite (avoid concomitant use)

- Methylthioninium: possible risk of CNS toxicity when bupropion given with methylthioninium—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)

Buspirone see Anxiolytics and Hypnotics

Busulfan

Analgesics: metabolism of intravenous busulfan possibly inhibited by paracetamol (manufacturer of intravenous busulfan advises caution within 72 hours of paracetamol)

Antibacterials: plasma concentration of busulfan increased by metronidazole (increased risk of toxicity)

Antileukemics: plasma concentration of busulfan possibly reduced by phenytoin
**Busulfan (continued)**

Antifungals: metabolism of busulfan inhibited by itraconazole (increased risk of toxicity)
- Antipsychotics: avoid concomitant use of cytototics with clozapine (increased risk of agranulocytosis)
- Cytotoxics: increased risk of hepatotoxicity when busulfan given with tioguanine

**Butyrophenones** see Antipsychotics

**Cabazitaxel**
- Antibacterials: plasma concentration of cabazitaxel possibly increased by clarithromycin and erythromycin—manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel; manufacturer of cabazitaxel advises avoid concomitant use with rifabutin; plasma concentration of cabazitaxel reduced by rifampicin—manufacturer of cabazitaxel advises avoid concomitant use
- Antidepressants: manufacturer of cabazitaxel advises avoid concomitant use with St John’s wort
- Antiepileptics: manufacturer of cabazitaxel advises avoid concomitant use with carbamazepine, phenobarbital and phenytoin
- Antifungals: plasma concentration of cabazitaxel possibly increased by itraconazole and voriconazole—manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel
- Antivirals: avoid concomitant use of cytototics with clozapine (increased risk of agranulocytosis)
- Antivirals: manufacturer of cabazitaxel advises avoid concomitant use with atazanavir; plasma concentration of cabazitaxel possibly increased by indinavir; ritonavir and saquinavir—manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel

**Cabergoline**

Antibacterials: plasma concentration of cabergoline increased by erythromycin (increased risk of toxicity); plasma concentration of cabergoline possibly increased by macrolides (increased risk of toxicity)

Antipsychotics: hypopro lactinaemic effects of cabergoline antagonised by antipsychotics

Domperidone: hypopro lactinaemic effect of cabergoline possibly antagonised by domperidone

Memantine: effects of dopaminergics possibly enhanced by memantine

Methyl dopa: antiparkinsonian effect of dopaminergics antagonised by methyl dopa

Metoclopramide: hypopro lactinaemic effect of cabergoline antagonised by metoclopramide

**Caffeine citrate**

Anti-arrhythmics: caffeine citrate antagonises anti-arrhythmic effect of adenosine—manufacturer of adenosine advises avoid caffeine citrate for at least 12 hours before adenosine

Antiepileptics: caffeine citrate possibly antagonises effects of phenobarbital; plasma concentration of caffeine citrate reduced by phenytoin

Theophylline: manufacturer of caffeine citrate advises avoid concomitant use with theophylline

Ulcer-healing Drugs: plasma concentration of caffeine citrate increased by cimetidine

**Calcitriol** see Vitamins

**Calcium Salts** (continued)

Cardiac Glycosides: large intravenous doses of calcium salts can precipitate arrhythmias when given with cardiac glycosides

Corticosteroids: absorption of calcium salts reduced by corticosteroids

Cytotoxics: calcium salts reduce absorption of estramustine (manufacturer of estramustine advises avoid concomitant administration)

Diuretics: increased risk of hypercalcaemia when calcium salts given with thiazides and related diuretics

Elltromobag: calcium salts possibly reduce absorption of eltromobag (give at least 4 hours apart)

Fluorides: calcium salts reduce absorption of fluorides

Iron: calcium salts reduce absorption of oral iron

Thyroid Hormones: calcium salts reduce absorption of levothyroxine

Zinc: calcium salts reduce absorption of zinc

**Calcium-channel Blockers**

- Alpha-blockers: verapamil increases plasma concentration of tamsulosin; enhanced hypotensive effect when calcium-channel blockers given with α-blockers, also increased risk of first-dose hypotension with post-synaptic α-blockers such as prazosin
- Anasthetics, General: enhanced hypotensive effect when calcium-channel blockers given with general anaesthetics or isoflurane; hypotensive effect of verapamil enhanced by general anaesthetics (also AV delay)

Analgesics: hypotensive effect of calcium-channel blockers antagonised by NSAIDs; diltiazem inhibits metabolism of alfentanil (risk of prolonged or delayed respiratory depression)

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when calcium-channel blockers given with angiotensin-II receptor antagonists

- Anti-arrhythmics: increased risk of bradycardia, AV block and myocardial depression when diltiazem or verapamil given with amiodarone; increased risk of myocardial depression and asystole when verapamil given with disopyramide or flecaïnide; nifedipine increases plasma concentration of dronedarone; increased risk of bradycardia and myocardial depression when diltiazem and verapamil given with dro nedarone

Antibacterials: metabolism of calcium-channel blockers possibly inhibited by clarithromycin, erythromycin and Neurontin (increased risk of side-effects); manufacturer of lercanidipine advises avoid concomitant use with erythromycin; metabolism of diltiazem, nifedipine, nimodipine and verapamil accelerated by rifampicin (plasma concentration significantly reduced); plasma concentration of felodipine possibly reduced by rifampicin; metabolism of nicardipine possibly accelerated by rifampicin (possible significantly reduced plasma concentration)

Anti-coagulants: verapamil possibly increases plasma concentration of dabigatran (see Dose under Dabigatran, p. 154)
Appendix 1: Interactions

Calcium-channel Blockers (continued)

- Antidepressants: metabolism of nifedipine possibly inhibited by fluoxetine (increased plasma concentration); diltiazem and verapamil increase plasma concentration of imipramine; enhanced hypotensive effect when calcium-channel blockers given with MAOIs; plasma concentration of nifedipine reduced by St John’s Wort; plasma concentration of amlo- dipine and felodipine possibly reduced by St John’s Wort; plasma concentration of verapamil significantly reduced by St John’s Wort; diltiazem and verapamil possibly increase plasma concentration of tricyclics

- Antiepileptics: diltiazem and verapamil enhance effects of carbamazepine; manufacturer of nimo- dipine advises avoid concomitant use with carbama- zepine and phenytoin (plasma concentration of nimodipine possibly reduced by carbamazepine; effects of felodipine reduced by carbamazepine and phenytoin; effects of calcium-channel blockers probably reduced by phenobarbi- tal); manufacturer of nimodipine advises avoid concomitant use with phenobarbital (plasma concentra- tion of nimodipine reduced); diltiazem increases plasma concentration of phenytoin but also effect of diltiazem increased; effects of verapamil reduced by phenytoin

- Antifungals: negative inotropic effect possibly increased when calcium-channel blockers given with itraconazole; metabolism of dihydropyridines possibly inhibited by itraconazole (increased plasma concentration); metabolism of felodipine inhibited by itraconazole (increased plasma concentration); manufacturer of lercanidipine advises avoid concomitant use with itraconazole; plasma concentration of nifedipine increased by midazolam; diltiazem and verapamil possibly increase plasma concentration of methylprednisolone

- Antimuscarinics: possible increased risk of bradycardia when calcium-channel blockers given with melfo- quine

- Antimucosaritins: avoidance of verapamil advised by manufacturer of darifenacin; verapamil increases plasma concentration of solifenacin

- Antipsychotics: enhanced hypotensive effect when calcium-channel blockers given with antipsychotics

- Antivirals: plasma concentration of diltiazem increased by atazanavir; plasma concentration of diltiazem reduced by efavirenz; plasma concentration of calcium-channel blockers possibly increased by ritonavir; manufacturer of lercanidipine advises avoid concomitant use with ritonavir; plasma concentration of amlo- dipine increased by telaprevir (consider reducing dose of amlo- dipine); caution with diltiazem, felodipine, nifedipine and verapamil advised by manufacturers; effects of hydralpyr- idines, nicardipine and nifedipine probably reduced by carbamazepine; effects of felodipine reduced by carbamazepine and phenytoin; effects of calcium-channel blockers probably reduced by phenobarbital; manufacturer of nimodipine advises avoid concomitant use with phenobarbital (plasma concentration of nimodipine reduced); diltiazem increases plasma concentration of phenytoin but also effect of diltiazem increased; effects of verapamil reduced by phenytoin

- Antifungals: negative inotropic effect possibly increased when calcium-channel blockers given with itraconazole; metabolism of dihydropyridines possibly inhibited by itraconazole (increased plasma concentration); metabolism of felodipine inhibited by itraconazole (increased plasma concentration); manufacturer of lercanidipine advises avoid concomitant use with itraconazole; plasma concentration of nifedipine increased by midazolam; diltiazem and verapamil possibly increase plasma concentration of methylprednisolone

Calcium-channel Blockers (continued)

- Beta-blockers (continued) hypotension and heart failure when verapamil given with beta-blockers (see p. 137); possible severe hypotension and heart failure when nifedipine given with beta-blockers

- Cardiac Glycosides: nifedipine possibly increases plasma concentration of digoxin; diltiazem, lercani- dipine and nicardipine increase plasma concentration of digoxin; verapamil increases plasma concentra- tion of digoxin, also increased risk of AV block and bradycardia

- Corticosteroids: diltiazem, nicardipine and verapamil increase plasma concentration of ciclosporin; combi- nation of lercanidipine with ciclosporin may increase plasma concentration of either drug (or both)—avoid concomitant use; plasma concentra- tion of nifedipine possibly increased by ciclosporin (increased risk of toxicity including gingival hyper- plasia)

- Diazoxide: diltiazem increases plasma concentration of ciclosporin (consider reducing dose of ciclosporin)

- Ciclosporin: diltiazem, nicardipine and verapamil increase plasma concentration of ciclosporin; combi- nation of lercanidipine with ciclosporin may increase plasma concentration of either drug (or both)—avoid concomitant use; plasma concentra- tion of nifedipine possibly increased by ciclosporin (increased risk of toxicity including gingival hyper- plasia)

- Diazoxide: diltiazem increases plasma concentration of ciclosporin (consider reducing dose of ciclosporin)

- Ciclosporin: diltiazem, nicardipine and verapamil increase plasma concentration of ciclosporin; combi- nation of lercanidipine with ciclosporin may increase plasma concentration of either drug (or both)—avoid concomitant use; plasma concentra- tion of nifedipine possibly increased by ciclosporin (increased risk of toxicity including gingival hyper- plasia)

- Diazoxide: diltiazem increases plasma concentration of ciclosporin (consider reducing dose of ciclosporin)

- Ciclosporin: diltiazem, nicardipine and verapamil increase plasma concentration of ciclosporin; combi- nation of lercanidipine with ciclosporin may increase plasma concentration of either drug (or both)—avoid concomitant use; plasma concentra- tion of nifedipine possibly increased by ciclosporin (increased risk of toxicity including gingival hyper- plasia)

- Diazoxide: diltiazem increases plasma concentration of ciclosporin (consider reducing dose of ciclosporin)

- Ciclosporin: diltiazem, nicardipine and verapamil increase plasma concentration of ciclosporin; combi- nation of lercanidipine with ciclosporin may increase plasma concentration of either drug (or both)—avoid concomitant use; plasma concentra- tion of nifedipine possibly increased by ciclosporin (increased risk of toxicity including gingival hyper- plasia)

- Diazoxide: diltiazem increases plasma concentration of ciclosporin (consider reducing dose of ciclosporin)

- Ciclosporin: diltiazem, nicardipine and verapamil increase plasma concentration of ciclosporin; combi- nation of lercanidipine with ciclosporin may increase plasma concentration of either drug (or both)—avoid concomitant use; plasma concentra- tion of nifedipine possibly increased by ciclosporin (increased risk of toxicity including gingival hyper- plasia)

- Diazoxide: diltiazem increases plasma concentration of ciclosporin (consider reducing dose of ciclosporin)

- Ciclosporin: diltiazem, nicardipine and verapamil increase plasma concentration of ciclosporin; combi- nation of lercanidipine with ciclosporin may increase plasma concentration of either drug (or both)—avoid concomitant use; plasma concentra- tion of nifedipine possibly increased by ciclosporin (increased risk of toxicity including gingival hyper- plasia)

- Diazoxide: diltiazem increases plasma concentration of ciclosporin (consider reducing dose of ciclosporin)

- Ciclosporin: diltiazem, nicardipine and verapamil increase plasma concentration of ciclosporin; combi- nation of lercanidipine with ciclosporin may increase plasma concentration of either drug (or both)—avoid concomitant use; plasma concentra- tion of nifedipine possibly increased by ciclosporin (increased risk of toxicity including gingival hyper- plasia)

- Diazoxide: diltiazem increases plasma concentration of ciclosporin (consider reducing dose of ciclosporin)

- Ciclosporin: diltiazem, nicardipine and verapamil increase plasma concentration of ciclosporin; combi- nation of lercanidipine with ciclosporin may increase plasma concentration of either drug (or both)—avoid concomitant use; plasma concentra- tion of nifedipine possibly increased by ciclosporin (increased risk of toxicity including gingival hyper- plasia)

- Diazoxide: diltiazem increases plasma concentration of ciclosporin (consider reducing dose of ciclosporin)

- Ciclosporin: diltiazem, nicardipine and verapamil increase plasma concentration of ciclosporin; combi- nation of lercanidipine with ciclosporin may increase plasma concentration of either drug (or both)—avoid concomitant use; plasma concentra- tion of nifedipine possibly increased by ciclosporin (increased risk of toxicity including gingival hyper- plasia)
Calcium-channel Blockers (continued)

- Ixabradine: diltiazem and verapamil increase plasma concentration of ixabradine—avoid concomitant use
- Levaldilomide: verapamil possibly increases plasma concentration of levaldilomide (increased risk of toxicity)
- Lipid-regulating Drugs: diltiazem increases plasma concentration of atorvastatin—possible increased risk of myopathy; possible increased risk of myopathy when amiodipine and diltiazem given with simvastatin (see Dose under Simvastatin, p. 173); increased risk of myopathy when verapamil given with simvastatin (see Dose under Simvastatin, p. 173); avoidance of diltiazem and verapamil advised by manufacturer of loratadine (plasma concentration of loratadine possibly increased)
- Magnesium (parenteral): profound hypotension reported with concomitant use of nifedipine and parenteral magnesium in pre-eclampsia
- Methylene diphosphonate: enhanced hypertensive effect when calcium-channel blockers given with methylene diphosphonate
- Mexiletine: enhanced hypertensive effect when calcium-channel blockers given with mexiletine
- Moxonidine: enhanced hypertensive effect when calcium-channel blockers given with moxonidine
- Muscle Relaxants: verapamil enhances effects of non-depolarising muscle relaxants and suxamethonium; enhanced hypertensive effect when calcium-channel blockers given with baclofen or tizanidine; manufacturer of verapamil advises avoid concomitant use of intravenous dantrolene; possible increased risk of ventricular arrhythmias when diltiazem given with intravenous dantrolene—manufacturer of diltiazem advises avoid concomitant use; calcium-channel blockers possibly enhance effects of non-depolarising muscle relaxants
- Nitrates: enhanced hypertensive effect when calcium-channel blockers given with nitrates
- Oestrogens: hypertensive effect of calcium-channel blockers antagonised by oestrogens
- Prostaglandins: enhanced hypertensive effect when calcium-channel blockers given with alprostadil
- Ranolazine: diltiazem and verapamil increase plasma concentration of ranolazine (consider reducing dose of ranolazine)
- Sildenafil: enhanced hypertensive effect when amiodipine given with sildenafil
- Sirolimus: diltiazem increases plasma concentration of sirolimus; plasma concentration of both drugs increased when verapamil given with sirolimus
- Sulfispyrazone: plasma concentration of verapamil reduced by sulfispyrazone
- Tacrolimus: diltiazem and nifedipine increase plasma concentration of tacrolimus; felodipine, nicardipine and verapamil possibly increase plasma concentration of tacrolimus
- Theophylline: calcium-channel blockers possibly increase plasma concentration of theophylline (enhanced effect); diltiazem increases plasma concentration of theophylline; verapamil increases plasma concentration of theophylline (enhanced effect)
- Ticagrelor: diltiazem increases plasma concentration of ticagrelor
- Ulcer-healing Drugs: metabolism of calcium-channel blockers possibly inhibited by cimetidine (increased plasma concentration)
- Ulipristal: avoidance of verapamil advised by manufacturer of ulipristal
- Vardenafil: enhanced hypertensive effect when nifedipine given with vardenafil

Calcium-channel Blockers (continued)

Vasodilators: Antihypertensives: enhanced hypotensive effect when calcium-channel blockers given with hydralazine, minoxidil or sodium nitroprusside

Calcium-channel Blockers (dihydropyridines) see Calcium-channel Blockers

Canagliflozin see Antidiabetics

Candesartan see Angiotensin-II Receptor Antagonists

Cannabis Extract

Antidepressants: possible increased risk of hyper tension and tachycardia when cannabis extract given with tricyclics

Capcetabine see Flurouracil

Captopril see ACE Inhibitors

Carbamazepine

Alcohol: CNS side-effects of carbamazepine possibly increased by alcohol

- Analgesics: effects of carbamazepine enhanced by dextropropoxyphene; carbamazepine possibly accelerates metabolism of fentanyl (reduced effect); carbamazepine reduces plasma concentration of methadone; carbamazepine reduces effects of tramadol; carbamazepine possibly accelerates metabolism of paracetamol (also isolated reports of hepatotoxicity)

- Anti-arrhythmics: carbamazepine possibly reduces plasma concentration of eprodide (avoid concomitant use)

- Antidepressants: plasma concentration of carbamazepine increased by clarithromycin (consider reducing dose of carbamazepine); plasma concentration of carbamazepine increased by erythromycin; plasma concentration of carbamazepine increased by rifabutin; carbamazepine accelerates metabolism of doxycycline (reduced effect); plasma concentration of carbamazepine increased by lasix (also possibly increased isoniazid hepatotoxicity); carbamazepine reduces plasma concentration of clindamycin (avoid during and for 2 weeks after carbamazepine)

- Anticoagulants: carbamazepine possibly reduces plasma concentration of apixaban; carbamazepine accelerates metabolism of enoxaparin (reduced anticoagulant effect); carbamazepine possibly reduces plasma concentration of dabigatran—manufacturer of dabigatran advises avoid concomitant use; carbamazepine possibly reduces plasma concentration of rivaroxaban—manufacturer of rivaroxaban advises monitor for signs of thrombosis

- Antidepressants: carbamazepine possibly reduces plasma concentration of reboxetine; plasma concentration of carbamazepine increased by fluoxetine and fluvoxamine; carbamazepine reduces plasma concentration of mianserin, mirtazapine and trazodone; manufacturer of carbamazepine advises avoid for 2 weeks after stopping MAOIs, also antagonism of antidepressant effect; anti-convulsant effect of antidepressants possibly antagonised by MAOIs and tricyclic-related antidepressants (conversive threshold lowered); anti-convulsant effect of antidepressants antagonised by SSRI and SSRI comb.; gabapentan; plasma concentration of carbamazepine possibly reduced by St John’s wort; carbamazepine accelerates metabolism of carbamazepine given with colistimethate sodium or polymyxins; increased risk of nephrotoxicity and ototoxicity when carbamazepine given with aminoglycosides or vancomycin

Cytotoxics: increased risk of nephrotoxicity and oto toxicity when carbamazepine given with platinum compounds

Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850
**Appendix 1: Interactions**

### Antivirals:
- Carbamazepine (reduced plasma concentration of efavirenz; increased risk of toxicity; carbamazepine probably reduces plasma concentration of nifedipine; avoidance of carbamazepine advised by manufacturer of nifedipine (reduced plasma concentration of nifedipine possibly reduced); effects of carbamazepine enhanced by ritonavir and erythromycin).
Carbamazepine (continued)

Muscle Relaxants: carbamazepine antagonises muscle relaxant effect of non-depolarising muscle relaxants (accelerated recovery from neuromuscular blockade)

- Oestrogens: carbamazepine accelerates metabolism of oestrogens (reduced contraceptive effect—see p. 536)
- Orlistat: possible increased risk of convulsions when anticonvulsants given with orlistat
- Progestogens: carbamazepine accelerates metabolism of progestogens (reduced contraceptive effect—see p. 536)

Retinoids: plasma concentration of carbamazepine possibly reduced by isotretinoin

Roflumilast: carbamazepine possibly inhibits effects of roflumilast (manufacturer of roflumilast advises avoid concomitant use)

Theophylline: carbamazepine accelerates metabolism of theophylline (reduced plasma concentration)

Thyroid Hormones: carbamazepine accelerates metabolism of thyroid hormones (may increase requirements for thyroid hormones in hypothyroidism)

Tobolone: carbamazepine accelerates metabolism of tobolone (reduced plasma concentration)

Ticagrelor: carbamazepine possibly reduces plasma concentration of ticagrelor

- Ulcer-healing Drugs: metabolism of carbamazepine inhibited by esomeprazole (increased plasma concentration)
- Ulipristal: avoidance of carbamazepine advised by manufacturer of ulipristal (contraceptive effect of ulipristal possibly reduced)

Vitamins: carbamazepine possibly increases requirements for vitamin D

Carbamazepine see Erthropenem, Imipenem with Cilastatin, and Meropenem

Carbonic Anhydrase Inhibitors see Diuretics

Carboplatin see Platinum Compounds

Carboprogest see Prostaglandins

Cardiac Glycosides

ACE Inhibitors: plasma concentration of digoxin possibly increased by captopril

Alpha-blockers: plasma concentration of digoxin increased by prazosin

Aminosalicylates: absorption of digoxin possibly reduced by sulfasalazine

Analgesics: plasma concentration of cardiac glycosides possibly increased by NSAIDs, also possible exacerbation of heart failure and reduction of renal function

Anticadis: absorption of digoxin possibly reduced by antacids

- Anti-arrhythmics: plasma concentration of digoxin increased by amiodarone, dronedarone and propafenone (halve dose of digoxin)
- Antibacterials: plasma concentration of digoxin possibly increased by gentamicin, teicoplanin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin possibly reduced by rifampicin; plasma concentration of digoxin increased by macrodolides (increased risk of toxicity)
- Antidepressants: plasma concentration of digoxin reduced by St John’s wort—avoid concomitant use
- Antidiabetics: plasma concentration of digoxin possibly reduced by acarbose; plasma concentration of digoxin increased by canagliflozin and sitagliptin
- Antiepileptics: plasma concentration of digoxin possibly reduced by phenytoin
- Antifungals: increased cardiac toxicity with cardiac glycosides if hypokalaemia occurs with amphotericin; plasma concentration of digoxin increased by itraconazole

Cardiac Glycosides (continued)

- Antiarrhythmics: plasma concentration of digoxin possibly increased by chloroquine and hydroxychloroquine; possible increased risk of bradycardia when digoxin given with melfloquine; plasma concentration of digoxin increased by etravirine and tenofovir: plasma concentration of digoxin possibly increased by ritonavir
- Antimuscarnetics: plasma concentration of digoxin possibly increased by darifenacin
- Antivirals: side-effects of digoxin possibly increased by bioreporter; plasma concentration of digoxin increased by efavirenz and telaprevir: plasma concentration of digoxin possibly increased by ritonavir
- Anxiolytics and Hypnotics: plasma concentration of digoxin increased by alprazolam (increased risk of toxicity)

Beta-blockers: increased risk of AV block and bradycardia when cardiac glycosides given with beta-blockers

Calcium Salts: arrhythmias can be precipitated when cardiac glycosides given with large intravenous doses of calcium salts

- Calcium-channel Blockers: plasma concentration of digoxin increased by diltiazem, nicardipine and verapamil, also increased risk of AV block and bradycardia
- Ciclosporin: plasma concentration of digoxin increased by ciclosporin (increased risk of toxicity)
- Cobicistat: plasma concentration of digoxin possibly increased by cobicistat—reduce initial dose of digoxin
- Colchicine: possible increased risk of myopathy when digoxin given with colchicine
- Corticosteroids: increased risk of hypokalaemia when cardiac glycosides given with corticosteroids
- Cytotoxics: absorption of digoxin tablets possibly reduced by bleomycin, carmustine, cyclophosphamide, cytarabine, doxorubicin, methotrexate, procarbazine and vincristine; possible increased risk of bradycardia when digoxin given with crizotinib; plasma concentration of digoxin increased by vandetanib—possible increased risk of bradycardia
- Diuretics: increased cardiac toxicity with cardiac glycosides if hypokalaemia occurs with azathioprine, ciclosporin (increased risk of toxicity)
- Diuretics: absorption of digoxin possibly reduced by spironolactone
- Lenalidomide: plasma concentration of digoxin possibly increased by lenalidomide
- Lipid-regulating Drugs: absorption of cardiac glycosides possibly reduced by colesevelam and colestipol: plasma concentration of digoxin possibly increased by atorvastatin
- Mirabar: plasma concentration of digoxin increased by mirabar—reduce initial dose of digoxin
- Muscle Relaxants: risk of ventricular arrhythmias when cardiac glycosides given with suxamethonium; possible increased risk of bradycardia when cardiac glycosides given with tizanidine
- Penicillamine: plasma concentration of digoxin possibly reduced by penicillamine
- Ranolazine: plasma concentration of digoxin increased by ranolazine
- Symptomimetics, Beta,: plasma concentration of digoxin possibly reduced by salbutamol
- Ticagrelor: plasma concentration of digoxin increased by ticagrelor
- Tolcapone: plasma concentration of digoxin increased by tolcapone (increased risk of toxicity)
- Urology Drugs: plasma concentration of digoxin possibly slightly increased by proton pump inhibitors
Cardiac Glycosides
Ulcer-healing Drugs (continued)
- Bitor: absorption of cardiac glycosides possibly reduced by sucralfate
Ultrapristil: manufacturer of ultrapristil advises giving digoxin at least 1.5 hours before or after ultrapristil

Carmustine
- Antipsyhotics: avoid concomitant use of cytoxycytos with depazapine (increased risk of agranulocytosis)
Cardiac Glycosides: carmustine possibly reduces absorption of digoxin tablets
Ulcer-healing Drugs: myelosuppressive effects of carmustine possibly enhanced by cimetidine

Carteolol see Beta-blockers
Carvedilol see Beta-blockers

Caspofungin
- Antibacterials: plasma concentration of caspofungin initially increased and then reduced by rifampin (consider increasing dose of caspofungin)

Antiepileptics: plasma concentration of caspofungin possibly reduced by carbamazepine and phenytoin—consider increasing dose of caspofungin
Antivirals: plasma concentration of caspofungin possibly reduced by efavirenz and nevirapine—consider increasing dose of caspofungin

Ciclosporin: plasma advises avoid concomitant use
Ciclosporin (manufacturer of caspofungin recommends monitoring liver enzymes)
Corticosteroids: plasma concentration of caspofungin possibly reduced by dexamethasone—consider increasing dose of caspofungin

Tacrolimus: caspofungin reduces plasma concentration of tacrolimus

Cefaclor see Cephalosporins
Cefadroxil see Cephalosporins
Cefalexin see Cephalosporins
Cefotaxime see Cephalosporins
Cefradine see Cephalosporins
Ceftaroline see Cephalosporins
Ceftazidime see Cephalosporins
Ceftriaxone see Cephalosporins
Cefuroxime see Cephalosporins
Cefcoxiv see NSAIDs
Celirol see Beta-blockers

Cephalosporins
Antacids: absorption of cefaclor reduced by antacids
Antibacterials: possible increased risk of nephrotoxicity when cephalosporins given with aminoglycosides

- Anticoagulants: cefaclor possibly enhance anticoagulant effect of coumarins
Probenecid: excretion of cephalosporins reduced by probenecid (increased plasma concentration)
Teriflunomide: plasma concentration of cefaclor increased by teriflunomide
Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850

Cefotizumab pegol
- Antacids: avoid concomitant use of cefotizumab pegol with batabacpt
- Anakinra: avoid concomitant use of cefotizumab pegol with anakinra
- Vaccines: avoid concomitant use of cefotizumab pegol with live vaccines (see p. 828)

Cetirizine see Antihistamines
Chenodeoxycholic Acid see Bile Acids
Chloral see Anxiolytics and Hypnotics
Chloramphenicol
Antibacterials: metabolism of chloramphenicol accelerated by rifampin (reduced plasma concentration)

- Anticoagulants: chloramphenicol enhances anticoagulant effect of coumarins

Chloramphenicol (continued)
- Antidiabetics: chloramphenicol enhances effects of sulfonylureas
- Antiepileptics: metabolism of chloramphenicol possibly accelerated by phenobarbital (reduced plasma concentration); chloramphenicol increases plasma concentration of phenytoin (increased risk of toxicity)

- Antipsyhotics: avoid concomitant use of chloramphenicol with depazapine (increased risk of agranulocytosis)
Cilcosporin: chloramphenicol possibly increases plasma concentration of ciclosporin
Clopodigrel: chloramphenicol possibly increases platelet effect of clopobigrel
Hydroxocobalamin: chloramphenicol reduces response to hydroxocobalamin
Tacrofimus: chloramphenicol possibly increases plasma concentration of tacrolimus

Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850

Chloridiazepoxide see Anxiolytics and Hypnotics

Chloropenrocaine
- Antibacterials: chloropenrocaine possibly inhibits effects of sulfonamides (manufacturer of chloropenrocaine advises avoid concomitant use)

Chloroquine and Hydroxychloroquine
Adsorbents: absorption of chloroquine and hydroxychloroquine reduced by kaolin
Agalsidase Alpha and Beta: chloroquine and hydroxychloroquine possibly inhibit effects of agalsidase alpha and beta (manufacturers of agalsidase alpha and beta advise avoid concomitant use)
Antacids: absorption of chloroquine and hydroxychloroquine reduced by antacids

- Anti-arrhythmics: increased risk of ventricular arrhythmias when chloroquine and hydroxychloroquine given with amiodarone—avoid concomitant use

- Antibacterials: increased risk of ventricular arrhythmias when chloroquine and hydroxychloroquine given with moxifloxacin—avoid concomitant use

- Antidepressants: avoidance of antimalarials advised by manufacturer of citoplastam and escitalopram (risk of ventricular arrhythmias)

- Antimalarials: avoidance of antimalarials advised by manufacturer of artemether with lumefantrine; increased risk of convulsions when chloroquine and hydroxychloroquine given with moxifloxacin

- Antipsyhotics: increased risk of ventricular arrhythmias when chloroquine and hydroxychloroquine given with droperidol—avoid concomitant use

Cardiac Glycosides: chloroquine and hydroxychloroquine possibly increase plasma concentration of digoxin

Ciclosporin: chloroquine and hydroxychloroquine increase plasma concentration of ciclosporin (increased risk of toxicity)

- Cytotoxics: possible increased risk of ventricular arrhythmias when chloroquine and hydroxychloroquine given with bosutinib

Histamine: avoidance of antimalarials advised by manufacturer of histamine
Lanthanum: absorption of chloroquine and hydroxychloroquine possibly reduced by lanthanum (give at least 2 hours apart)
Laronidase: chloroquine and hydroxychloroquine possibly inhibit effects of laronidase (manufacturer of laronidase advises avoid concomitant use)
Parasymptomimetics: chloroquine and hydroxychloroquine have potential to increase symptoms of myasthenia gravis and thus diminish effect of neostigmine and pyridostigmine

Ulcer-healing Drugs: metabolism of chloroquine and hydroxychloroquine inhibited by cimetidine (increased plasma concentration)

918 Appendix 1: Interactions BNF 68
Antifungals:

Antiepileptics:

Antibacterials:

Ciclosporin

- ACE inhibitors: increased risk of hyperkalaemia when ciclosporin given with ACE inhibitors
- Aliskiren: ciclosporin increases plasma concentration of aliskiren—avoid concomitant use
- Allopurinol: plasma concentration of ciclosporin possibly increased by allopurinol (risk of nephrotoxicity)
- Ambisentan: ciclosporin increases plasma concentration of ambisentan (see Dose under Ambisentan, p. 110)
- Analgesics: increased risk of nephrotoxicity when ciclosporin given with NSAIDs; ciclosporin increases plasma concentration of ciclofenac (halved dose of ciclofenac)
- Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when ciclosporin given with angiotensin-II receptor antagonists

Anti-arthrythmics: plasma concentration of ciclosporin possibly increased by amiodarone and propafenone

Antibacterials: metabolism of ciclosporin inhibited by clarithromycin and erythromycin (increased plasma concentration); metabolism of ciclosporin accelerated by rifampicin (reduced plasma concentration); plasma concentration of ciclosporin possibly reduced by sulfadiazine; increased risk of nephrotoxicity when ciclosporin given with azithromycin, clarithromycin, erythromycin, sulfadiazine; increased plasma concentration of ciclosporin possibly increased by accelerated metabolism; metabolism of ciclosporin possibly inhibited by macrolides (increased plasma concentration); increased risk of nephrotoxicity when ciclosporin given with azithromycin, clarithromycin, erythromycin, sulfadiazine; increased plasma concentration of ciclosporin possibly increased by eflornithine, ornipressin, tegafur; also plasma concentration of ciclosporin reduced by intravenous trimethoprim

Anticoagulants: ciclosporin possibly increases plasma concentration of dabigatran—manufacturer of dabigatran advises avoid concomitant use

Antidepressants: plasma concentration of ciclosporin reduced by St John’s Wort—avoid concomitant use

Antidiabetics: ciclosporin possibly enhances hypoglycaemic effect of repaglinide

Antiepileptics: metabolism of ciclosporin accelerated by carbamazepine, phenobarbital and phenytoin (reduced plasma concentration); plasma concentration of ciclosporin possibly reduced by oxcarbazepine

Antifungals: metabolism of ciclosporin possibly inhibited by miconazole (increased plasma concentration); increased risk of nephrotoxicity when ciclosporin given with amphotericin; metabolism of ciclosporin inhibited by fluconazole, itraconazole, posaconazole and voriconazole (increased plasma concentration); ciclosporin increases plasma concentration of caspofungin (manufacturer of caspofungin recommends monitoring liver enzymes); plasma concentration of ciclosporin possibly reduced by griseofulvin and terbinafine; plasma concentration of ciclosporin possibly increased by micafungin

Antimalarials: plasma concentration of ciclosporin increased by chloroquine and hydroxychloroquine (increased risk of toxicity)

Antimuscarinics: avoidance of ciclosporin advised by manufacturer of darifenacin

Antivirals: increased risk of nephrotoxicity when ciclosporin given with aciclovir; plasma concentration of ciclosporin possibly increased by azatavanovir and ritonavir; plasma concentration of ciclosporin increased by boceprevir, fosamprenavir and indinavir; plasma concentration of ciclosporin possibly reduced by efavirenz; plasma concentration of both drugs increased when ciclosporin given with nelfinavir; plasma concentration of both drugs increased when ciclosporin given with telaprevir (reduce dose of ciclosporin)

Beta-blockers: plasma concentration of ciclosporin increased by carvedilol

Bile Acids: Absorption of ciclosporin increased by ursodeoxycholic acid

Calcium-Channel Blockers: combination of ciclosporin with verapamil may increase plasma concentration of ciclosporin

Cardiac Glycosides: ciclosporin increases plasma concentration of digoxin (increased risk of toxicity)

Colchicine: possible increased risk of nephrotoxicity and myotoxicity when ciclosporin given with colchicine—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)

Colestilan: manufacturer of colestilan advises give ciclosporin at least 1 hour before or 3 hours after colestilan

Corticosteroids: plasma concentration of ciclosporin increased by high-dose methylprednisolone (risk of convulsions); ciclosporin increases plasma concentration of prednisolone

Cytoxotics: increased risk of nephrotoxicity when ciclosporin given with melphalan; increased risk of neurotoxicity when ciclosporin given with dactinomycin; ciclosporin increases plasma concentration of etoposide

Diuretics: plasma concentration of ciclosporin possibly increased by furosemide (increased risk of hyperkalaemia when ciclosporin given with potassium-sparing diuretics and aldosterone antagonists); increased risk of nephrotoxicity and possibly hypermagnesaemia when ciclosporin given with thiazides and related diuretics

Fidaxomicin: avoidance of ciclosporin advised by manufacturer of fidaxomicin

Grapefruit Juice: plasma concentration of ciclosporin increased by grapefruit juice (increased risk of toxicity)

Hormone Antagonists: metabolism of ciclosporin inhibited by danazol (increased plasma concentration...
Appendix 1: Interactions

**Ciclosporin**
- Hormone Antagonists
  - (continued)
    - plasma concentration of ciclosporin reduced by lanreotide and octreotide; plasma concentration of ciclosporin possibly reduced by pasireotide
    - Lenalidomide: ciclosporin possibly increases plasma concentration of lenalidomide (increased risk of toxicity)
- Lipid-regulating Drugs: absorption of ciclosporin reduced by colestevam; increased risk of renal impairment when ciclosporin given with bezafibrate or fenofibrate; increased risk of myopathy when ciclosporin given with atorvastatin (see Dose under Atorvastatin, p. 171); increased risk of myopathy when ciclosporin given with flavastatin or pravastatin; increased risk of myopathy when ciclosporin given with rosuvastatin or simvastatin (avoid concomitant use); plasma concentration of both drugs may increase when ciclosporin given with ezetimibe
  - Mannitol: possible increased risk of nephrotoxicity when ciclosporin given with mannitol
  - Metoclopramide: plasma concentration of ciclosporin increased by metoclopramide
  - Mifamurtide: avoidance of ciclosporin advised by manufacturer of mifamurtide
  - Modafinil: plasma concentration of ciclosporin reduced by modafinil
  - Oestrogens: plasma concentration of ciclosporin possibly increased by oestrogens
  - Orlistat: absorption of ciclosporin possibly reduced by orlistat
  - Potassium Salts: increased risk of hyperkalaemia when ciclosporin given with potassium salts
  - Progestogens: plasma concentration of ciclosporin possibly increased by progestogens
  - Ranolazine: plasma concentration of both drugs may increase when ciclosporin given with ranolazine
  - Sevelamer: plasma concentration of ciclosporin possibly reduced by sevelamer
  - Sirolimus: ciclosporin increases plasma concentration of sirolimus
  - Sulfipyrazone: plasma concentration of ciclosporin reduced by sulfipyrazone
  - Tacrolimus: plasma concentration of ciclosporin increased by tacrolimus (increased risk of nephrotoxicity)—avoid concomitant use
  - Tegafur: ciclosporin increases plasma concentration of tegafur
  - Ulcer-healing Drugs: plasma concentration of ciclosporin possibly increased by cimetidine; plasma concentration of ciclosporin possibly affected by omeprazole
  - Vitamins: plasma concentration of ciclosporin possibly affected by vitamin E

**Cidofovir**
- Antivirals: manufacturers advise avoid concomitant use of cidofovir with cidofovir

**Cilazapril** see ACE Inhibitors

**Cilostazol**
- Angioplasty: avoidance of cilostazol advised by manufacturer of anagrelide
- Antibacterial: plasma concentration of cilostazol possibly increased by clarithromycin (see Dose under Cilostazol, p. 140); plasma concentration of cilostazol increased by erythromycin (see Dose under Cilostazol, p. 140)
- Antifungal: plasma concentration of cilostazol possibly increased by fluconazole, itraconazole and telaprevir (see Dose under Cilostazol, p. 140)
- Antivirals: plasma concentration of cilostazol possibly increased by boceprevir, simeprevir and telaprevir (see Dose under Cilostazol, p. 140)
  - Calcium-channel Blockers: plasma concentration of cilostazol increased by diltiazem (consider reducing dose of cilostazol)

**Cilostazol (continued)**
- Ulcer-healing Drugs: plasma concentration of cilostazol increased by omeprazole (see Dose under Cilostazol, p. 140)

**Cimetidine** see Histamine H₂-antagonists

**Cinacalcet**
- Hormone Antagonists: cinacalcet possibly inhibits metabolism of tamoxifen to active metabolite (avoid concomitant use)

**Cinnarizine** see Antihistamines

**Ciprofibrate** see Fibrates

**Ciprofloxacin** see Quinolones

**Cisatracurium** see Muscle Relaxants

**Cisplatin** see Platinum Compounds

**Citalopram** see Antidepressants, SSRIs

**Cladribine**
- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
- Antivirals: avoidance of cladribine advised by manufacturer of lamivudine

**Clarithromycin** see Macrolides

**Clenbuterol** see Antihistamines

**Clindamycin**
- Muscle Relaxants: clindamycin enhances effects of non-depolarising muscle relaxants and suxamethonium
- Parasympathomimetics: clindamycin antagonises effects of neostigmine and pyridostigmine
- Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850

**Clotrazolam** see Anxiolytics and Hypnotics

**Clotrimazole** see Antifungals

**Clomipramine** see Antidepressants, Tricyclic

**Clonazepam** see Anxiolytics and Hypnotics

**Clonidine**
- ACE Inhibitors: enhanced hypotensive effect when clonidine given with ACE inhibitors; previous treatment with clonidine possibly delays antihypertensive effect of captopril
- Adrenergic Neurone Blockers: enhanced hypotensive effect when clonidine given with adrenergic neurone blockers
- Alcohol: enhanced hypotensive effect when clonidine given with alcohol
- Aldesleukin: enhanced hypotensive effect when clonidine given with aldesleukin
- Alpha-blockers: enhanced hypotensive effect when clonidine given with alpha-blockers
- Anaesthetics, General: enhanced hypotensive effect when clonidine given with general anaesthetics
- Analgesics: hypotensive effect of clonidine antagonised by NSAIDs
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when clonidine given with angiotensin-II receptor antagonists
- Antidepressants: enhanced hypotensive effect when clonidine given with MAOIs; hypotensive effect of clonidine possibly antagonised by mirtazapine; hypotensive effect of clonidine antagonised by atriocynics, also increased risk of hypertension on clonidine withdrawal
- Antipsychotics: enhanced hypotensive effect when clonidine given with phenothiazines
- Anxiolytics and Hypnotics: enhanced hypotensive effect when clonidine given with anxiolytics and hypnotics
- Beta-blockers: increased risk of withdrawal hypertension when clonidine given with beta-blockers (withdraw beta-blockers several days before slowly withdrawing clonidine)
- Calcium-channel Blockers: enhanced hypotensive effect when clonidine given with calcium-channel blockers
- Corticosteroids: hypotensive effect of clonidine antagonised by corticosteroids
Clonidine (continued)

Cytotoxics: possible increased risk of bradycardia when clonidine given with crixotinib
Diuretics: enhanced hypotensive effect when clonidine given with diazoxide
Diuretics: enhanced hypotensive effect when clonidine given with diuretics
Dopaminergics: enhanced hypotensive effect when clonidine given with levodopa
Histamine: avoidance of clonidine advised by manufacturer of histamine
Methyldopa: enhanced hypotensive effect when clonidine given with methyldopa
Moxisylyte: enhanced hypotensive effect when clonidine given with moxisylyte
Moxonidine: enhanced hypotensive effect when clonidine given with moxonidine
Muscle Relaxants: enhanced hypotensive effect when clonidine given with baclofen or tizanidine
Nitrates: enhanced hypotensive effect when clonidine given with nitrates
Oestrogens: hypotensive effect of clonidine antagonised by oestrogens
Prostaglandins: enhanced hypotensive effect when clonidine given with alprostadil
● Sympathomimetics: possible risk of hypertension when clonidine given with adrenaline (epinephrine) or noradrenaline (norepinephrine); serious adverse events reported with concomitant use of clonidine and methyldopa (causality not established)
Vasoconstrictor Antihypertensives: enhanced hypotensive effect when clonidine given with hydralazine, minoxidil or sodium nitroprusside

Clozapine see Diuretics

Clopidogrel

Analgesics: increased risk of bleeding when clopidogrel given with NSAIDs or aspirin
● Antioxidants: antiplatelet effect of clopidogrel possibly reduced by evelorophenicol, eprofloxacin and erythromycin
● Anticoagulants: manufacturer of clopidogrel advises avoid concomitant use with warfarin; antiplatelet action of clopidogrel enhances anticoagulant effect of coumarins and heparins; increased risk of bleeding when clopidogrel given with heparins
● Antidepressants: antiplatelet effect of clopidogrel possibly reduced by duloxetine, fluvoxamine and moclobemide
● Antiepileptics: antiplatelet effect of clopidogrel possibly reduced by esorazapine and zoxcarbazepine
● Antifungals: antiplatelet effect of clopidogrel possibly reduced by fluconazole, itraconazole and voriconazole
● Antivirals: antiplatelet effect of clopidogrel possibly reduced by etravirine
● Dipyridamole: increased risk of bleeding when clopidogrel given with dipyridamole
● Lipoxygenase inhibitor: increased risk of bleeding when clopidogrel given with iloprost
● Prasugrel: increased risk of bleeding when clopidogrel given with prasugrel
● Ulcer-healing Drugs: antiplatelet effect of clopidogrel possibly reduced by esomeprazole, lanosoprazole, pantoprazole and rabeprazole; antiplatelet effect of clopidogrel reduced by esomeprazole and omeprazole

Clofibrate see Antipsychotics

Co-amoxiclav see Penicillins

Co-beneldopa see Levodopa

Cobicistat (continued)
● Anti-arrhythmics: cobicistat possibly increases plasma concentration of amiodarone—manufacturer of cobicistat advises avoid concomitant use
● Antibacterial: plasma concentration of cobicistat reduced by ritapam—a dose—consult product literature; plasma concentration of cobicistat possibly reduced by ritapamcic—manufacturer of cobicistat advises avoid concomitant use
● Anticoagulants: cobicistat possibly enhances anticoagulant effect of rivaroxaban—avoid concomitant use
● Antidepressants: plasma concentration of cobicistat possibly reduced by St John’s wort—manufacturer of cobicistat advises avoid concomitant use
● Antiepileptics: plasma concentration of cobicistat possibly reduced by carbamazepine, phenobarbital and phenytoin—manufacturer of cobicistat advises avoid concomitant use
● Antiplatelets: cobicistat possibly increases plasma concentration of itraconazole—manufacturer of cobicistat advises reduce dose of itraconazole
● Antipsychotics: cobicistat possibly increases plasma concentration of pimozide—manufacturer of cobicistat advises avoid concomitant use
● Antivirals: manufacturer of cobicistat advises avoid concomitant use with boceprevir; cobicistat possibly increases plasma concentration of maraviroc (reduce dose of maraviroc); avoidance of cobicistat advised by manufacturer of nevirapine
● Anxiolytics and Hypnotics: manufacturer of cobicistat advises avoid concomitant use with zopiclone
● Bosentan: manufacturer of cobicistat advises avoid concomitant use with bosentan
● Cardiac Glycosides: cobicistat possibly increases plasma concentration of digoxin—reduce initial dose of digoxin
● Domperidone: possible increased risk of ventricular arrhythmias when cobicistat given with domperidone—avoid concomitant use
● Ergot Alkaloids: cobicistat possibly increases plasma concentration of ergot alkaloids—manufacturer of cobicistat advises avoid concomitant use
● Lipid-regulating Drugs: cobicistat possibly increases plasma concentration of atorvastatin—manufacturer of cobicistat advises reduce dose of atorvastatin; manufacturer of cobicistat advises avoid concomitant use with simvastatin
● Oestrogens: cobicistat accelerates metabolism of oestrogens (reduced contraceptive effect—see p. 536)
● Progestogens: cobicistat increases plasma concentration of norgestimate
● Sildenafil: cobicistat possibly increases plasma concentration of sildenafil—manufacturer of cobicistat advises avoid concomitant use of sildenafil for pulmonary arterial hypertension or reduce dose of sildenafil for erectile dysfunction—consult cobicistat product literature
● Tadalafil: cobicistat possibly increases plasma concentration of tadalafil—manufacturer of cobicistat advises reduce dose of tadalafil (consult cobicistat product literature)
● Vardenafil: cobicistat possibly increases plasma concentration of vardenafil—manufacturer of cobicistat advises reduce dose of vardenafil (consult cobicistat product literature)
● Co-careldopa see Levodopa
● Coflumilpic see Penicillins

Colchicine
● Anti-arrhythmics: possible increased risk of colchicine toxicity when given with amiodarone
Appendix 1: Interactions

Colestipol (continued)
- Antidiabetics: manufacturer of canagliflozin advises give bile acid sequestrants at least 1 hour before or 4—6 before canagliflozin
- Bile Acids: colestipol possibly reduces absorption of bile acids
- Cardiac Glycosides: colestipol possibly reduces absorption of cardiac glycosides
- Diuretics: colestipol reduces absorption of thiazides and related diuretics (give at least 2 hours apart)
- Lipid-regulating Drugs: bile acid sequestrants possibly reduce absorption of lomitapide (give at least 4 hours apart)
- Thyroid Hormones: colestipol reduces absorption of thyroid hormones

Colestyramine
- Note Other drugs should be taken at least 1 hour before or 4—6 hours after colestyramine to reduce possible interference with absorption
- Antidiabetics: colestyramine reduces absorption of glibenclamide and glipizide; colestyramine reduces absorption of glimepiride—manufacturer of glimepiride advises give bile acid sequestrants at least 4 hours before, or 1 hour after canagliflozin
- Antiepileptics: colestyramine possibly reduces absorption of phenytoin
- Ciclosporin: colestyramine reduces absorption of ciclosporin
- Lipid-regulating Drugs: bile acid sequestrants possibly reduce absorption of lomitapide (give at least 4 hours apart)
- Oestrogens and Progestogens: colestyramine reduces absorption of levonorgestrel
- Thyroid Hormones: colestyramine reduces absorption of levothyroxine

Colestilan
- Note Other drugs should be taken at least 1 hour before or 3 hours after colestilan to reduce possible interference with absorption
- Antidiabetics: manufacturer of colestilan advises give gliclazide at least 1 hour before or 3 hours after colestilan
- Mycophenolate: manufacturer of colestilan advises give mycophenolate at least 1 hour before or 3 hours after colestilan
- Thyroid Hormones: manufacturer of colestilan advises give levothyroxine at least 1 hour before or 3 hours after colestilan

Colestipol
- Note Other drugs should be taken at least 1 hour before or 4—6 hours after colestipol to reduce possible interference with absorption
- Antidiabetics: colestipol possibly reduces absorption of tetracycline

Colchicine (continued)
- Antibacterials: possible increased risk of colchicine toxicity when given with azithromycin, clarithromycin, erythromycin and itraconazole—suspending or reducing dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Antifungals: possible increased risk of colchicine toxicity when given with itraconazole—suspending or reducing dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Antivirals: possible increased risk of colchicine toxicity when given with atazanavir, indinavir, ritonavir and elaprevir—suspending or reducing dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Calcium-channel Blockers: possible increased risk of colchicine toxicity when given with diltiazem and verapamil—suspending or reducing dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Cardiac Glycosides: possible increased risk of myopathy when colchicine given with digoxin
- Ciclosporin: possible increased risk of nephrotoxicity and myotoxicity when colchicine given with ciclosporin—suspending or reducing dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Grapefruit juice: possible increased risk of colchicine toxicity when given with grapefruit juice
- Lipid-regulating Drugs: possible increased risk of myopathy when colchicine given with fibrates or statins

Colesterylamine
- Note Other drugs should be taken at least 4 hours before or after colesterylamine to reduce possible interference with absorption
- Anticoagulants: colesterylamine may enhance or reduce anticoagulant effect of coumarins and phenindione
- Antidiabetics: colesterylamine possibly enhances hypoglycaemic effect of acarbose; manufacturer of canagliflozin advises give bile acid sequestrants at least 1 hour after or 4—6 before canagliflozin
- Antiepileptics: colesterylamine possibly reduces absorption of valproate
- Bile Acids: colesterylamine possibly reduces absorption of bile acids
- Cardiac Glycosides: colesterylamine possibly reduces absorption of cardiac glycosides
- Diuretics: colesterylamine reduces absorption of thi-azides and related diuretics (give at least 2 hours apart)
- Leflunomide: colesterylamine significantly decreases effect of leflunomide (enhanced elimination)—avoid unless drug elimination desired
- Lipid-regulating Drugs: bile acid sequestrants possibly reduce absorption of lomitapide (give at least 4 hours apart)
- Mycophenolate: colesterylamine reduces absorption of mycophenolate
- Telithromycin: colesterylamine reduces absorption of telithromycin (manufacturer of telithromycin advises avoid concomitant administration)
- Teriflunomide: colesterylamine significantly decreases effect of teriflunomide (enhanced elimination)—avoid unless drug elimination desired
- Thyroid Hormones: colesterylamine reduces absorption of thyroid hormones
- Vitamins: colesterylamine possibly reduces absorption of calcitriol (give at least 1 hour before or 4 to 6 hours after colesterylamine)

Colistimethate Sodium see Polymyxins

Contraceptives, oral see Oestrogens and Progestogens

Corticosteroids
- Note Interactions do not generally apply to corticosteroids used for topical action (including inhalation) unless specified
- ACE Inhibitors: corticosteroids antagonise hypotensive effect of ACE inhibitors
- Adrenergic Neurone Blockers: corticosteroids antagonise hypotensive effect of adrenergic neurone blockers
- Aldesleukin: avoidance of corticosteroids advised by manufacturer of aldesleukin
- Alpha-blockers: corticosteroids antagonise hypotensive effect of alpha-blockers
- Analgesics: increased risk of gastro-intestinal bleeding and ulceration when corticosteroids given with
Corticosteroids

Analgesics (continued)
NSAIDs; increased risk of gastro-intestinal bleeding and ulceration when corticosteroids given with aspirin, also corticosteroids reduce plasma concentration of salicylate

Anticoagulants: corticosteroids antagonise hypotensive effect of anticoagulants

Antifungals: corticosteroids reduce plasma concentration of itraconazole; plasma concentration of intranasal budesonide possibly increased by itraconazole; dexamethasone possibly reduces plasma concentration of ondansetron; metabolism of corticosteroids accelerated by rifampicin (reduced effect)

Anticoagulants: corticosteroids may enhance or reduce anticoagulant effect of warfarin (high-dose corticosteroids enhance anticoagulant effect); corticosteroids may enhance or reduce anticoagulant effect of phenindione

Antidiabetics: corticosteroids antagonise hypoglycaemic effect of antidiabetics

Antifungals: metabolism of corticosteroids accelerated by carbamazepine, phenobarbital and phenytoin (reduced effect)

Antihypertensives: increased risk of hypokalaemia when corticosteroids given with antihypertensives—see Hypokalaemia, Nitrate

Antivirals: dexamethasone possibly reduces plasma concentration of inindinavir, lopinavir, saquinavir and telaprevir; avoidance of dexamethasone (except when given as a single dose) advised by manufacturer of elvitegravir; plasma concentration of inhaled and intranasal fluticasone increased by ritonavir—increased risk of adrenal suppression; plasma concentration of budesonide (including inhaled, intranasal, and rectal budesonide) possibly increased by ritonavir—increased risk of adrenal suppression; plasma concentration of corticosteroids possibly increased by ritonavir—increased risk of adrenal suppression; plasma concentration of inhaled and intranasal budesonide and fluticasone possibly increased by telaprevir

Antidepressants: metabolism of dexamethasone and methylprednisolone inhibited by aripiprazole—increased risk of hypokalaemia and voriconazole

Antihistamines: increased risk of hypokalaemia when corticosteroids given with antihistamines—see Hypokalaemia

Beta-blockers: corticosteroids antagonise hypotensive effect of beta-blockers

Calcium Salts: corticosteroids reduce absorption of calcium salts

Calcium-channel Blockers: corticosteroids antagonise hypotensive effect of calcium-channel blockers; plasma concentration of methylprednisolone increased by diltiazem

Cardiac Glycosides: increased risk of hypokalaemia when corticosteroids given with cardiac glycosides

Ciclosporin: high-dose methylprednisolone increases plasma concentration of ciclosporin (risk of convulsions); plasma concentration of prednisolone increased by ciclosporin

Clonidine: corticosteroids antagonise hypotensive effect of clonidine

Corticosteroids (continued)

Cytotoxics: possible increased risk of hepatotoxicity when dexamethasone given with high-dose methotrexate; dexamethasone possibly decreases plasma concentration of azithromycin (increase dose of azithromycin—consult azithromycin product literature)

Diazoxide: corticosteroids antagonise hypotensive effect of diazoxide

Diuretics: corticosteroids antagonise diuretic effect of diuretics; increased risk of hypokalaemia when corticosteroids given with acetazolamide, loop diuretics or thiazides and related diuretics

Histamine: avoidance of corticosteroids advised by manufacturer of histamine

Methylprednisolone: corticosteroids antagonise hypotensive effect of methylprednisolone

Mifamurtide: avoidance of corticosteroids advised by manufacturer of mifamurtide

Mifepristone: effect of corticosteroids (including inhaled corticosteroids) may be reduced for 3–4 days after mifepristone

Moxonidine: corticosteroids antagonise hypotensive effect of moxonidine

Muscle Relaxants: corticosteroids possibly antagonise effects of pancuronium and vecuronium

Nitrates: corticosteroids antagonise hypotensive effect of nitrates

Oestrogens: plasma concentration of corticosteroids increased by oral contraceptives containing oestrogens

Sodium Benzoate: corticosteroids possibly reduce effects of sodium benzoate

Sodium Phenylbutyrate: corticosteroids possibly reduce effects of sodium phenylbutyrate

Somatropin: corticosteroids may inhibit growth-promoting effect of somatropin

Symptomimetics: metabolism of dexamethasone accelerated by ephedrine

Symptomimetics, Beta-2: increased risk of hypokalaemia when corticosteroids given with beta-2 sympathomimetics—see Hypokalaemia, Nitrate

Ticagrelor: dexamethasone possibly reduces plasma concentration of ticagrelor

Vaccines: high doses of corticosteroids impair immune response to vaccines, avoid concomitant use with live vaccines (see p. 828)

 Vasodilators: Angiotensin II receptor antagonists: corticosteroids antagonise hypertensive effect of hydralazine, minoxidil and sodium nitroprusside

Coombs Test

Note Change in patient’s clinical condition, particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing. Major changes in diet (especially involving salads and vegetables) and in alcohol consumption may also affect anticoagulant control

Alcohol: anticoagulant effect of coumarins may be affected by major changes in consumption of alcohol

Allopurinol: anticoagulant effect of coumarins possibly enhanced by allopurinol

Anabolic Steroids: anticoagulant effect of coumarins enhanced by anabolic steroids

Analgesics: anticoagulant effect of coumarins possibly enhanced by NSAIDs; increased risk of haemorrhage when anticoagulants given with intravenous diclofenac (avoid concomitant use, including low-dose heparin); increased risk of haemorrhage when anticoagulants given with ketorolac (avoid concomitant use, including low-dose heparin); anti-coagulant effect of coumarins enhanced by
Appendix 1: Interactions

Anticoagulants: increased risk of haemorrhage when other anticoagulants given with apixaban, dabigatran and rivaroxaban (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency).

Antidepressants: anticoagulant effect of warfarin possibly enhanced by mirtazapine; anticoagulant effect of warfarin, enhanced due to antiplatelet action of clopidogrel; avoidance of warfarin advised by manufacturer of clopidogrel.

Anticoagulant effect of warfarin possibly enhanced or reduced by atorvastatin; anticoagulant effect of warfarin possibly enhanced by aspirin (due to antiplatelet effect); anticoagulant effect of coumarins possibly enhanced by prolonged regular use of paracetamol.

Anticancer Drugs: anticoagulant effect of warfarin possibly enhanced or reduced by curcumin (enhanced anticoagulant effect); plasma concentration of warfarin possibly affected by high-dose corticosteroids (enhanced anticoagulant effect); replacement of warfarin with a heparin advised by manufacturer of imatinib (possibility of enhanced anticoagulant effect), increased risk of bleeding when warfarin given with regorafenib.

Anticoagulant effect of warfarin possibly enhanced by leflunomide; anticoagulant effect of warfarin possibly enhanced or reduced by azole antifungals; anticoagulant effect of warfarin possibly enhanced or reduced by high-dose corticosteroids enhance anticoagulant effect; plasma concentration of both drugs increased when warfarin given with neomycin (given for local action on gut); anticoagulant effect of coumarins possibly enhanced by azithromycin, aztreonam, cephapirin, ciprofloxacin, levofloxacin, etretinate, tretinoin and thalidomide; anticoagulant effect of coumarins possibly enhanced by chloramphenicol, clarithromycin, erythromycin, metronidazole, macrolides, norfloxacin, ofloxacin and sulfonamides; an interaction between coumarins and biperiden (given for local action on gut) suggests that INR possibly altered when coumarins are given with biperidine (given for local action on gut).
Antivirals: [continued]

Antipsychotics:

Antibacterials:

Crizotinib

Anticoagulants:

Ulcer-healing Drugs:

Thyroid Hormones:

Testosterone: [continued]

Sulfinpyrazone: anticoagulant effect of coumarins enhanced by sulfinpyrazone

Sympathomimetics: anticoagulant effect of coumarins possibly enhanced by methylphenidate

Testolactone: anticoagulant effect of coumarins enhanced by testolactone

Thyroid Hormones: anticoagulant effect of coumarins enhanced by thyroid hormones

Ubidecarenone: anticoagulant effect of warfarin may be enhanced or reduced by ubidecarenone

Ulcér-healing Drugs: metabolism of coumarins inhibited by cimetidine (enhanced anticoagulant effect); anticoagulant effect of coumarins possibly enhanced by omeprazole and pantoprazole; absorption of coumarins possibly reduced by sucralfate (reduced anticoagulant effect)

Vaccines: anticoagulant effect of warfarin possibly enhanced by influenza vaccine

Vitamins: anticoagulant effect of coumarins possibly enhanced by vitamin E; anticoagulant effect of coumarins antagonised by vitamin K

Cranberry Juice

Anticoagulants: cranberry juice possibly enhances anticoagulant effect of coumarins—avoid concomitant use

Crizotinib

Analgesics: manufacturer of crizotinib advises caution with alfentanil and entantyl

Antibacterials: plasma concentration of crizotinib possibly increased by clarithromycin and telithromycin—manufacturer of crizotinib advises avoid concomitant use; plasma concentration of crizotinib possibly reduced by rifabutin—manufacturer of crizotinib advises avoid concomitant use; plasma concentration of crizotinib reduced by rifampicin—manufacturer of crizotinib advises avoid concomitant use

Antidepressants: plasma concentration of crizotinib possibly reduced by St John’s wort—manufacturer of crizotinib advises avoid concomitant use

Antiepileptics: plasma concentration of crizotinib possibly reduced by carbamazepine, phenobarbital and phenytoin—manufacturer of crizotinib advises avoid concomitant use

Antifungals: plasma concentration of crizotinib possibly reduced by ciclosporin, ketoconazole and voriconazole—manufacturer of crizotinib advises avoid concomitant use

Antimalarials: possible increased risk of bradycardia when crizotinib given with methotrexate

Antipsychotics: avoid concomitant use of cytoxicoids with clozapine (increased risk of agranulocytosis); manufacturer of crizotinib advises caution with pimozide

Antivirals: plasma concentration of crizotinib possibly increased by stavudinavir, vindinavir, ritonavir and saquinavir—manufacturer of crizotinib advises avoid concomitant use

Cyclizine see Antihistamines

Cyclophosphamide

Antifungals: side-effects of cyclophosphamide possibly increased by fluconazole and itraconazole

Antipsychotics: avoid concomitant use of cytoxicoids with clozapine (increased risk of agranulocytosis); manufacturer of cyclizine advises caution with sirolimus

Cyclosporin: manufacturer of crizotinib advises caution with ergot alkaloids

Grapefruit juice: plasma concentration of crizotinib possibly increased by grapefruit juice—manufacturer of crizotinib advises avoid concomitant use

Oestrogens: manufacturer of crizotinib advises contra-ceptive effect of oestrogens possibly reduced

Parasympathomimetics: possible increased risk of bradycardia when crizotinib given with pilocarpine

Progestogens: manufacturer of crizotinib advises contra-ceptive effect of progestogens possibly reduced

Sulfinpyrazone:

Testosterone:

Thyroid Hormones:

Vaccines:

Cranberry Juice

Anticoagulants: cranberry juice possibly enhances anticoagulant effect of coumarins—avoid concomitant use

Crizotinib

Analgesics: manufacturer of crizotinib advises caution with alfentanil and entantyl

Antibacterials: plasma concentration of crizotinib possibly increased by clarithromycin and telithromycin—manufacturer of crizotinib advises avoid concomitant use; plasma concentration of crizotinib possibly reduced by rifabutin—manufacturer of crizotinib advises avoid concomitant use; plasma concentration of crizotinib reduced by rifampicin—manufacturer of crizotinib advises avoid concomitant use

Antidepressants: plasma concentration of crizotinib possibly reduced by St John’s wort—manufacturer of crizotinib advises avoid concomitant use

Antiepileptics: plasma concentration of crizotinib possibly reduced by carbamazepine, phenobarbital and phenytoin—manufacturer of crizotinib advises avoid concomitant use

Antifungals: plasma concentration of crizotinib possibly reduced by ciclosporin, ketoconazole and voriconazole—manufacturer of crizotinib advises avoid concomitant use

Antimalarials: possible increased risk of bradycardia when crizotinib given with methotrexate

Antipsychotics: avoid concomitant use of cytoxicoids with clozapine (increased risk of agranulocytosis); manufacturer of crizotinib advises caution with pimozide

Antivirals: plasma concentration of crizotinib possibly increased by stavudinavir, vindinavir, ritonavir and saquinavir—manufacturer of crizotinib advises avoid concomitant use
Appendix 1: Interactions

**Dabigatran (continued)**
- Antibacterials: possible increased risk of bleeding when dabigatran given with clarithromycin—manufacturer of dabigatran advises avoid concomitant use
- Anticoagulants: increased risk of haemorrhage when dabigatran given with other anticoagulants (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency); increased risk of haemorrhage when other anticoagulants given with apixaban and rivaroxaban (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
- Antidepressants: possible increased risk of bleeding when dabigatran given with SSRI-related antidepressants or SSRIs; plasma concentration of dabigatran possibly increased by rilpivirine and telaprevir
- Calcium-channel Blockers: possible increased risk of bleeding when dabigatran given with amlodipine and telmisartan
- Antiepileptics: possible increased risk of bleeding when dabigatran given with barbital and phenytoin—manufacturer of dabigatran advises avoid concomitant use
- Antihypertensives: manufacturer of dabigatran advises avoid concomitant use with irtraconazole
- Antivirals: plasma concentration of dabigatran possibly increased by raltegravir

**Dapoxetine**
- Alcohol: increased sedative effect when dapoxetine given with alcohol
- Analgesics: possible increased risk of serotonergic effects when dapoxetine given with tramadol (manufacturer of dapoxetine advises tramadol should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping tramadol)
- Antibacterials: manufacturer of dapoxetine advises dose reduction when dapoxetine given with clarithromycin and erythromycin (see Dose under Dapoxetine, p. 560); manufacturer of dapoxetine advises avoiding concomitant use with etanercept (increased risk of toxicity)
- Antidepressants: possible increased risk of serotonergic effects when dapoxetine given with MAOIs; St John’s wort, duloxetine, tricyclics and venlafaxine (manufacturer of dapoxetine advises SSRIs, St John’s wort, duloxetine, tricyclics and venlafaxine should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping SSRIs, St John’s wort, duloxetine, tricyclics and venlafaxine); increased risk of serotonergic effects when dapoxetine given with MAOIs (MAOIs should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping MAOIs)
- Antifungals: manufacturer of dapoxetine advises dose reduction when dapoxetine given with fluconazole (see Dose under Dapoxetine, p. 560); manufacturer of dapoxetine advises avoiding concomitant use with irtraconazole (increased risk of toxicity)
- Antivirals: manufacturer of dapoxetine advises avoiding concomitant use with atazanavir, ritonavir and saquinavir (increased risk of toxicity); manufacturer of dapoxetine advises dose reduction when dapoxetine given with fosamprenavir (see Dose under Dapoxetine, p. 560)

**Dacarbazine**
- 5HT3-receptor Antagonists: possible increased risk of serotoninergic effects when dapoxetine given with 5HT3 antagonists (manufacturer of dapoxetine advises 5HT3 antagonists should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping 5HT3 antagonists)
- Lithium: possible increased risk of serotoninergic effects when dapoxetine given with lithium (manufacturer of dapoxetine advises lithium should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping lithium)
Dapoxetine
● Lithium (continued)
  of dapoxetine advises lithium should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping lithium
Sildenafil: manufacturer of dapoxetine advises avoid concomitant use with sildenafil
Tadalafil: manufacturer of dapoxetine advises avoid concomitant use with tadalafil
Vardenafil: manufacturer of dapoxetine advises avoid concomitant use with vardenafil

Dapsone
Antibacterials: plasma concentration of dapsone reduced by rifampicin; plasma concentration of both drugs may increase when dapsone given with trimethoprim
● Antivirals: increased risk of ventricular arrhythmias when dapsone given with osoguvinavir—avoid concomitant use
Probenecid: excretion of dapsone reduced by probenecid (increased risk of side-effects)
Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850

Daptomycin
● Clindamycin: increased risk of myopathy when daptomycin given with clindamycin (preferably avoid concomitant use)
● Lipid-regulating Drugs: increased risk of myopathy when daptomycin given with statins (preferably avoid concomitant use)
Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850

Darifenacin
See Antimuscarinics

Darunavir
Anti-arrhythmics: darunavir possibly increases plasma concentration of lidocaine—avoid concomitant use
● Antibacterials: darunavir increases plasma concentration of rifabutin (reduce dose of rifabutin); plasma concentration of darunavir significantly reduced by rifampicin—avoid concomitant use
Anticoagulants: avoidance of darunavir advised by manufacturer of apixaban and rivaroxaban
● Antidepressants: plasma concentration of paroxetine and sertraline; plasma concentration of darunavir reduced by St John’s wort—avoid concomitant use
Antiepileptics: plasma concentration of darunavir possibly reduced by carbamazepine, phenobarbital and phenytoin
● Antimalarials: darunavir increases plasma concentration of quinine (increased risk of toxicity)
● Antipsychotics: darunavir possibly increases plasma concentration of aripiprazole (reduce dose of aripiprazole—consult aripiprazole product literature); darunavir possibly increases plasma concentration ofquetiapine—manufacturer of quetiapine advises avoid concomitant use
● Antivirals: avoid concomitant use of darunavir with boceprevir or telaprevir; manufacturer of darunavir advises take didanosine 1 hour before or 2 hours after darunavir; plasma concentration of darunavir reduced by ritonavir (adjust dose—consult product literature); plasma concentration of both drugs increased when darunavir given with indinavir; plasma concentration of darunavir reduced by lopinavir, also plasma concentration of lopinavir increased (avoid concomitant use); darunavir increases plasma concentration of maraviroc (consider reducing dose of maraviroc); increased risk of rash when darunavir given with raltegravir; plasma concentration of darunavir reduced by saquinavir
● Cytotoxics: darunavir possibly increases the plasma concentration of bosutinib—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; darunavir possibly increases plasma concentration of everolimus—manufacturer of everolimus advises avoid concomitant use
● Ergot Alkaloids: increased risk of ergotism when darunavir given with ergot alkaloids—manufacturer of darunavir advises avoid concomitant use
● Lipid-regulating Drugs: possible increased risk of myopathy when darunavir given with atorvastatin; darunavir possibly increases plasma concentration of pravastatin; darunavir increases plasma concentration of lomitapide possibly increased
● Orlistat: absorption of darunavir possibly reduced by orlistat
● Ranolazine: darunavir possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use

Dasatinib
● Anticoagulants: metabolism of dasatinib accelerated by rifampicin (reduced plasma concentration—avoid concomitant use)
● Antipsychotics: avoid concomitant use of citalopram or escitalopram (increased risk of agranulocytosis)
Antivirals: avoidance of dasatinib advised by manufacturer of boceprevir and sar笏vlar; dasatinib possibly increases plasma concentration of simvastatin
Ulcera-healing Drugs: plasma concentration of dasatinib possibly reduced by famotidine

Decitabine
● Antipsychotics: avoid concomitant use of citalopram or escitalopram (increased risk of agranulocytosis)

Deferasirox
Antacids: absorption of deferasirox possibly reduced by antacids containing aluminium (manufacturer of deferasirox advises avoid concomitant use)
Antibacterials: plasma concentration of deferasirox reduced by rifampicin
Antidiabetics: deferasirox increases plasma concentration of repaglinide
Antipsychotics: manufacturer of deferasirox advises avoid concomitant use with clozapine
Anxiolytics and Hypnotics: deferasirox possibly reduces plasma concentration of midazolam
Muscle Relaxants: manufacturer of deferasirox advises avoid concomitant use with tizanidine
● Theophylline: deferasirox increases plasma concentration of theophylline (consider reducing dose of theophylline)

Deferiprone
Antacids: absorption of deferiprone possibly reduced by antacids containing aluminium (manufacturer of deferiprone advises avoid concomitant use)

Delfazacort see Corticosteroids

Demeclocycline see Tetracyclines

Desferrioxamine
Antipsychotics: avoidance of desferrioxamine advised by manufacturer of levomepromazine; manufacturer of desferrioxamine advises avoid concomitant use with prochlorperazine

Desflurane see Anaesthetics, General

Desloratadine see Antihistamines

Desmopressin Analgesics: effects of desmopressin enhanced by indometacin
Loperamide: plasma concentration of oral desmopressin increased by loperamide

Desogestrel see Progestogens

Dexamethasone see Corticosteroids

Dexamfetamine see Sympathomimetics

Dexibuprofen see NSAIDs
Appendix 1: Interactions

**Didanosine** (continued)

Antibacterials: manufacturer of norfloxacin advises give didanosine at least 2 hours before or after norfloxacin.

- Antivirals: didanosine tablets reduce absorption of atazanavir (give at least 2 hours before or 1 hour after didanosine tablets); manufacturer of darunavir advises take didanosine 1 hour before or 2 hours after darunavir; plasma concentration of didanosine possibly increased by ganciclovir; didanosine tablets reduce absorption of indinavir (give at least 1 hour apart); increased risk of side-effects when didanosine given with ritonavir—avoid concomitant use; manufacturer of rilpivirine advises give didanosine 2 hours before or 4 hours after rilpivirine; manufacturer of ritonavir advises didanosine and ritonavir should be taken 2.5 hours apart; increased risk of side-effects when didanosine given with estavudine; plasma concentration of didanosine increased by zidovudine—avoid concomitant use; plasma concentration of didanosine reduced by tipranavir—manufacturer of tipranavir advises tipranavir and didanosine capsules should be taken at least 2 hours apart.

- Cytotoxics: increased risk of toxicity when didanosine given with hydroxyurea—avoid concomitant use.

- Orlstat: absorption of didanosine possibly reduced by orlistat.

**Dienogest** see Progestogens

**Digoxin** see Cardiac Glycosides

**Dihydrocodeine** see Opioid Analgesics

**Diltiazem** see Calcium-channel Blockers

**Dimethyl sulfoxide**

- Analgesics: avoid concomitant use of dimethyl sulfoxide with eulindac.

**Dinoprostone** see Prostaglandins

**Diphenoxylate** see Opioid Analgesics

**Dipipanone** see Opioid Analgesics

**Dipyridamole**

Antacids: absorption of dipyridamole possibly reduced by antacids.

- Anti-arrhythmics: dipyridamole enhances and extends effect of adenosine (important risk of toxicity)—reduce dose of adenosine, see Dose under Adenosine, p. 96.

- Anticoagulants: antiplatelet action of dipyridamole increases anticoagulant effect of coumarins and phenindione; dipyridamole enhances anticoagulant effect of heparins.

- Clopidogrel: increased risk of bleeding when dipyridamole given with clopidogrel.

- Cytotoxics: dipyridamole possibly reduced effects of fludarabine.

**Disopyramide**

Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with bupivacaine, levobupivacaine, prilocaine or ropivacaine.

- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with anti-arrhythmics; increased risk of ventricular arrhythmias when disopyramide given with amiodarone or dronedarone—avoid concomitant use.

- Antibacterials: plasma concentration of disopyramide possibly increased by azithromycin (increased risk of toxicity); plasma concentration of disopyramide possibly increased by clarithromycin (increased risk of ventricular arrhythmias); plasma concentration of disopyramide increased by erythromycin (increased risk of toxicity); increased risk of ventricular arrhythmias when disopyramide given with moxifloxacin—avoid concomitant use; metabolism of disopyramide accelerated by rifampicins (reduced plasma concentration); possible increased...
Disopyramide

- **Antibacterials (continued)** risk of ventricular arrhythmias when disopyramide given with *tetracyclines*. 
- **Anticoagulants**: disopyramide may enhance or reduce anticoagulant effect of warfarin.
- **Antidepressants**: avoidance of disopyramide advised by manufacturer of *citalopram* and *eslicitalopram* (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when disopyramide given with *tricyclics*.
- **Antidiabetics**: disopyramide possibly enhances hypoglycaemic effect of *gliptizide*, *insulin* and *metformin*.
- **Antipileptics**: metabolism of disopyramide accelerated by *phenobarbital* (reduced plasma concentration); plasma concentration of disopyramide reduced by *phenytoin*.
- **Antifungals**: avoidance of disopyramide advised by manufacturer of *itraconazole*.
- **Antihistamines**: increased risk of ventricular arrhythmias when disopyramide given with *desloratadine*—avoid concomitant use.
- **Antimalarials**: risk of ventricular arrhythmias when disopyramide given with *hydroxychloroquine*; increased cardiac toxicity with disopyramide and *methotrexate* with *lumefantrine* (risk of ventricular arrhythmias).
- **Antimuscarinics**: increased risk of antimuscarinic side-effects when disopyramide given with *antimuscarinics*; increased risk of ventricular arrhythmias when disopyramide given with *olotidine*.
- **Antipsychotics**: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with *antipsychotics* that prolong the QT interval; increased risk of ventricular arrhythmias when disopyramide given with *amisulpride*; *droperidol*, *epinastine* or *zuclopenthixol*—avoid concomitant use; possible increased risk of ventricular arrhythmias when disopyramide given with *haloperidol*—avoid concomitant use; increased risk of ventricular arrhythmias when disopyramide given with *pioperidol*.
- **Antivirals**: plasma concentration of disopyramide possibly increased by *efavirenz* (increased risk of toxicity); increased risk of ventricular arrhythmias when disopyramide given with *saquinavir*—avoid concomitant use; avoidance of disopyramide advised by manufacturer of *telaprevir* (risk of ventricular arrhythmias).
- **Atomoxetine**: increased risk of ventricular arrhythmias when disopyramide given with *atomoxetine*.
- **Beta-blockers**: increased risk of myocardial depression when anti-arrhythmics given with *beta-blockers*; increased risk of ventricular arrhythmias when disopyramide given with *betaxolol*.
- **Calcium-channel Blockers**: increased risk of myocardial depression and asystole when disopyramide given with *verapamil*.
- **Cytotoxics**: possible increased risk of ventricular arrhythmias when disopyramide given with *busulphan*; possible increased risk of ventricular arrhythmias when disopyramide given with *vandetanib*—avoid concomitant use; increased risk of ventricular arrhythmias when disopyramide given with *arsenic trioxide*.
- **Diuretics**: increased cardiac toxicity with disopyramide if hypokalaemia occurs with *acetazolamide*, *loop diuretics* or *thiazides and related diuretics*.
- **Fingolimod**: possible increased risk of bradycardia when disopyramide given with *fingolimod*.
- **Ivabradine**: increased risk of ventricular arrhythmias when disopyramide given with *ivabradine*.

Disopyramide (continued)

Nitrates: disopyramide reduces effects of sublingual tablets of *nitrates* (failure to dissolve under tongue owing to dry mouth).
- **Pentamidine isethionate**: possible increased risk of ventricular arrhythmias when disopyramide given with *pentamidine isethionate*.
- **Ranolazine**: avoidance of disopyramide advised by manufacturer of *ranolazine*.
- **Sildenafil**: manufacturer of disopyramide advises avoid concomitant use with *sildenafil* (risk of ventricular arrhythmias).
- **Tadalafil**: manufacturer of disopyramide advises avoid concomitant use with *tadalafil* (risk of ventricular arrhythmias).
- **Vardenafil**: manufacturer of disopyramide advises avoid concomitant use with *vardenafil* (risk of ventricular arrhythmias).

Disulfram

Alcohol: disulfram reaction when disulfiram given with alcohol (see p. 334).
- **Antibacterials**: psychotomimetic reaction reported when disulfiram given with *metronidazole*; CNS effects of disulfiram possibly increased by *isoniazid*.
- **Anticoagulants**: disulfiram enhances anticoagulant effect of *coumarins*.
- **Antidepressants**: increased disulfiram reaction with alcohol reported with concomitant amitriptyline; disulfiram inhibits metabolism of tricyclics (increased plasma concentration).
- **Antipileptics**: disulfiram inhibits metabolism of *phenytoin* (increased risk of toxicity).
- **Anxiolytics and Hypnotics**: disulfiram increases risk of *temazepam* toxicity; disulfiram inhibits metabolism of benzodiazepines (increased sedative effects).
- **Paraldehyde**: risk of toxicity when disulfiram given with *paraldehyde*.
- **Theophylline**: disulfiram inhibits metabolism of *theophylline* (increased risk of toxicity).

Diuretics

- **Note**: Since systemic absorption may follow topical application of brinzolamide to the eye, the possibility of interactions should be borne in mind.
- **Note**: Since systemic absorption may follow topical application of dorzolamide to the eye, the possibility of interactions should be borne in mind.
- **ACE Inhibitors**: enhanced hypotensive effect when diuretics given with *ACE inhibitors*; increased risk of severe hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with *ACE inhibitors*.

Adrenergic Neurone Blockers: enhanced hypotensive effect when diuretics given with *adrenergic neurone blockers*.
- **Alcohol**: enhanced hypotensive effect when diuretics given with alcohol.
- **Aldesleukin**: enhanced hypotensive effect when diuretics given with *aldesleukin*.
- **Aliskiren**: plasma concentration of furosemide reduced by *aliskiren*; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with *aliskiren*.
- **Allopurinol**: increased risk of hypersensitivity when thiazides and related diuretics given with *allopurinol* especially in renal impairment.
- **Alpha-blockers**: enhanced hypotensive effect when diuretics given with *alpha-blockers*, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin.
- **Anaesthetics, General**: enhanced hypotensive effect when diuretics given with general anaesthetics.
- **Analgesics**: possible increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with *NSAIDs*; diuretics increase risk of nephrotoxicity of *NSAIDs*, also antagonism of diuretic effect, Diuretic effect of potassium can-
Appendix 1: Interactions

Antiepileptics: (continued)

- renopterin possibly antagonised by NSAIDs; furosemide possibly increases the excretion of acetazolamide and ketorolac; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with indomethacin; occasional reports of reduced renal function when triamterene given with indomethacin—avoid concomitant use; diuretic effect of spironolactone antagonised by aspirin; possible increased risk of toxicity when loop diuretics given with high-dose aspirin (also possible reduced effect of loop diuretics); increased risk of toxicity when acetazolamide given with high-dose aspirin

- Angiotensin-II Receptor Antagonists: enhanced hypertensive effect when diuretics given with activating ATP-sensitive potassium channel activators, diuretics and aldosterone antagonists given with angiotensin-II receptor antagonists

- Anti-arrhythmics: plasma concentration of eplerenone increased by amiodarone (reduce dose of eplerenone); hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with amiodarone; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with diuretics; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with flecainide; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with sotalol

- Antibacterials: plasma concentration of eplerenone increased by clarithromycin and telithromycin—avoid concomitant use; plasma concentration of eplerenone increased by erythromycin (reduce dose of eplerenone); plasma concentration of eplerenone reduced by rifampicin—avoid concomitant use; avoidance of diuretics advised by manufacturer of lymecycline; increased risk of ototoxicity when loop diuretics given with amphotericin; polymyxins or vancomycin; acetazolamide antagonises effects of metenamine; possible increased risk of hyperkalaemia when spironolactone given with trimethoprim; increased risk of hyperkalaemia when eplerenone given with trimethoprim

- Anti-depressants: possible increased risk of hyperkalaemia when loop diuretics or thiazides and related diuretics given with reboxetine; enhanced hypertensive effect when diuretics given with MAOIs; plasma concentration of eplerenone reduced by St John’s wort—avoid concomitant use; increased risk of postural hypotension when diuretics given with tricyclics

Antidiabetics: loop diuretics and thiazides and related diuretics antagonise the hyperglycaemic effect of antidiabetics; diuretic effect of diuretics possibly enhanced by canagliflozin; avoidance of loop diuretics advised by manufacturer of canagliflozin; diuretic effect of loop diuretics and thiazides and related diuretics possibly enhanced by dapagliflozin

- Antiepileptics: plasma concentration of eplerenone reduced by carbamazepine, phenobarbital and phenytoin—avoid concomitant use; increased risk of hyponatraemia when diuretics given with carbamazepine; acetazolamide increases plasma concentration of carbamazepine; increased risk of osteomalacia when carbonic anhydrase inhibitors given with phenobarbital or phenytoin; effects of furosemide antagonised by phenytoin; acetazolamide possibly increases plasma concentration of phenytoin; hydrochlorothiazide possibly increases plasma concentration of topiramate; avoidance of carbonic acid

Antiepileptics (continued)

- anhydrate in children advised by manufacturer of zonisamide

- Antifungals: increased risk of hypokalaemia when loop diuretics or thiazides and related diuretics given with amphotericin; hydrochlorothiazide increases plasma concentration of fluconazole; plasma concentration of eplerenone increased by fluconazole (reduce dose of eplerenone); plasma concentration of eplerenone increased by saquinavir (reduce dose of eplerenone)

- Antipsychotics: hypokalaemia caused by diuretics increases risk of ventricular arrhythmias with amisulpride; increased hypertensive effect when diuretics given with phenothiazines; hypokalaemia caused by diuretics increases risk of ventricular arrhythmias with pimozide (avoid concomitant use)

- Antihypertensives: plasma concentration of eplerenone increased by ritonavir—avoid concomitant use; plasma concentration of eplerenone increased by saquinavir (reduce dose of eplerenone)

- Anxiolytics and Hypnotics: enhanced hypertensive effect when diuretics given with anxiolytics and hypnotics; administration of parenteral furosemide with chloral may displace thyroid hormone from binding sites

- Antihistamines: hypokalaemia caused by diuretics increases risk of ventricular arrhythmias with atropine

- Antiarrhythmics: plasma concentration of eplerenone increased by thioridazine and verapamil (reduce dose of eplerenone)

- Cardiac Glycosides: hypokalaemia caused by diuretics or thiazides and related diuretics increases risk of ventricular arrhythmias with lidocaine

- Calcium Salts: increased risk of hyperkalaemia when thiazides and related diuretics given with calcium salts

- Calcium-channel Blockers: enhanced hypertensive effect when diuretics given with calcium-channel blockers; plasma concentration of eplerenone increased by diltiazem and verapamil (reduce dose of eplerenone)

- Carboxylic Acid Metabolites: hypokalaemia caused by diuretics or thiazides and related diuretics increases cardiac toxicity with cardiac glycosides; potassium canrenoate possibly increases plasma concentration of digoxin; spironolactone increases plasma concentration of digoxin

- Ciclosporin: increased risk of nephrotoxicity and possibly hypermagnesaemia when thiazides and related diuretics given with ciclosporin; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with ciclosporin; acitretinamide possibly increases plasma concentration of ciclosporin

- Clonidine: enhanced hypertensive effect when diuretics given with clonidine

- Corticosteroids: diuretic effect of diuretics antagonised by corticosteroids; increased risk of hypokalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with corticosteroids

- Cytoprotectants: alkaline urine due to acetazolamide increases excetration of methotrexate; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases risk of ventricular arrhythmias with arsenic trioxide; avoidance of spironolactone advised by manufacturer of mitotane (antagonism of effect); increased risk of nephrotoxicity and ototoxicity when diuretics given with platinum compounds

- Diazoxide: enhanced hypertensive and hyperglycaemic effects when diuretics given with diazoxide

- Diuretics: increased risk of hypokalaemia when loop diuretics or thiazides and related diuretics given with diazoxide
Docetaxel (continued)

Cytotoxics: possible increased risk of neutropenia when docetaxel given with lapatinib; plasma concentration of docetaxel increased by sorafenib.

Donagavir

Antacids: absorption of dolatregravir possibly reduced by aluminium hydroxide and oral magnesium salts—manufacturer of donagavir advises give at least 2 hours before or 6 hours after aluminium hydroxide and oral magnesium salts.

Antibacterials: plasma concentration of dolatregravir reduced by ritonavir (see Dose under Dolatregravir, p. 421); plasma concentration of dolatregravir reduced by nevirapine (see Dose under Dolatregravir, p. 421); plasma concentration of dolatregravir possibly reduced by ritonavir, cobicistat, etravirine (see Cautions under Dolatregravir, p. 421); plasma concentration of dolatregravir possibly reduced by ritonavir, cobicistat—avoid concomitant use with St John’s wort.

Antidepressants: manufacturer of dolatregravir advises avoid concomitant use with St John’s wort.

Antiepileptics: manufacturer of dolatregravir advises avoid concomitant use with carbamazepine, oxcarbazepine, phenobarbital and phenytoin.

Antivirals: plasma concentration of dolatregravir reduced by efavirenz and nevirapine (see Dose under Dolatregravir, p. 421); plasma concentration of dolatregravir possibly reduced by efavirenz and etravirine (see Cautions under Dolatregravir, p. 421); plasma concentration of dolatregravir possibly reduced by ritonavir, cobicistat—avoid concomitant use with St John’s wort.

Antifungals: possible increased risk of ventricular arrhythmias when domperidone given with trifluridin.

Antiarrhythmics: avoidance of domperidone advised by manufacturer of piperaquine with artesminal (possible risk of ventricular arrhythmias).

Antimuscarinics: effects of domperidone on gastrointestinal activity antagonised by antimuscarinics.

Antivirals: possible increased risk of ventricular arrhythmias when domperidone given with telaprevir, boceprevir, etravirine or telaprevir—avoid concomitant use.

Antiarrhythmics: avoidance of domperidone given with trifluridin (risk of ventricular arrhythmias).

Dopaminergics: domperidone possibly antagonises hypoprolactinaemic effects of bromocriptine and cabergoline.

Dopamine see Parasympathomimetics

Dopamine see Symptomimetics

Dopaminergics see Amantadine, Apomorphine, Bromocriptine, Cabergoline, Entacapone, Levodopa, Pergolide, Pramipexole, Quinagolide, Rasagiline, Ropinirole, Rotigotine, Selegiline, and Tolcapone

Dopexamine see Symptomimetics

Dorzolamide see Diuretics

Doxepin see Antidepressants, Tricyclic

Doxapram

Antianasthetics, General: increased risk of arrhythmias when doxapram given with volatile liquid general anaesthetics (avoid doxapram for at least 10 minutes after volatile liquid general anaesthetics).
Appendix 1: Interactions

Doxapram (continued)
Antidepressants: effects of doxapram enhanced by MAOIs
Sympathomimetics: increased risk of hypertension when doxapram given with sympathomimetics
Theophylline: increased CNS stimulation when doxapram given with theophylline

Doxazosin see Alpha-blockers

Doxepin see Antidepressants, Tricyclic

Doxurubicin
- Antipsychotics: avoid concomitant use of cytoxics with doxapine (increased risk of agranulocytosis)
- Antivirals: doxurubicin possibly inhibits effects of stavudine

Calcium-channel Blockers: plasma concentration of doxurubicin possibly increased by verapamil
Cardiac Glicosides: doxurubicin possibly reduces absorption of digitoxin tablets
- Ciclosporin: increased risk of neurotoxicity when doxurubicin given with ciclosporin
- Cytoxics: plasma concentration of doxurubicin possibly increased by vorinostat

Droxycycline see Tetracyclines

Dronedarone
Anesthetics, Local: increased myocardial depression when anti-arrhythmics given with bupivacaine, levobupivacaine, prilocaine or ropivacaine
- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other anti-arrhythmics; increased risk of ventricular arrhythmias when dronedarone given with amiodarone or disopyramide—avoid concomitant use
- Antibacterials: manufacturer of dronedarone advises avoidance of dronedarone in patients on anti-arrhythmics; possibility of enhanced anti-arrhythmic effects
- Anticoagulants: dronedarone possibly enhances anticoagulant effect of coumarins and phenindione
- Antiplatelet agents: dronedarone increases plasma concentration of dabigatran—avoid concomitant use
- Anticoagulants: manufacturer of dronedarone advises caution with sirolimus
- Anticoagulants: manufacturer of dronedarone advises caution with tacrolimus

Droperidol see Antiemetics

Droxiprone see Progestogens

Duloxetine
Analgesics: possible increased serotonergic effects when SSRI-related antidepressants given with fentanyl; possible increased serotonergic effects when duloxetine given with pethidine or tramadol
- Antibacterials: metabolism of duloxetine inhibited by ciprofloxacin—avoid concomitant use
- Anticoagulants: possible increased risk of bleeding when SSRI-related antidepressants given with dabigatran
- Antidepressants: metabolism of duloxetine inhibited by fluoxetine—avoid concomitant use; possible increased serotonergic effects when duloxetine given with SSRIs, St John’s wort, amitriptyline, clomipramine, moclobemide or venlafaxine; duloxetine should not be started until 2 weeks after stopping MAOIs; also MAOIs should not be started until at least 5 days after stopping duloxetine; after stopping SSRI-related antidepressants do not start moclobemide for at least 1 week
- Antimalarials: duloxetine should not be started until 2 weeks after stopping duloxetine; administration of other SSRI-related antidepressants given for at least 1 week
- Antipsychotics: avoid concomitant use with manufacturer of atomoxetine with luteaustrin and piperaquine with artemether
- Antidepressants: possible increased risk of convulsions when antidepressants given with atomoxetine
- Antidepressants: metabolism of duloxetine inhibited by fluvoxamine—avoid concomitant use; possible increased serotonergic effects when duloxetine given with SSRIs, St John’s wort, amitriptyline, clomipramine, moclobemide or venlafaxine; duloxetine should not be started until 2 weeks after stopping MAOIs; also MAOIs should not be started until at least 5 days after stopping duloxetine; after stopping SSRI-related antidepressants do not start moclobemide for at least 1 week

Drusian see Antipsychotics

Fingolimod: possible increased risk of bradycardia when dronedarone given with fingolimod
- Grapefruit juice: plasma concentration of dronedarone increased by grapefruit juice—avoid concomitant use
- Lipid-regulating Drugs: dronedarone possibly increases plasma concentration of atorvastatin; dronedarone increases plasma concentration of rosuvastatin—adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when dronedarone given with simvastatin; avoidance of dronedarone advised by manufacturer of lomitapide (plasma concentration of lomitapide possibly increased)

Sirolimus: manufacturer of dronedarone advises caution with sirolimus
Tacrolium: manufacturer of dronedarone advises caution with tacrolimus

Dropinol see Antipsychotics

Fingolimod: possible increased risk of bradycardia when dronedarone given with fingolimod
- Grapefruit juice: plasma concentration of dronedarone increased by grapefruit juice—avoid concomitant use
- Lipid-regulating Drugs: dronedarone possibly increases plasma concentration of atorvastatin; dronedarone increases plasma concentration of rosuvastatin—adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when dronedarone given with simvastatin; avoidance of dronedarone advised by manufacturer of lomitapide (plasma concentration of lomitapide possibly increased)

Sirolimus: manufacturer of dronedarone advises caution with sirolimus
Tacrolium: manufacturer of dronedarone advises caution with tacrolimus

Droperidol see Antiemetics

Droxiprone see Progestogens

Duloxetine
Analgesics: possible increased serotonergic effects when SSRI-related antidepressants given with fentanyl; possible increased serotonergic effects when duloxetine given with pethidine or tramadol
- Antibacterials: metabolism of duloxetine inhibited by ciprofloxacin—avoid concomitant use
- Anticoagulants: possible increased risk of bleeding when SSRI-related antidepressants given with dabigatran
- Antidepressants: metabolism of duloxetine inhibited by fluoxetine—avoid concomitant use; possible increased serotonergic effects when duloxetine given with SSRIs, St John’s wort, amitriptyline, clomipramine, moclobemide or venlafaxine; duloxetine should not be started until 2 weeks after stopping MAOIs; also MAOIs should not be started until at least 5 days after stopping duloxetine; after stopping SSRI-related antidepressants do not start moclobemide for at least 1 week
- Antimalarials: duloxetine should not be started until 2 weeks after stopping duloxetine; administration of other SSRI-related antidepressants given for at least 1 week
- Antipsychotics: avoid concomitant use with manufacturer of atomoxetine with luteaustrin and piperaquine with artemether
- Antidepressants: possible increased risk of convulsions when antidepressants given with atomoxetine
- Antidepressants: metabolism of duloxetine inhibited by fluoxetine—avoid concomitant use; possible increased serotonergic effects when duloxetine given with SSRIs, St John’s wort, amitriptyline, clomipramine, moclobemide or venlafaxine; duloxetine should not be started until 2 weeks after stopping MAOIs; also MAOIs should not be started until at least 5 days after stopping duloxetine; after stopping SSRI-related antidepressants do not start moclobemide for at least 1 week

Drusian see Antipsychotics
Efavirenz

Analgesics: efavirenz reduces plasma concentration of methadone

Antibacterials: efavirenz reduces plasma concentration of clarithromycin, also plasma concentration of active metabolite of clarithromycin increased; efavirenz reduces plasma concentration of rifabutin—increase dose of rifabutin; plasma concentration of efavirenz reduced by rifampicin—increase dose of efavirenz

Anticoagulants: efavirenz possibly affects plasma concentration of coumarins

Antidepressants: plasma concentration of efavirenz reduced by St John's wort—avoid concomitant use

Antiepileptics: plasma concentration of both drugs reduced when efavirenz given with carbamazepine

Antifungals: efavirenz reduces plasma concentration of itraconazole and posaconazole; efavirenz reduces plasma concentration of voriconazole, also plasma concentration of efavirenz increased (increase voriconazole dose and reduce efavirenz dose); efavirenz possibly reduces plasma concentration of caspofungin—consider increasing dose of caspofungin

Antimalarials: efavirenz reduces plasma concentration of arteether with lumefantrine; efavirenz possibly affects plasma concentration of proguanil

Antipsychotics: efavirenz possibly reduces plasma concentration of aripiprazole (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); efavirenz possibly increases plasma concentration of pimozide (increased risk of ventricular arrhythmias—avoid concomitant use)

Antivirals: avoidance of efavirenz advised by manufacturer of atazanavir (plasma concentration of atazanavir reduced); efavirenz reduces plasma concentration of darunavir (adjust dose—consult product literature); efavirenz reduces the plasma concentration of dolotegravir (see Dose under Dolotegravir, p. 421); avoidance of efavirenz advised by manufacturer of elvitegravir; efavirenz possibly reduces plasma concentration of etravirine—avoid concomitant use; efavirenz reduces plasma concentration of indinavir; efavirenz reduces plasma concentration of lopinavir—consider increasing dose of lopinavir; efavirenz possibly reduces plasma concentration of maraviroc—consider increasing dose of maraviroc; plasma concentration of efavirenz reduced by nevirapine—avoid concomitant use; toxicity of efavirenz increased by ritonavir; monitor liver function tests —manufacturer of Atopil® advises avoid concomitant use with high-dose ritonavir; efavirenz significantly reduces plasma concentration of saquinavir; efavirenz reduces plasma concentration of telaprevir—increase dose of telaprevir

Anxiolytics and Hypnotics: increased risk of prolonged sedation when efavirenz given with midazolam—avoid concomitant use

Atovaquone: efavirenz reduces plasma concentration of atovaquone—avoid concomitant use

Avanafil: efavirenz possibly reduces plasma concentration of avanafil—manufacturer of avanafil advises avoid concomitant use

Bupropion: efavirenz accelerates metabolism of bupropion (reduced plasma concentration)

Calcium-channel Blockers: efavirenz reduces plasma concentration of diltiazem

Ciclosporin: efavirenz possibly reduces plasma concentration of ciclosporin

Efavirenz (continued)

Cytotoxics: efavirenz possibly reduces plasma concentration of bosutinib—manufacturer of bosutinib advises avoid concomitant use

Ergot Alkaloids: increased risk of ergotism when efavirenz given with ergot alkaloids—avoid concomitant use

Grapefruit juice: plasma concentration of efavirenz possibly increased by grapefruit juice

Lipid-regulating Drugs: efavirenz reduces plasma concentration of atorvastatin, pravastatin and simvastatin

Orlistat: absorption of efavirenz possibly reduced by orlistat

Progestogens: efavirenz possibly reduces contraceptive effect of progestogens

Tacrolimus: efavirenz possibly affects plasma concentration of tacrolimus

Eleetiptan see SHT-receptor Agonists (under HT)

Eltrombopag

Antacids: absorption of eltrombopag reduced by antacids (give at least 4 hours apart)

Antivirals: plasma concentration of eltrombopag possibly reduced by lopinavir

Calcium Salts: absorption of eltrombopag possibly reduced by calcium salts (give at least 4 hours apart)

Dairy Products: absorption of eltrombopag possibly reduced by dairy products (give at least 4 hours apart)

Iron: absorption of eltrombopag possibly reduced by oral iron (give at least 4 hours apart)

Lipid-regulating Drugs: eltrombopag increases plasma concentration of rosuvastatin—adjust dose of rosuvastatin (consult product literature)

Selenium: absorption of eltrombopag possibly reduced by selenium (give at least 4 hours apart)

Zinc: absorption of eltrombopag possibly reduced by zinc (give at least 4 hours apart)

Elvitegravir

Antacids: absorption of elvitegravir reduced by antacids (give at least 4 hours apart)

Antibacterials: plasma concentration of elvitegravir reduced by rifabutin also plasma concentration of active metabolite of rifabutin increased—reduce dose of rifabutin; manufacturer of elvitegravir advises avoid concomitant use with rifampicin

Antidepressants: manufacturer of elvitegravir advises avoid concomitant use with St John’s wort

Antiepileptics: manufacturer of elvitegravir advises avoid concomitant use with carbamazepine, phenobarbital and phenytoin

Antivirals: plasma concentration of elvitegravir increased by atazanavir and lopinavir boosted with ritonavir (reduce dose of elvitegravir); manufacturer of elvitegravir advises avoid concomitant use with efavirenz and nevirapine

Bosentan: manufacturer of elvitegravir advises avoid concomitant use with bosentan

Orlistat: absorption of elvitegravir possibly reduced by orlistat

Progestogens: elvitegravir increases plasma concentration of norgestimate

Emtricitabine

Antivirals: manufacturer of emtricitabine advises avoid concomitant use with lamivudine

Orlistat: absorption of emtricitabine possibly reduced by orlistat

Enalapril see ACE Inhibitors

Enfuvirtide

Orlistat: absorption of enfuvirtide possibly reduced by orlistat

Enoxaparin see Heparins

Exonimone see Phosphodiesterase Inhibitors
Appendix 1: Interactions

Entacapone
- Anticoagulants: entacapone enhances anticoagulant effect of warfarin
- Antidepressants: manufacturer of entacapone advises caution with moclobemide, tricyclics and venlafaxine; avoid concomitant use of entacapone with non-selective MAOIs

Dopaminergics: entacapone possibly enhances effects of apomorphine; entacapone possibly reduces plasma concentration of rasagiline; manufacturer of entacapone advises max. dose of 10mg selegiline if used concomitantly

Iron: absorption of entacapone reduced by oral iron

Methyldopa: entacapone possibly enhances effects of methyldopa; antiparkinsonian effect of dopaminergics antagonised by methyldopa

Sympathomimetics: entacapone possibly enhances effects of adrenaline (epinephrine), dobutamine, dopamine and noradrenaline (norepinephrine)

Enteral Foods
- Anticoagulants: the presence of vitamin K in some enteral feeds can antagonise the anticoagulant effect of warfarin and Enoxaparin

Antiepileptics: enteral feeds possibly reduce absorption of phenytoin

Enzalutamide
- Antibacterials: manufacturer of enzalutamide advises avoid concomitant use with rifampicin
- Anticoagulants: enzalutamide possibly reduces plasma concentration of coumarins
- Lipid-regulating Drugs: plasma concentration of enzalutamide increased by gemfibrozil—manufacturer of enzalutamide advises avoid concomitant use or halve dose of enzalutamide

Ephedrine see Sympathomimetics

Epinephrine (adrenaline) see Sympathomimetics

Eripubicin
- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
- Ciclosporin: plasma concentration of eripubicin increased by ciclosporin
- Ulcer-healing Drugs: plasma concentration of eripubicin increased by cimetidine

Eplerenone see Diuretics

Eprosartan see Angiotensin-II Receptor Antagonists

Eptifibatide
- Iloprost: increased risk of bleeding when epftibatide given with iloprost

Ergometrine see Ergot Alkaloids

Ergot Alkaloids
- Antibacterials: increased risk of ergotism when ergotamine given with macrolides or telithromycin—avoid concomitant use; increased risk of ergotism when ergotamine given with tetracyclines
- Antidepressants: possible risk of hypertension when ergotamine given with reboxetine, dobutamine, dopamine and noradrenaline (norepinephrine)
- Antifungals: avoidance of ergotamine advised by manufacturer of itraconazole (increased risk of ergotism); increased risk of ergotism when ergotamine given with imidazoles or triazoles—avoid concomitant use

Antivirals: plasma concentration of ergot alkaloids possibly increased by stavudine—avoid concomitant use; avoidance of ergot alkaloids advised by manufacturer of fosamprenavir and indinavir or saquinavir—avoid concomitant use

Anticoagulants: increased peripheral vasoconstriction when ergotamine given with beta-blockers
- Cobicistat: plasma concentration of ergot alkaloids possibly increased by cobicistat—manufacturer of cobicistat advises avoid concomitant use
- Cytotoxics: caution with ergot alkaloids advised by manufacturer of crizotinib
- 5HT1-receptor Agonists: increased risk of vasospasm when ergotamine given with almotriptan, rizatRIPTAN, sumatriptan or zolmitriptan (avoid ergotamine for 6 hours after almotriptan, rizatRIPTAN, sumatriptan or zolmitriptan, almotriptan, rizatRIPTAN, sumatriptan or zolmitriptan for 24 hours after ergotamine); increased risk of vasospasm when ergotamine given with eletriptan, frovatriptan or naratriptan, avoid eletriptan, frovatriptan or naratriptan for 24 hours after ergotamine

Sympathomimetics: increased risk of ergotism when ergotamine given with sympathomimetics

Eticaretilor: plasma concentration of ergot alkaloids possibly increased by ticagrelor
- Ulcer-healing Drugs: increased risk of ergotism when ergotamine given with omeprazole—avoid concomitant use

Erlotinib
- Analgesics: increased risk of bleeding when erlotinib given with NSAIDs
- Antacids: plasma concentration of erlotinib possibly reduced by antacids give antacids at least 6 hours before or 2 hours after erlotinib

Antidepressants: plasma concentration of erlotinib increased by ciprofloxacin; metabolism of erlotinib accelerated by rifampicin (reduced plasma concentration)

Anticoagulants: increased risk of bleeding when erlotinib given with coumarins

Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)

Antivirals: avoidance of erlotinib advised by manufacturer of boceprevir

Cytotoxics: plasma concentration of erlotinib possibly increased by capetabine

Ulcer-healing Drugs: manufacturer of erlotinib advises avoid concomitant use with omeprazole, esomeprazole, pantoprazole, nizatidine, pantoprazole and rabeprazole; plasma concentration of erlotinib reduced by nizatidine—manufacturer of erlotinib advises give at least 2 hours before or 10 hours after ranitidine; plasma concentration of erlotinib reduced by omeprazole—manufacturer of erlotinib advises avoid concomitant use

Ertapenem
- Antiepileptics: carbapenem reduces plasma concentration of valproate—avoid concomitant use

Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850

Erythromycin see Macrolides

Escitalopram see Antidepressants, SSRI

Esilcarbazepine
- Anticoagulants: esilcarbazepine reduces plasma concentration of warfarin
Antibacterials: see Ethinylestradiol

Vaccines: see Estriol

Etanercept see Estrone

Antimalarials: anticonvulsant effect of antiepileptics antagonised by phenytoin, also plasma concentration of phenytoin increased

Antimalarials: anticonvulsant effect of antiepileptics antagonised by etoricoxin

Antiepileptics: plasma concentration of ethosuximide possibly reduced by phenobarbital and phenytoin, also plasma concentration of ethosuximide increased by valproate

Antiepileptics: plasma concentration of ethosuximide possibly reduced by phenobarbital and phenytoin, also plasma concentration of ethosuximide increased by valproate

Antimalarials: anticonvulsant effect of antiepileptics antagonised by emelfoquine

Antipsychotics: anticonvulsant effect of antiepileptics antagonised by antipsychotics (convulsive threshold lowered)

Antidepressants: etrapirine increases plasma concentration of simvastatin—consider increasing dose of simvastatin

Lipid-regulating Drugs: eslicarbazepine reduces plasma concentration of rosuvastatin; eslicarbazepine reduces plasma concentration of simvastatin—consider increasing dose of simvastatin

Oestrogens: eslicarbazepine accelerates metabolism of oestrone (reduced contraceptive effect—see p. 536)

Orlistat see Beta-blockers

Esomeprazole see Proton Pump Inhibitors

Estradiol see Oestrogens

Estramustine Antacids: absorption of estramustine possibly reduced by aluminium hydroxide and oral magnesium salts—manufacturer of estramustine advises avoid concomitant administration

Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)

Bisphosphonates: plasma concentration of estramustine increased by sodium clodronate

Calcium Salts: absorption of estramustine reduced by calcium salts (manufacturer of estramustine advises avoid concomitant administration)

Estradiol see Oestrogens

Estrone see Oestrogens

Etil dorzolomide (continued)

Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSNRIs and tricyclics (convulsive threshold lowered)

Antiepileptics: plasma concentration of eslicarbazepine possibly reduced by carbamazepine but risk of side-effects increased; manufacturer of eslicarbazepine advises avoid concomitant use with oxcarbazepine; plasma concentration of eslicarbazepine reduced by phenytoin, also plasma concentration of phenytoin increased

Antimalarials: anticonvulsant effect of antiepileptics antagonised by emelfoquine

Antipsychotics: anticonvulsant effect of antiepileptics antagonised by antipsychotics (convulsive threshold lowered)

Orlistat: possible increased risk of convulsions when antiepileptics given with orlistat

Etidronate Disodium see Bisphosphonates

Etolodac see NSAIDs

Etomide see Anaesthetics, General

Progestogens see Estradiol

Etoricoxin see NSAIDs

Etravirine

Antibacterials: etrapirine reduces plasma concentration of etrapirine (but concentration of an active metabolite increased), also plasma concentration of etrapirine increased; plasma concentration of both drugs reduced when etrapirine given with efavirenz; manufacturer of etrapirine advises avoid concomitant use with rifapentine

Antidepressants: manufacturer of etrapirine advises avoid concomitant use with St John’s wort

Antiepileptics: manufacturer of etrapirine advises avoid concomitant use with carbamazepine, phenobarbital and phenytoin

Antimalarials: etrapirine reduces plasma concentration of arteether with lumefantrine

Antivirals: effects of both drugs possibly reduced when etrapirine given with boceprevir; etrapirine reduces the plasma concentration of dolutegravir (see Cautions under Dolutegravir, p. 421); plasma concentration of etrapirine possibly reduced by efavirenz and nelfinavir—avoid concomitant use; etrapirine increases plasma concentration of fosamprenavir (consider reducing dose of fosamprenavir); etrapirine possibly reduces plasma concentration of indinavir—avoid concomitant use; etrapirine possibly reduces plasma concentration of maraviroc; plasma concentration of etrapirine reduced by maraviroc, also plasma concentration of tipranavir increased (avoid concomitant use) Caridac Glycosides: etrapirine increases plasma concentration of digoxin

Clopidogrel: etrapirine possibly reduces antiplatelet effect of clopidogrel

Cytotoxics: etrapirine possibly reduces plasma concentration of bosutinib—manufacturer of bosutinib advises avoid concomitant use

Lipid-regulating Drugs: etrapirine possibly reduces plasma concentration of atorvastatin

Orlistat: absorption of etrapirine possibly reduced by orlistat

Sildenafil: etrapirine reduces plasma concentration of sildenafil

Etorborole (continued)

Antibacterials: plasma concentration of etorphinre possibly increased by sarilumycin and etorphinre—manufacturer of etorphinre advises avoid concomitant use; plasma concentration of everolimus increased by etorphinre (consider reducing the dose of etorphinre —consult everolimus product literature) Plasma concentration of everolimus reduced by rifapentine (avoid concomitant use or consider increasing the dose of everolimus —consult everolimus product literature)
Everolimus (continued)  
Antidepressants: plasma concentration of everolimus possibly reduced by St John’s wort—manufacturer of everolimus advises avoid concomitant use  
Antifungals: plasma concentration of everolimus possibly increased by itraconazole, posaconazole and voriconazole—manufacturer of everolimus advises avoid concomitant use  
Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)  
Antivirals: plasma concentration of everolimus possibly increased by atazanavir, darunavir, etravirine, ritonavir and saquinavir—manufacturer of everolimus advises avoid concomitant use  
Calcium-channel Blockers: plasma concentration of both drugs may increase when everolimus given with verapamil (consider reducing the dose of everolimus—consult everolimus product literature)  
Ciclosporin: plasma concentration of everolimus increased by ciclosporin (consider reducing the dose of everolimus—consult everolimus product literature)  
Cytotoxics: plasma concentration of everolimus increased by matinib (consider reducing the dose of everolimus—consult everolimus product literature)  
Grapefruit Juice: manufacturer of everolimus advises avoid concomitant use with grapefruit juice  

Exemestane  
Antibacterials: plasma concentration of exemestane possibly reduced by rifampicin  

Exenatide see Antidiabetics  

Ezetimibe  
Anticoagulants: ezetimibe possibly enhances anticoagulant effect of coumarins  
Ciclosporin: plasma concentration of both drugs may increase when ezetimibe given with ciclosporin  
Lipid-regulating Drugs: ezetimibe increases plasma concentration of rosvustatin (consult product literature); increased risk of cholelithiasis and gallbladder disease when ezetimibe given with ezetimibe—discontinue if suspected  

Famciclovir  
Probencid: excretion of famciclovir possibly reduced by probenecid (increased plasma concentration)  
Famotidine see Histamine H2-antagonists  
Fampridine  
Ulcer-healing Drugs: manufacturer of fampridine advises avoid concomitant use with cimetidine  

Febuxostat  
Azathioprine: manufacturer of febuxostat advises avoid concomitant use with azathioprine  
Cytotoxics: manufacturer of febuxostat advises avoid concomitant use with mercaptopurine  

Felodipine see Calcium-channel Blockers  
Fenofibrate see Fibrates  
Fenoprofen see NSAIDs  
Fentanyl see Opioid Analgesics  
Ferrous Salts see Iron  
Fesoterodine see Antimuscarinics  
Fexofenadine see Antihistamines  

Fibrates  
Antibacterials: increased risk of myopathy when fibrates given with daptomycin (preferably avoid concomitant use)  
Anticoagulants: fibrates enhance anticoagulant effect of coumarins and phenindione  
Antidiabetics: fibrates may improve glucose tolerance and have an additive effect with insulin or sulphonylureas; gemfibrozil possibly enhances hypoglycaemic effect of nateglinide; increased risk of severe hypoglycaemia when gemfibrozil given with repaglinide—avoid concomitant use  

Fibrates (continued)  
Ciclosporin: increased risk of renal impairment when bezafibrate or fenofibrate given with ciclosporin  
Colchicine: possible increased risk of myopathy when fibrates given with colchicine  
Cytoxotics: gemfibrozil increases plasma concentration of exatecorine—avoid concomitant use  
Hormone Antagonists: gemfibrozil increases plasma concentration of enzalutamide—manufacturer of enzalutamide advises avoid concomitant use or halve dose of enzalutamide  
Leukotriene Receptor Antagonists: gemfibrozil increases plasma concentration of montelukast  

Lipid-regulating Drugs: increased risk of myopathy when gemfibrozil given with atorvastatin, simvastatin or pravastatin (preferably avoid concomitant use); increased risk of myopathy when fibrates given with rosuvastatin (see Dose under Rosuvastatin, p. 173); possible increased risk of myopathy when bezafibrate and ciprofibrate given with simvastatin (see Dose under Simvastatin, p. 173); increased risk of myopathy when gemfibrozil given with simvastatin (avoid concomitant use); increased risk of cholelithiasis and gallbladder disease when fibrates given with ezetimibe—discontinue if suspected; reduce maximum dose of fenofibrate when given with statins—see Dose under Fenofibrate, p. 176; increased risk of myopathy when fibrates given with statins  

Fidaxomicin  
Anti-arrhythmics: manufacturer of fidaxomicin advises avoid concomitant use with amiodarone and dronedarone  
Antibacterials: manufacturer of fidaxomicin advises avoid concomitant use with clarithromycin and erythromycin  
Calcium-channel Blockers: manufacturer of fidaxomicin advises avoid concomitant use with verapamil  
Ciclosporin: manufacturer of fidaxomicin advises avoid concomitant use with ciclosporin  

Filgrastim  
Note Pegfilgrastim interactions as for filgrastim  
Cytotoxics: neutropenia possibly exacerbated when filgrastim given with fluorouracil  

Fingolimod  
Anti-arrhythmics: possible increased risk of bradyarrhythmias when fingolimod given with amiodarone, disopyramide or dronedarone  
Antidepressants: plasma concentration of fingolimod possibly reduced by St John’s wort—manufacturer of fingolimod advises avoid concomitant use  
Anti-epileptics: plasma concentration of fingolimod reduced by carbamazepine  
Beta-blockers: possible increased risk of bradycardia when fingolimod given with beta-blockers  
Calcium-channel Blockers: possible increased risk of bradycardia when fingolimod given with diltiazem or verapamil  

Flavoxate see Antimuscarinics  

Flecainide  
Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with bupivacaine, levobupivacaine, prilocaine or ropivacaine  
Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with amiodarone, disopyramide or dronedarone  
Antidepressants: plasma concentration of flecainide increased by st John’s wort—manufacturer of flecainide advises avoid concomitant use  
Anti-arrhythmics: increased risk of ventricular arrhythmias when flecainide given with tricyclics  
Antihistamines: increased risk of ventricular arrhythmias when flecainide given with mizolastine—avoid concomitant use  
Anti-malarials: avoidance of flecainide advised by manufacturer of arteether with lumefantrine (risk

Appendix 1: Interactions

Fosamprenavir
- Antivirals (continued)
  - Increases plasma concentration of fosamprenavir possibly reduced by
  nevirapine—avoid unboosted fosamprenavir; manufacturer advises avoid concomitant use
  fosamprenavir with eliprevir; plasma concentration of fosamprenavir reduced by
  ritonavir
  - Anti-inflammatory: fosamprenavir increases plasma concentration of emidazolam (risk of
  prolonged sedation—avoid concomitant use of oral midazolam)
  - Avanafil: fosamprenavir possibly increases plasma concentration of avanafil—see Dose under
  Avanafil, p. 559
  - Ciclosporin: fosamprenavir increases plasma concentration of ciclosporin
  - Cytotoxic: fosamprenavir possibly increases the plasma concentration of
  fosamprenavir increases plasma concentration of tacrolimus—avoid concomitant use
  Lipid-regulating Drugs: possible increased risk of myopathy
  when fosamprenavir given with atorvastatin; possible increased risk of myopathy when
  fosamprenavir given with rosuvastatin advises avoid concomitant use; possible
  increased risk of myopathy when fosamprenavir given with simvastatin—avoid concomitant use;
  avoidance of fosamprenavir advised by manufacturer of lonitapide (plasma concentration of lomi-
  tapide possibly increased)
  - Orlistat: absorption of fosamprenavir possibly reduced by orlistat
  - Ranolazine: fosamprenavir possibly increases plasma concentration of ranolazine—manufacturer
  of ranolazine advises avoid concomitant use
  - Simvastatin: fosamprenavir possibly increases plasma concentration of simvastatin
  - Tacrolimus: fosamprenavir increases plasma concentration of tacrolimus
  - Tadalafil: fosamprenavir possibly increases plasma concentration of tadalafil
  - Vardenafil: fosamprenavir possibly increases plasma concentration of vardenafil

Fosaprepitant see Aprepitant

Foscarnet
- Pentamide isethionate: increased risk of hypocalcaemia when foscarnet given with parenteral pent-
  amide isethionate

Fosinopril see ACE Inhibitors

Fosphenytoin see Phenytoin

Frovatriptan see SHT-receptor Agonists (under HT)

Furosemide see Diuretics

Fusidic Acid
- Antivirals: plasma concentration of both drugs increased when fusidic acid given with
  ritonavir—avoid concomitant use; plasma concentration of both drugs may increase when fusidic acid given
  with saquinavir
  - Lipid-regulating Drugs: risk of myopathy and rhombo-
  myositis when fusidic acid given with statins—
  avoid concomitant use and for 7 days after last fusi-
  dic acid dose

Sugammadex: fusidic acid possibly reduces response
to sugammadex
  - Vaccines: antibacterials inactivate oral typhoid
  vaccine—see p. 850

Gabapentin
- Analgesics: bioavailability of gabapentin increased by
  morphine
  - Antidepressants: increased risk of antiepileptic effects
  possibly antagonised by MAOIs and related antidepressants (convulsive threshold lowered); antiepileptic effect of antiepileptics antago-
  nised by SSRI s and clofibrate (convulsive threshold lowered)
  - Antimicrobials: anticonvulsant effect of antiepileptics
  antagonised by mifepristone
  - Antipsychotics: anticonvulsant effect of antiepileptics
  antagonised by antipsychotics (convulsive threshold lowered)
  - Orlistat: possible increased risk of convulsions when antiepileptics given with orlistat

Galantamine see Parasympathomimetics

Ganciclovir
- Note Increased risk of myelosuppression with other
  myelosuppressive drugs—consult product literature
  - Antivirals: increased risk of convulsions when ganciclovir given with amisulpride with cilastatin
  - Antivirals: ganciclovir possibly increases plasma concentra-
  tion of didanosine; profound myelosuppression when ganciclovir given with zidovudine (if possible avoid concomitant administration, particu-
  larly during initial ganciclovir therapy)

Mycophenolate: plasma concentration of ganciclovir possibly increased by mycophenolate, also plasma
centration of inactive metabolite of mycopheno-
late possibly increased

Probencid: excretion of ganciclovir reduced by pro-
benecid (increased plasma concentration and risk of
toxicity)

Tacrolimus: possible increased risk of nephrotoxicity when ganciclovir given with tacrolimus

Gefitinib
- Antidepressants: concentration of gefitinib reduced by
  tramadol—avoid concomitant use
  - Anticoagulants: gefitinib possibly enhances anti-
  coagulant effect of warfarin
  - Antidepressants: manufacturer of gefitinib advises
  avoid concomitant use with St John’s wort
  - Antiepileptics: manufacturer of gefitinib advises avoid concomitant use with carbamazepine, phenobarbital and phenytoin
  - Antifungals: plasma concentration of gefitinib increased by itraconazole
  - Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)
  - Antivirals: avoidance of gefitinib advised by manufactur-
  er of boceprevir
  - Uler-healing Drugs: plasma concentration of gefitinib reduced by ranitidine

Gemcitabine
- Antioxidants: gemcitabine possibly enhances anti-
  coagulant effect of warfarin
  - Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)

Gemeprost see Prostaglandins

Gemfibrozil see Fibrates

Gentamicin see Aminoglycosides

Gefitinib see Antiepileptics

Gliclazide see Antidiabetics

Glimepiride see Antidiabetics

Glipizide see Antidiabetics

Glucocorticoids
- Anticoagulants: glucocorticoids enhance anticoagulant
effect of warfarin (avoid concomitant use)

Glycerol Trinitrate see Nitrates

Glycopyrronium see Antimuscarinics
Gold see Sodium Aurothiomalate

Golimumab
- Abatacept: avoid concomitant use of golimumab with abatacept
- Auranofin: avoid concomitant use of golimumab with auranofin
- Vaccines: avoid concomitant use of golimumab with live vaccines (see p. 828)

Grapefruit Juice
- Aliskiren: grapefruit juice reduces plasma concentration of aliskiren—avoid concomitant use
- Anti-arrhythmics: grapefruit juice increases plasma concentration of amiodarone; grapefruit juice increases plasma concentration of dronedarone—avoid concomitant use
- Antidepressants: grapefruit juice possibly increases plasma concentration of sertraline
- Antihistamines: grapefruit juice reduces plasma concentration of bilastine; grapefruit juice increases plasma concentration of cetirizine—avoid concomitant use
- Antimalarials: avoidance of grapefruit juice advised by manufacturer of piperaquine with arteminol; grapefruit juice possibly increases plasma concentration of arteether with lumefantrine
- Antipsychotics: grapefruit juice possibly increases plasma concentration of aripiprazole; manufacturer of quetiapine advises avoid concomitant use
- Antibacterials: grapefruit juice possibly increases plasma concentration of oritavancin; manufacturer of quetiapine advises avoid concomitant use
- Antivirals: grapefruit juice possibly increases plasma concentration of efavirenz
- Anxiolytics and Hypnotics: grapefruit juice possibly increases plasma concentration of midazolam; grapefruit juice increases plasma concentration of buspirone
- Avanafil: grapefruit juice possibly increases plasma concentration of avanafil—manufacturer of avanafil advises avoid grapefruit juice for 24 hours before avanafil
- Calcium-channel Blockers: grapefruit juice possibly increases plasma concentration of amlodipine; grapefruit juice increases plasma concentration of felodipine, lacidipine, lercanidipine, nicardipine, nilfipidine, nimodipine and verapamil
- Ciclosporin: grapefruit juice increases plasma concentration of ciclosporin (increased risk of toxicity)
- Colchicine: grapefruit juice possibly increases risk of colchicine toxicity
- Cytotoxics: grapefruit juice possibly increases plasma concentration of axitinib; grapefruit juice possibly increases the plasma concentration of bosutinib—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; grapefruit juice possibly increases plasma concentration of crizotinib and vinflunine—manufacturer of crizotinib and vinflunine advises avoid concomitant use; avoidance of grapefruit juice advised by manufacturer of everolimus, lapatinib, nilotinib and pazopanib
- Ivabradine: grapefruit juice increases plasma concentration of ivabradine
- Ivecafar: grapefruit juice possibly increases plasma concentration of ivacaftor—manufacturer of ivacaftor advises avoid concomitant use
- Lipid-regulating Drugs: grapefruit juice possibly increases plasma concentration of atorvastatin; grapefruit juice increases plasma concentration of simvastatin—avoid concomitant use; avoidance of grapefruit juice advised by manufacturer of lomitapide
- Pirfenidone: avoidance of grapefruit juice advised by manufacturer of pirfenidone
- Ranolazine: grapefruit juice possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: grapefruit juice possibly increases plasma concentration of sildenafil

Grapefruit Juice (continued)
- Sirolimus: grapefruit juice increases plasma concentration of sirolimus—avoid concomitant use
- Tacrolimus: grapefruit juice increases plasma concentration of tacrolimus
- Tadalafil: grapefruit juice possibly increases plasma concentration of tadalafil
- Tolvaptan: grapefruit juice increases plasma concentration of tolvaptan—avoid concomitant use with ulipristal; avoidance of grapefruit juice advised by manufacturer of ulipristal
- Vardenafil: grapefruit juice possibly increases plasma concentration of vardenafil—avoid concomitant use

Griselofulvin
Alcohol: griseofulvin possibly enhances effects of alcohol
- Anticoagulants: griseofulvin reduces anticoagulant effect of coumarins
- Antiepileptics: absorption of griseofulvin reduced by phenobarbital (reduced effect)
- Ciclosporin: griseofulvin possibly reduces plasma concentration of ciclosporin
- Oestrogens: anecdotal reports of contraceptive failure and menstrual irregularities when griseofulvin given with oestrogens
- Progestogens: anecdotal reports of contraceptive failure and menstrual irregularities when griseofulvin given with progestogens

Guanethidine see Adrenergic Neurone Blockers

Haloperidol see Antipsychotics

Heparin see Heparins

Heparins
- ACE Inhibitors: increased risk of hyperkalaemia when heparins given with ACE inhibitors
- Alikiren: increased risk of hyperkalaemia when heparins given with aliskiren
- Analgesics: possible increased risk of bleeding when heparins given with NSAIDs; increased risk of haemorrhage when anticoagulants given with intravenous diclofenac (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with ketorolac (avoid concomitant use, including low-dose heparins); anticoagulant effect of heparin enhanced by aspirin
- Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when heparins given with angiotensin-II receptor antagonists
- Anticoagulants: increased risk of haemorrhage when other anticoagulants given with apixaban, dabigatran and rivaroxaban (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
- Clopidogrel: increased risk of bleeding when heparins given with clopidogrel
- Dipryidamole: anticoagulant effect of heparins enhanced by dipryidamole
- Iloprost: anticoagulant effect of heparins possibly enhanced by iloprost
- Nitrates: anticoagulant effect of heparins reduced by infusion of glyceryl trinitrate

Histamine
- Antidepressants: manufacturer of histamine advises avoid concomitant use with MAOIs; effects of histamine theoretically antagonised by tricyclics—manufacturer of histamine advises avoid concomitant use
- Antihistamines: effects of histamine theoretically antagonised by antihistamines—manufacturer of histamine advises avoid concomitant use
- Antimalarials: manufacturer of histamine advises avoid concomitant use with antimalarials
- Antipsychotics: effects of histamine theoretically antagonised by antipsychotics—manufacturer of histamine advises avoid concomitant use
Appendix 1: Interactions

Histamine (continued)

Antivirals: cimetidine and ranitidine antagonise effects of azithromycin

Analgesics: cimetidine inhibits metabolism of opioid analgesics (increased plasma concentration)

Antiarrhythmics: cimetidine increases plasma concentration of amiodarone and propafenone; cimetidine inhibits metabolism of flecaïnine (increased plasma concentration); cimetidine increases plasma concentration of lidocaine (increased risk of toxicity)

Antibacterials: cimetidine increases plasma concentration of erythromycin (increased risk of toxicity, including deafness); cimetidine inhibits metabolism of metronidazole (increased plasma concentration); metabolism of cimetidine accelerated by rifampicin (reduced plasma concentration)

Anticoagulants: cimetidine inhibits metabolism of warfarin

Antidepressants: cimetidine increases plasma concentration of citalopram, escitalopram, mirtazapine and sertraline; cimetidine inhibits metabolism of amitriptyline, doxepin, imipramine and nortriptyline (increased plasma concentration); cimetidine increases plasma concentration of moclobemide (halved dose of moclobemide); cimetidine possibly increases plasma concentration of tricyclics

Antidiabetics: cimetidine reduces excretion of metformin (increased plasma concentration); cimetidine causes hypoglycaemia

Antiepileptics: cimetidine inhibits metabolism of carbamazepine, phenytoin and valproate (increased plasma concentration)

Antifungals: histamine H2-antagonists reduce absorption of itraconazole; cimetidine reduces plasma concentration of posaconazole—manufacturer of posaconazole suspension advises avoid concomitant use; famotidine, nizatidine and ranitidine possibly reduce plasma concentration of posaconazole—manufacturer of posaconazole suspension advises avoid concomitant use; cimetidine increases plasma concentration of terbinafine

Antihistamines: manufacturer of loratadine advises cimetidine possibly increases plasma concentration of loratadine; cimetidine increases plasma concentration of hydroxyzine

Antimalarials: avoidance of cimetidine advised by manufacturer of artether with lumefantrine; cimetidine inhibits metabolism of chloroquine and hydroxychloroquine and quinine (increased plasma concentration)

Antipsychotics: cimetidine possibly enhances effects of antipsychotics, chlorpromazine and clozapine

Antivirals: famotidine and ranitidine reduce the plasma concentration of atazanavir (adjust doses of both drugs—consult atazanavir product literature); manufacturer of atazanavir advises adjust doses of both drugs when cimetidine and nizatidine given with atazanavir—consult atazanavir product literature; famotidine increases plasma concentration of raltegravir; avoidance of histamine H2-antagonists for 12 hours before or 4 hours after rilpivirine advised by manufacturer of rilpivirine—consult product literature; cimetidine possibly increases plasma concentration of saquinavir

Anxiolytics and Hypnotics: cimetidine inhibits metabolism of benzodiazepines, clometiazole and zopiclone

Histamine H2-antagonists

Anxiolytics and Hypnotics (continued)

Ciclosporin: cimetidine possibly increases plasma concentration of ciclosporin

Clodirexed: cimetidine possibly reduces antiplatelet effect of clopidogrel

Cytostatics: cimetidine possibly enhances myelosuppressive effects of carmustine and lomustine; cimetidine increases plasma concentration of cisplatin; cimetidine inhibits metabolism of fluorouracil (increased plasma concentration); famotidine possibly reduces plasma concentration of dasatinib; avoidance of cimetidine, famotidine and nizatidine advised by manufacturer of erlotinib; ranitidine reduces plasma concentration of erlotinib—manufacturer of erlotinib advises give at least 2 hours before or 10 hours after ranitidine; ranitidine reduces plasma concentration of gefitinib; histamine H2-antagonists possibly reduce absorption of lapatinib; histamine H2-antagonists possibly reduce absorption of pazopanib—manufacturer of pazopanib advises give at least 2 hours before or 10 hours after histamine H2-antagonists

Dopaminergics: cimetidine reduces excretion of pramipexole (increased plasma concentration)

Ergot Alkaloids: increased risk of ergotism when cimetidine given with ergotamine—avoid concomitant use

Fampridine: avoidance of cimetidine advised by manufacturer of fampridine

Histamine: histamine H2-antagonists theoretically antagonise effects of histamine—manufacturer of histamine advises avoid concomitant use

Hormone Antagonists: absorption of cimetidine possibly delayed by octreotide

5HT1-receptor Agonists: cimetidine inhibits metabolism of zolmitriptan (reduce dose of zolmitriptan)

Lipid-regulating Drugs: manufacturer of lomitapide advises dose reduction when cimetidine given with lomitapide (see Dose under Lomitapide, p. 177)

Mebendazole: cimetidine possibly inhibits metabolism of mebendazole (increased plasma concentration)

Roflumilast: cimetidine inhibits the metabolism of roflumilast

Sildenafil: cimetidine increases plasma concentration of sildenafil (consider reducing dose of sildenafil)

Sympathomimetics: cimetidine possibly inhibits metabolism of dobutamine

Theophylline: cimetidine inhibits metabolism of theophylline (increased plasma concentration)

Thyroid Hormones: cimetidine reduces absorption of levothyroxine

Ulipristal: avoidance of histamine H2-antagonists advised by manufacturer of high-dose ulipristal (contraceptive effect of ulipristal possibly reduced)

Homatropine see Antimuscarinics

Hormone Antagonists see Abiraterone, Bicalutamide, Danazol, Dutasteride, Enzalutamide, Exemestane, Fluamide, Flutamide, Luteotid, Ocreotide, Pasireotide, Tamoxifen, and Toremifene

5HT2-receptor Agonists

Antibacterials: plasma concentration of eletopirac increased by clarithromycin and erythromycin (risk of toxicity)—avoid concomitant use; metabolism of zolmitriptan possibly inhibited by quinolones (reduce dose of zolmitriptan)
**SHT<sub>1</sub>-receptor Agonists** (continued)

- Antidepressants: increased risk of CNS toxicity when SHT<sub>1</sub> agonists given with citalopram (manufacturer of citalopram advises avoid concomitant use); increased risk of CNS toxicity when sumatriptan given with citalopram, escitalopram, fluoxetine, fluvoxamine or paroxetine; metabolism of frovatriptan inhibited by fluvoxamine; metabolism of zolmitriptan possibly inhibited by fluvoxamine (reduce dose of zolmitriptan); CNS toxicity reported when sumatriptan given with sertraline; possible increased serotonergic effects when SHT<sub>1</sub> agonists given with duloxetine or venlafaxine; risk of CNS toxicity when zolmitriptan given with MAOIs or moclobemide (reduce dose of zolmitriptan); risk of CNS toxicity when rizatriptan or sumatriptan given with MAOIs (avoid rizatriptan or sumatriptan for 2 weeks after MAOIs); risk of CNS toxicity when rizatriptan or sumatriptan given with moclobemide (avoid rizatriptan or sumatriptan for 2 weeks after moclobemide); possible increased serotonergic effects when naratriptan given with SSRIs; increased serotonergic effects when SHT<sub>1</sub> agonists given with St John’s wort—avoid concomitant use
- Antifungals: plasma concentration of eletriptan increased by itraconazole (risk of toxicity)—avoid concomitant use
- Antivirals: plasma concentration of eletriptan increased by indinavir and ritonavir (risk of toxicity)—avoid concomitant use
- Beta-blockers: plasma concentration of sumatriptan increased by propranolol (manufacturer of rizatriptan advises halve dose and avoid within 2 hours of propranolol)
- Dopaminergics: avoidance of SHT<sub>1</sub> agonists advised by manufacturer of selegiline
- Ergot Alkaloids: increased risk of vasospasm when almotriptan, rizatriptan, sumatriptan or zolmitriptan given with ergotamine (avoid ergotamine for 6 hours after almotriptan, rizatriptan, sumatriptan or zolmitriptan, avoid almotriptan, rizatriptan, sumatriptan or zolmitriptan for 24 hours after ergotamine); increased risk of vasospasm when efopropit, frovatriptan or naratriptan given with ergotamine (avoid ergotamine for 24 hours after efopropit, frovatriptan or naratriptan, avoid efopropit, frovatriptan or naratriptan for 24 hours after ergotamine)
- Lithium: possible risk of toxicity when sumatriptan given with lithium
- Ulcer-healing Drugs: metabolism of zolmitriptan inhibited by cimetidine (reduce dose of zolmitriptan)

**SHT<sub>2</sub>-receptor Antagonists**

Analgesics: ondansetron possibly antagonises effects of tramadol
Antibacterials: metabolism of ondansetron accelerated by rifampicin (reduced effect)
Antiepileptics: metabolism of ondansetron accelerated by carbamazepine and phenytoin (reduced effect)
Cytoxotics: increased risk of ventricular arrhythmias when ondansetron given with vanetup—avoid concomitant use
Dopaminergics: increased possibility of hypertension effect when ondansetron given with dopamine—avoid concomitant use
Hydralazine see Vasodilator Antihypertensives
Hydrochlorothiazide see Diuretics
Hydrocortisone see Corticosteroids
Hydroflumethiazide see Diuretics
Hydromorphone see Opioid Analgesics

**Hydralazine** see Vasodilator Antihypertensives
**Hydrochlorothiazide** see Diuretics
**Hydrocortisone** see Corticosteroids
**Hydroflumethiazide** see Diuretics
**Hydromorphone** see Opioid Analgesics
Appendix 1: Interactions

### Indinavir

- **Anticoagulants:** avoidance of indinavir advised by manufacturer of apixaban and rivaroxaban.
- **Antidepressants:** plasma concentration of indinavir reduced by St John’s wort—avoid concomitant use.
- **Antiepileptics:** plasma concentration of indinavir possibly reduced by phenytoin and possibly increased by phenobarbital.
- **Antifungals:** plasma concentration of indinavir increased byitraconazole (consider reducing dose of indinavir).
- **Antimalarials:** caution with indinavir advised by manufacturer of artemether with lumefantrine; indinavir possibly increases plasma concentration of quinine (increased risk of toxicity).
- **Antimuscarinics:** avoidance of indinavir advised by manufacturer of darifenacin and tolterodine; manufacturer of fesoterodine advises dose reduction when indinavir given with fesoterodine—consult fesoterodine product literature.
- **Antipsychotics:** indinavir possibly increases plasma concentration of aripiprazole—consult aripiprazole product literature; indinavir reduces plasma concentration of clozapine (increased risk of ergotism when indinavir given with clozapine)—avoid concomitant use.
- **Antitussives:** absorption of indinavir possibly increased by dextromethorphan and dextrocycline.
- **Antivirals:** indinavir possibly increases plasma concentration of oseltamivir (reduce dose of oseltamivir—consult oseltamivir product literature); indinavir possibly increases plasma concentration of ribavirin (reduce dose of ribavirin—consult ribavirin product literature).

### Lipid-regulating Drugs

- **Corticosteroids:** increased risk of myopathy when indinavir given with atorvastatin; possibly increased risk of myopathy when indinavir given with rosuvastatin; manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when indinavir given with simvastatin (avoid concomitant use); avoidance of indinavir advised by manufacturer of lomitapide (plasma concentration of lomitapide possibly increased)
- **Orlistat:** absorption of indinavir possibly reduced by orlistat.
- **Probucol:** absorption of indinavir possibly increased by probucol.
- **Ranolazine:** indinavir possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use.
- **Sildenafil:** indinavir possibly increases plasma concentration of sildenafil.
- **Vardenafil:** indinavir possibly increases plasma concentration of vardenafil.

### Other Drugs

- **Cyclosporin:** indinavir possibly increases plasma concentration of ciclosporin.
- **Cytostatics:** indinavir possibly increases plasma concentration of axitinib (reduce dose of axitinib—consult axitinib product literature); indinavir possibly increases the plasma concentration of bosutinib and cabazitaxel—manufacturer of bosutinib and cabazitaxel advises avoid or consider reducing dose of bosutinib and cabazitaxel; indinavir possibly increases plasma concentration of olivatizidin and everolimus—manufacturer of crizotinib and everolimus advises avoid concomitant use; indinavir possibly increases plasma concentration of pazopanib (reduce dose of pazopanib); manufacturer of ruxolitinib advises dose reduction when indinavir given with ruxolitinib—consult ruxolitinib product literature.

### Indinavir Interactions with Other Drugs

- **Corticosteroids:** increased risk of myopathy when indinavir given with atorvastatin; possibly increased risk of myopathy when indinavir given with rosuvastatin; manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when indinavir given with simvastatin (avoid concomitant use); avoidance of indinavir advised by manufacturer of lomitapide (plasma concentration of lomitapide possibly increased)
- **Orlistat:** absorption of indinavir possibly reduced by orlistat.
- **Probucol:** absorption of indinavir possibly increased by probucol.
- **Ranolazine:** indinavir possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use.
- **Sildenafil:** indinavir possibly increases plasma concentration of sildenafil.
- **Vardenafil:** indinavir possibly increases plasma concentration of vardenafil.
- **Cyclosporin:** indinavir possibly increases plasma concentration of ciclosporin.
- **Cytostatics:** indinavir possibly increases plasma concentration of axitinib (reduce dose of axitinib—consult axitinib product literature); indinavir possibly increases the plasma concentration of bosutinib and cabazitaxel—manufacturer of bosutinib and cabazitaxel advises avoid or consider reducing dose of bosutinib and cabazitaxel; indinavir possibly increases plasma concentration of olivatizidin and everolimus—manufacturer of crizotinib and everolimus advises avoid concomitant use; indinavir possibly increases plasma concentration of pazopanib (reduce dose of pazopanib); manufacturer of ruxolitinib advises dose reduction when indinavir given with ruxolitinib—consult ruxolitinib product literature.

### Indinavir Interactions with Other Drugs

- **Corticosteroids:** increased risk of myopathy when indinavir given with atorvastatin; possibly increased risk of myopathy when indinavir given with rosuvastatin; manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when indinavir given with simvastatin (avoid concomitant use); avoidance of indinavir advised by manufacturer of lomitapide (plasma concentration of lomitapide possibly increased)
- **Orlistat:** absorption of indinavir possibly reduced by orlistat.
- **Probucol:** absorption of indinavir possibly increased by probucol.
- **Ranolazine:** indinavir possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use.
- **Sildenafil:** indinavir possibly increases plasma concentration of sildenafil.
- **Vardenafil:** indinavir possibly increases plasma concentration of vardenafil.
- **Cyclosporin:** indinavir possibly increases plasma concentration of ciclosporin.
- **Cytostatics:** indinavir possibly increases plasma concentration of axitinib (reduce dose of axitinib—consult axitinib product literature); indinavir possibly increases the plasma concentration of bosutinib and cabazitaxel—manufacturer of bosutinib and cabazitaxel advises avoid or consider reducing dose of bosutinib and cabazitaxel; indinavir possibly increases plasma concentration of olivatizidin and everolimus—manufacturer of crizotinib and everolimus advises avoid concomitant use; indinavir possibly increases plasma concentration of pazopanib (reduce dose of pazopanib); manufacturer of ruxolitinib advises dose reduction when indinavir given with ruxolitinib—consult ruxolitinib product literature.

### Indinavir Interactions with Other Drugs

- **Corticosteroids:** increased risk of myopathy when indinavir given with atorvastatin; possibly increased risk of myopathy when indinavir given with rosuvastatin; manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when indinavir given with simvastatin (avoid concomitant use); avoidance of indinavir advised by manufacturer of lomitapide (plasma concentration of lomitapide possibly increased)
- **Orlistat:** absorption of indinavir possibly reduced by orlistat.
- **Probucol:** absorption of indinavir possibly increased by probucol.
- **Ranolazine:** indinavir possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use.
- **Sildenafil:** indinavir possibly increases plasma concentration of sildenafil.
- **Vardenafil:** indinavir possibly increases plasma concentration of vardenafil.
- **Cyclosporin:** indinavir possibly increases plasma concentration of ciclosporin.
- **Cytostatics:** indinavir possibly increases plasma concentration of axitinib (reduce dose of axitinib—consult axitinib product literature); indinavir possibly increases the plasma concentration of bosutinib and cabazitaxel—manufacturer of bosutinib and cabazitaxel advises avoid or consider reducing dose of bosutinib and cabazitaxel; indinavir possibly increases plasma concentration of olivatizidin and everolimus—manufacturer of crizotinib and everolimus advises avoid concomitant use; indinavir possibly increases plasma concentration of pazopanib (reduce dose of pazopanib); manufacturer of ruxolitinib advises dose reduction when indinavir given with ruxolitinib—consult ruxolitinib product literature.

### Indinavir Interactions with Other Drugs

- **Corticosteroids:** increased risk of myopathy when indinavir given with atorvastatin; possibly increased risk of myopathy when indinavir given with rosuvastatin; manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when indinavir given with simvastatin (avoid concomitant use); avoidance of indinavir advised by manufacturer of lomitapide (plasma concentration of lomitapide possibly increased)
- **Orlistat:** absorption of indinavir possibly reduced by orlistat.
- **Probucol:** absorption of indinavir possibly increased by probucol.
- **Ranolazine:** indinavir possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use.
- **Sildenafil:** indinavir possibly increases plasma concentration of sildenafil.
- **Vardenafil:** indinavir possibly increases plasma concentration of vardenafil.
- **Cyclosporin:** indinavir possibly increases plasma concentration of ciclosporin.
- **Cytostatics:** indinavir possibly increases plasma concentration of axitinib (reduce dose of axitinib—consult axitinib product literature); indinavir possibly increases the plasma concentration of bosutinib and cabazitaxel—manufacturer of bosutinib and cabazitaxel advises avoid or consider reducing dose of bosutinib and cabazitaxel; indinavir possibly increases plasma concentration of olivatizidin and everolimus—manufacturer of crizotinib and everolimus advises avoid concomitant use; indinavir possibly increases plasma concentration of pazopanib (reduce dose of pazopanib); manufacturer of ruxolitinib advises dose reduction when indinavir given with ruxolitinib—consult ruxolitinib product literature.
Appendix 1: Interactions

Antiepileptics:
- Increased risk of ventricular arrhythmias when ivabradine given with valproate.
- Reduced oral bioavailability of valproate when given concomitantly with ivabradine.
- Reduced plasma concentration of efexaxib when given concomitantly with ivabradine.
- Increased plasma concentration of ivabradine when given concomitantly with levetiracetam.
- Reduced plasma concentration of levetiracetam when given concomitantly with ivabradine.
- Reduced plasma concentration of long-acting anticonvulsants when given concomitantly with ivabradine.
- Reduced plasma concentration of short-acting anticonvulsants when given concomitantly with ivabradine.
- Increased risk of ventricular arrhythmias when ivabradine given with felbamate.
- Reduced plasma concentration of felbamate when given concomitantly with ivabradine.
- Reduced plasma concentration of carbamazepine when given concomitantly with ivabradine.
- Reduced plasma concentration of lamotrigine when given concomitantly with ivabradine.
- Increased risk of ventricular arrhythmias when ivabradine given with oxcarbazepine.
- Reduced plasma concentration of oxcarbazepine when given concomitantly with ivabradine.
- Reduced plasma concentration of phenytoin when given concomitantly with ivabradine.
- Reduced plasma concentration of topiramate when given concomitantly with ivabradine.
- Increased risk of ventricular arrhythmias when ivabradine given with lamotrigine.
- Reduced plasma concentration of lamotrigine when given concomitantly with ivabradine.
- Reduced plasma concentration of levetiracetam when given concomitantly with ivabradine.
- Reduced plasma concentration of valproate when given concomitantly with ivabradine.
- Reduced plasma concentration of carbamazepine when given concomitantly with ivabradine.
- Reduced plasma concentration of lamotrigine when given concomitantly with ivabradine.
- Reduced plasma concentration of phenytoin when given concomitantly with ivabradine.
- Reduced plasma concentration of topiramate when given concomitantly with ivabradine.
- Increased risk of ventricular arrhythmias when ivabradine given with oxcarbazepine.
- Reduced plasma concentration of oxcarbazepine when given concomitantly with ivabradine.
- Reduced plasma concentration of phenytoin when given concomitantly with ivabradine.
- Reduced plasma concentration of levetiracetam when given concomitantly with ivabradine.
- Reduced plasma concentration of valproate when given concomitantly with ivabradine.
- Reduced plasma concentration of carbamazepine when given concomitantly with ivabradine.
- Reduced plasma concentration of lamotrigine when given concomitantly with ivabradine.
- Reduced plasma concentration of phenytoin when given concomitantly with ivabradine.
- Reduced plasma concentration of topiramate when given concomitantly with ivabradine.
- Increased risk of ventricular arrhythmias when ivabradine given with lamotrigine.
- Reduced plasma concentration of lamotrigine when given concomitantly with ivabradine.
- Reduced plasma concentration of levetiracetam when given concomitantly with ivabradine.
- Reduced plasma concentration of valproate when given concomitantly with ivabradine.
- Reduced plasma concentration of carbamazepine when given concomitantly with ivabradine.
- Reduced plasma concentration of phenytoin when given concomitantly with ivabradine.
- Reduced plasma concentration of topiramate when given concomitantly with ivabradine.
- Increased risk of ventricular arrhythmias when ivabradine given with oxcarbazepine.
- Reduced plasma concentration of oxcarbazepine when given concomitantly with ivabradine.
- Reduced plasma concentration of phenytoin when given concomitantly with ivabradine.
- Reduced plasma concentration of levetiracetam when given concomitantly with ivabradine.
- Reduced plasma concentration of valproate when given concomitantly with ivabradine.
- Reduced plasma concentration of carbamazepine when given concomitantly with ivabradine.
- Reduced plasma concentration of lamotrigine when given concomitantly with ivabradine.
- Reduced plasma concentration of phenytoin when given concomitantly with ivabradine.
- Reduced plasma concentration of topiramate when given concomitantly with ivabradine.
- Increased risk of ventricular arrhythmias when ivabradine given with lamotrigine.
- Reduced plasma concentration of lamotrigine when given concomitantly with ivabradine.
- Reduced plasma concentration of levetiracetam when given concomitantly with ivabradine.
- Reduced plasma concentration of valproate when given concomitantly with ivabradine.
- Reduced plasma concentration of carbamazepine when given concomitantly with ivabradine.
- Reduced plasma concentration of phenytoin when given concomitantly with ivabradine.
- Reduced plasma concentration of topiramate when given concomitantly with ivabradine.
- Increased risk of ventricular arrhythmias when ivabradine given with oxcarbazepine.
- Reduced plasma concentration of oxcarbazepine when given concomitantly with ivabradine.
- Reduced plasma concentration of phenytoin when given concomitantly with ivabradine.
- Reduced plasma concentration of levetiracetam when given concomitantly with ivabradine.
- Reduced plasma concentration of valproate when given concomitantly with ivabradine.
- Reduced plasma concentration of carbamazepine when given concomitantly with ivabradine.
- Reduced plasma concentration of lamotrigine when given concomitantly with ivabradine.
- Reduced plasma concentration of phenytoin when given concomitantly with ivabradine.
- Reduced plasma concentration of topiramate when given concomitantly with ivabradine.
- Increased risk of ventricular arrhythmias when ivabradine given with lamotrigine.
- Reduced plasma concentration of lamotrigine when given concomitantly with ivabradine.
- Reduced plasma concentration of levetiracetam when given concomitantly with ivabradine.
- Reduced plasma concentration of valproate when given concomitantly with ivabradine.
- Reduced plasma concentration of carbamazepine when given concomitantly with ivabradine.
- Reduced plasma concentration of phenytoin when given concomitantly with ivabradine.
- Reduced plasma concentration of topiramate when given concomitantly with ivabradine.
- Increased risk of ventricular arrhythmias when ivabradine given with oxcarbazepine.
- Reduced plasma concentration of oxcarbazepine when given concomitantly with ivabradine.
- Reduced plasma concentration of phenytoin when given concomitantly with ivabradine.
- Reduced plasma concentration of levetiracetam when given concomitantly with ivabradine.
- Reduced plasma concentration of valproate when given concomitantly with ivabradine.
- Reduced plasma concentration of carbamazepine when given concomitantly with ivabradine.
- Reduced plasma concentration of lamotrigine when given concomitantly with ivabradine.
- Reduced plasma concentration of phenytoin when given concomitantly with ivabradine.
- Reduced plasma concentration of topiramate when given concomitantly with ivabradine.
- Increased risk of ventricular arrhythmias when ivabradine given with lamotrigine.
- Reduced plasma concentration of lamotrigine when given concomitantly with ivabradine.
- Reduced plasma concentration of levetiracetam when given concomitantly with ivabradine.
- Reduced plasma concentration of valproate when given concomitantly with ivabradine.
- Reduced plasma concentration of carbamazepine when given concomitantly with ivabradine.
- Reduced plasma concentration of phenytoin when given concomitantly with ivabradine.
- Reduced plasma concentration of topiramate when given concomitantly with ivabradine.
- Increased risk of ventricular arrhythmias when ivabradine given with oxcarbazepine.
- Reduced plasma concentration of oxcarbazepine when given concomitantly with ivabradine.
- Reduced plasma concentration of phenytoin when given concomitantly with ivabradine.
- Reduced plasma concentration of levetiracetam when given concomitantly with ivabradine.
- Reduced plasma concentration of valproate when given concomitantly with ivabradine.
- Reduced plasma concentration of carbamazepine when given concomitantly with ivabradine.
- Reduced plasma concentration of lamotrigine when given concomitantly with ivabradine.
- Reduced plasma concentration of phenytoin when given concomitantly with ivabradine.
- Reduced plasma concentration of topiramate when given concomitantly with ivabradine.
- Increased risk of ventricular arrhythmias when ivabradine given with lamotrigine.
- Reduced plasma concentration of lamotrigine when given concomitantly with ivabradine.
- Reduced plasma concentration of levetiracetam when given concomitantly with ivabradine.
- Reduced plasma concentration of valproate when given concomitantly with ivabradine.
- Reduced plasma concentration of carbamazepine when given concomitantly with ivabradine.
- Reduced plasma concentration of phenytoin when given concomitantly with ivabradine.
- Reduced plasma concentration of topiramate when given concomitantly with ivabradine.
- Increased risk of ventricular arrhythmias when ivabradine given with oxcarbazepine.
- Reduced plasma concentration of oxcarbazepine when given concomitantly with ivabradine.
- Reduced plasma concentration of phenytoin when given concomitantly with ivabradine.
- Reduced plasma concentration of levetiracetam when given concomitantly with ivabradine.
- Reduced plasma concentration of valproate when given concomitantly with ivabradine.
- Reduced plasma concentration of carbamazepine when given concomitantly with ivabradine.
- Reduced plasma concentration of lamotrigine when given concomitantly with ivabradine.
- Reduced plasma concentration of phenytoin when given concomitantly with ivabradine.
- Reduced plasma concentration of topiramate when given concomitantly with ivabradine.
- Increased risk of ventricular arrhythmias when ivabradine given with lamotrigine.
- Reduced plasma concentration of lamotrigine when given concomitantly with ivabradine.
- Reduced plasma concentration of levetiracetam when given concomitantly with ivabradine.
- Reduced plasma concentration of valproate when given concomitantly with ivabradine.
- Reduced plasma concentration of carbamazepine when given concomitantly with ivabradine.
- Reduced plasma concentration of phenytoin when given concomitantly with ivabradine.
- Reduced plasma concentration of topiramate when given concomitantly with ivabradine.
Appendix 1: Interactions

Ivacaftor
- Antifungals (continued) tor, p. 216; plasma concentration of ivacaftor possibly increased by eritroconazole, esposaconazole and voriconazole (see Dose under Ivacaftor, p. 216)
- Anxiolytics and Hypnotics: ivacaftor increases plasma concentration of midazolam
- Grapefruit juice: plasma concentration of ivacaftor possibly increased by grapefruit juice—manufacturer of ivacaftor advises avoid concomitant use

Kaolin
- Analgesics: kaolin possibly reduces absorption of aspirin
- Antibacterials: kaolin possibly reduces absorption of tetracyclines
- Antimalarials: kaolin reduces absorption of chloroquine and hydroxychloroquine
- Antipsychotics: kaolin possibly reduces absorption of phenothiazines
- Ketamine see Anaesthetics, General
- Ketotifen see Antihistamines
- Labelatal see Beta-blockers
- Lacidipine see Calcium-channel Blockers
- Lacosamide
  - Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIs and tricyclics (convulsive threshold lowered)
  - Antimalarials: anticonvulsant effect of antiepileptics antagonised by antipsychotics (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with orlistat
- Lactulose
  - Anticoagulants: lactulose possibly enhances anticoagulant effect of coumarins
- Lamivudine
  - Antibacterials: plasma concentration of lamivudine increased by trimethoprim (as co-trimoxazole)—avoid concomitant use of high-dose co-trimoxazole
  - Antivirals: avoidance of lamivudine advised by manufacturer of emtricitabine
  - Cytoxics: manufacturer of lamivudine advises avoid concomitant use with cladribine
  - Orlistat: absorption of lamivudine possibly reduced by orlistat
- Lamotrigine
  - Antibacterials: plasma concentration of lamotrigine reduced by rifampicin
  - Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIs and tricyclics (convulsive threshold lowered)
  - Antiepileptics: plasma concentration of lamotrigine often reduced by carbamazepine, also plasma concentration of an active metabolite of carbamazepine sometimes raised (but evidence is conflicting); plasma concentration of lamotrigine reduced by phenobarbital and phenytoin; plasma concentration of lamotrigine increased by valproate (increased risk of toxicity—reduce lamotrigine dose)
  - Antimalarials: anticonvulsant effect of antiepileptics antagonised by antipsychotics (convulsive threshold lowered)
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by antipsychotics (convulsive threshold lowered)

Lamotrigine (continued)
  - Antibacterials: plasma concentration of lamotrigine possibly reduced by ritonavir
  - Oestrogens: plasma concentration of lamotrigine reduced by oestrogens—consider increasing dose of lamotrigine
  - Orlistat: possible increased risk of convulsions when antiepileptics given with orlistat
  - Progestogens: plasma concentration of lamotrigine possibly increased by desogestrel

Lanreotide
- Antidiabetics: lanreotide possibly reduces requirements for antidiabetics
- Ciclosporin: lanreotide reduces plasma concentration of ciclosporin
- Lansoprazole see Proton Pump Inhibitors
- Lanthanum
  - Antibacterials: lanthanum possibly reduces absorption of quinolones (give at least 2 hours before or 4 hours after lanthanum)
  - Antimalarials: lanthanum possibly reduces absorption of chloroquine and hydroxychloroquine (give at least 2 hours apart)
- Thyroid Hormones: lanthanum reduces absorption of levothyroxine (give at least 2 hours apart)
- Lapatinib
  - Antibacterials: manufacturer of lapatinib advises avoid concomitant use with rifabutin, rifampicin and telithromycin
  - Antidepressants: manufacturer of lapatinib advises avoid concomitant use with St John’s wort
  - Antidiabetics: manufacturer of lapatinib advises avoid concomitant use with repaglinide
  - Antiepileptics: plasma concentration of lapatinib reduced by carbamazepine—avoid concomitant use; manufacturer of lapatinib advises avoid concomitant use with ephedrine
  - Anifungals: manufacturer of lapatinib advises avoid concomitant use with traconazole, posaconazole and voriconazole
  - Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis); manufacturer of lapatinib advises avoid concomitant use with gonadotropins
  - Antivirals: avoidance of lapatinib advised by manufacturer of boceprevir; manufacturer of lapatinib advises avoid concomitant use with saquinavir
  - Cytotoxic: lapatinib increases plasma concentration of pazopanib; possible increased risk of neutropenia when lapatinib given with docetaxel; increased risk of neutropenia when lapatinib given with paclitaxel; lapatinib increases plasma concentration of active metabolite of irinotecan—consider reducing dose of irinotecan
- Grapefruit juice: manufacturer of lapatinib advises avoid concomitant use with grapefruit juice
- Ulcer-healing Drugs: absorption of lapatinib possibly reduced by histamine H 2-antagonists and proton pump inhibitors

Laronidase
- Antimalarials: effects of laronidase possibly inhibited by chloroquine and hydroxychloroquine (manufacturer of laronidase advises avoid concomitant use)

Lefunomide
- Note Increased risk of toxicity with other haematotoxic and hepatotoxic drugs
- Antibacterials: plasma concentration of active metabolite of lefunomide possibly increased by rifampicin
- Anticoagulants: lefunomide possibly enhances anticoagulant effect of warfarin
- Antidiabetics: lefunomide possibly enhances hypoglycaemic effect of tolbutamide
- Antiepileptics: lefunomide possibly increases plasma concentration of phenytoin
Levodopa (continued)
- Adrenergic Neurone Blockers: enhanced hypotensive effect when levodopa given with adrenergic neurone blockers
- Alpha-blockers: enhanced hypotensive effect when levodopa given with alpha-blockers
- Anæsthetics, General: increased risk of arrhythmias when levodopa given with volatile liquid general anaesthetics
- Angiotensin-II Receptor Antagonists: enhanced hypertensive effect when levodopa given with angiotensin-II receptor antagonists
- Antibacterials: effects of levodopa possibly reduced by isoniazid
- Antidepressants: risk of hypertensive crisis when levodopa given with MAOIs, avoid levodopa for at least 2 weeks after stopping MAOIs; increased risk of side-effects when levodopa given with moclobemide
- Antiepileptics: effects of levodopa possibly reduced by phenytoin
- Antimuscarinics: absorption of levodopa possibly reduced by antimuscarinics
- Antipsychotics: effects of levodopa antagonised by antipsychotics; avoidance of levodopa advised by manufacturer of amisulpride (antagonism of effect)
- Anxiolytics and Hypnotics: effects of levodopa possibly antagonised by benzodiazepines
- Beta-blockers: enhanced hypotensive effect when levodopa given with beta-blockers
- Bupropion: increased risk of side-effects when levodopa given with bupropion
- Calcium-channel Blockers: enhanced hypotensive effect when levodopa given with calcium-channel blockers
- Clonidine: enhanced hypotensive effect when levodopa given with clonidine
- Diazoxide: enhanced hypertensive effect when levodopa given with diazoxide
- Diuretics: enhanced hypotensive effect when levodopa given with diuretics
- Dopaminergics: enhanced effects and increased toxicity of levodopa when given with selegiline (reduce dose of levodopa)
- Iron: absorption of levodopa possibly reduced by oral iron
- Memantine: effects of dopaminergics possibly enhanced by memantine
- Methyldopa: enhanced hypotensive effect when levodopa given with methyldopa; antiparkinsonian effect of dopaminergics antagonised by methyldopa
- Moxonidine: enhanced hypotensive effect when levodopa given with moxonidine
- Muscle Relaxants: possible agitation, confusion and hallucinations when levodopa given with baclofen
- Nitrates: enhanced hypotensive effect when levodopa given with nitrates
- Vasodilator Antihypertensives: enhanced hypotensive effect when levodopa given with hydralazine, minoxidil or sodium nitroprusside
- Vitamins: effects of levodopa reduced by pyridoxine when given without dopa-decarboxylase inhibitor

Levofoxacin see Quinolones
Levoferolinic Acid see Folate
Levomepromazine see Antipsychotics
Levonorgestrel see Progestogens
Levothryoxine see Thyroid Hormones
Lidocaine
- Note: Interactions less likely when lidocaine used topically

Levofulvanolol see Beta-blockers
Levobupivacaine
- Anti-arrhythmics: increased myocardial depression when levobupivacaine given with anti-arrhythmics
- Antipsychotics given with levobupivacaine, levobupivacaine, prilocaine or ropivacaine

Levothryoxine see Thyroid Hormones

Levodopa
- ACE Inhibitors: enhanced hypotensive effect when levodopa given with ACE inhibitors

Levetiracetam
- Anticonvulsant effect of antiepileptics antagonised by methyldopa; antiparkinsonian effect of levodopa when given with dopamine-decarboxylase inhibitor
- Antidepressants: increased risk of side-effects when levodopa given with isoniazid
- Antihistamines: increased myocardial depression when levodopa given with antihistamines
Appendix 1: Interactions

Lidocaine (continued)

- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics given with
- Antivirals: plasma concentration of lidocaine possibly increased by telaprevir
- Beta-blockers: increased myocardial depression when anti-arrhythmics given with 
- Diuretics: action of lidocaine antagonised by hypokalaemic agents caused by
- Muscle Relaxants: neuromuscular blockade enhanced and prolonged when lidocaine given with

Linagliptin see Antidiabetics

Lipid-regulating Drugs see Colestyramine, Ezetimibe, Niacin, Statins

Lisinopril see ACE Inhibitors

Lithium
- ACE Inhibitors: excretion of lithium reduced by 
- Analgesics: excretion of lithium reduced by NSAIDs (increased risk of toxicity); excretion of lithium reduced by 
- Angiotensin-II Receptor Antagonists: excretion of lithium reduced by 
- Antacids: excretion of lithium increased by 
- Anti-arrhythmics: avoidance of lithium advised by manufacturer of 
- Antidepressants: possible increased serotoninergic effects when lithium given with SSRIs (lithium toxicity reported); risk of toxicity when lithium given with tricyclics
- Antiepileptics: neurotoxicity may occur when lithium given with carbamazepine or phenytoin without increased plasma concentration of lithium; plasma concentration of lithium possibly affected by 
- Antipsychotics: increased risk of extrapyramidal side-effects and possibly neurotoxicity when lithium given with clozapine, flupentixol, haloperidol, phenothiazines, risperidone or zuclopenthixol; possible risk of toxicity when lithium given with 

Lithium (continued)

- Antipsychotics: increased risk of extrapyramidal side-effects and possibly neurotoxicity when lithium given with sulpiride
- Antipsychotics and Hypnotics: increased risk of neurotoxicity when lithium given with clonazepam
- Calcium-channel Blockers: neurotoxicity may occur when lithium given with diltiazem or verapamil without increased plasma concentration of lithium
- Cytotoxics: increased risk of ventricular arrhythmias when lithium given with arsenic trioxide
- Dapoxetine: possible increased risk of serotoninergic effects when lithium given with dapoxetine (manufacturer of dapoxetine advises lithium should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping lithium)
- Diuretics: excretion of lithium increased by acetazolamide; excretion of lithium reduced by loop diuretics or thiazides and related diuretics
- Muscle Relaxants: lithium enhances effects of muscle relaxants; hyperkinesia caused by lithium possibly aggravated by baclofen
- Parasympathomimetics: lithium antagonises effects of neostigmine
- Theophylline: excretion of lithium increased by theophylline (reduced plasma concentration)

Lixisenatide see Antidiabetics

Lofenoxime see Antidepressants, Tricyclic

Lofexidine
- Alcohol: increased sedative effect when lofexidine given with alcohol
- Anxiolytics and Hypnotics: increased sedative effect when lofexidine given with anxiolytics and hypnotics

Lomitapide
- Alcohol: manufacturer of lomitapide advises avoid concomitant use with alcohol
- Antipsychotics: manufacturer of lomitapide advises avoid concomitant use with 
- Antibacterials: manufacturer of lomitapide advises avoid concomitant use with 
- Antibacterials: manufacturer of lomitapide possibly increased 
- Anticoagulants: lomitapide possibly enhances anti-coagulant effect of warfarin
- Antifungals: manufacturer of lomitapide advises avoid concomitant use with 
- Antivirals: manufacturer of lomitapide possibly increased 
- Antivirals: manufacturer of lomitapide advises avoid concomitant use with 
- Aprepitant: manufacturer of lomitapide advises dose reduction when lomitapide given with fosaprepitant (see Dose under Lomitapide, p. 177)
- Calcium-channel Blockers: manufacturer of lomitapide advises avoid concomitant use with diltiazem and verapamil (plasma concentration of lomitapide possibly increased)
- Grapefruit Juice: manufacturer of lomitapide advises avoid concomitant use with grapefruit juice
- Lipid-regulating Drugs: lomitapide increases plasma concentration of atorvastatin; lomitapide increases plasma concentration of simvastatin (see Dose
**Lopinavir**

*Note* In combination with ritonavir as Kaletra® (ritonavir is present to inhibit lopinavir metabolism and increase plasma-lopinavir concentration)—see also Ritonavir

- Anti-arrhythmics: lopinavir possibly increases plasma concentration of *levetiracetam* (increased risk of ventricular arrhythmias—avoid concomitant use); lopinavir possibly increases plasma concentration of *lidocaine*
- Antibacterials: plasma concentration of lopinavir reduced by *rifampicin*—avoid concomitant use; avoidance of concomitant lopinavir in severe renal and hepatic impairment advised by manufacturer of *clarithromycin*
- Anticoagulants: avoidance of lopinavir advised by manufacturer of *apixaban*; manufacturers advise avoid concomitant use of lopinavir with *rivaroxaban*
- Antidepressants: plasma concentration of lopinavir reduced by *St John’s wort*—avoid concomitant use
- Antiepileptics: plasma concentration of lopinavir possibly reduced by *carbamazepine*, *phenobarbital* and *phenytoin*
- Antihistamines: lopinavir possibly increases plasma concentration of *chlorphenamine*
- Antimalarials: caution with lopinavir advised by manufacturer of *artemether* with *lumefantrine*
- Antimuscarinics: avoidance of lopinavir advised by manufacturer of *darifenacin* and *tolterodine*
- Antipsychotics: lopinavir possibly increases plasma concentration of *aripiprazole* (reduce dose of aripiprazole—consult aripiprazole product literature); lopinavir possibly increases plasma concentration of *quetiapine*—manufacturer of quetiapine advises avoid concomitant use with *carbamazepine* and *phenytoin*

**Loratadine**

- *Antipyschotics*: avoidance of loratadine advised by manufacturers of *clozapine* (increased risk of agranulocytosis) and *quetiapine*—manufacturer of quetiapine advises avoid concomitant use with *salmeterol*
- *Loperamide*: desmopressin: loperamide increases plasma concentration of oral *desmopressin*

**Lipid-regulating Drugs**

- *Anticyctic*: lopinavir possibly increases plasma concentration of *fosamprenavir*; effect on plasma concentration of *elvitegravir*—see also Ritonavir
- *Corticosteroids*: manufacturer advises avoid concomitant use with *ruxolitinib*—manufacturer of ruxolitinib advises avoid concomitant use
- *Cytotoxics*: lopinavir possibly increases plasma concentration of *elvitegravir*—consult elvitegravir product literature
- *Lipid-regulating Drugs*: possible increased risk of myopathy when lopinavir given with *atorvastatin*; lopinavir increases plasma concentration of *rosuvastatin*—adjust dose of rosuvastatin (consult product literature); possible increased risk of myopathy when lopinavir given with *simvastatin*—avoid concomitant use; avoidance of lopinavir advised by manufacturer of *lomitapide* (plasma concentration of lomitapide possibly increased)
- *Olistat*: absorption of lopinavir possibly reduced by *olistat*
- *Ranolazine*: manufacturer advises avoid concomitant use of lopinavir with *rivaroxaban*; avoidance of lopinavir advised by manufacturer of *bosentan*
- *Sirolimus*: lopinavir possibly increases plasma concentration of *sirolimus*; Sympathomimetics, *Beta*.; manufacturer of lopinavir advises avoid concomitant use with *salmeterol*
Macrolides
- Antibacterials (continued)
  • rifabutin (increased risk of toxicity—reduce rifabutin dose); erythromycin possibly increases plasma concentration of rifabutin (increased risk of toxicity—reduce rifabutin dose); plasma concentration of clarithromycin reduced by rifamycins.
- Anticoagulants: azithromycin possibly enhances anticoagulant effect of coumarins; clarithromycin and erythromycin enhance anticoagulant effect of coumarins; possible increased risk of bleeding when clarithromycin given with dabigatran.
- Antidepressants: avoidance of macrolides advised by manufacturer of eseboxetine; avoidance of intravenous erythromycin advised by manufacturer of citalopram and escitalopram (risk of ventricular arrhythmias); clarithromycin possibly increases plasma concentration of trazodone.

Antidiabetics: clarithromycin enhances effects of repaglinide.

Antiepileptics: erythromycin increases plasma concentration of carbamazepine; clarithromycin increases plasma concentration of carbamazepine (consider reducing dose of carbamazepine); clarithromycin inhibits metabolism of phenytoin (increased plasma concentration); erythromycin possibly inhibits metabolism of valproate (increased plasma concentration).

Antifungals: avoidance of erythromycin advised by manufacturer of fluconazole; clarithromycin increases plasma concentration of itraconazole.

Antihistamines: manufacturer of loratadine advises avoidance of erythromycin possibly increases plasma concentration of loratadine; macrolides possibly inhibit metabolism of mizolastine (avoid concomitant use); erythromycin inhibits metabolism of mizolastine—avoid concomitant use; erythromycin increases plasma concentration of rupatidine.

Antimalarials: avoidance of macrolides advised by manufacturer of clonazepam; clarithromycin increases plasma concentration of iraconazole.

Antimycotics: clarithromycin increases plasma concentration of darifenacin; manufacturer of fosfoterodine advises dose reduction when clarithromycin given with fosfoterodine—consult fosfoterodine product literature; avoidance of clarithromycin and erythromycin advised by manufacturer of tolterodine.

Antipsychotics: avoidance of macrolides advised by manufacturer of droperidol (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when parenteral erythromycin given with zuclopenthixol; plasma concentration of digoxin (increased risk of toxicity).

Cytotoxics: azithromycin, clarithromycin and erythromycin possibly increase risk of dexamethasone; clarithromycin and erythromycin increase plasma concentration of dexamethasone—see Dose under Avanafil, p. 559.

Calcium-channel Blockers: clarithromycin and erythromycin possibly inhibit metabolism of calcium-channel blockers (increased risk of side-effects); avoidance of erythromycin advised by manufacturer of lercanidipine.

Ciclosporin: increased plasma concentration of cyclosporine; increased risk of nephrotoxicity when cyclosporine given with antiretrovirals.

Ciclosporin: increased plasma concentration of ciclosporin; increased risk of nephrotoxicity when ciclosporin given with antiretrovirals.

Ciclosporin: increased plasma concentration of ciclosporin; increased risk of nephrotoxicity when ciclosporin given with antiretrovirals.

Ciclosporin: increased plasma concentration of ciclosporin; increased risk of nephrotoxicity when ciclosporin given with antiretrovirals.

Ciclosporin: increased plasma concentration of ciclosporin; increased risk of nephrotoxicity when ciclosporin given with antiretrovirals.

Ciclosporin: increased plasma concentration of ciclosporin; increased risk of nephrotoxicity when ciclosporin given with antiretrovirals.

Ciclosporin: increased plasma concentration of ciclosporin; increased risk of nephrotoxicity when ciclosporin given with antiretrovirals.

Ciclosporin: increased plasma concentration of ciclosporin; increased risk of nephrotoxicity when ciclosporin given with antiretrovirals.

Ciclosporin: increased plasma concentration of ciclosporin; increased risk of nephrotoxicity when ciclosporin given with antiretrovirals.

Ciclosporin: increased plasma concentration of ciclosporin; increased risk of nephrotoxicity when ciclosporin given with antiretrovirals.

Ciclosporin: increased plasma concentration of ciclosporin; increased risk of nephrotoxicity when ciclosporin given with antiretrovirals.
Macrolides

- Cytoxins (continued)
  Erythromycin possibly increase plasma concentration of amlodipine (consult amlodipine product literature); clarithromycin and erythromycin possibly increase the plasma concentration of bosutinib—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; clarithromycin possibly increases plasma concentration of crizotinib and everolimus—manufacturer of crizotinib and everolimus advises avoid concomitant use; erythromycin increases plasma concentration of everolimus (consider reducing the dose of everolimus—consult everolimus product literature); avoidance of clarithromycin advised by manufacturer of nilotinib; clarithromycin possibly increases plasma concentration of pazopanib (reduce dose of pazopanib); manufacturer of ruxolitinib advises dose reduction when clarithromycin given with ruxolitinib—consult ruxolitinib product literature; possible increased risk of ventricular arrhythmias when parenteral erythromycin given with vandetanib—avoid concomitant use; clarithromycin plasma concentration of cabazitaxel—manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel; in vitro studies suggest a possible interaction between erythromycin and docetaxel (consult docetaxel product literature); increased risk of ventricular arrhythmias when erythromycin given with arsenic trioxide; erythromycin increases toxicity of vinblastine—avoid concomitant use; possible increased risk of neutropenia when clarithromycin given with vinorelbine.

Dapoxetine: manufacturer of dapoxetine advises dose reduction when clarithromycin and erythromycin given with dapoxetine (see Dose Under Dapoxetine, p. 560).

- Diuretics: clarithromycin increases plasma concentration of eplerenone—avoid concomitant use; erythromycin increases plasma concentration of eplerenone (reduce dose of eplerenone).

- Domperidone: possible increased risk of ventricular arrhythmias when erythromycin given with domperidone—avoid concomitant use; erythromycin increases plasma concentration of domperidone (increased risk of ventricular arrhythmias—avoid concomitant use).

Dopaminergics: macrolides possibly increase plasma concentration of bromocriptine and cabergoline (increased risk of toxicity).

- Ergot Alkaloids: increased risk of ergotism when macrolides given with ergotamine—avoid concomitant use.

Fidaxomicin: avoidance of clarithromycin and erythromycin advised by manufacturer of fidaxomicin.

- 5HT1-receptor Agonists: clarithromycin and erythromycin increase plasma concentration of eletriptan (risk of toxicity)—avoid concomitant use.

Ivabradine: clarithromycin possibly increases plasma concentration of ivabradine—avoid concomitant use; increased risk of ventricular arrhythmias when erythromycin given with ivabradine—avoid concomitant use.

- Ivacaftor: clarithromycin and erythromycin possibly increase plasma concentration of ivacaftor (see Dose Under Ivacaftor, p. 216).

Lenalidomide: clarithromycin possibly increases plasma concentration of lenalidomide (increased risk of toxicity).

Leukotriene Receptor Antagonists: erythromycin reduces plasma concentration of zafirlukast.

Lipid-regulating Drugs: clarithromycin increases plasma concentration of atorvastatin and pravastatin; possible increased risk of myopathy when clarithromycin given with atorvastatin; erythromycin increases plasma concentration of pravastatin; erythromycin reduces plasma concentration of rosuvastatin; increased risk of myopathy when clarithromycin or erythromycin given with simvastatin (avoid concomitant use); avoidance of clarithromycin and erythromycin advised by manufacturer of lomitapide (plasma concentration of lomitapide possibly increased).

Mirabegron: when given with clarithromycin avoid or reduce dose of mirabegron in hepatic or renal impairment—see Mirabegron, p. 552.

Oestrogens: erythromycin increases plasma concentration of estradiol.

Parasympathomimetics: erythromycin increases plasma concentration of galantamine.

Pentamidine isethionate: increased risk of ventricular arrhythmias when parenteral erythromycin given with pentamidine isethionate.

Progestogens: erythromycin increases plasma concentration of delgocitin, possibly increased risk of ototoxicity.

- Ranolazine: clarithromycin possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use.

Sildenafil: clarithromycin increases plasma concentration of sildenafil (consider reducing dose of sildenafil); erythromycin increases plasma concentration of sildenafil (reduce initial dose of sildenafil).

Sirolimus: clarithromycin increases plasma concentration of sirolimus—avoid concomitant use; plasma concentration of both drugs increased when erythromycin given with sirolimus.

Tacrolimus: clarithromycin and erythromycin increase plasma concentration of tacrolimus.

Tadalafil: clarithromycin and erythromycin possibly increase plasma concentration of tadalafil.

Theophylline: clarithromycin possibly increases plasma concentration of theophylline; erythromycin increases plasma concentration of theophylline (also theophylline may reduce absorption of oral erythromycin).

Ticagrelor: clarithromycin possibly increases plasma concentration of ticagrelor—manufacturer of ticagrelor advises avoid concomitant use; erythromycin possibly increases plasma concentration of ticagrelor.

Ulcercating Drugs: plasma concentration of erythromycin increased by cimetidine (increased risk of toxicity, including deafness); plasma concentration of both drugs increased when clarithromycin given with omeprazole.

Ulipristal: avoidance of clarithromycin advised by manufacturer of ulipristal; erythromycin increases plasma concentration of ulipristal—manufacturer of ulipristal advises avoid concomitant use.

Vaccines: antibiotics inactivate oral typhoid vaccine—see p. 850.

Vardenafil: clarithromycin possibly increases plasma concentration of vardenafil (consider reducing initial dose of vardenafil); erythromycin increases plasma concentration of vardenafil (reduce dose of vardenafil).

Magnesium (parenteral)

- Calcium-channel Blockers: profound hypotension reported with concomitant use of parental magnesium and nifedipine in pre-eclampsia.

Muscle Relaxants: parental magnesium enhances effects of non-depolarising muscle relaxants and suxamethonium.

Magnesium Salts (oral) see Antacids.

Mannitol: Antibacterials: avoidance of mannitol advised by manufacturer of tobramycin.
Appendix 1: Interactions

Antidepressants:

Anti-blockers:

MAOIs possibly enhance hypertensive effect when MAOIs given with alpha-blockers

Adrenergic Neurone Blockers: enhanced hypertensive effect when MAOIs given with adrenergic neurone blockers

- Alcohol: MAOIs interact with tyramine found in some beverages containing alcohol and some decahoholised beverages (hypertensive crisis)—if no tyramine, enhanced hypertensive effect

- Alpha₂-adrenoceptor Stimulants: avoidance of MAOIs advised by manufacturer of moxonidine

- Alpha-blockers: avoidance of MAOIs advised by manufacturer of indoramin; enhanced hypertensive effect when MAOIs given with alpha-blockers

Analgesics: possible increased serotonergic effects when MAOIs given with fentanyl; CNS excitation or depression (hypertension or hypotension) when MAOIs given with pethidine—avoid concomitant use and for 2 weeks after stopping MAOIs; possible increased serotonergic effects and increased risk of convulsions when MAOIs given with tramadol—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs; avoidance of MAOIs advised by manufacturer of nefopam; possible CNS excitation or depression (hypertension or hypotension) when MAOIs given with epidural analgesics—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect of angiotensin-II receptor antagonists

Antidepressants: increased risk of hypertension and CNS excitation when MAOIs given with reboxetine (MAOIs should not be started until 1 week after stopping reboxetine, avoid reboxetine for 2 weeks after stopping MAOIs); after stopping MAOIs do not start clonidine, escitalopram, duloxetine, paroxetine or sertraline for 2 weeks, also MAOIs should not be started until at least 1 week after stopping citalopram, escitalopram, duloxetine, paroxetine or sertraline; after stopping MAOIs do not start duloxetine for 2 weeks, also MAOIs should not be started until at least 5 days after stopping duloxetine; enhanced CNS effects and toxicity when MAOIs given with venlafaxine (venlafaxine should not be started until 2 weeks after stopping MAOIs; avoid MAOIs for 1 week after stopping venlafaxine); increased risk of hypertension and CNS excitation when MAOIs given with other MAOIs (avoid at least 2 weeks after stopping previous MAOIs and then start at a reduced dose); after stopping MAOIs do not start moclobemide for at least 1 week; MAOIs increase CNS effects of SSRIs (risk of serious toxicity); after stopping MAOIs do not start mirtazapine for 2 weeks, also MAOIs should not be started until at least 2 weeks after stopping mirtazapine; after stopping MAOIs do not start tricyclic-related antidepressants for 2 weeks, also MAOIs should not be started until at least 1–2 weeks after stopping tricyclic-related antidepressants; increased risk of hypertension and CNS excitation when MAOIs given with tricyclics, tricycles should not be started until 2 weeks after stopping MAOIs

Antipsychotics: possible increased risk of antimuscarinic side-effects when MAOIs given with antimuscarinics

Anxiolytics and Hypnotics: avoidance of MAOIs advised by manufacturer of buspirone; manufacturer of tranylcypromine advises avoid buspirone for 14 days after stopping tranylcypromine

Atomoxetine: after stopping MAOIs do not start atomoxetine for 2 weeks, also MAOIs should not be started until at least 2 weeks after stopping atomoxetine; possible increased risk of convulsions when antidepressants given with atomoxetine

Beta-blockers: enhanced hypertensive effect when MAOIs given with beta-blockers

Bupropion: avoidance of bupropion for 2 weeks after stopping MAOIs advised by manufacturer of bupropion

Calcium-channel Blockers: enhanced hypertensive effect when MAOIs given with calcium-channel blockers

Clonidine: enhanced hypertensive effect when MAOIs given with clonidine

Dapoxetine: increased risk of serotonergic effects when MAOIs given with dapoxetine (MAOIs should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping MAOIs)

Diazoxide: enhanced hypertensive effect when MAOIs given with diazoxide

Diuretics: enhanced hypertensive effect when MAOIs given with diuretics

Dopaminergics: avoid concomitant use of non-selective MAOIs with entacapone; risk of hypertensive crisis when MAOIs given with levodopa, avoid levodopa for at least 2 weeks after stopping MAOIs; risk of hypertensive crisis when MAOIs given with rasagiline, avoid MAOIs for at least 2 weeks after stopping rasagiline; enhanced hypertensive effect when MAOIs given with selegiline—manufacturer of selegiline advises avoid concomitant use; avoid concomitant use of MAOIs with tolcapone

Dopaxpram: MAOIs enhance effects of dopaxpram

Histamine: avoidance of MAOIs advised by manufacturer of histamine

5HT1-receptor Agonists: risk of CNS toxicity when MAOIs given with rizatriptan or sumatriptan (avoid rizatriptan or sumatriptan for 2 weeks after MAOIs); risk of CNS toxicity when MAOIs given with zolmitriptan (reduce dose of zolmitriptan)
MAOIs (continued)
- Methyldopa: avoidance of MAOIs advised by manufacturer of methyldopa
- Moxonidine: enhanced hypertensive effect when MAOIs given with moxonidine
- Muscle Relaxants: phenelzine enhances effects of suxamethonium
- Nicorandil: enhanced hypertensive effect when MAOIs given with nicorandil
- Nitrates: enhanced hypertensive effect when MAOIs given with nitrates
- Pholcodine: avoidance of pholcodine for 2 weeks after stopping MAOIs advised by manufacturer of pholcodine

- Sympathomimetics: risk of hypertensive crisis when MAOIs given with ephedrine (epinephrine), deuteramine, dopamine, methoxamine, noradrenaline (norepinephrine) or xylometazoline; risk of hypertensive crisis when MAOIs given with dexamethasone, ephedrine, isometheptene, lisdexamethasone, metaraminol, methylenidate, phentylephrine or pseudoephedrine, avoid dexamethasone, ephedrine, isometheptene, lisdexamethasone, metaraminol, methylenidate, phentylephrine or pseudoephedrine for at least 2 weeks after stopping MAOIs; risk of hypertensive crisis when MAOIs given with oxymetazoline, some manufacturers advise avoid oxymetazoline for at least 2 weeks after stopping MAOIs
- Tetraabenazine: risk of CNS toxicity when MAOIs given with tetraabenazine (avoid tetraabenazine for 2 weeks after MAOIs)

Vasodilator Antihypertensives: enhanced hypertensive effect when MAOIs given with hydralazine, minoxidil or sodium nitroprusside

MAOIs, reversible see Moclobemide

Maraviroc
- Antibacterials: plasma concentration of maraviroc possibly increased by clarithromycin and telithromycin (consider reducing dose of maraviroc); plasma concentration of maraviroc reduced by rifampicin—consider increasing dose of maraviroc
- Antidepressants: plasma concentration of maraviroc possibly reduced by St John’s wort—avoid concomitant use
- Antivirals: plasma concentration of maraviroc increased by atazanavir, boceprevir, darunavir, indinavir, lopinavir, saquinavir and telaprevir (consider reducing dose of maraviroc); plasma concentration of maraviroc possibly reduced by efavirenz—consider increasing dose of maraviroc; plasma concentration of maraviroc possibly reduced by etravirine; maraviroc reduces plasma concentration of osampravir—avoid concomitant use; plasma concentration of maraviroc increased by ritonavir
- Cobicistat: plasma concentration of maraviroc possibly increased by cobicistat (reduce dose of maraviroc)
- Orlistat: absorption of maraviroc possibly reduced by orlistat

Mebendazole
Ulceric healing Drugs: metabolism of mebendazole possibly inhibited by cimetidine (increased plasma concentration)

Mefoxon see NSAIDs

Mefloquine (continued)
- Anti-arrhythmics: increased risk of ventricular arrhythmias when mefloquine given with amiodarone—avoid concomitant use
- Antibacterials: increased risk of ventricular arrhythmias when mefloquine given with moxifloxacin—avoid concomitant use
- Antiepileptics: mefloquine antagonises anticonvulsant effect of antiepileptics
- Antimalarials: avoidance of antimalarials advised by manufacturer of artemether with lumefantrine; increased risk of convulsions when mefloquine given with chloroquine and hydroxychloroquine; increased risk of convulsions when mefloquine given with quinine (but should not prevent the use of intravenous quinine in severe cases)
- Antipsychotics: possible increased risk of ventricular arrhythmias when mefloquine given with haloperidol—avoid concomitant use; avoidance of mefloquine advised by manufacturer of amisulpride; increased risk of ventricular arrhythmias when mefloquine given with ziprasidone—avoid concomitant use; manufacturer of risperidone advises possible risk of ventricular arrhythmias when mefloquine given with risperidone
- Antivirals: mefloquine possibly reduces plasma concentration of ritonavir

Antagonist: increased risk of ventricular arrhythmias when mefloquine given with atorvastatin—increased risk of bradycardia when mefloquine given with beta-blockers
Calcium-channel Blockers: possible increased risk of bradycardia when mefloquine given with calcium-channel blockers
Cardiac Glycosides: possible increased risk of bradycardia when mefloquine given with digoxin
Corticosteroids: possible increased risk of bradycardia when mefloquine given with corticosteroids
The manufacturer of histamine—avoid concomitant use; manufacturer of risperidone advises possible risk of ventricular arrhythmias when mefloquine given with risperidone
Vaccines: antimalarials inactivate oral typhoid vaccine—see p. 850

Megestrol see Progestogens
Melatonin see Sedative Agents and Hypnotics
Methoxacinn see NSAIDs

Melfalan
- Antibacterials: increased risk of melphalan toxicity when given with nalidixic acid
- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
Cardiac Glycosides: melphalan possibly reduces absorption of digoxin tablets
Ciclosporin: increased risk of nephrotoxicity when melphalan given with ciclosporin

Memitane
- Anaesthetics, General: increased risk of CNS toxicity when memantine given with ketamine (manufacturer of memantine advises avoid concomitant use)
- Analgesics: increased risk of CNS toxicity when memantine given with electrocorticophan (manufacturer of memantine advises avoid concomitant use)
Anticoagulants: memantine possibly enhances anti-coagulant effect of warfarin
Antimuscarinics: memantine possibly enhances effects of antimuscarinics
Antipsychotics: memantine possibly reduces effects of antipsychotics
- Dopaminergics: memantine possibly enhances effects of dopamine agonists and selegiline; increased risk of CNS toxicity when memantine given with amantadine (manufacturer of memantine advises avoid concomitant use)
Muscle Relaxants: memantine possibly modifies effects of baclofen and dantrolene

Mepacrine
- Antiarrhythmics: increased plasma concentration of primaquine (increased risk of toxicity)
Appendix 1: Interactions

Meprobamate see Anxiolytics and Hypnotics
Mepatrazol see Opioid Analgesics
Mecaptopurine
  - Allopurinol: enhanced effects and increased toxicity of mecapurturine when given with diogurin (reduce dose of mecapurturine to one quarter of usual dose)
  - Aminosalicylates: possible increased risk of leucopenia when mecapurturine given with aminosalicylates
  - Antibacterials: increased risk of haematological toxicity when mecapurturine given with sulfaflometoxazole (as co-trimoxazole); increased risk of haematological toxicity when mecapurturine given with trimethoprim (also with co-trimoxazole)
  - Anticoagulants: mecapurturine possibly reduces coagulant effect of coumarins
  - Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
  - Dairy Products: plasma concentration of mecapurturine possibly reduced by dairy products—manufacturer of mecapurturine advises give at least 1 hour before or 2 hours after dairy products
  - Febuxostat: avoidance of mecapurturine advised by manufacturer of febuxostat
Meropenem
  - Antiepileptics: carbapenems reduce plasma concentration of valproate—avoid concomitant use
  - Probenecid: excretion of meropenem reduced by probenecid
  - Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850
Mesalazine see Aminosalicylates
Mestranol see Estrogens
Metaraminol see Sympathomimetics
Metformin see Antidiabetics
Methadone see Opioid Analgesics
Methazol see Opioid Analgesics
Methoxamine see Sympathomimetics
Methotrexate (continued)
  - Antiepileptics: antifolate effect of methotrexate increased by phenytoin
  - Antimalarias: antifolate effect of methotrexate increased by pyrimethamine
  - Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
  - Cardiac Glycosides: methotrexate possibly reduces absorption of digoxin tablets
  - Ciclosporin: risk of toxicity when methotrexate given with ciclosporin
  - Corticosteroids: possible increased risk of hepatoxicity when high-dose methotrexate given with dexamethasone
  - Cytotoxics: increased pulmonary toxicity when methotrexate given with cisplatin
  - Diuretics: excretion of methotrexate increased by alkaline urine due to acetazolamide
  - Leflunomide: risk of toxicity when methotrexate given with leflunomide
  - Probenecid: excretion of methotrexate reduced by probenecid (increased risk of toxicity)
  - Retinoids: plasma concentration of methotrexate increased by acitretin (also increased risk of hepatotoxicity)—avoid concomitant use
  - Theophylline: methotrexate possibly increases plasma concentration of theophylline
  - Ulcer-healing Drugs: excretion of methotrexate possibly reduced by proton pump inhibitors (increased risk of toxicity)
Methoxamine see Sympathomimetics
Methyldopa
  - ACE Inhibitors: enhanced hypotensive effect when methyldopa given with ACE inhibitors
  - Adrenergic Neurone Blockers: enhanced hypotensive effect when methyldopa given with adrenergic neurone blockers
  - Alcohol: enhanced hypotensive effect when methyldopa given with alcohol
  - Aldesleukin: enhanced hypotensive effect when methyldopa given with aldesleukin
  - Alpha-blockers: enhanced hypotensive effect when methyldopa given with alpha-blockers
  - Anaesthetics, General: enhanced hypotensive effect when methyldopa given with general anaesthetics
  - Analgesics: hypotensive effect of methyldopa antagonised by NSAIDs
  - Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when methyldopa given with angiotensin-II receptor antagonists
  - Antidepressants: manufacturer of methyldopa advises avoid concomitant use with MAOIs
  - Antipsychotics: enhanced hypotensive effect when methyldopa given with antipsychotics (also increased risk of extrapyramidal effects)
  - Anxiolytics and Hypnotics: enhanced hypotensive effect when methyldopa given with anxiolytics and hypnotics
  - Beta-blockers: enhanced hypotensive effect when methyldopa given with beta-blockers
  - Calcium-channel Blockers: enhanced hypotensive effect when methyldopa given with calcium-channel blockers
  - Clonidine: enhanced hypotensive effect when methyldopa given with clonidine
  - Corticosteroids: hypotensive effect of methyldopa antagonised by corticosteroids
  - Diazoxide: enhanced hypotensive effect when methyldopa given with diazoxide
  - Diuretics: enhanced hypotensive effect when methyldopa given with diuretics
  - Dopaminergics: methyldopa antagonises anti-parkinsonian effect of dopamineergics; increased risk of extrapyramidal side-effects when methyldopa given with amantadine; effects of methyldopa possi-
Methyldopa
Dopaminergics (continued) bly enhanced by entacapone; enhanced hypotensive effect when methyldopa given with levodopa
Iron: hypotensive effect of methyldopa antagonised by oral iron
- Lithium: neurotoxicity may occur when methyldopa given with lithium without increased plasma concentration of lithium
- Moxisylyte: enhanced hypotensive effect when methyldopa given with moxisylyte
- Moxonidine: enhanced hypotensive effect when methyldopa given with moxonidine
- Muscle Relaxants: enhanced hypotensive effect when methyldopa given with baclofen or tizanidine
- Nitrates: enhanced hypotensive effect when methyldopa given with nitrates
- Oestrogens: hypotensive effect of methyldopa antagonised by oestrogens
- Prostaglandins: enhanced hypotensive effect when methyldopa given with alprostadil
- Sympathomimetics, Beta2: acute hypotension reported when methyldopa given with infusion of salbutamol
- Vasodilator Hypertensives: enhanced hypotensive effect when methyldopa given with hydralazine, minoxidil or sodium nitroprusside

Methyldopa see Sympathomimetics
Methylprednisolone see Corticosteroids
Methyldopa
- Antidepressants: risk of CNS toxicity when methyldopa given with SSRIs-related antidepressants, SSRIs and clozapine—avoid concomitant use (if avoidance not possible, use lowest possible dose of methyldopa and observe patient for up to 4 hours after administration); possible risk of CNS toxicity when methyldopa given with mirtazapine—avoid concomitant use (if avoidance not possible, use lowest possible dose of methyldopa and observe patient for up to 4 hours after administration)
- Anxiolytics and Hypnotics: possible risk of CNS toxicity when methyldopa given with buspirone—avoid concomitant use (if avoidance not possible, use lowest possible dose of methyldopa and observe patient for up to 4 hours after administration)
- Bupropion: possible risk of CNS toxicity when methyldopa given with bupropion—avoid concomitant use (if avoidance not possible, use lowest possible dose of methyldopa and observe patient for up to 4 hours after administration)

Metoclopramide
- Alcohol: metoclopramide possibly increases absorption of alcohol
- Anaesthetics, General: metoclopramide enhances effects of thiopental
- Analgesics: metoclopramide increases rate of absorption of aspirin (enhanced effect); effects of metoclopramide on gastro-intestinal activity antagonised by opioid analgesics; metoclopramide increases rate of absorption of paracetamol
- Antidepressants: CNS toxicity reported when metoclopramide given with SSRIs
- Antimuscarnics: effects of metoclopramide on gastro-intestinal activity antagonised by antimuscarinics
- Antipsychotics: increased risk of extrapyramidal side-effects when metoclopramide given with antipsychotics
- Atovaquone: metoclopramide reduces plasma concentration of atovaquone—avoid concomitant use
- Ciclosporin: metoclopramide increases plasma concentration of ciclosporin
- Dopaminergics: metoclopramide antagonises hypopro-lactinaemic effects of bromocriptine and cabergoline; metoclopramide antagonises antiparkinsonian
Appendix 1: Interactions

Mirabegron (continued)
Antivirals: avoid or reduce dose of mirabegron in hepatic or renal impairment when given with ritom- 
vir—see Mirabegron, p. 552
Beta-blockers: mirabegron increases plasma concentra-

tion of metoprolol
Cardiac Glycosides: mirabegron increases plasma concen-

tration of digoxin—reduce initial dose of digoxin

Mirtazapine
● Alcohol: increased sedative effect when mirtazapine
given with alcohol
Analgesics: possible increased serotonergic effects 
when mirtazapine given with tramadol
Anticoagulants: mirtazapine enhances anticoagulant 
effect of warfarin
● Antidepressants: possible increased serotonergic 
effects when mirtazapine given with fluoxetine, 

duloxetine or venlafaxine; mirtazapine should not be 
not started until 2 weeks after stopping MAOIs, also 
MAOIs should not be started until at least 2 weeks 
after stopping mirtazapine; after stopping mirtaza-
pine do not start moclobemide for at least 1 week
Antiepileptics: plasma concentration of mirtazapine 
reduced by carbamazepine and phenytoin
● Antimalarias: avoidance of antidepressants advised 
by manufacturer of artemether with lumefantrine 
and piperaquine with artemi

Axionlyics and Hypnotics: increased sedative effect 
when mirtazapine given with axionlyics and hyp-

notics
Atomoxetine: possible increased risk of convulsions 
when antidepressants given with atomoxetine
Clopidogrel: mirtazapine possibly antagonises hypoten-
sive effect of clopidogrel
● Methylthioninium: possible risk of CNS toxicity when 
mirtazapine given with methylthioninium—avoid 
concomitant use (if avoidance not possible, use lowest 
possible dose of methylthioninium and observe 
patient for up to 4 hours after administration)
Ulcer-healing Drugs: plasma concentration of mirtaz-
pine increased by cimetidine

Mitomycin
● Antihistamines: avoid concomitant use of cytotoxics 
with zolmitriptan (anti-growth effect)
Mitotane
● Anticoagulants: mitotane possibly reduces anti-

coagulant effect of coumarins
● Antipsychotics: avoid concomitant use of cytotoxics 
with zolmitriptan (anti-growth effect)
Diuretics: manufacturer of mitotane advises avoid 
concomitant use of spirinolactone (antagonism of 
effect)

Moxisylyte
● Antipsychotics: avoid concomitant use of cytotoxics 
with zolmitriptan (anti-growth effect)
Ciclosporin: excretion of moxisylyte reduced by 
ciclosporin (increased plasma concentration)

Mivacurium see Muscle Relaxants
Mizolastine see Antihistamines
Moclobemide
● Analgesics: possible CNS excitation or depression 
(hypertension or hypotension) when moclobemide given with 
exetemiphoran or metidione—avoid concomitant use; possible CNS excitation or depression 
(hypertension or hypotension) when moclobemide given with opioid analgesics—manufactu-
er of moclobemide advises consider reducing 
dose of opioid analgesics
● Antidepressants: moclobemide should not be started 
for at least 1 week after stopping MAOIs, SSRl-
related antidepressants, eicitolopram, fluvoxamine, 
mirtazapine, paroxetine, sertraline, tricyclic-
related antidepressants or tricyclics; increased risk 
of CNS toxicity when moclobemide given with 
escitalopram, preferably avoid concomitant use; 
moclobemide should not be started until 5 weeks

Moclobemide (continued)
after stopping fluoxetine; possible increased sero-
tonergic effects when moclobemide given with 
fluoxetine
● Antimalarias: avoidance of antidepressants advised 
by manufacturer of artemether with lumefantrine 
and piperaquine with artemi

Atomoxetine: possible increased risk of convulsions 
when antidepressants given with atomoxetine
● Bupropion: avoidance of moclobemide advised by 
manufacturer of bupropion
● Clopidogrel: moclobemide possibly reduces anti-
platelet effect of clopidogrel
● Dopaminergics: caution with moclobemide advised 
by manufacturer of entacapone; increased risk of side-
effects when moclobemide given with levodopa; 
avoid concomitant use of moclobemide with sele-
gline
● 5HT1-receptor Agonists: risk of CNS toxicity when 
moclobemide given with rizatriptan or sumatriptan 
(avoid rizatriptan or sumatriptan for 2 weeks after moclobemide); risk of CNS toxicity when 
moclobemide given with zolmitriptan (reduce dose 
of zolmitriptan)
● Symptom limitatrics: risk of hypertensive crisis when 
moclobemide given with sympathomimetics

Ulcer-healing Drugs: plasma concentration of mocl-

obemide increased by cimetidine (halve dose of 
moclobemide)

Modafinil
Antiepileptics: modafinil possibly increases plasma 
concentration of phenytoin
● Ciclosporin: modafinil reduces plasma concentration 
of ciclosporin
● Cytotoxics: modafinil possibly reduces plasma concen-
tration of bosutinib—manufacturer of bosutinib 
advices avoid concomitant use
● Oestrogens: modafinil accelerates metabolism of 
oestrogen (reduced contraceptive effect—see p. 536)

Moxepin see ACE Inhibitors
Mometasone see Corticosteroids
Monobactams see AstraZenam
Montelukast see Leukotriene Receptor Antagonists
Morphine see Opioid Analgesics

Moxifloxacin see Quinolones

Mosixislyte
ACE inhibitors: enhanced hypotensive effect when 
mosixislyte given with ACE inhibitors
Adrenergic Neurone Blockers: enhanced hypotensive 
effect when mosixislyte given with adrenergic neu-
rone blockers
● Alpha-blockers: possible severe postural hypotension 
when mosixislyte given with alpha-blockers
Angiotensin-II Receptor Antagonists: enhanced hypo-
tensive effect when mosixislyte given with angio-
tensin-II receptor antagonists
● Beta-blockers: possible severe postural hypotension 
when mosixislyte given with beta-blockers
Calcium-channel Blockers: enhanced hypotensive 
effect when mosixislyte given with calcium-channel 
blockers
Clonidine: enhanced hypotensive effect when mosix-
islyte given with clonidine
Diazoxide: enhanced hypotensive effect when mosix-
islyte given with diazoxide

Diuretics: enhanced hypotensive effect when mosix-
islyte given with diuretics
Methyldopa: enhanced hypotensive effect when mosix-
islyte given with methyldopa
Moxonidine: enhanced hypotensive effect when mosix-
islyte given with moxonidine
Nitrate: enhanced hypotensive effect when mosix-
islyte given with nitrates
Moxisylyte (continued)
Vasodilator Antihypertensives: enhanced hypotensive effect when moxisylyte given with hydralazine, minoxidil or sodium nitroprusside

Moxonidine
ACE Inhibitors: enhanced hypotensive effect when moxonidine given with ACE inhibitors
Adrenergic Neurone Blockers: enhanced hypotensive effect when moxonidine given with adrenergic neurone blockers
Alcohol: enhanced hypotensive effect when moxonidine given with alcohol
Aldesleukin: enhanced hypotensive effect when moxonidine given with aldesleukin
Allopurinol: enhanced hypotensive effect when moxonidine given with allopurinol
Anaesthetics, General: enhanced hypotensive effect when moxonidine given with general anaesthetics
Analgesics: hypotensive effect of moxonidine antagonised by NSAIDs
Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when moxonidine given with angiotensin-II receptor antagonists
Antidepressants: enhanced hypotensive effect when moxonidine given with MAOIs; hypotensive effect of moxonidine possibly antagonised by tricyclics (manufacturer of moxonidine advises avoid concomitant use)
Antipsychotics: enhanced hypotensive effect when moxonidine given with phenothiazines
Anxiolytics and Hypnotics: enhanced hypotensive effect when moxonidine given with anxiolytics and hypnotics; sedative effects possibly increased when moxonidine given with benzodiazepines
Beta-blockers: enhanced hypotensive effect when moxonidine given with beta-blockers
Calcium-channel Blockers: enhanced hypotensive effect when moxonidine given with calcium-channel blockers
Clonidine: enhanced hypotensive effect when moxonidine given with clonidine
Corticosteroids: hypotensive effect of moxonidine antagonised by NSAIDs
Diazoxide: enhanced hypotensive effect when moxonidine given with diazoxide
Diuretics: enhanced hypotensive effect when moxonidine given with diuretics
Dopaminergics: enhanced hypotensive effect when moxonidine given with levodopa
Methyldopa: enhanced hypotensive effect when moxonidine given with methyldopa
Moxisylyte: enhanced hypotensive effect when moxonidine given with moxisylyte
Muscle Relaxants: enhanced hypotensive effect when moxonidine given with baclofen or tizanidine
Nitrates: enhanced hypotensive effect when moxonidine given with nitrates
Oestrogens: hypotensive effect of moxonidine antagonised by oestrogens
Prostaglandins: enhanced hypotensive effect when moxonidine given with prostaglandins
Vasodilator Antihypertensives: enhanced hypotensive effect when moxonidine given with hydralazine, minoxidil or sodium nitroprusside

Muscle Relaxants
ACE Inhibitors: enhanced hypotensive effect when baclofen or tizanidine given with ACE inhibitors
Adrenergic Neurone Blockers: enhanced hypotensive effect when baclofen or tizanidine given with adrenergic neurone blockers
Alcohol: increased sedative effect when baclofen, methocarbamol or tizanidine given with alcohol
Alpha-blockers: enhanced hypotensive effect when baclofen or tizanidine given with alpha-blockers
Anaesthetics, General: effects of atracurium enhanced by ketamine; increased risk of myocardial depres
Appendix 1: Interactions

Mycophenolate (continued)

Cytoxic: effects of suxamethonium by cyclophosphamide and thiopeta

Deferasirox: avoidance of tizanidine advised by manufacturer of deferasirox

Diuretics: enhanced hypnotic effect when baclofen or tizanidine given with diuretics

Dopaminergic: possible agitation, confusion and hallucinations when baclofen given with levodopa

Lithium: effects of muscle relaxants enhanced by lithium; baclofen possibly aggravates hyperkinesia caused by lithium

Magnesium (parenteral): effects of non-depolarising muscle relaxants and suxamethonium enhanced by parenteral magnesium

Iron: increased

Methylene: effects of baclofen and dantrolene possibly modified by memarote

Methyldopa: enhanced hypnotic effect when baclofen or tizanidine given with methyldopa

Metoclopramide: effects of suxamethonium enhanced by metoclopramide

Moxonidine: enhanced hypnotic effect when baclofen or tizanidine given with moxonidine

Nitrates: enhanced hypnotic effect when baclofen or tizanidine given with nitrates

Nifedipine: plasma concentration of tizanidine possibly increased by nifedipine (increased risk of toxicity)

Parasymptomimetics: effects of non-depolarising muscle relaxants possibly antagonised by donepezil; effects of suxamethonium possibly enhanced by donepezil; effects of non-depolarising muscle relaxants organised by edrophonium, neostigmine, pyridostigmine and rivastigmine; effects of suxamethonium enhanced by edrophonium, galantamine, neostigmine, pyridostigmine and rivastigmine

PropGESTONS: plasma concentration of tizanidine possibly increased by propGESTONS (increased risk of toxicity)

Symptomimetics, Beta-2: effects of suxamethonium enhanced by bambuterol

Vasodilators Antihypertensives: enhanced hypnotic effect when baclofen or tizanidine given with hydralazine; enhanced hypnotic effect when baclofen or tizanidine given with minoxidil; enhanced hypnotic effect when baclofen or tizanidine given with sodium nitroprusside

Muscle Relaxants, depolarising see Muscle Relaxants

Muscle Relaxants, non-depolarising see Muscle Relaxants

MycoPhenolate

Antacids: absorption of mycophenolate reduced by antacids

Antibacterials: plasma concentration of mycophenolate possibly reduced by co-amoxiclav; bioavailability of mycophenolate possibly reduced by metronidazole and norfloxacin; plasma concentration of active metabolite of mycophenolate reduced by erfampin

Antivirals: mycophenolate increases plasma concentration of aciclovir, also plasma concentration of inactive metabolite of mycophenolate increased; mycophenolate possibly increases plasma concentration of ganciclovir, also plasma concentration of inactive metabolite of mycophenolate possibly increased

Colestilan: manufacturer of colestilan advises give mycophenolate at least 1 hour before or 3 hours after colestilan

Iron: absorption of mycophenolate reduced by oral iron

Lipid-regulating Drugs: absorption of mycophenolate reduced by colestemamine

Mycophenolate (continued)

Sevelamer: plasma concentration of mycophenolate possibly reduced by sevelamer

Mycophenolate Mofetil see Mycophenolate

Mycophenolate Sodium see Mycophenolate

Mycophenolic Acid see Mycophenolate

Nabumetone see NSAIDS

Nadolol see Beta-blockers

Nalidixic Acid see Quinolones

Nalmefene

Analgesics: manufacturer of nalmefene advises avoid concomitant use with opioid analgesics

Nandrolone see Anabolic Steroids

Naproxen see NSAIDS

Naratipran see SHT,-receptor Agonists (under HT)

Nateglinide see Antidiabetics

Nebivolol see Beta-blockers

Nefopam

Antidepressants: manufacturer of nefopam advises avoid concomitant use with MAOIs; side-effects possibly increased when nefopam given with tricyclics

Antismuscarinics: increased risk of antismuscarinic side-effects when nefopam given with antismuscarinics

Neomycin see Aminoglycosides

Neostigmine see Parasympathomimetics

Nevirapine

Analgesics: nevirapine possibly reduces plasma concentration of methadone

Antibacterials: nevirapine reduces plasma concentration of clarithromycin (but concentration of an active metabolite increased), also plasma concentration of nevirapine increased; nevirapine possibly increases plasma concentration of rifabutin; plasma concentration of nevirapine reduced by rifampicin—avoid concomitant use

Antiepileptics: plasma concentration of nevirapine reduced by carbamazepine

Antifungals: plasma concentration of nevirapine increased by fluconazole; nevirapine possibly reduces plasma concentration of caspofungin and itraconazole—consider increasing dose of caspofungin and itraconazole

Antipsychotics: nevirapine possibly reduces plasma concentration of aripiprazole (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature)

Antivirals: nevirapine possibly reduces plasma concentration of atazanavir and etravirine—avoid concomitant use; manufacturer of nevirapine advises avoid concomitant use with boccaprevir and rilpivirine; nevirapine possibly reduces the plasma concentration of dolutegravir (see Dose under Dolutegravir, p. 421); nevirapine reduces plasma concentration of efavirenz—avoid concomitant use; avoidance of nevirapine advised by manufacturer of elvitegravir; nevirapine possibly reduces plasma concentration of fosamprenavir—avoid unboosted fosamprenavir; nevirapine reduces plasma concentration of indinavir; nevirapine possibly reduces plasma concentration of elopinavir and telaprevir—consider increasing dose of lopinavir and telaprevir. increased risk of granulocytopenia when nevirapine given with zidovudine

Cobicistat: manufacturer of nevirapine advises avoid concomitant use with cobicistat

Oestrogens: nevirapine accelerates metabolism of oestrogens (reduced contraceptive effect—see p. 536)
Nitrates (continued)

Anticoagulants: infusion of glyceryl trinitrate reduces anticoagulant effect of heparins

Antidepressants: enhanced hypotensive effect when nitrates given with MAOIs; effects of sublingual tablets of nitrates possibly reduced by tricyclic-related antidepressants (failure to dissolve under tongue owing to dry mouth); effects of sublingual tablets of nitrates reduced by tricyclics (failure to dissolve under tongue owing to dry mouth)

Antimuscarinics: effects of sublingual tablets of nitrates possibly reduced by antimuscarinics (failure to dissolve under tongue owing to dry mouth)

Analgesics: possible increased hypotensive effect when nitrates given with acetaminophen

Anxiolytics and Hypnotics: enhanced hypotensive effect when nitrates given with anxiolytics and hypnotics

Avanafil: hypotensive effect of nitrates significantly enhanced by avanafil (avoid concomitant use)

Beta-blockers: enhanced hypotensive effect when nitrates given with beta-blockers

Calcium-channel Blockers: enhanced hypotensive effect when nitrates given with calcium-channel blockers

Clonidine: enhanced hypotensive effect when nitrates given with clonidine

Diazoxide: enhanced hypotensive effect when nitrates given with diazoxide

Diuretics: enhanced hypotensive effect when nitrates given with diuretics

Dopaminergics: enhanced hypotensive effect when nitrates given with levodopa

Methylxanthines: enhanced hypotensive effect when nitrates given with methylxanthines

Muscle Relaxants: enhanced hypotensive effect when nitrates given with muscle relaxants

Muscle Relaxants: enhanced hypotensive effect when nitrates given with agents that act on the autonomic nervous system

Nitrofurantoin possibly antagonises effects of nalidixic acid

Nitroglycerin possibly antagonises effects of tolbutamide

Nitroglycerin possibly antagonises effects of tolbutamide

Nitroprusside (continued)

ACE Inhibitors: enhanced hypotensive effect when nitrates given with ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when nitrates given with adrenergic neurone blockers

Alcohol: enhanced hypotensive effect when nitrates given with alcohol

Aldesleukin: enhanced hypotensive effect when nitrates given with aldesleukin

Alpha-blockers: enhanced hypotensive effect when nitrates given with alpha-blockers

Anaesthetics, General: enhanced hypotensive effect when nitrates given with general anaesthetics

Analgésics: hypotensive effect of nitrates antagonised by NSAIDs

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when nitrates given with angiotensin-II receptor antagonists

Anti-arrhythmics: effects of sublingual tablets of nitrates reduced by disopyramide (failure to dissolve under tongue owing to dry mouth)

Nevirapine (continued)

Orlistat: absorption of nevirapine possibly reduced by orlistat

Progestogens: nevirapine accelerates metabolism of progestogens (reduced contraceptive effect—see p. 536)

Nicardipine see Calcium-channel Blockers

Nicorandil

Alcohol: hypotensive effect of nicorandil possibly enhanced by alcohol

Antidepressants: enhanced hypotensive effect when nicorandil given with MAOIs; hypotensive effect of nicorandil possibly enhanced by tricyclics

Avanafil: hypotensive effect of nicorandil significantly enhanced by avanafil (avoid concomitant use)

Sildenafil: hypotensive effect of nicorandil significantly enhanced by sildenafil (avoid concomitant use)

Tadalafil: hypotensive effect of nicorandil significantly enhanced by tadalafil (avoid concomitant use)

Vardenafil: possible increased hypotensive effect when nicorandil given with vardenafil—avoid concomitant use

Vasodilator Antihypertensives: possible enhanced hypotensive effect when nicorandil given with hydralazine, minoxidil or sodium nitroprusside

Nicotine

Anti-arrhythmics: nicotine possibly enhances effects of adenosine

Nicotinic Acid

Note: Interactions apply to lipid-dissolving doses of nicotinic acid

Lipid-regulating Drugs: increased risk of myopathy when nicotinic acid given with statins (applies to lipid-regulating doses of nicotinic acid)

Nifedipine see Calcium-channel Blockers

Nilotinib

Antibacterials: manufacturer of nilotinib advises avoid concomitant use with clarithromycin and erythromycin; plasma concentration of nilotinib reduced by ritampicin—avoid concomitant use

Antifungals: manufacturer of nilotinib advises avoid concomitant use with voriconazole

Antipsychotics: avoid concomitant use of cytoxycs with clozapine (increased risk of agranulocytosis)

Antivirals: avoidance of nilotinib advised by manufacturer of boceprevir; plasma concentration of nilotinib possibly increased by ritonavir—manufacturer of nilotinib advises avoid concomitant use

Anxiolytics and Hypnotics: nilotinib increases plasma concentration of midazolam

Grapefruit Juice: manufacturer of nilotinib advises avoid concomitant use with grapefruit juice

Nomegestrol see Progestogens

Nitrate (continued)

Anticoagulants: infusion of glyceryl trinitrate reduces anticoagulant effect of heparins

Antidepressants: enhanced hypotensive effect when nitrates given with MAOIs; effects of sublingual tablets of nitrates possibly reduced by tricyclic-related antidepressants (failure to dissolve under tongue owing to dry mouth); effects of sublingual tablets of nitrates reduced by tricyclics (failure to dissolve under tongue owing to dry mouth)

Antimuscarinics: effects of sublingual tablets of nitrates possibly reduced by antimuscarinics (failure to dissolve under tongue owing to dry mouth)

Analgesics: possible increased hypotensive effect when nitrates given with acetaminophen

Anxiolytics and Hypnotics: enhanced hypotensive effect when nitrates given with anxiolytics and hypnotics

Avanafil: hypotensive effect of nitrates significantly enhanced by avanafil (avoid concomitant use)

Beta-blockers: enhanced hypotensive effect when nitrates given with beta-blockers

Calcium-channel Blockers: enhanced hypotensive effect when nitrates given with calcium-channel blockers

Clonidine: enhanced hypotensive effect when nitrates given with clonidine

Diazoxide: enhanced hypotensive effect when nitrates given with diazoxide

Diuretics: enhanced hypotensive effect when nitrates given with diuretics

Dopaminergics: enhanced hypotensive effect when nitrates given with levodopa

Methylxanthines: enhanced hypotensive effect when nitrates given with methylxanthines

Muscle Relaxants: enhanced hypotensive effect when nitrates given with muscle relaxants

Muscle Relaxants: enhanced hypotensive effect when nitrates given with agents that act on the autonomic nervous system

Nitrofurantoin possibly antagonises effects of tolbutamide

Nitroglycerin possibly antagonises effects of tolbutamide

Nitroglycerin possibly antagonises effects of tolbutamide

Nitroprusside (continued)

ACE Inhibitors: enhanced hypotensive effect when nitrates given with ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when nitrates given with adrenergic neurone blockers

Alcohol: enhanced hypotensive effect when nitrates given with alcohol

Aldesleukin: enhanced hypotensive effect when nitrates given with aldesleukin

Alpha-blockers: enhanced hypotensive effect when nitrates given with alpha-blockers

Anaesthetics, General: enhanced hypotensive effect when nitrates given with general anaesthetics

Analgésics: hypotensive effect of nitrates antagonised by NSAIDs

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when nitrates given with angiotensin-II receptor antagonists

Anti-arrhythmics: effects of sublingual tablets of nitrates reduced by disopyramide (failure to dissolve under tongue owing to dry mouth)
Appendix 1: Interactions

Antivirals:

Noradrenaline (norepinephrine) see Sympathomimetics
Norelgestromin see Progestogens
Norepinephrine (noradrenaline) see Sympathomimetics
Norethisterone see Progestogens
Norflaxcin see Quinolones
Norgestimate see Progestogens
Norgestrel see Progestogens
Nortriptyline see Antidepressants, Tricyclic

NSAIDs

Note See also Aspirin. Interactions do not generally apply to topical NSAIDs.
ACE Inhibitors: increased risk of renal impairment when NSAIDs given with ACE inhibitors, also hypotensive effect antagonised
Adrenergic Neurone Blockers: NSAIDs antagonise hypotensive effect of adrenergic neurone blockers
Aliskiren: NSAIDs possibly antagonise hypotensive effect of aliskiren
Alpha-blockers: NSAIDs antagonise hypotensive effect of alpha-blockers
Analgesics: avoid concomitant use of NSAIDs with
● NSAIDs or aspirin (increased side-effects); avoid concomitant use of NSAIDs with ketorolac (increased side-effects and haemorrhage); ibuprofen possibly reduces antplatelet effect of aspirin
Angiotensin-II Receptor Antagonists: increased risk of renal impairment when NSAIDs given with angiotensin-II receptor antagonists, also hypotensive effect antagonised
Antacids: absorption of aemetacin possibly reduced by antacids
Antibacterials: indometacin possibly increases plasma concentration of amikacin and gentamicin in neonates; plasma concentration of celecoxib, diclofenac and etoricoxib reduced by rifampicin; possible increased risk of convulsions when NSAIDs given with rifampicin
Anticoagulants: increased risk of haemorrhage when intravenous diclofenac given with anticoagulants (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when ketorolac given with anticoagulants (avoid concomitant use, including low-dose heparins); NSAIDs possibly enhance anticoagulant effect of coumarins and phenindione; possible increased risk of bleeding when NSAIDs given with dabigatran or heparins
Antidepressants: increased risk of bleeding when NSAIDs given with SSRI or venlafaxine
Antidiabetics: NSAIDs possibly enhance effects of sulfonylureas
Antiepileptics: aemetacin possibly reduces excretion of phenytoin (increased risk of toxicity)
Antifungals: plasma concentration of pareaexib increased by fluconazole (reduce dose of pareaexib); plasma concentration of celecoxib increased by fluconazole (halve dose of celecoxib); plasma concentration of flurbiprofen and ibuprofen increased by fluconazole; plasma concentration of diclofenac and ibuprofen increased by voriconazole
Antipsychotics: possible severe drowsiness when aemetacin or indometacin given with haloperidol
Antivirals: plasma concentration of NSAIDs possibly increased by ritonavir; plasma concentration of piroxicam increased by ritonavir (risk of toxicity)—avoid concomitant use; increased risk of hematological toxicity when NSAIDs given with zidovudine
Beta-blockers: NSAIDs antagonise hypotensive effect of beta-blockers
Calcium-channel Blockers: NSAIDs antagonise hypotensive effect of calcium-channel blockers
Cardiac Glycosides: NSAIDs possibly increase plasma concentration of cardiac glycosides, also possible

NSAIDs

Cardiac Glycosides (continued)
exacerbation of heart failure and reduction of renal function
● Ciclosporin: increased risk of nephrotoxicity when NSAIDs given with ciclosporin; plasma concentration of diclofenac increased by ciclosporin (halve dose of diclofenac)
Clonidine: NSAIDs antagonise hypotensive effect of clonidine
Clopidogrel: increased risk of bleeding when NSAIDs given with clopidogrel
Corticosteroids: increased risk of gastrointestinal bleeding and ulceration when NSAIDs given with corticosteroids
● Cytotoxics: NSAIDs probably reduce excretion of methotrexate (increased risk of toxicity)—but for concomitant use in rheumatic disease see p. 718; diclofenac, ibuprofen, indometacin, ketoprofen, meloxicam and naproxen reduce excretion of methotrexate (increased risk of toxicity)—but for concomitant use in rheumatic disease see p. 718; NSAIDs possibly reduce renal excretion of pemetrexed—consult product literature; increased risk of bleeding when NSAIDs given with fototerib; avoidance of mefenamic acid advised by manufacturer of regorafenib
Desmopressin: indometacin enhances effects of desmopressin
Diuretics: NSAIDs antagonise hypotensive effect of diuretics

Doxycycline: NSAIDs antagonise hypotensive effect of diuretics
Diethyl sulfoxide: avoid concomitant use of sulindac with diethyl sulfoxide
Diuretics: risk of nephrotoxicity of NSAIDs increased by diuretics, also antagonism of diuretic effect; indometacin and ketorolac antagonise effects of diuretics; excretion of aemetacin possibly increased by furosemide; NSAIDs possibly antagonise diuretic effect of potassium canrenoate; occasional reports of reduced renal function when indometacin given with etriamterene—avoid concomitant use; increased risk of hyperkalaemia when indometacin given with potassium-sparing diuretics and aldosterone antagonists; possible increased risk of hyperkalaemia when NSAIDs given with potassium-sparing diuretics and aldosterone antagonists
Iloprost: increased risk of bleeding when NSAIDs given with iloprost
Lipid-regulating Drugs: excretion of meloxicam increased by colesteroylamine
● Lithium: NSAIDs reduce excretion of lithium (increased risk of toxicity); ketorolac reduces excretion of lithium (increased risk of toxicity)—avoid concomitant use
Methyldopa: NSAIDs antagonise hypotensive effect of methyldopa
Mifepristone: avoidance of high doses of NSAIDs advised by manufacturer of mifepristone
Moxonidine: NSAIDs antagonise hypotensive effect of moxonidine
Muscle Relaxants: ibuprofen reduces excretion of baclofen (increased risk of toxicity); NSAIDs possibly reduce excretion of baclofen (increased risk of toxicity)
Nitrates: NSAIDs antagonise hypotensive effect of nitrates
Oestrogens: etoricoxib increases plasma concentration of ethynylestradiol
Penicillamine: possible increased risk of nephrotoxicity when NSAIDs given with penicillamine
● Pentoxyfylline: possible increased risk of bleeding when NSAIDs given with pentoxyfylline; increased risk of bleeding when ketorolac given with pentoxyfylline (avoid concomitant use)
NSAIDs (continued)
Prasugrel: possible increased risk of bleeding when NSAIDs given with prasugrel
- Probenecid: excretion of acemetacin, doxketoprofen, indometacin, ketoprofen and naproxen reduced by probenecid (increased plasma concentration); excretion of ketorolac reduced by probenecid (increased plasma concentration)—avoid concomitant use
- Tacrolimus: possible increased risk of nephrotoxicity when NSAIDs given with tacrolimus; increased risk of nephrotoxicity when ibuprofen given with tacrolimus
Vasoconstrictor Antihypertensives: NSAIDs antagonise hypotensive effect of hydralazine, minoxidil and sodium nitroprusside

Octreotide
Antidiabetics: octreotide possibly reduces requirements for antidiabetics
- Ciclosporin: octreotide reduces plasma concentration of ciclosporin
Dopaminergics: octreotide increases plasma concentration of bromocriptine
Ulcer-healing Drugs: octreotide possibly delays absorption of cimetidine

Oestrogens
Note Interactions of combined oral contraceptives may also apply to combined contraceptive patches and vaginal rings, see p. 536
ACE inhibitors: oestrogens antagonise hypotensive effect of ACE inhibitors
Adrenergic Neurone Blockers: oestrogens antagonise hypotensive effect of adrenergic neurone blockers
Alpha-blockers: oestrogens antagonise hypotensive effect of alpha-blockers
Analgesics: plasma concentration of ethinylestradiol increased by etoricoxib
Angiotensin-II Receptor Antagonists: oestrogens antagonise hypotensive effect of angiotensin-II receptor antagonists
- Antibacterials: plasma concentration of estradiol increased by erythromycin; metabolism of oestrogens accelerated by rifampicin (reduced contraceptive effect—see p. 536)
- Anticoagulants: oestrogens may enhance or reduce anticoagulant effect of coumarins; oestrogens antagonise anticoagulant effect of warfarin
- Antidepressants: contraceptive effect of oestrogens reduced by St John’s wort (avoid concomitant use); oestrogens antagonise antidepressant effect of tricyclics (but side-effects of tricyclics possibly increased due to increased plasma concentration)
Antidiabetics: oestrogens antagonise hypoglycaemic effect of antidiabetics
- Antiepileptics: metabolism of oestrogens accelerated by carbamazepine, oxcarbazepine, oxcarbazepine, phenobarbital, phenytoin, rufinamide and topiramate (reduced contraceptive effect—see p. 536); oestrogens reduce plasma concentration of lamotrigine—consider increasing dose of lamotrigine; ethinylestradiol possibly reduces plasma concentration of valproate
Antifungals: oestrogens increase plasma concentration of voriconazole; anecdotal reports of contraceptive failure and menstrual irregularities when oestrogens given with griseofulvin; anecdotal reports of contraceptive failure when oestrogens given with imidazole; occasional reports of breakthrough bleeding when oestrogens (used for contraception) given with terbinafine
- Antivirals: plasma concentration of ethinylestradiol increased by tenofovir; metabolism of oestrogens accelerated by efavirenz and etravirine (reduced contraceptive effect—see p. 536); plasma concentration of ethinylestradiol possibly reduced by

Oestrogens
- Antivirals (continued)
  - telaprevir—manufacturer of telaprevir advises additional contraceptive precautions
  - Antihistamines and Hypnotics: oestrogens possibly increase plasma concentration of chloroquine, diazepam and nitrazepam; oestrogens possibly reduce plasma concentration of lorazepam, oxazepam and temazepam; oestrogens increase plasma concentration of melatonin
  - Aprepitant: possible contraceptive failure of hormonal contraceptives containing oestrogens when given with aprepitant (alternative contraception recommended)
Beta-blockers: oestrogens antagonise hypotensive effect of beta-blockers
  - Bosantan: possible contraceptive failure of hormonal contraceptives containing oestrogens when given with bosantan (alternative contraception recommended)
Calcium-channel Blockers: oestrogens antagonise hypotensive effect of calcium-channel blockers
Ciclosporin: oestrogens possibly increase plasma concentration of ciclosporin
Clonidine: oestrogens antagonise hypotensive effect of clonidine
  - Cobicistat: metabolism of oestrogens accelerated by cobicistat (reduced contraceptive effect—see p. 536)
Corticosteroids: oral contraceptives containing oestrogens increase plasma concentration of corticosteroids
  - Cytoxics: possible reduction in contraceptive effect of oestrogens advised by manufacturer of eribulin and vemurafenib; possible reduced contraceptive effect of hormonal contraceptives containing oestrogens advised by manufacturer of dabrafenib (alternative contraception recommended)
Diuretics: oestrogens antagonise diuretic effect of diuretics
  - Dopaminergics: oestrogens increase plasma concentration of ropinirole; oestrogens increase plasma concentration of selegiline—manufacturer of selegiline advises avoid concomitant use
Lipid-regulating Drugs: absorption of ethinylestradiol reduced by colesevelam; plasma concentration of ethinylestradiol increased by atorvastatin and rosuvastatin
Methyldopa: oestrogens antagonise hypotensive effect of methyldopa
- Modafinil: metabolism of oestrogens accelerated by modafinil (reduced contraceptive effect—see p. 536)
Moxonidine: oestrogens antagonise hypotensive effect of moxonidine
Muscle Relaxants: oestrogens possibly increase plasma concentration of tizanidine (increased risk of toxicity)
Nitrites: oestrogens antagonise hypotensive effect of nitrates
Somatropin: oestrogens (when used as oral replacement therapy) may increase dose requirements of somatropin
Tacrolimus: ethinylestradiol possibly increases plasma concentration of tacrolimus
Telithromycin: plasma concentration of ethinylestradiol increased by telithromycin
Theophylline: oestrogens increase plasma concentration of theophylline (consider reducing dose of theophylline)
Thyroid Hormones: oestrogens may increase requirements for thyroid hormones in hypothyroidism
 Vasodilator Antihypertensives: oestrogens antagonise hypotensive effect of hydralazine, minoxidil and sodium nitroprusside
Oestrogens, conjugated see Oestrogens

Appendix 1: Interactions

BNF 68
Antifungals: Ofloxacin see Quinolones 
Olanzapine see Antipsychotics 
Olmesartan see Angiotensin-II Receptor Antagonists 
Olsalazine see Aminosalicylates 
Omeprozole see Proton Pump Inhibitors 
Ondansetron see 5HT3-receptor Antagonists (under HT) 

Opioid Analgesics

Alcohol: enhanced hypotensive and sedative effects when opioid analgesics given with alcohol. 

Antineoplastics: General: fentanyl inhibits metabolism of etomidate (consider reducing dose of etomidate); opioid analgesics possibly enhance effects of intravenous general anaesthetics and volatile liquid general anaesthetics. 

Antibacterials: plasma concentration of fentanyl possibly increased by clarithromycin; plasma concentration of alfentanil increased by erythromycin; metabolism of alfentanil, codeine, fentanyl, methadone and morphine accelerated by rifampicin (reduced effect); metabolism of oxycodone possibly accelerated by rifampicin; manufacturer of pethidine advises avoid concomitant use with isoniazid; possible increased risk of ventricular arrhythmias when methadone given with telithromycin; metabolism of oxycodone inhibited by telithromycin. 

Anticoagulants: tramadol enhances anticoagulant effect of coumarins. 

Antidepressants: plasma concentration of methadone possibly increased by fluoxetine, fluvoxamine, paroxetine and sertraline; possible increased serotonergic effects when pethidine or tramadol given with duloxetine; possible increased serotonergic effects when tramadol given with mirtazapine or venlafaxine; possible increased serotonergic effects and increased risk of convulsions when tramadol given with MAOIs—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs; CNS excitation or depression (hypertension or hypotension) when pethidine given with MAOIs—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs; possible increased serotonergic effects when fentanyl given with MAOIs, SSRIs-related antidepressants or SSRIs; possible CNS excitation or depression (hypertension or hypotension) when opioid analgesics given with MAOIs—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs; possible increased risk of CNS toxicity when tramadol given with SSRIs or tricyclics; plasma concentration of methadone possibly reduced by St John’s wort; sedative effects possibly increased when opioid analgesics given with tricyclics. 

Antiepileptics: metabolism of fentanyl possibly accelerated by carbamazepine and phenytoin (reduced effect); dextropropoxyphene enhances effects of carbamazepine; effects of tramadol reduced by carbamazepine; plasma concentration of methadone reduced by carbamazepine and phenobarbital; morphine increases bioavailability of gabapentin; metabolism of methadone accelerated by phenytoin (reduced effect and risk of withdrawal effects); possible increased risk of pethidine toxicity when given with phenytoin. 

Antifungal metabolism of alfentanil inhibited by fluconazole (risk of prolonged or delayed respiratory depression); plasma concentration of methadone increased by fluconazole; metabolism of alfentanil possibly inhibited by itraconazole; plasma concentration of methadone possibly increased by itraconazole (increased risk of ventricular arrhythmias); plasma concentration of oxycodone increased by itraconazole and voriconazole; plasma concentration of alfentanil and methadone increased by voriconazole (consider reducing dose of alfentanil and methadone); plasma concentration of fentanyl possibly increased by triazoles. 

Antihistamines: sedative effects possibly increased when opioid analgesics given with sedating antihistamines. 

Antimicrobials: avoidance of methadone advised by manufacturer of zidovudine with artenimol (possible risk of ventricular arrhythmias). 

Antimuscarinics: possible increased risk of anti-muscarnic side-effects when codeine given with antimuscarinics. 

Antipsychotics: enhanced hypotensive and sedative effects when opioid analgesics given with antipsychotics; increased risk of ventricular arrhythmias when methadone given with antipsychotics that prolong the QT interval; increased risk of convulsions when tramadol given with antipsychotics; increased risk of ventricular arrhythmias when methadone given with eamsulpride—avoid concomitant use. 

Antivirals: plasma concentration of methadone possibly reduced by abacavir, nevirapine and rilpirivirine; plasma concentration of methadone possibly affected by boceprevir; possibly increased risk of prolonged sedation and respiratory depression when buprenorphine given with boceprevir; methadone possibly reduces plasma concentration of didanosine; plasma concentration of methadone reduced by efavirenz, fosamprenavir and ritonavir; plasma concentration of morphine possibly reduced by ritonavir; plasma concentration of alfentanil and fentanyl increased by ritonavir; plasma concentration of dextropropoxyphene increased by ritonavir (risk of toxicity)—avoid concomitant use; plasma concentration of buprenorphine possibly increased by ritonavir; plasma concentration of pethidine reduced by ritonavir, but plasma concentration of toxic pethidine metabolite increased (avoid concomitant use); increased risk of ventricular arrhythmias when methadone given with saquinavir—avoid concomitant use; caution with methadone advised by manufacturer of telaprevir (risk of ventricular arrhythmias); buprenorphine possibly reduces plasma concentration of tipranavir; methadone possibly increases plasma concentration of zidovudine. 

Anxiolytics and Hypnotics: increased sedative effects when opioid analgesics given with anxiolytics and hypnotics; fentanyl possibly inhibits metabolism of midazolam. 

Atomoxetine: increased risk of ventricular arrhythmias when methadone given with atomoxetine; possible increased risk of convulsions when tramadol given with atomoxetine. 

Beta-blockers: morphine possibly increases plasma concentration of esmolol. 

Calcium-channel Blockers: metabolism of alfentanil inhibited by diltiazem (risk of prolonged or delayed respiratory depression). 

Cytoxotics: possible increased risk of ventricular arrhythmias when methadone given with bosutinib; caution with alfentanil and fentanyl advised by manufacturer of vorozolinib; possible increased risk of ventricular arrhythmias when methadone given with vanetanib—avoid concomitant use. 

Dapoxetine: possible increased risk of serotoninergic effects when tramadol given with...
Opioid Analgesics
- Dapoxetine (continued)
  - dapoxetine (manufacturer of dapoxetine advises tramadol should not be started until 1 week after stopping dapoxetine; avoid dapoxetine for 2 weeks after stopping tramadol).
  
  Domperidone: opioid analgesics antagonise effects of domperidone on gastro-intestinal activity.
  
  Dopaminergics: risk of CNS toxicity when pethidine given with rasagiline (avoid pethidine for 2 weeks after rasagiline); avoid concomitant use of dextromethorphan with rasagiline; hyperpyrexia and CNS toxicity reported when pethidine given with seleagine (avoid concomitant use); avoidance of opioid analgesics advised by manufacturer of seleagine.
  
  5HT₁-receptor Antagonists: effects of tramadol possibly antagonised by ondansetron.
  
  Memantine: increased risk of CNS toxicity when dextromethorphan given with memantine (manufacturer of memantine advises avoid concomitant use).
  
  Metoclopramide: opioid analgesics antagonise effects of metoclopramide on gastro-intestinal activity.
  
  Muscle Relaxants: increased sedative effect when fentanyl or morphine given with baclofen.
  
  Nalmefene: avoidance of opioid analgesics advised by manufacturer of nalmefene.
  
  Sodium Oxibate: opioid analgesics enhance effects of sodium oxibate (avoid concomitant use).
  
  Ucer-healing Drugs: metabolism of opioid analgesics inhibited by cimetidine (increased plasma concentration).

Orlistat
- Anti-arhythmic: orlistat possibly reduces plasma concentration of amiodarone.

Anticoagulants: manufacturer of orlistat advises avoiding concomitant use with acarbose.

Antiepileptics: possible increased risk of convulsions when orlistat given with antiepileptics.

Antivirals: orlistat possibly reduces absorption of
- abacavir, atazanavir, darunavir, didanosine, efavirenz, elvitegravir, emtricitabine, enfuvirtide, etravirine, fosamprenavir, indinavir, lamivudine, lopinavir, maraviroc, nelfinavir, nevirapine, ritonavir, saquinavir, stavudine, emtricitabine, tenofovir and zidovudine.

Ciclosporin: orlistat possibly reduces absorption of ciclosporin.

Thyroid Hormones: possible increased risk of hyperthyroidism when orlistat given with levothyroxine.

Orphenadrine see Antimuscarinics.

Oxaliplatin see Platinum Compounds.

Oxandrolone see Anabolic Steroids.

Oxazepam see Anxiolytics and Hypnotics.

Oxcarbazepine
- Antiepileptics (continued)
  bolus of oxcarbazepine reduced; plasma concentration of an active metabolite of oxcarbazepine sometimes reduced by valproate.

Antimalarial: anticonvulsant effect of antiepileptics antagonised by mexitelone.

Antipsychotics: anticonvulsant effect of antiepileptics antagonised by antipsychotics (convulsive threshold lowered).

Antiviral: avoidance of oxcarbazepine advised by manufacturer of dolutenavir and sofosbuvir; avoidance of oxcarbazepine advised by manufacturer of rilpivirine (plasma concentration of rilpivirine possibly reduced).

Ciclosporin: oxcarbazepine possibly reduces plasma concentration of ciclosporin.

Clopidogrel: oxcarbazepine possibly reduces antiplatelet effect of clopidogrel.

Cytotoxics: oxcarbazepine reduces plasma concentration of etoposide—avoid concomitant use.

Cyclosporin: oxcarbazepine accelerates metabolism of ciclosporin (reduced contraceptive effect—see p. 536).

Orlistat: possible increased risk of convulsions when antiepileptics given with orlistat.

Progestogens: oxcarbazepine accelerates metabolism of progestogens (reduced contraceptive effect—see p. 536).

Oxynopholol see Beta-blockers.

Oxybutynin see Antimuscarinics.

Oxycodeone see Opioid Analgesics.

Oxytetracycline see Sympathomimetics.

Oxytetracycline see Tetracyclines.

Oxytocin
- Anaesthetics, General: oxytocic effect possibly reduced, also enhanced hypotensive effect and risk of arrhythmias when oxytocin given with volatile liquid general anaesthetics.

Anticoagulants: risk of hypertension when oxytocin given with vasocostractor sympathomimetics (due to enhanced vasopressor effect).

Paclitaxel
- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis).

Antivirals: plasma concentration of paclitaxel increased by ritonavir.

Cytotoxics: increased risk of neutropaenia when paclitaxel given with lopatinib.

Paliperidone see Antipsychotics.

Pamidronate Disodium see Bisphosphonates.

Pancreatin
- Antidiabetics: pancreatic antagonises hypoglycaemic effect of acarbose.

Pancuronium see Muscle Relaxants.

Pantoprazole see Proton Pump Inhibitors.

Papaveretum see Opioid Analgesics.

Paracetamol
- Anticoagulants: prolonged regular use of paracetamol possibly enhances anticoagulant effect of coumarins.

Antidiabetics: absorption of paracetamol possibly reduced when given 1 to 4 hours after lixisenatide.

Antiepileptics: metabolism of paracetamol possibly accelerated by carbamazepine, phenobarbital and phenytoin (also isolated reports of hepatotoxicity).

Cytotoxic: paracetamol possibly inhibits metabolism of intravenous busulfan (manufacturer of intravenous busulfan advises caution within 72 hours of paracetamol; caution with paracetamol advised by manufacturer of imatinib).

Lipid-regulating Drugs: absorption of paracetamol reduced by colesteamine.
Paracetamol (continued)
Metoclopramide: rate of absorption of paracetamol increased by metoclopramide

Paraldehyde
- Alcohol: increased sedative effect when paraldehyde given with alcohol
- Disulfiram: risk of toxicity when paraldehyde given with disulfiram

Parasympathomimetics
Anti-arrhythmics: effects of neostigmine and pyridostigmine possibly antagonised by propafenone
- Antibacterials: plasma concentration of galantamine increased by erythromycin; effects of neostigmine and pyridostigmine antagonised by trimethaphan; effects of neostigmine and pyridostigmine antagonised by clidamycin; effects of neostigmine and pyridostigmine antagonised by pyomyxin
- Antidepressants: plasma concentration of galantamine increased by paroxetine
- Antimalarials: effects of neostigmine and pyridostigmine may be diminished because of potential for chloroquine and hydroxychloroquine to increase symptoms of myasthenia gravis
- Antimuscarinics: effects of parasympathomimetics antagonised by antimuscarinics
- Beta-blockers: increased risk of arrhythmias when pilocarpine given with beta-blockers; effects of neostigmine and pyridostigmine antagonised by propranolol
- Cytotoxics: possible increased risk of bradycardia when pilocarpine given with crizotinib
- Lithium: effects of neostigmine antagonised by lithium
- Muscle Relaxants: donepezil possibly enhances effects of suxamethonium; edrophonium, galantamine, neostigmine, pyridostigmine and rivastigmine enhance effects of suxamethonium; edrophonium, neostigmine, pyridostigmine and rivastigmine antagonise effects of non-depolarising muscle relaxants; donepezil possibly antagonises effects of non-depolarising muscle relaxants

Paracoxib see NSAIDs

Paricalcitol see Vitamins

Paroxetine see Antidepressants, SSRI

Pasireotide
- Anti-diabetics: pasireotide possibly reduces requirements for antidiabetics
- Antimuscarinics: possible increased risk of bradycardia when pasireotide given with irapritropium or oxybutynin
- Beta-blockers: increased risk of bradycardia when pasireotide given with carteolol, metoprolol, propranolol or sotalol
- Calcium-channel Blockers: possible increased risk of bradycardia when pasireotide given with diltiazem or verapamil
- Ciclosporin: pasireotide possibly reduces plasma concentration of ciclosporin

Pazopanib (continued)
- Grapefruit Juice: manufacturer of pazopanib advises avoid concomitant use with grapefruit juice
- Ulcer-healing Drugs: absorption of pazopanib possibly reduced by histamine H2-antagonists—manufacturer of pazopanib advises give at least 2 hours before or 10 hours after histamine H2-antagonists; absorption of pazopanib possibly reduced by proton pump inhibitors—manufacturer of pazopanib advises give at the same time as proton pump inhibitors

Pegfilgrastim see Filgrastim

Peginterferon Alfa see Interferons

Pemetrexed
- Analgesics: renal excretion of pemetrexed possibly reduced by NSAIDs and aspirin—consult product literature
- Antimalarials: antifolate effect of pemetrexed increased by pyrimethamine
- Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)

Penicillamine
- Analgesics: increased risk of nephrotoxicity when penicillamine given with NSAIDs
- Antacids: absorption of penicillamine reduced by antacids
- Antipsychotics: avoid concomitant use of penicillamine with clozapine (increased risk of agranulocytosis)
- Cardiac Glycerolides: penicillamine possibly reduces plasma concentration of digoxin
- Gold: manufacturer of penicillamine advises avoid concomitant use with sodium aurothiomalate (increased risk of toxicity)
- Iron: absorption of penicillamine reduced by oral iron
- Zinc: penicillamine reduces absorption of zinc, also absorption of penicillamine reduced by zinc

Penicillins
- Allopurinol: increased risk of rash when amoxicillin or ampicillin given with allopurinol
- Antibacterials: absorption of phenoxymethylpenicillin reduced by neomycin; effects of penicillins possibly antagonised by tetracyclines
- Anticoagulants: an interaction between broad-spectrum penicillins and coumarins and phenindione has not been demonstrated in studies, but common experience in anticoagulant clinics is that INR can be altered
- Antiepileptics: manufacturer of pivmecillinam advises avoid concomitant use with valproate
- Cytotoxics: penicillins reduce excretion of methotrexate (increased risk of toxicity)
- Muscle Relaxants: piperacillin enhances effects of non-depolarising muscle relaxants and suxamethonium

Pentamidine
- Anti-arrhythmics: increased risk of ventricular arrhythmias when pentamidine isetionate given with amiodarone—avoid concomitant use; possible increased risk of ventricular arrhythmias when pentamidine isetionate given with edisopramide
- Antibacterials: increased risk of ventricular arrhythmias when pentamidine isetionate given with paraternal erythromycin; increased risk of ventricular arrhythmias when pentamidine isetionate given with moxifloxacin—avoid concomitant use; possible increased risk of ventricular arrhythmias when
**Pentamidine Isetionate**
- **Antibacterials (continued)** *peritrichomycin*
- **Antidepressants:** avoidance of pentamidine isetionate advised by manufacturer of *citalopram* and *eslicotralopram* (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when pentamidine isetionate given with *tricyclics*
- **Antifungals:** possible increased risk of nephrotoxicity when pentamidine isetionate given with *amphotericin*
- **Antimalarials:**
  - avoidance of pentamidine isetionate advised by manufacturer of *terprepirine with arte-nimol* (possible risk of ventricular arrhythmias)
  - *Antipsychotics:* possible increased risk of ventricular arrhythmias when pentamidine isetionate given with *antipsychotics*—*perparamealin*—avoid concomitant use
- **Cytotoxics:** possible increased risk of ventricular arrhythmias when pentamidine isetionate given with *pentoxifylline*
- **Antivirals:** increased risk of hypocalcaemia when *parenteral* pentamidine isetionate given with *foscarinet*; increased risk of ventricular arrhythmias when pentamidine isetionate given with *edacanavir*—avoid concomitant use
  - *Cytoplasmodium*: increased risk of ventricular arrhythmias when pentamidine isetionate given with *vandetanib*—avoid concomitant use
- *Cytotoxic*: increased risk of ventricular arrhythmias when pentamidine isetionate given with *ivabradine*

**Pentoxifylline**

**Pentazocine** *see Opioid Analgesics*

**Pentostatin**
- *Antipsychotics:* possible increased risk of ventricular arrhythmias when pentamidine isetionate given with *sulphasalazine*—avoid concomitant use
- *Cytoplasmodium*: increased risk of ventricular arrhythmias when pentamidine isetionate given with *edacanavir* (unacceptably high incidence of fatalities)

**Pentoxifylline**

**Perampanel**
- *Antiparkinsonian effects of antiepileptics possibly antagonised by* MAOIs and *tricyclic-related antidepresseants* (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by *SSRIs* and *tricyclics* (convulsive threshold lowered)
- *Antiepileptics:* plasma concentration of perampanel reduced by *carbamazepine*, *oxcarbazepine* and *phenytoin* (see Dose under Perampanel, p. 307); plasma concentration of perampanel reduced by *topiramate*
- **Antimalarials:** anticonvulsant effect of antiepileptics antagonised by *emefioquinone*
- *Antipsychotics:* anticonvulsant effect of antiepileptics antagonised by *antipsychotics* (convulsive threshold lowered)
- **Anticonvulsant effect of antiepileptics**
  - *Antiepileptics*: plasma concentration of perampanel reduced by *carbamazepine*, *oxcarbazepine* and *phenytoin* (see Dose under Perampanel, p. 307); plasma concentration of perampanel reduced by *topiramate*
- **Antimalarials:** anticonvulsant effect of antiepileptics antagonised by *emefioquinone*
- *Antipsychotics:* anticonvulsant effect of antiepileptics antagonised by *antipsychotics* (convulsive threshold lowered)
  - *Anticonvulsant effect of antiepileptics* possibly antagonised by *methadone*; anticonvulsant effect of antiepileptics antagonised by *other anticonvulsants given with* *bupropion*, *savagatran* and *esviroxaban* (avoid concomitant use except when switching with other anticonvulsants or using heparin to maintain catheter patency)
- **Antivirals:** anticonvulsant effect of phenindione possibly enhanced by *vinamidone*
- *Clopidogrel:* anticoagulant effect of phenindione enhanced due to antiplatelet action of *clopidogrel*
- *Corticosteroids:* anticoagulant effect of phenindione may be enhanced or reduced by *corticosteroids*
- *Dipyridamole:* anticoagulant effect of phenindione enhanced due to antiplatelet action of *dipyridamole*
  - *Corticosteroids:* anticoagulant effect of phenindione enhanced due to antiplatelet action of *dipyridamole*
  - *Clopidogrel:* anticoagulant effect of phenindione enhanced due to antiplatelet action of *dipyridamole*
  - *Corticosteroids:* anticoagulant effect of phenindione may be enhanced or reduced by *corticosteroids*
- **Enteral Foods:** anticoagulant effect of phenindione antagonised by vitamin K (present in some *enteral foods*)
  - *Roflotar*: increased risk of bleeding when phenindione given with *roflotar*
- **Lipid-regulating Drugs:** anticoagulant effect of phenindione antagonised by *colestyramine*; anticoagulant effect of phenindione possibly enhanced by *esuvastatin*; anticoagulant effect of phenindione enhanced by *fibrates*
- **Oestrogens:** anticoagulant effect of phenindione antagonised by *oestrogens*
- **Prazosin:** possible increased risk of bleeding when phenindione given with *prazosin*
- **Progestogens:** anticoagulant effect of phenindione antagonised by *progestogens*
Antibacterials:

- Testolactone: anticoagulant effect of phenindione enhanced by testolactone
- Testosterone: anticoagulant effect of phenindione enhanced by testosterone
- Thyroid Hormones: anticoagulant effect of phenindione enhanced by ebyrhoid hormones
- Vitamins: anticoagulant effect of phenindione antagonised by vitamin K

Phenobarbital

Note: Primidone interactions as for phenobarbital

- Alcohol: increased sedative effect when phenobarbital given with alcohol
- Analgesics: phenobarbital reduces plasma concentration of methadone; phenobarbital possibly accelerates metabolism of paracetamol (also isolated reports of hepatotoxicity)
- Anti-arrhythmics: phenobarbital accelerates metabolism of disopyramide (reduced plasma concentration); phenobarbital possibly reduces plasma concentration of dronedaron—avoid concomitant use; phenobarbital possibly accelerates metabolism of propranolol
- Antibacterials: phenobarbital accelerates metabolism of metronidazole (reduced effect); phenobarbital possibly reduces plasma concentration of rifampicin; phenobarbital accelerates metabolism of doxycycline (reduced plasma concentration); phenobarbital possibly accelerates metabolism of chloramphenicol (reduced plasma concentration); phenobarbital reduces plasma concentration of etyl bromycin (avoid during and for 2 weeks after phenobarbital)
- Antiacoagulents: phenobarbital possibly reduces plasma concentration of apixaban; phenobarbital accelerates metabolism of coumarins (reduced anticoagulant effect); phenobarbital possibly reduces plasma concentration of rivaroxaban (maker of rivaroxaban advises monitor for signs of thrombosis)
- Antidepressants: phenobarbital possibly reduces plasma concentration of reboxetine; phenobarbital reduces plasma concentration of paroxetine; phenobarbital accelerates metabolism of emianserin (reduced plasma concentration); anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIs and tricyclics (convulsive threshold lowered); plasma concentration of phenobarbital possibly reduced by St John’s wort—avoid concomitant use; phenobarbital possibly accelerates metabolism of tricyclics (reduced plasma concentration)
- Antiepileptics: plasma concentration of phenobarbital possibly increased by carbamazepine; phenobarbital possibly reduces plasma concentration of ethosuximide, rufinamide and topiramate; phenobarbital reduces plasma concentration of lamotrigine, tiagabine and zonisamide; plasma concentration of phenobarbital increased by oxcarbazepine, also plasma concentration of an active metabolite of oxcarbazepine reduced; plasma concentration of phenobarbital often increased by phenytoin, plasma concentration of phenytoin often reduced but may be increased; plasma concentration of phenobarbital increased by stiripentol; plasma concentration of phenobarbital increased by valproate (also plasma concentration of valproate reduced)
- Antifungals: phenobarbital possibly reduces plasma concentration of itraconazole and posaconazole; phenobarbital possibly reduces plasma concentration of voriconazole—avoid concomitant use; phenobarbital reduces absorption of griseofulvin (reduced effect)

Phenobarbital

- Antimarialis: avoidance of phenobarbital advised by manufacturer of piperequine with arteminol; anti-convulsant effect of antiepileptics antagonised by mefloquine
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by antipsychotics (convulsive threshold lowered); phenobarbital accelerates metabolism of haloperidol (reduced plasma concentration); plasma concentration of both drugs reduced when phenobarbital given with chlorpromazine; phenobarbital possibly reduces plasma concentration of aripiprazole (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); phenobarbital possibly reduces plasma concentration of clozapine
- Antivirals: phenobarbital possibly reduces plasma concentration of abacavir, darunavir, fosamprenavir, indinavir, lopinavir and saquinavir; avoidance of phenobarbital advised by manufacturer of voriconazole and ritipirine (plasma concentration of boceprevir and rifilviren possibly reduced); avoidance of phenobarbital advised by manufacturer of dolotegravir, elvitegravir, etravirine, sofubuvir and telaprevir
- Anxiolytics and Hypnotics: increased sedative effect when phenobarbital given with anxiolytics and hypnotics; phenobarbital often reduces plasma concentration of clonazepam
- Aprepitant: phenobarbital possibly reduces plasma concentration of aprepitant
- Avanafil: phenobarbital possibly reduces plasma concentration of avanafil—manufacturer of avanafil advises avoid concomitant use
- Beta-blockers: phenobarbital possibly reduces plasma concentration of propanolol
- Caffeine citrate: effects of phenobarbital possibly antagonised by caffeine citrate
- Calcium-channel Blockers: phenobarbital probably reduces effects of calcium-channel blockers; avoidance of phenobarbital advised by manufacturer of nimodipine (plasma concentration of nimodipine reduced)
- Ciclosporin: phenobarbital accelerates metabolism of ciclosporin (reduced plasma concentration)
- Cobicistat: phenobarbital possibly reduces plasma concentration of cobicistat—manufacturer of cobicistat advises avoid concomitant use
- Cytotoxic: phenobarbital possibly reduces plasma concentration of alkylating agents, platin compounds, topoisomerase inhibitors and vinca alkaloids; phenobarbital possibly reduces plasma concentration of busulfin and crizotinib—manufacturer of busulfan and crizotinib advises avoid concomitant use; avoidance of phenobarbital advised by manufacturer of abastaxel, dabrafenib and gefitinib; avoidance of phenobarbital advised by manufacturer of vandetanib (plasma concentration of vandetanib possibly reduced); phenobarbital possibly reduces plasma concentration of etoposide; phenobarbital reduces plasma concentration of irinotecan and its active metabolite; manufacturer of procabazine advises possible increased risk of hypersensitivity reactions when phenobarbital given with procabazine
- Diuretics: phenobarbital reduces plasma concentration of espereone—avoid concomitant use; increased risk of osteomalacia when phenobarbital given with carbonic anhydrase inhibitors
- Folates: plasma concentration of phenobarbital possibly reduced by folates
- Hormone Antagonists: phenobarbital possibly reduces plasma concentration of abiraterone—manufacturer of abiraterone advises avoid concomitant use;
Phenytoin

Antibacterials (continued)

Phenytoin reduces plasma concentration of sulfuramides; phenytoin reduces plasma concentration of thiouramycins (avoid during and for 2 weeks after phenytoin); plasma concentration of phenytoin increased by trimethoprim (also increased anti-foliate effect).

Anticoagulants: phenytoin possibly reduces plasma concentration of apixaban; phenytoin accelerates metabolism of coumarins (possibility of reduced anticoagulant effect, but enhancement also reported); phenytoin possibly reduces plasma concentration of dabigatran—manufacturer of dabigatran advises avoid concomitant use; phenytoin possibly reduces plasma concentration of rivaroxaban—manufacturer of rivaroxaban advises monitor for signs of thrombosis.

Antidepressants: plasma concentration of phenytoin increased by fluoxetine and fluvoxamine; phenytoin reduces plasma concentration of enanserin, mirtazapine and paroxetine; plasma concentration of phenytoin possibly increased by sertraline, also plasma concentration of sertraline possibly increased; anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related anti-depressants (convulsive threshold lowered); anti-convulsant effect of antiepileptics antagonised by SSRIs and tricyclics (convulsive threshold lowered); plasma concentration of phenytoin possibly reduced by St John’s wort—avoid concomitant use; phenytoin possibly reduces plasma concentration of escitalopram.

Antidiabetics: plasma concentration of phenytoin transiently increased by tolbutamide (possibility of toxicity).

Antiepileptics: plasma concentration of both drugs often reduced when phenytoin given with carbamazepine, also plasma concentration of phenytoin may be increased; phenytoin reduces plasma concentration of eslicarbazepine, also plasma concentration of phenytoin increased; plasma concentration of phenytoin possibly increased by ethosuximide, also plasma concentration of ethosuximide possibly reduced; phenytoin reduces plasma concentration of lamotrigine, tiagabine and zonisamide; plasma concentration of phenytoin increased or possibly reduced when given with valproate; plasma concentration of active metabolite of oxcarbazepine reduced; phenytoin reduces plasma concentration of perampanel (see Dose under Perampanel, p. 307); phenytoin often increases plasma concentration of phenytoin often reduced but may be increased; phenytoin possibly reduces plasma concentration of retigabine; phenytoin possibly reduces plasma concentration of rufinamide, also plasma concentration of phenytoin increased or possibly reduced when given with valproate, also plasma concentration of valproate reduced; plasma concentration of phenytoin reduced by vigabatrin.

Antifungals: anticonvulsant effect of phenytoin enhanced by micafungin (plasma concentration of phenytoin increased); plasma concentration of phenytoin increased by fluconazole (consider reducing dose of phenytoin); phenytoin reduces plasma concentration of itraconazole—avoid concomitant use; phenytoin reduces plasma concentration of posaconazole; plasma concentration of phenytoin increased by voriconazole, also phenytoin reduces...
Appendix 1: Interactions

Phenytoin

- Antifungals (continued)
  - plasma concentration of voriconazole (increase dose of voriconazole and also monitor for phenytoin toxicity); phenytoin possibly reduces plasma concentration of caspofungin—consider increase dose of caspofungin
- Antimalarials: avoidance of phenytoin advised by manufacturer of piperaquine with artemisinin; anticonvulsant effect of antiepileptics antagonised by mefloquine; anticonvulsant effect of phenytoin antagonised by pyrimethamine, also increased antifolate effect
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by carbamazepine and phenobarbital (reduced plasma concentration)
- Antivirals: phenytoin possibly reduces plasma concentration of abacavir, darunavir, lopinavir and saquinavir; avoidance of phenytoin advised by manufacturer of boceprevir and ritonavir (plasma concentration of boceprevir and ritonavir possibly reduced); avoidance of phenytoin advised by manufacturer of dolotegravir, elvitegravir, etravirine,osophuvir and oselaprevir; phenytoin possibly reduces plasma concentration of nelfinavir, also plasma concentration of phenytoin possibly increased; phenytoin possibly reduces plasma concentration of ritonavir, also plasma concentration of phenytoin possibly affected; plasma concentration of phenytoin increased or decreased by zidovudine
- Anxiolytics and Hypnotics: phenytoin possibly reduces plasma concentration of clonazepam; plasma concentration of phenytoin possibly increased or decreased by benzodiazepines
- Aprepitant: phenytoin possibly reduces plasma concentration of aprepitant
- Bupropion: phenytoin reduces plasma concentration of bupropion
- Caffeine citrate: phenytoin reduces plasma concentration of caffeine citrate
- Calcium-channel Blockers: phenytoin reduces effects of felodipine and verapamil; avoidance of phenytoin advised by manufacturer of nimodipine (plasma concentration of nimodipine possibly reduced); plasma concentration of phenytoin increased by diltilazem but also effect of diltiazem reduced
- Cardiac Glycosides: phenytoin possibly reduces plasma concentration of digoxin
- Ciclosporin: phenytoin accelerates metabolism of ciclosporin (reduced plasma (avoid concomitant use; increased risk of osteomalacia when phenytoin given with carbonic anhydrase inhibitors
- Diazoxide: plasma concentration of phenytoin reduced by diazoxide, also effect of diazoxide may be reduced
- Disulfiram: metabolism of phenytoin inhibited by disulfiram (increased risk of toxicity)
- Diuretics: plasma concentration of phenytoin possibly increased by acetazolamide; phenytoin antagonises effects of furosemide; phenytoin reduces plasma concentration of spironolactone—avoid concomitant use; increased risk of osteomalacia when phenytoin given with carbolic acid and anaesthetic agents
- Dopaminergics: phenytoin possibly reduces effects of levodopa
- Enteral Foods: absorption of phenytoin possibly reduced by enteral feeds
- Folates: plasma concentration of phenytoin possibly reduced by folates
- Hormone Antagonists: phenytoin possibly reduces plasma concentration of abiraterone—manufacturer of abiraterone advises avoid concomitant use; phenytoin possibly accelerates metabolism of toremifene
- H3-receptor Antagonists: phenytoin accelerates metabolism of omdansetron (reduced effect)
- ICAVATOR: phenytoin possibly reduces plasma concentration of ivacaftor—manufacturer of ivacaftor advises avoid concomitant use; increased risk of osteomalacia when phenytoin given with carbolic acid and anaesthetic agents
- Lipid-regulating Drugs: absorption of phenytoin possibly reduced by colesevelam; combination of phenytoin with lovastatin may increase plasma concentration of either drug (or both)
- Lithium: neurotoxicity may occur when phenytoin given with lithium without increased plasma concentration of lithium
- Machtentan: avoidance of phenytoin advised by manufacturer of machtentan
- Modafinil: plasma concentration of phenytoin possibly increased by modafinil
- Muscle Relaxants: long-term use of phenytoin reduces effects of non-depolarising muscle relaxants (but acute use of phenytoin might increase effects of non-depolarising muscle relaxants
- Oestrogens: phenytoin accelerates metabolism of oestrogens (reduced contraceptive effect—see p. 536)
- Orlistat: possible increased risk of convulsions when antiepileptics given with orlistat
- Progestogens: phenytoin accelerates metabolism of progestogens (reduced contraceptive effect—see p. 536)
- Roflumilast: phenytoin possibly inhibits effects of roflumilast (manufacturer of roflumilast advises avoid concomitant use)
- Sulfinpyrazone: plasma concentration of phenytoin increased by sulfinpyrazone
- Symptomonimetics: plasma concentration of phenytoin increased by methylphenidate
Phenytoin (continued)

Tacrolimus: phenytoin reduces plasma concentration of tacrolimus, also plasma concentration of phenytoin possibly increased

- Theophylline: plasma concentration of both drugs reduced when phenytoin given with theophylline

Thyroid Hormones: phenytoin accelerates metabolism of thyroid hormones (may increase requirements in hypothyroidism), also plasma concentration of phenytoin possibly increased

Tibolone: phenytoin accelerates metabolism of tibolone

Ticagrelor: phenytoin possibly reduces plasma concentration of ticagrelor

- Ulcer-healing Drugs: metabolism of phenytoin inhibited by esomeprazole; effects of phenytoin possibly enhanced by omeprazole; absorption of phenytoin reduced by sucralfate

- Ulipristal: avoidance of enoximone and milrinone

Vaccines: effects of phenytoin enhanced by influenza vaccine

Pharmacokinetics: phenytoin possibly increases requirements for vitamin D

Pholcodine

Antidepressants: manufacturer of pholcodine advises avoid for 2 weeks after stopping MAOIs

Phosphodiesterase Type-3 Inhibitors

- Anagrelide: avoidance of enoximone and milrinone advised by manufacturer of anagrelide

Physostigmine see Parasympathomimetics

Pilocarpine see Parasympathomimetics

Pimozide see Antipsychotics

Pindolol see Beta-blockers

Piroglitazone see Antidiabetics

Piperacillin see Penicillins

Piperazinone see Piperazine with Artenimol

Piperazine with Artenimol

Note Piperazine has a long half-life; there is a potential for drug interactions to occur for up to 3 months after treatment has been stopped

- Analgesics: manufacturer of piperazine with artemizol advises avoid concomitant use with methadone (possible risk of ventricular arrhythmias)

- Antibiotics: manufacturer of piperazine with artemizol advises avoid concomitant use with amiodarone and disopyramide (possible risk of ventricular arrhythmias)

- Antibacterials: manufacturer of piperazine with artemizol advises avoid concomitant use with nafcillin and moxifloxacin (possible risk of ventricular arrhythmias); manufacturer of piperazine with artemizol advises avoid concomitant use with rifampicin

- Antidepressants: avoidance of antimalarials advised by manufacturer of cilazapram and escitalopram (risk of ventricular arrhythmias); manufacturer of piperazine with artemizol advises avoid concomitant use with antidepresants

Antiepileptics: manufacturer of piperazine with artemizol advises avoid concomitant use with carbamazepine, phenobarbital and phenytoin

- Antifungals: manufacturer of piperazine with artemizol advises avoid concomitant use with miconazole and itraconazole (possible risk of ventricular arrhythmias)

- Antihistamines: manufacturer of piperazine with artemizol advises avoid concomitant use with mizolastine (possible risk of ventricular arrhythmias)

- Antimalarials: avoidance of antimalarials advised by manufacturer of artemether with lumefantrine

Piperazine with Artenimol (continued)

- Antipsychotics: manufacturer of piperazine with artemizol advises avoid concomitant use with droperidol, haloperidol, phenothiazines and pimozide (possible risk of ventricular arrhythmias)

- Antivirals: manufacturer of piperazine with artemizol advises avoid concomitant use with saquinavir (possible risk of ventricular arrhythmias)

- Beta-blockers: manufacturer of piperazine with artemizol advises avoid concomitant use with sotalol (possible risk of ventricular arrhythmias)

- Cytotoxics: manufacturer of piperazine with artemizol advises avoid concomitant use with arsenic trioxide (possible risk of ventricular arrhythmias); manufacturer of piperazine with artemizol advises avoid concomitant use with vinblastine, vincristine, vinflunine and vinorelbine

- Domperidone: manufacturer of piperazine with artemizol advises avoid concomitant use with domperidone (possible risk of ventricular arrhythmias); manufacturer of piperazine with artemizol advises avoid concomitant use with grapefruit juice

Histamine: avoidance of antimalarials advised by manufacturer of histamine

- Pentamidine isethionate: manufacturer of piperazine with artemizol advises avoid concomitant use with pentamidine isethionate (possible risk of ventricular arrhythmias)

Vaccines: antimalarials inactivate oral typhoid vaccine—see p. 850

Piperoxan see Antipsychotics

Pipemidic acid see Antipsychotics

Pixantrone see Antipsychotics

- Antipsychotics: avoid concomitant use of cytoxotics with vinorelbine (increased risk of agranulocytosis)

- Vaccines: avoid concomitant use of pixantrone with live vaccines (see p. 828)

Piroxicam see NSAIDs

Pivmecillinam see Penicillins

Pizotifen

Adrenergic Neurone Blockers: pizotifen antagonises hypotensive effect of adrenergic neurone blockers

Platinum Compounds

Aldesleukin: avoidance of cisplatin advised by manufacturer of aldesleukin

- Antibacterials: increased risk of nephrotoxicity and possibly of otoxicity when platinum compounds given with aminoglycosides or polymyxins; increased risk of nephrotoxicity and otoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and possibly of otoxicity when cisplatin given with vancomycin

Antiepileptics: cisplatin possibly reduces plasma concentration of phenytoin

- Antipsychotics: avoid concomitant use of cytoxotics with olanzapine (increased risk of agranulocytosis)

- Cytotoxics: increased risk of otoxicity when cisplatin given with bleomycin and methotrexate

Diuretics: increased risk of nephrotoxicity and otoxicity when platinum compounds given with diuretics

Polymyxin B see Polymyxins

Polymyxins

Antibacterials: increased risk of nephrotoxicity when colistimethate sodium or polymyxins given with
Appendix 1: Interactions

### Polymyxins
**Antibacterials (continued)**
- **aminoglycosides**: increased risk of nephrotoxicity when collistimethate sodium or polymyxins given with *capreomycin*; increased risk of nephrotoxicity when polymyxins given with *vancomycin*; increased risk of nephrotoxicity and ototoxicity when collistimethate sodium given with *vancomycin*
  - Ciclosporin: increased risk of nephrotoxicity when polymyxins given with *ciclosporin*
  - Cytotoxics: increased risk of nephrotoxicity and possibly of ototoxicity when polymyxins given with *platinum compounds*
  - **Diuretics**: increased risk of oxicotyoxity when polymyxins given with *loop diuretics*
  - Muscle Relaxants: polymyxins enhance effects of
    - *non-depolarising muscle relaxants* and *moxa-methodon*
  - Parasympathomimetics: polymyxins antagonise effects of
    - *neostigmine* and *pyridostigmine*
  - **Vaccines**: antibacterials inactivate oral typhoid vaccine—see p. 850

### Polystyrene Sulfonate Resins
**Antacids**: risk of intestinal obstruction when polystyrene sulfonate resins given with *aluminium hydroxide*; risk of metabolic alkalosis when polystyrene sulfonate resins given with *oral magnesium salts*

### Potassium Salts
**Potassium Salts**
- *Potassium Salts* see
- **Potassium Salts** see

### Potassium Canrenoate
**Potassium Canrenoate** see

### Potassium Bicarbonate
**Potassium Bicarbonate** see Potassium Salts

### Potassium Citrate
**Potassium Citrate** see Potassium Salts

**Potassium Salts**
- **Note**: Includes salt substitutes
  - **ACE Inhibitors**: increased risk of severe hyperkalaemia when potassium salts given with
    - *ACE inhibitors* *Aliskiren*: increased risk of hyperkalaemia when potassium salts given with *aliskiren*
  - **Angiotensin-II Receptor Antagonists**: increased risk of hyperkalaemia when potassium salts given with
    - *Angiotensin-II receptor antagonists* *Aldosterone antagonists*
  - **Antibacterials**: avoid concomitant use of potassium citrate with *methenamine*
  - Ciclosporin: increased risk of hyperkalaemia when potassium salts given with *ciclosporin*
  - Diuretics: increased risk of hyperkalaemia when potassium salts given with
    - *potassium-sparing diuretics* and *aldosterone antagonists*
  - Tacrolimus: increased risk of hyperkalaemia when potassium salts given with *tacrolimus*

**Ulcet-healing Drugs**: avoidance of potassium citrate advised by manufacturer of *sucrefat*

### Pramipexole
**Antipsychotics**: manufacturer of pramipexole advises avoid concomitant use of *antipsychotics* (agonism of effect)

**Memantine**: effects of dopaminergics possibly enhanced by *memantine*

**Methylidopa**: antiparkinsonian effect of dopaminergics antagonised by *methylidopa*

*Pramipexole (continued)*
- Ulcer-healing Drugs: excretion of pramipexole reduced by *cimetidine* (increased plasma concentration)

### Prasugrel
**Analgesics**: possible increased risk of bleeding when prasugrel given with *NSAIDs*

**Anticoagulants**: possible increased risk of bleeding when prasugrel given with *coumarins* or *phenindione*

**Clevidoprole**: possible increased risk of bleeding when prasugrel given with *clevidoprole*

**Pravastatin** see Statin

**Prazosin** see Alpha-blockers

**Prednisolone** see Corticosteroids

**Prednisone** see Corticosteroids

### Pregabalin
- **Antidepressants**: anticonvulsant effect of antiepileptics possibly antagonised by *MAOIs* and *tricyclic-related antidepressants* (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by *SSRIs* and *tricyclics* (convulsive threshold lowered)

**Antimalarials**: anticonvulsant effect of antiepileptics antagonised by *neefloquine*

**Antipsychotics**: anticonvulsant effect of antiepileptics antagonised by *antipsychotics* (convulsive threshold lowered)

**Oritstat**: possible increased risk of convulsions when antiepileptics given with *orlistat*

### Prilocaine
**Anti-arrhythmics**: increased myocardial depression when prilocaine given with *anti-arrhythmics*

**Antibacterials**: increased risk of methaemoglobinemia when prilocaine given with *sulfonamides*

### Primaquine
- **Antidepressants**: avoidance of antimalarials advised by manufacturer of *eitalopram* and *escitalopram* (risk of ventricular arrhythmias)

**Antimalarials**: avoidance of antimalarials advised by manufacturer of *artemether* with *lumefantrine*

**Histamine**: avoidance of antimalarials advised by manufacturer of *histamine*

**Mepacrine**: plasma concentration of primaquine increased by *mepacrine* (increased risk of toxicity)

**Vaccines**: antimalarials inactivate oral typhoid vaccine—see p. 850

### Primidone
**See Phenobarbital**

### Probenecid
**ACE Inhibitors**: probenecid reduces excretion of *captopril*

**Anaesthetics, General**: probenecid possibly enhances effects of *thiopental*

**Analgesics**: probenecid reduces excretion of
  - *acemetacain*, *dextketoprofain*, *indometacain*, *ketoprofain* and *naproxen* (increased plasma concentration)—avoid concomitant use; effects of probenecid antagonised by *aspirin*

**Antibacterials**: probenecid reduces excretion of *meropenem*; probenecid reduces excretion of *cephalosporins*, *ciprofloxacin*, *nalidixic acid*, *norfloxacain* and *pencillins* (increased plasma concentration); probenecid reduces excretion of *dapsone* and *nitrofurantoin* (increased risk of side-effects); effects of probenecid antagonised by *pyrazinamide*

**Antivirals**: probenecid reduces excretion of *aciclovir* (increased plasma concentration); probenecid possibly reduces excretion of *famciclovir* (increased plasma concentration); probenecid reduces excretion of *ganciclovir* and *cidofovir* (increased plasma concentration and risk of toxicity)

**Anxiolytics and Hypnotics**: probenecid reduces excretion of *lorazepam* (increased plasma concentration);
Probenecid

Antiepileptics: probenecid possibly reduces excretion of cyclosporin and ciclosporin, possibly increases plasma concentration of ciclosporin and ciclosporin.

Procarbazine

Cardiac Glycosides: probenecid possibly reduces excretion of digoxin, tends to increase plasma concentration of digoxin, tends to increase plasma concentration of digoxin.

Prochlorperazine

Ciclosporin: probenecid possibly reduces excretion of ciclosporin, tends to increase plasma concentration of ciclosporin.

Propafenone

Teriflunomide: probenecid possibly increases plasma concentration of teriflunomide.

Promethazine

Antidepressants: probenecid increases plasma concentration of amitriptyline, increases plasma concentration of desipramine, increases plasma concentration of imipramine, increases plasma concentration of mianserin.

Propafenone

β-blockers: probenecid possibly increases plasma concentration of norgestimate, tends to increase plasma concentration of levonorgestrel.

Promazine

Antidepressants: probenecid possibly increases plasma concentration of desipramine.

Promethazine

Antidepressants: probenecid possibly increases plasma concentration of nortriptyline.

Propafenone

β-blockers: probenecid possibly increases plasma concentration of norgestimate.

Progestogens (continued)

• Bosentan: possible contraceptive failure of hormonal contraceptives containing progestogens when given with bosentan (alternative contraception recommended).

Ciclosporin: progestogens possibly increase plasma concentration of ciclosporin.

Cobicistat: plasma concentration of norgestimate possibly increased by cobicistat.

Cytotoxics: possible reduction in contraceptive effect of progestogens when given with efavirenz and lamivudine; possible reduced contraceptive effect of hormonal contraceptives containing progestogens when given with efavirenz (alternative contraception recommended).

Diuretics: risk of hyperkalaemia when propranolol is given with potassium-sparing diuretics and aldosterone antagonists (monitor serum potassium during first cycle).

Dopaminergics: progestogens possibly increase plasma concentration of delepine—manufacturer of selegiline advises avoid concomitant use.

Lipid-regulating Drugs: plasma concentration of nor-ethisterone increased by atorvastatin; plasma concentration of norgestimate increased by rosuvastatin; plasma concentration of norgestrel increased by rosuvastatin.

Muscle Relaxants: progestogens possibly increase plasma concentration of tizanidine.

Sugammadex: plasma concentration of progestogens possibly reduced by sugammadex—manufacturer of sugammadex advises additional contraceptive precautions.

Teriflunomide: plasma concentration of levonorgestrel increased by teriflunomide.

Ulipristal: contraceptive effect of progestogens possibly reduced by ulipristal.

Progauan

Antacids: absorption of proguanil is reduced by oral magnesium salts (as magnesium trisilicate).

Anticoagulants: isolated reports that proguanil may enhance anticoagulant effect of warfarin.

Antidepressants: avoidance of antimalarials advised by manufacturer of efavirenz.

Antimalarials: antifolate effect when proguanil given with pyrimethamine.

Antivirals: plasma concentration of proguanil possibly increased by efavirenz.

Histamine: avoidance of antimalarials advised by manufacturer of histamine.

Vaccines: antimalarials inactivate oral typhoid vaccine—see p. 850.

Promazine see Antipsychotics

Promethazine see Antihistamines

Propafenone

Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with bupivacaine, levobupivacaine, prilocaine or ropivacaine.

Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other anti-arrhythmics.

Antibacterials: metabolism of propafenone accelerated by phenobarbital.

Antidepressants: metabolism of propafenone possibly inhibited by fluoxetine and paroxetine; increased risk of arrhythmias when propafenone given with tricyclics.

Antipsychotics: metabolism of propafenone possibly accelerated by phenobarbital.

Appendix 1: Interactions
Propafenone (continued)
Antihistamines: avoidance of propafenone advised by manufacturer of mizolastine (possible risk of ventricular arrhythmias)
Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with antipsychotics that prolong the QT interval
Antivirals: plasma concentration of propafenone possibly increased by fosamprenavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of propafenone increased by ritonavir (increased risk of ventricular arrhythmias—avoid concomitant use); increased risk of ventricular arrhythmias when propafenone given with saquinavir—avoid concomitant use; caution with propafenone advised by manufacturer of telaprevir (risk of ventricular arrhythmias)
Beta-blockers: increased myocardial depression when anti-arrhythmics given with beta-blockers; propafenone increases plasma concentration of metoprolol and propranolol
Cardiac Glycosides: propafenone increases plasma concentration of digoxin
Ciclosporin: propafenone possibly increases plasma concentration of ciclosporin
Parasympathomimetics: propafenone possibly antagonises effects of neostigmine and pyridostigmine
Theophylline: propafenone increases plasma concentration of theophylline
Ulcer-healing Drugs: plasma concentration of propafenone increased by cimetidine
Propantheline see Antimuscarinics
Propiverine see Antimuscarinics
Propofol see Beta-blockers
Prostaglandins
ACE Inhibitors: enhanced hypotensive effect when alprostadil given with ACE inhibitors
Adrenergic Neurone Blockers: enhanced hypotensive effect when alprostadil given with adrenergic neurone blockers
Alpha-blockers: enhanced hypotensive effect when alprostadil given with alpha-blockers
Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when alprostadil given with angiotensin-II receptor antagonists
Beta-blockers: enhanced hypotensive effect when alprostadil given with beta-blockers
Calcium-channel Blockers: enhanced hypotensive effect when alprostadil given with calcium-channel blockers
Clonidine: enhanced hypotensive effect when alprostadil given with clonidine
Diazoxide: enhanced hypotensive effect when alprostadil given with diazoxide
Diuretics: enhanced hypotensive effect when alprostadil given with diuretics
Methyldopa: enhanced hypotensive effect when alprostadil given with methyldopa
Moxonidine: enhanced hypotensive effect when alprostadil given with moxonidine
Nitrate: enhanced hypotensive effect when alprostadil given with nitrates
Oxytocin: prostaglandins potentiate uterotent effect of oxytocin
Vasodilator Antihypertensives: enhanced hypotensive effect when alprostadil given with hydralazine, minoxidil or sodium nitroprusside
Protein Kinase Inhibitors see individual drugs
Proton Pump Inhibitors
Antacids: absorption of lansoprazole possibly reduced by antacids
Antibacterials: plasma concentration of both drugs increased when omeprazole given with clarithromycin

Proton Pump Inhibitors (continued)
Anticoagulants: pantoprazole might enhance the anticoagulant effect of coumarins; esomeprazole and omeprazole possibly enhance anticoagulant effect of coumarins
Antidepressants: omeprazole increases plasma concentration of escitalopram; plasma concentration of lansoprazole possibly increased by fluvoxamine; plasma concentration of omeprazole possibly reduced by St John’s wort
Antiepileptics: omeprazole possibly enhances effects of phenytoin; esomeprazole enhances effects of phenytoin
Antifungals: proton pump inhibitors reduce absorption of itraconazole; esomeprazole reduces plasma concentration of posaconazole—manufacturer of posaconazole suspension advises avoid concomitant use; lansoprazole, omeprazole, pantoprazole and rabeprazole possibly reduce plasma concentration of posaconazole; manufacturer of posaconazole suspension advises avoid concomitant use; plasma concentration of esomeprazole possibly increased by voriconazole; plasma concentration of omeprazole increased by voriconazole (consider reducing dose of omeprazole)
Antipsychotics: omeprazole possibly reduces plasma concentration of clozapine
Antiarrhythmics: proton pump inhibitors reduce plasma concentration of atazanavir—avoid or adjust dose of both drugs (consult product literature); omeprazole increases plasma concentration of raltegravir; omeprazole reduces plasma concentration of raltegravir—avoid concomitant use; plasma concentration of omeprazole possibly increased by voriconazole; plasma concentration of omeprazole increased by voriconazole (consider reducing dose of omeprazole)
Clotazol: omeprazole increases plasma concentrations of clotazol (see Dose under Clotazol, p. 140)
Clopidogrel: esomeprazole and omeprazole reduce antiplatelet effect of clopidogrel; lansoprazole, pantoprazole and rabeprazole possibly reduce antiplatelet effect of clopidogrel
Cytotoxics: proton pump inhibitors possibly reduce excretion of methotrexate (increased risk of toxicity); lansoprazole reduces plasma concentration of bosutinib; esomeprazole reduces plasma concentration of dabrafenib (plasma concentration of dabrafenib possibly reduced); avoidance of esomeprazole, lansoprazole, pantoprazole and rabeprazole advised by manufacturer of erlotinib—manufacturer of erlotinib advises avoid concomitant use; proton pump inhibitors possibly reduce absorption of lapatinib; proton pump inhibitors possibly reduce absorption of pazopanib—manufacturer of pazopanib advises give at the same time as proton pump inhibitors
Tacrolimus: omeprazole possibly increases plasma concentration of tacrolimus
Proton Pump Inhibitors (continued)

Ulcercating Drugs: absorption of lansoprazole possibly reduced by sucralfate
- Ulipristal: avoidance of proton pump inhibitors advised by manufacturer of high-dose ulipristal (contraceptive effect of ulipristal possibly reduced)

Quetiapine

Cytotoxics:

Pyridoxine

Pyrazinamide

Pseudoephedrine see Symptomomimetics

Pyrazinamide

Probencid: pyrazinamide antagonises effects of probenecid

Sulfinpyrazone: pyrazinamide antagonises effects of sulfinpyrazone

Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850

Pyridostigmine see Parasympathomimetics

Pyrimethamine

Antibacterials: increased antifolate effect when pyrimethamine given with sulphonamides or trimethoprím

Antidepressants: avoidance of antibacterials advised by manufacturer of citalopram and esicitalopram (risk of ventricular arrhythmias)

Antiepileptics: pyrimethamine antagonises anticonvulsant effect of phenytoin, also increased anti-folate effect

Antimalarials: avoidance of antibacterials advised by manufacturer of trimethoprim with lufenamate; increased antifolate effect when pyrimethamine given with proguanil

Antivirals: increased antifolate effect when pyrimethamine given with trimethoprim

Cytotoxics: pyrimethamine increases antifolate effect of methotrexate and metemtxedex

Histamine: avoidance of antibacterials advised by manufacturer of histamine

Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850

Quetiapine see Antipsychotics

Quinagolide

Memantine: effects of dopaminergics possibly enhanced by memantine

Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa

Quinapril see ACE Inhibitors

Quinine

Anti-arrhythmics: increased risk of ventricular arrhythmias when quinine given with amiodarone—avoid concomitant use; quinine increases plasma concentration of flecainide

Antibacterials: increased risk of ventricular arrhythmias when quinine given with moxifloxacin—avoid concomitant use; plasma concentration of quinine reduced by rifampicin

Anticoagulants: plasma concentration of both drugs increased when quinine given with warfarin

Antidepressants: avoidance of antibacterials advised by manufacturer of citalopram and escitalopram (risk of ventricular arrhythmias)

Antimalarials: avoidance of antibacterials advised by manufacturer of trimethoprim with lufenamate; increased risk of ventricular arrhythmias when quinine given with moxifloxacin; increased risk of convulsions when quinine given with intravenous quinine in severe cases

Antipsychotics: increased risk of ventricular arrhythmias when quinine given with droperidol or pimozide—avoid concomitant use; possible increased risk of ventricular arrhythmias when quinine given with haloperidol—avoid concomitant use; possible increased risk of ventricular arrhythmias when quinine given with risperidone

Antivirals: plasma concentration of quinine possibly increased by lopinavir, ritonavir, darunavir, nelfinavir

Quinidine

Analgesics: possible increased risk of convulsions when quinolones given with NSAIDs

Antacids: absorption of ciprofloxacin, levofloxacin, moxifloxacin, norfloxacin and ofloxacin reduced by antacids

Anti-arrhythmics: increased risk of ventricular arrhythmias when levofloxacin or moxifloxacin given with amiodarone—avoid concomitant use; increased risk of ventricular arrhythmias when moxifloxacin given with disopyramide—avoid concomitant use

Antibacterials: increased risk of ventricular arrhythmias when moxifloxacin given with piperacillin, ciprofloxacin or levofloxacin—avoid concomitant use; effects of nalidixic acid possibly antagonised by nitrofurantoin; possible increased risk of ventricular arrhythmias when moxifloxacin given with sulphonamides

Anticoagulants: ciprofloxacin and levofloxacin possibly enhance anticoagulant effect of coumarins; nalidixic acid, norfloxacin and ofloxacin enhance anti-coagulant effect of coumarins; levofloxacin possibly enhances anticoagulant effect of phenindione

Antidepressants: avoidance of moxifloxacin advised by manufacturer of citalopram and escitalopram (risk of ventricular arrhythmias); ciprofloxacin inhibits metabolism of duloxetine—avoid concomitant use; avoidance of ciprofloxacin advised by manufacturer of paroxetine; increased risk of ventricular arrhythmias when moxifloxacin given with trimethoprim; increased risk of ventricular arrhythmias when moxifloxacin given with trimethoprim—avoid concomitant use

Antidiabetics: norfloxacin possibly enhances effects of glibenclamide

Antipsychotics: ciprofloxacin increases or decreases plasma concentration of phenytoin

Antihistamines: increased risk of ventricular arrhythmias when moxifloxacin given with azathioprine—avoid concomitant use

Antimalarials: avoidance of moxifloxacin advised by manufacturer of piperacillin with tazobactam (possible risk of ventricular arrhythmias); ciprofloxacin inhibits metabolism of sulfonamides—avoid concomitant use; avoidance of moxifloxacin advised by manufacturer of trimethoprim with sulfonamides; increased risk of ventricular arrhythmias when moxifloxacin given with chloroquine and hydroxychloroquine, sulphonamides or quinine—avoid concomitant use

Antipsychotics: increased risk of ventricular arrhythmias when moxifloxacin given with benperidol—manufacturer of benperidol advises avoid concomitant use; increased risk of ventricular arrhythmias when moxifloxacin given with droperidol, haloperidol, pimozide or clozapine;
Appendix 1: Interactions

Quinolones
- Antipsychotics (continued): ciprofloxacin possibly increases plasma concentration of olanzapine
- Antivirals: manufacturer of norfloxacin advises give didanosine at least 2 hours before or after norfloxacin; increased risk of ventricular arrhythmias when moxifloxacin given with <i>saquinavir</i>—avoid concomitant use
- Atomoxetine: increased risk of ventricular arrhythmias when moxifloxacin given with <i>atomoxetine</i>
- Beta-blockers: increased risk of ventricular arrhythmias when moxifloxacin given with <i>sotalol</i>—avoid concomitant use
- Calcium Salts: absorption of ciprofloxacin reduced by calcium salts
- Ciclosporin: increased risk of nephrotoxicity when quinolones given with <i>ciclosporin</i>
- Clopidogrel: ciprofloxacin possibly reduces antiplatelet effect of <i>clopidogrel</i>
- Cytotoxics: nalidixic acid increases risk of melphalan toxicity; ciprofloxacin possibly reduces excretion of methotrexate (increased risk of toxicity); possible increased risk of ventricular arrhythmias when moxifloxacin given with <i>bosutinib</i>; ciprofloxacin possibly increases the plasma concentration of <i>bosutinib</i>—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; ciprofloxacin increases plasma concentration of <i>erlotinib</i>; possible increased risk of ventricular arrhythmias when moxifloxacin given with <i>vandetanib</i>—avoid concomitant use; increased risk of ventricular arrhythmias when levofloxacin or moxifloxacin given with <i>arsenic trioxide</i>

Dairy products: absorption of ciprofloxacin and norfloxacin reduced by dairy products

Dopaminergics: ciprofloxacin increases plasma concentration of rasagline; ciprofloxacin inhibits metabolism of ropinirole (increased plasma concentration)

5HT<sub>1</sub>-receptor Agonists: increased risk of ventricular arrhythmias when moxifloxacin given with <i>sotalol</i>—avoid concomitant use

Orlistat: plasma concentration of ranolazine possibly increased by paroxetine

Antacids: plasma concentration of ranolazine increased by diltiazem and verapamil (consider reducing dose of ranolazine)

Cardiac Glycosides: plasma concentration of ranolazine increased by diltiazem and verapamil (consider reducing dose of ranolazine)

Calcium-channel Blockers: plasma concentration of ranolazine increased by diltiazem and verapamil (consider reducing dose of ranolazine)

Calcium Regulating Drugs: plasma concentration of ranolazine increased by diltiazem and verapamil (consider reducing dose of ranolazine)

Triglycerides: plasma concentration of ranolazine increased by diltiazem and verapamil (consider reducing dose of ranolazine)

Vaccines: ciprofloxacin antagonises anticoagulant effect of <i>coumarins</i>

Lipid-regulating Drugs: absorption of ranolazine reduced by ciprofloxacin, moxifloxacin and ofloxacin reduced by <i>coxeteratromine</i> (manufacturer of ranolazine advises avoid concomitant use)

BNF 68

Quinolones (continued)

Ulcer-healing Drugs: absorption of ciprofloxacin, levofloxacin, moxifloxacin and ofloxacin reduced by <i>sucralfate</i>; absorption of norfloxacin reduced by <i>sucralfate</i> (give at least 2 hours apart)

Vaccines: antibacterials inactivate <i>oral typhoid vaccine</i>—see p. 850

Zinc: absorption of ciprofloxacin, levofloxacin, moxifloxacin and ofloxacin reduced by zinc; absorption of norfloxacin reduced by zinc (give at least 2 hours apart)

Rabeprazole see Proton Pump Inhibitors

Rabies Vaccine see Vaccines

Raloxifene
Anticoagulants: raloxifene antagonises anticoagulant effect of <i>coumarins</i>

BNF 68
Antidepressants:
- Retigabine

Antibacterials:
- Regorafenib

Antifungals:

Antidepressants:
- Atomoxetine
- Ciprolcoxacin
- Antidepressants: after stopping rasagiline do not start
  - Fluoxetine for 2 weeks, also rasagiline should not be started until at least 5 weeks after stopping fluoxetine; after stopping rasagiline do not start
  - Fluvoxamine for 2 weeks; risk of hypertensive crisis when rasagiline given with MAOIs, avoid MAOIs for at least 2 weeks after stopping rasagiline; increased risk of CNS toxicity when rasagiline given with SSRI or tricyclics

Dopaminergics: plasma concentration of rasagiline possibly reduced by entacapone
- Memantine: effects of dopaminergics possibly enhanced by memantine
- Sympathomimetics: avoid concomitant use of rasagiline with sympathomimetics

Reboxetine
- Antibacterials: manufacturer of reboxetine advises avoid concomitant use with macrolides
- Antidepressants: manufacturer of reboxetine advises avoid concomitant use with midaazoles and triaazoles
- Antimalarials: avoidance of antidepressants advised by manufacturer of arteether with lumeфанprine and pipерарине with аrtemимол

Atomoxetine: possible increased risk of convulsions when antidepressants advised by manufacturer of arteether with lumeфанprine and pipерарине with аrtemимол
- Diuretics: possible increased risk of hypokalaemia when reboxetine given with loop diuretics or thiazides and related diuretics

Ergot Alkaloids: possible risk of hypertension when reboxetine given with ergotamine

Regorafenib
- Analgesics: manufacturer of regorafenib advises avoid concomitant use with memefamic acid
- Antibacterials: plasma concentration of regorafenib reduced by rifampcin—manufacturer of regorafenib advises avoid concomitant use
- Anticoagulants: increased risk of bleeding when regorafenib given with warfarin
- Antipsychotics: avoid concomitant use of cytotoxics with etretinate (increased risk of agranulocytosis)

Cytotoxics: regorafenib increases plasma concentration of irinotecan

Remifentanil see Opioid Analgesics

Rifapentin see Antidiabetics

Reticabine
- Alcohol: increased risk of blurred vision when retigabine given with alcohol
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclics; anticonvulsant effect of antiepileptics antagonised by SSRI and tricyclics (convulsive threshold lowered)
- Antidepressants: after stopping rasagiline do not start
- Fluoxetine for 2 weeks, also rasagiline should not be started until at least 5 weeks after stopping fluoxetine; after stopping rasagiline do not start
- Fluvoxamine for 2 weeks; risk of hypertensive crisis when rasagiline given with MAOIs, avoid MAOIs for at least 2 weeks after stopping rasagiline; increased risk of CNS toxicity when rasagiline given with SSRI or tricyclics

Atorvastatin possibly reduced by carbamazepine and phenobarbital
- Antifungals: possible risk of tretinoin toxicity when given with fluconazole and voriconazole
- Antivirals: ribavirin possibly reduces plasma concentration of carbamazepine
- Rifampicin possibly increases plasma concentration of simvastatin
- Antimetabolites: vitamin A—avoid concomitant use

Rifaximin see Rifamycins

Rifampicin see Rifamycins

Rifamycins
- Note: Interactions do not apply to rifaximin
- ACE Inhibitors: rifampicin reduces plasma concentration of active metabolite of imidapril (reduced anti-hypertensive effect)
- Alcohol: rifampicin reduces plasma concentration of alcohol
- Ambisentan: rifampicin possibly increases plasma concentration of ambisentan
- Analgesics: rifampicin reduces plasma concentration of celecoxib, diclofenac and etoricoxib; rifampicin accelerates metabolism of alfentanil, codeine, fentanyl, methadone and morphine (reduced effect); rifampicin possibly accelerates metabolism of oxycodone
- Anti-infective-Il Receptor Antagonists: rifampicin reduces plasma concentration of losartan and its active metabolite
- Antacids: absorption of rifampicin reduced by
- Anti-arrrythmics: rifamycins accelerate metabolism of disopyramide (reduced plasma concentration); rifampicin reduces plasma concentration of edroantorin—avoid concomitant use; rifampicin accelerates metabolism of propafenone (reduced effect)
- Antibacterials: increased risk of side-effects including neutropenia when rifabutin given with azithromycin; rifampicin reduces plasma concentration of clarithromycin and dapsone; plasma concentration of rifabutin increased by clarithromycin (increased risk of toxicity—reduce rifabutin dose); plasma concentration of rifabutin possibly increased by erythromycin (increased risk of toxicity—reduce
Appendix 1: Interactions

Rifamycins

- Antibacterials (continued)
  rifabutin dose; rifampicin possibly reduces plasma concentration of tindazolone and trimethoprim; rifampicin reduces plasma concentration of doxycycline—consider increasing dose of doxycycline; rifampicin accelerates metabolism of chloramphenicol (reduced plasma concentration); increased risk of hepatotoxicity when rifampicin given with licorice; rifampicin reduces plasma concentration of linezolid (possible therapeutic failure of linezolid); rifampicin reduces plasma concentration of etil thromycin (avoid during and for 2 weeks after rifampicin).

- Anticoagulants: rifampicin reduces plasma concentration of apixaban; rifampicins accelerate metabolism of coumarins (reduced anticoagulant effect); rifampicin reduces plasma concentration of dabigatran—manufacturer of dabigatran advises avoid concomitant use; rifampicin reduces plasma concentration of rivaroxaban—manufacturer of rivaroxaban advises monitor for signs of thrombosis.

- Antidiabetics: rifampicins accelerate metabolism of tolbutamide (reduced effect); rifampicin reduces plasma concentration of canagliflozin and nateglinide; rifampicin possibly reduces effects of linagliptin; rifampicin possibly antagonises hypoglycaemic effect of repaglinide; rifampicin possibly accelerate metabolism of linagliptin (reduced effect).

- Antiepileptics: rifabutin reduces plasma concentration of carbamazepine; rifampicin reduces plasma concentration of lamotrigine; plasma concentration of rifampicin possibly reduced by phenobarbital; rifampicins accelerate metabolism of phenytoin (reduced plasma concentration).

- Antifungals: plasma concentration of rifabutin increased by fluconazole (increased risk of uveitis—reduce rifabutin dose); rifampicin accelerates metabolism of itraconazole (reduced plasma concentration); rifabutin and rifampicin reduce plasma concentration of itracazone—manufacturer of itraconazole advises avoid concomitant use; plasma concentration of rifabutin increased by posaconazole (also plasma concentration of posaconazole reduced); rifampicin reduces plasma concentration of posaconazole and terbinafine; plasma concentration of rifabutin increased by voriconazole, also rifabutin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for rifabutin toxicity); rifampicin reduces plasma concentration of voriconazole—avoid concomitant use; rifampicin initially increases and then reduces plasma concentration of caspofungin (consider increasing dose of caspofungin); plasma concentration of rifabutin possibly increased by etravirine (increased risk of uveitis—reduce rifabutin dose).

- Antiinfluenza: rifampicin possibly reduces effects of fosfenumadine.

- Antimalarials: avoidance of rifampicin advised by manufacturer of piperaquine with artemisinum; rifampicin reduces plasma concentration of emefloquine—avoid concomitant use; rifampicin reduces plasma concentration of equinine.

- Antimuscarnic: rifampicin reduces plasma concentration of fezoloreline.

- Antipsychotics: rifampicin accelerates metabolism of haloperidol (reduced plasma concentration); rifampicin and rifabutin possibly reduce plasma concentration of aripiprazole (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); rifampicin possibly reduces plasma concentration of clozapine.

- Antivirals: rifampicin possibly reduces plasma concentration of abacavir, efavirenz and lamivudine—avoid concomitant use; rifampicin reduces plasma concentration of abacavir advised by manufacturer of efavirenz (plasma concentration of abacavir possibly reduced); rifampicin significantly reduces plasma concentration of darunavir, fosamprenavir and tipranavir—avoid concomitant use; rifampicin reduces the plasma concentration of dolutegravir (see Dose under Dolutegravir, p. 421); plasma concentration of rifabutin reduced by efavirenz—increase dose of rifabutin; rifampicin reduces plasma concentration of efavirenz—increase dose of efavirenz; rifabutin reduces plasma concentration of elvitegravir also plasma concentration of active metabolite of rifabutin increased—reduce dose of rifabutin; avoidance of rifampicin advised by manufacturer of elvitegravir, etravirine, sofosbuvir and zidovudine; plasma concentration of both drugs reduced when rifabutin given with etravirine; rifampicin accelerates metabolism of indinavir (reduced plasma concentration—avoid concomitant use); plasma concentration of rifabutin increased by indinavir and saquinavir (also plasma concentration of indinavir and saquinavir reduced)—reduce rifabutin dose; rifampicin reduces plasma concentration of maraviroc and raltegravir—consider increasing dose of maraviroc and raltegravir; plasma concentration of rifabutin possibly increased by nevirapine; rifabutin decreases plasma concentration of tipranavir (reduce dose of ritiprivine—consult tipranavir product literature); rifampicin possibly reduces plasma concentration of ritonavir; plasma concentration of ritonavir increased by ritonavir (increased risk of toxicity—reduce rifabutin dose); rifampicin significantly reduces plasma concentration of saquinavir, also risk of hepatotoxicity—avoid concomitant use; avoidance of rifabutin advised by manufacturer of sofosbuvir and telaprevir; rifampicin possibly reduces plasma concentration of telaprevir—avoid concomitant use.

- Anxiolytics and Hypnotics: rifampicin accelerates metabolism of diazepam and zaleplon (reduced plasma concentration); rifampicin possibly accelerates metabolism of benzodiazepines (reduced plasma concentration); rifampicin possibly accelerates metabolism of buspirone; rifampicin accelerates metabolism of zolpidem (reduced plasma concentration and reduced effect); rifampicin significantly reduces plasma concentration of zopiclone.

- Aprepitant: rifampicin reduces plasma concentration of aprepitant.

- Atovaquone: avoidance of concomitant rifabutin advised by manufacturer of atovaquone (plasma concentration of both drugs reduced); rifampicin reduces plasma concentration of atovaquone (and concentration of rifampicin increased)—avoid concomitant use.

- Avanafil: rifampicin possibly reduces plasma concentration of avanafil—manufacturer of avanafil advises avoid concomitant use.

- Beta-blockers: rifampicin accelerates metabolism of bisoprolol and propranolol (plasma concentration significantly reduced); rifampicin reduces plasma concentration of carvedilol, celiprolol and metoprolol.

- Bosentan: rifampicin reduces plasma concentration of bosentan—avoid concomitant use.

- Calcium-channel Blockers: rifampicin possibly reduces plasma concentration of felodipine; rifampicin possibly accelerates metabolism of nifedipine (possibly significantly reduced plasma concentration); rifampicin accelerates metabolism of diltiazem, rifampicin.

Rifamycins

- Antivirals (continued)
  rifampicin reduces plasma concentration of atazanavir, elvitegravir, nevirapine and tipranavir and —avoid concomitant use; rifampicin reduces the plasma concentration of dolutegravir (see Dose under Dolutegravir, p. 421); plasma concentration of rifabutin reduced by efavirenz—increase dose of rifabutin; rifampicin reduces plasma concentration of elvitegravir also plasma concentration of active metabolite of rifabutin increased—reduce dose of rifabutin; avoidance of rifampicin advised by manufacturer of elvitegravir, etravirine, sofosbuvir and zidovudine; plasma concentration of both drugs reduced when rifabutin given with etravirine; rifampicin accelerates metabolism of indinavir (reduced plasma concentration—avoid concomitant use); plasma concentration of rifabutin increased by indinavir and saquinavir (also plasma concentration of indinavir and saquinavir reduced)—reduce rifabutin dose; rifampicin reduces plasma concentration of maraviroc and raltegravir—consider increasing dose of maraviroc and raltegravir; plasma concentration of rifabutin possibly increased by nevirapine; rifabutin decreases plasma concentration of tipranavir (increased risk of toxicity—reduce rifabutin dose); rifampicin significantly reduces plasma concentration of saquinavir, also risk of hepatotoxicity—avoid concomitant use; avoidance of rifabutin advised by manufacturer of sofosbuvir and telaprevir; rifampicin possibly reduces plasma concentration of telaprevir—avoid concomitant use.

- Anxiolytics and Hypnotics: rifampicin accelerates metabolism of diazepam and zaleplon (reduced plasma concentration); rifampicin possibly accelerates metabolism of benzodiazepines (reduced plasma concentration); rifampicin possibly accelerates metabolism of buspirone; rifampicin accelerates metabolism of zolpidem (reduced plasma concentration and reduced effect); rifampicin significantly reduces plasma concentration of zopiclone.

- Aprepitant: rifampicin reduces plasma concentration of aprepitant.

- Atovaquone: avoidance of concomitant rifabutin advised by manufacturer of atovaquone (plasma concentration of both drugs reduced); rifampicin reduces plasma concentration of atovaquone (and concentration of rifampicin increased)—avoid concomitant use.

- Avanafil: rifampicin possibly reduces plasma concentration of avanafil—manufacturer of avanafil advises avoid concomitant use. rifampicin.

- Beta-blockers: rifampicin accelerates metabolism of bisoprolol and propranolol (plasma concentration significantly reduced); rifampicin reduces plasma concentration of carvedilol, celiprolol and metoprolol.

- Bosentan: rifampicin reduces plasma concentration of bosentan—avoid concomitant use.

- Calcium-channel Blockers: rifampicin possibly reduces plasma concentration of felodipine; rifampicin possibly accelerates metabolism of nifedipine (possibly significantly reduced plasma concentration); rifampicin accelerates metabolism of diltiazem, rifampicin.

- Anxiolytics and Hypnotics: rifampicin accelerates metabolism of diazepam and zaleplon (reduced plasma concentration); rifampicin possibly accelerates metabolism of benzodiazepines (reduced plasma concentration); rifampicin possibly accelerates metabolism of buspirone; rifampicin accelerates metabolism of zolpidem (reduced plasma concentration and reduced effect); rifampicin significantly reduces plasma concentration of zopiclone.
Cytotoxics:

- Diuretics: rifampicin possibly reduces plasma concentration of digoxin
- Ciclosporin: rifampicin accelerates metabolism of ciclosporin
- Calcium-channel Blockers

BNF 68 Appendix 1: Interactions 975

Cobicistat:

- HIV integrase strand transfer inhibitors: cobicistat possibly reduces plasma concentration of atazanavir, darunavir, indinavir and tipranavir; cobicistat (manufacturer of cobicistat advises avoid concomitant use
- Corticosteroids: rifampicin accelerate metabolism of corticosteroids (reduced effect)

Cytotoxic: rifampicin reduces plasma concentration of
- afatinib, ruxolitinib and sorafenib; rifampicin possibly reduces plasma concentration of axitinib (increase dose of axitinib—consult axitinib product literature); rifampicin reduces plasma concentration of bosutinib, cabazitaxel, crizotinib, efgatinsib and vandetanib; rifampicin accelerates metabolism of dasatinib (reduced plasma concentration—avoid concomitant use); rifampicin possibly reduces plasma concentration of erlotinib and sunitinib (reduced plasma concentration); rifampicin possibly reduces plasma concentration of everolimus (reduced plasma concentration—avoid concomitant use); rifampicin possibly reduces plasma concentration of temsirolimus (reduced plasma concentration); rifampicin possibly reduces plasma concentration of teniposide; rifampicin possibly reduces plasma concentration of epirubicin and epazopanib; rifampicin possibly reduces plasma concentration of vemurafenib; rifampicin possibly reduces plasma concentration of vemurafenib
- Hormone Antagonists:
- Antidepressants:
- Antiepileptics:
- Antidiabetic Drugs (oral hypoglycaemiant): rilpivirine possibly reduces plasma concentration of rilpivirine
- Antihypertensive Drugs (Angiotensin-Converting Enzyme (ACE) inhibitors, Angiotensin II Receptor Blockers (ARBs), Angiotensin II Receptor Neprilysin Inhibitors (ARNIs))
- Anticoagulants: rilpivirine possibly reduces plasma concentration of dabigatran
- Antidepressants: rilpivirine possibly reduces plasma concentration of citalopram
- Antidiabetic Drugs (oral hypoglycaemiant): rilpivirine possibly reduces plasma concentration of metformin, pioglitazone and rosiglitazone
- Antihypertensive Drugs (Angiotensin-Converting Enzyme (ACE) inhibitors, Angiotensin II Receptor Blockers (ARBs), Angiotensin II Receptor Neprilysin Inhibitors (ARNIs))
- Antiplatelet Agents: ticagrelor; rilpivirine possibly reduces plasma concentration of ticagrelor
- Anticoagulants: rilpivirine possibly reduces plasma concentration of dabigatran
- Antidepressants: rilpivirine possibly reduces plasma concentration of citalopram
- Antidiabetic Drugs (oral hypoglycaemiant): rilpivirine possibly reduces plasma concentration of metformin, pioglitazone and rosiglitazone
- Antihypertensive Drugs (Angiotensin-Converting Enzyme (ACE) inhibitors, Angiotensin II Receptor Blockers (ARBs), Angiotensin II Receptor Neprilysin Inhibitors (ARNIs))
- Antiplatelet Agents: ticagrelor; rilpivirine possibly reduces plasma concentration of ticagrelor
- Anticoagulants: rilpivirine possibly reduces plasma concentration of dabigatran
- Antidepressants: rilpivirine possibly reduces plasma concentration of citalopram
- Antidiabetic Drugs (oral hypoglycaemiant): rilpivirine possibly reduces plasma concentration of metformin, pioglitazone and rosiglitazone
- Antihypertensive Drugs (Angiotensin-Converting Enzyme (ACE) inhibitors, Angiotensin II Receptor Blockers (ARBs), Angiotensin II Receptor Neprilysin Inhibitors (ARNIs))
- Antiplatelet Agents: ticagrelor; rilpivirine possibly reduces plasma concentration of ticagrelor
- Anticoagulants: rilpivirine possibly reduces plasma concentration of dabigatran
- Antidepressants: rilpivirine possibly reduces plasma concentration of citalopram
- Antidiabetic Drugs (oral hypoglycaemiant): rilpivirine possibly reduces plasma concentration of metformin, pioglitazone and rosiglitazone
- Antihypertensive Drugs (Angiotensin-Converting Enzyme (ACE) inhibitors, Angiotensin II Receptor Blockers (ARBs), Angiotensin II Receptor Neprilysin Inhibitors (ARNIs))
- Antiplatelet Agents: ticagrelor; rilpivirine possibly reduces plasma concentration of ticagrelor
- Anticoagulants: rilpivirine possibly reduces plasma concentration of dabigatran
- Antidepressants: rilpivirine possibly reduces plasma concentration of citalopram
- Antidiabetic Drugs (oral hypoglycaemiant): rilpivirine possibly reduces plasma concentration of metformin, pioglitazone and rosiglitazone
- Antihypertensive Drugs (Angiotensin-Converting Enzyme (ACE) inhibitors, Angiotensin II Receptor Blockers (ARBs), Angiotensin II Receptor Neprilysin Inhibitors (ARNIs))
- Antiplatelet Agents: ticagrelor; rilpivirine possibly reduces plasma concentration of ticagrelor
- Anticoagulants: rilpivirine possibly reduces plasma concentration of dabigatran
- Antidepressants: rilpivirine possibly reduces plasma concentration of citalopram
- Antidiabetic Drugs (oral hypoglycaemiant): rilpivirine possibly reduces plasma concentration of metformin, pioglitazone and rosiglitazone
- Antihypertensive Drugs (Angiotensin-Converting Enzyme (ACE) inhibitors, Angiotensin II Receptor Blockers (ARBs), Angiotensin II Receptor Neprilysin Inhibitors (ARNIs))
- Antiplatelet Agents: ticagrelor; rilpivirine possibly reduces plasma concentration of ticagrelor
- Anticoagulants: rilpivirine possibly reduces plasma concentration of dabigatran
- Antidepressants: rilpivirine possibly reduces plasma concentration of citalopram
- Antidiabetic Drugs (oral hypoglycaemiant): rilpivirine possibly reduces plasma concentration of metformin, pioglitazone and rosiglitazone
- Antihypertensive Drugs (Angiotensin-Converting Enzyme (ACE) inhibitors, Angiotensin II Receptor Blockers (ARBs), Angiotensin II Receptor Neprilysin Inhibitors (ARNIs))
- Antiplatelet Agents: ticagrelor; rilpivirine possibly reduces plasma concentration of ticagrelor
- Anticoagulants: rilpivirine possibly reduces plasma concentration of dabigatran
- Antidepressants: rilpivirine possibly reduces plasma concentration of citalopram
- Antidiabetic Drugs (oral hypoglycaemiant): rilpivirine possibly reduces plasma concentration of metformin, pioglitazone and rosiglitazone
- Antihypertensive Drugs (Angiotensin-Converting Enzyme (ACE) inhibitors, Angiotensin II Receptor Blockers (ARBs), Angiotensin II Receptor Neprilysin Inhibitors (ARNIs))
- Antiplatelet Agents: ticagrelor; rilpivirine possibly reduces plasma concentration of ticagrelor
- Anticoagulants: rilpivirine possibly reduces plasma concentration of dabigatran
- Antidepressants: rilpivirine possibly reduces plasma concentration of citalopram
- Antidiabetic Drugs (oral hypoglycaemiant): rilpivirine possibly reduces plasma concentration of metformin, pioglitazone and rosiglitazone
- Antihypertensive Drugs (Angiotensin-Converting Enzyme (ACE) inhibitors, Angiotensin II Receptor Blockers (ARBs), Angiotensin II Receptor Neprilysin Inhibitors (ARNIs))
- Antiplatelet Agents: ticagrelor; rilpivirine possibly reduces plasma concentration of ticagrelor
- Anticoagulants: rilpivirine possibly reduces plasma concentration of dabigatran
- Antidepressants: rilpivirine possibly reduces plasma concentration of citalopram
- Antidiabetic Drugs (oral hypoglycaemiant): rilpivirine possibly reduces plasma concentration of metformin, pioglitazone and rosiglitazone
- Antihypertensive Drugs (Angiotensin-Converting Enzyme (ACE) inhibitors, Angiotensin II Receptor Blockers (ARBs), Angiotensin II Receptor Neprilysin Inhibitors (ARNIs))
- Antiplatelet Agents: ticagrelor; rilpivirine possibly reduces plasma concentration of ticagrelor
- Anticoagulants: rilpivirine possibly reduces plasma concentration of dabigatran
- Antidepressants: rilpivirine possibly reduces plasma concentration of citalopram
- Antidiabetic Drugs (oral hypoglycaemiant): rilpivirine possibly reduces plasma concentration of metformin, pioglitazone and rosiglitazone
- Antihypertensive Drugs (Angiotensin-Converting Enzyme (ACE) inhibitors, Angiotensin II Receptor Blockers (ARBs), Angiotensin II Receptor Neprilysin Inhibitors (ARNIs))
- Antiplatelet Agents: ticagrelor; rilpivirine possibly reduces plasma concentration of ticagrelor
- Anticoagulants: rilpivirine possibly reduces plasma concentration of dabigatran
- Antidepressants: rilpivirine possibly reduces plasma concentration of citalopram
- Antidiabetic Drugs (oral hypoglycaemiant): rilpivirine possibly reduces plasma concentration of metformin, pioglitazone and rosiglitazone
- Antihypertensive Drugs (Angiotensin-Converting Enzyme (ACE) inhibitors, Angiotensin II Receptor Blockers (ARBs), Angiotensin II Receptor Neprilysin Inhibitors (ARNIs))
- Antiplatelet Agents: ticagrelor; rilpivirine possibly reduces plasma concentration of ticagrelor
- Anticoagulants: rilpivirine possibly reduces plasma concentration of dabigatran
- Antidepressants: rilpivirine possibly reduces plasma concentration of citalopram
- Antidiabetic Drugs (oral hypoglycaemiant): rilpivirine possibly reduces plasma concentration of metformin, pioglitazone and rosiglitazone
- Antihypertensive Drugs (Angiotensin-Converting Enzyme (ACE) inhibitors, Angiotensin II Receptor Blockers (ARBs), Angiotensin II Receptor Neprilysin Inhibitors (ARNIs))
- Antiplatelet Agents: ticagrelor; rilpivirine possibly reduces plasma concentration of ticagrelor
- Anticoagulants: rilpivirine possibly reduces plasma concentration of dabigatran
- Antidepressants: rilpivirine possibly reduces plasma concentration of citalopram
- Antidiabetic Drugs (oral hypoglycaemiant): rilpivirine possibly reduces plasma concentration of metformin, pioglitazone and rosiglitazone
- Antihypertensive Drugs (Angiotensin-Converting Enzyme (ACE) inhibitors, Angiotensin II Receptor Blockers (ARBs), Angiotensin II Receptor Neprilysin Inhibitors (ARNi...
Appendix 1: Interactions

**Rilpivirine (continued)**

Antivirals: manufacturer of rilpivirine advises give
didanosine 2 hours before or 4 hours after rilpivir-
ine; avoidance of rilpivirine advised by manufac-
turer of nevirapine.

Calcium Salts: manufacturer of rilpivirine advises give
calum salts 2 hours before or 4 hours after rilpivir-
ine.

- Corticosteroids: manufacturer of rilpivirine advises
  avoid concomitant use with dexamethasone
  (except when given as a single dose)

- Orlistat: absorption of rilpivirine possibly reduced by
  orlistat.

- Ulcer-healing Drugs: manufacturer of rilpivirine
  advises avoid concomitant use with esomeprazole,
lansoprazole, pantoprazole and rabeprazole (plasma
  concentration of rilpivirine possibly reduced);
  plasma concentration of rilpivirine reduced by
  omeprazole—avoid concomitant use; manufacturer
  of rilpivirine advises avoid histamine H₂-antagonists
  for 12 hours before or 4 hours after rilpivirine—con-
  sult product literature.

**Riociguat**

Antacids: absorption of riociguat reduced by antacids
(continued).

**Ritonavir**

- Antibacterials (continued)
  - renal impairment); ritonavir increases plasma con-
    ncentration of rifabutin (increased risk of toxicity—
    reduce rifabutin dose); plasma concentration of rito-
    navir reduced by rifampicin; plasma concentration of
    both drugs increases when ritonavir given with
    fusidic acid—avoid concomitant use; avoidance of
    concomitant ritonavir in severe renal and hepatic
    impairment advised by manufacturer of telithromycin.

- Anticoagulants: ritonavir may enhance or reduce anti-
  coagulant effect of warfarin; avoidance of ritonavir
  advised by manufacturer of apixaban; ritonavir pos-
  sibly enhances anticoagulant effect of warfarin and
  phenindione; ritonavir increases plasma concentra-
  tion of rivaroxaban—avoid concomitant use.

- Antidepressants: ritonavir possibly reduces plasma
  concentration of paroxetine; ritonavir increases plasma
  concentration of doxepin; ritonavir reduces plasma
  concentration of SSRIs and tricyclics; plasma concentra-
  tion of ritonavir reduced by St John’s wort—avoid concomitant use.

- Antidiabetics: ritonavir possibly increases plasma con-
  centration of tolbutamide.

- Antiepileptics: ritonavir possibly increases plasma
  concentration of carbamazepine; ritonavir possibly
  reduces plasma concentration of lamotrigine and
  valproate; plasma concentration of ritonavir possi-
  bly reduced by phenytoin, also plasma concentra-
  tion of phenytoin possibly affected.

- Antifungals: plasma concentration of ritonavir
  increased by fluconazole; combination of ritonavir
  with itraconazole may increase plasma concentra-
  tion of either drug (or both); ritonavir reduces plasma
  concentration of voriconazole—avoid concomitant use.

- Antihistamines: ritonavir possibly increases plasma
  concentration of non-sedating antihistamines.

- Antimalarials: caution with ritonavir advised by manu-
  facturer of arteether with lumeferan; plasma
  concentration of ritonavir possibly reduced by
  mefloquine; ritonavir increases plasma concentra-
  tion of artemether; ritonavir reduces plasma
  concentration of quinine (increased risk of toxicity).

- Antimuscarinics: avoidance of ritonavir advised by
  manufacturer of darifenacin and tolterodine; manu-
  facturer of fesoterodine advises dose reduction
  when given with fesoterodine—consult feso-
  terodine product literature; ritonavir possibly
  increases plasma concentration of solifenacin—see
  Dose under Solifenacin, p. 553.

- Antipsychotics: ritonavir possibly increases plasma
  concentration of antipsychotics; ritonavir possibly
  increases plasma concentration of aripiprazole
  (reduce dose of aripiprazole—consult aripiprazole
  product literature); manufacturer of ritonavir advises
  avoid concomitant use with clozapine (increased
  risk of toxicity); ritonavir increases plasma concentra-
  tion of olanzapine—consider increasing dose of
  olanzapine; ritonavir increases plasma concentra-
  tion of pimozide (increased risk of ventricular
  arrhythmias—avoid concomitant use); ritonavir pos-
  sibly increases plasma concentration of tardine-
  pinae—manufacturer of quetiapine advises avoid
  concomitant use.

- Antivirals: plasma concentration of both drugs
  reduced when ritonavir given with boceprevir.
  Manufacturer of ritonavir advises ritonavir and dida-
  nosine should be taken 2.5 hours apart; ritonavir
  increases the toxicity of efavirenz, monitor liver
  function tests—manufacturer of Atripla® advises
  avoid concomitant use with high-dose ritonavir; rito-
  navir increases plasma concentration of indinavir,
  maraviroc and saquinavir; ritonavir possibly
  reduces plasma concentration of telaprevir.
**BNF 68**

**Appendix 1: Interactions**

**Ritonavir** (continued)

- Anxiolytics and Hypnotics: ritonavir possibly increases plasma concentration of anxiolytics and hypnotics; ritonavir possibly increases plasma concentration of alprazolam, diazepam, flurazepam and oxazepam (risk of extreme sedation and respiratory depression—avoid concomitant use); ritonavir possibly increases plasma concentration of midazolam (risk of prolonged sedation—avoid concomitant use of oral midazolam); ritonavir increases plasma concentration of buspirone (increased risk of toxicity). Aprepitant: ritonavir possibly increases plasma concentration of aprepitant.

- Atovaquone: ritonavir possibly increases plasma concentration of atovaquone—manufacturer of atovaquone advises avoid concomitant use.

- Avanafil: ritonavir significantly increases plasma concentration of avanafil—avoid concomitant use.

- Bosentan: ritonavir increases plasma concentration of bosentan (consider reducing dose of bosentan).

- Calcium-channel Blockers: ritonavir possibly increases plasma concentration of calcium-channel blockers; avoidance of ritonavir advised by manufacturer of lercanidipine.

- Cardiac Glycosides: ritonavir possibly increases plasma concentration of digoxin.

- Ciclosporin: ritonavir possibly increases plasma concentration of ciclosporin.

- Cilostazol: ritonavir possibly increases plasma concentration of cilostazol (see Dose under Cilostazol, p. 140).

- Colchicine: ritonavir possibly increases risk of colchicine toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment).

- Corticosteroids: ritonavir possibly increases plasma concentration of corticosteroids—increased risk of adrenal suppression; ritonavir possibly increases plasma concentration of budesonide (including inhaled, intranasal, and rectal budesonide)—increased risk of adrenal suppression; ritonavir increases plasma concentration of inhaled and intranasal fluticasone—increased risk of adrenal suppression.

- Cytotoxics: ritonavir increases the plasma concentration of afatinib—manufacturer of afatinib advises separating administration of ritonavir by 6 to 12 hours; ritonavir possibly increases plasma concentration of axitinib (reduce dose of axitinib—consult axitinib product literature); ritonavir possibly increases the plasma concentration of bosutinib and cabozantinib—manufacturer of bosutinib and cabazitaxel advises avoid or consider reducing dose of bosutinib and cabazitaxel; ritonavir possibly increases plasma concentration of crizotinib, everolimus, nilotinib and vinflunine—manufacturer of crizotinib, everolimus, nilotinib and vinflunine advises avoid concomitant use; avoidance of ritonavir advised by manufacturer of lapatinib; ritonavir possibly increases plasma concentration of pazopanib (reduce dose of pazopanib); manufacturer of ruxolitinib advises dose reduction when ritonavir given with ruxolitinib—consult ruxolitinib product literature; ritonavir possibly increases plasma concentration of docetaxel (increased risk of toxicity); ritonavir increases plasma concentration of paclitaxel; ritonavir possibly increases plasma concentration of vinblastine.

- Dapoxetine: avoidance of ritonavir advised by manufacturer of dapoxetine (increased risk of toxicity).

- Diuretics: ritonavir increases plasma concentration of spironolactone—avoid concomitant use.

- Domperidone: possible increased risk of ventricular arrhythmias when ritonavir given with domperidone—avoid concomitant use.

- Ergot Alkaloids: increased risk of ergotism when ritonavir given with ergotamine—avoid concomitant use.

- H1-receptor Agonists: ritonavir increases plasma concentration of eletriptan (risk of toxicity)—avoid concomitant use.

- Ibaviridine: ritonavir possibly increases plasma concentration of ibaviridine—avoid concomitant use.

- Lipid-regulating Drugs: possible increased risk of myopathy when ritonavir given with statins—possible increased risk of myopathy when ritonavir given with rosvastatin—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when ritonavir given with simvastatin (avoid concomitant use); avoidance of ritonavir advised by manufacturer of lomitapide (plasma concentration of lomitapide possibly increased).

- Mirabegron: when given with ritonavir avoid or reduce dose of mirabegron in hepatic or renal impairment—see Mirabegron, p. 552.

- Oestrogens: ritonavir accelerates metabolism of oestrogens (reduced contraceptive effect—see p. 536).

- Orlistat: absorption of ritonavir possibly reduced by orlistat.

- Ranolazine: ritonavir possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use. Riociguat: avoidance of ritonavir advised by manufacturer of riociguat.

- Sildenafil: ritonavir significantly increases plasma concentration of sildenafil—avoid concomitant use.

- Tacrolimus: ritonavir possibly increases plasma concentration of tacrolimus.

- Tadalafil: ritonavir increases plasma concentration of tadalafil—manufacturer of tadalafil advises avoid concomitant use.

- Theophylline: ritonavir accelerates metabolism of theophylline (reduced plasma concentration).

- Ticagrelor: ritonavir possibly increases plasma concentration of ticagrelor—manufacturer of ticagrelor advises avoid concomitant use.

- Ulipristal: avoidance of ritonavir advised by manufacturer of ulipristal (contraceptive effect of ulipristal possibly reduced).

- Vardenafil: ritonavir increases plasma concentration of vardenafil—avoid concomitant use.

**Rivaroxaban**

- Analgesics: increased risk of haemorrhage when anticoagulants given with intravenous diclofenac (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with ketorolac (avoid concomitant use, including low-dose heparins).

- Anti-arrhythmics: manufacturer of rivaroxaban advises avoid concomitant use with dronedarone.

- Antibacterials: plasma concentration of rivaroxaban reduced by rifampicin—manufacturer of rivaroxaban advises monitor for signs of thrombosis.

- Anticoagulants: increased risk of haemorrhage when rivaroxaban given with other anticoagulants (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency); increased risk of haemorrhage when other anticoagulants given with apixaban and dabigatran (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency).
Appendix 1: Interactions

**Antidepressants:**
- Antidepressants: plasma concentration of rivaroxaban possibly reduced by **St John’s wort**—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- Antiepileptics: plasma concentration of rivaroxaban possibly reduced by **carbamazepine, phenobarbital** and **phenytoin**—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- Antifungals: manufacturer of rivaroxaban advises avoid concomitant use with **itraconazole, posaconazole** and **voriconazole**
- Antivirals: manufacturer of rivaroxaban advises avoid concomitant use with **atazanavir, darunavir, fosamprenavir, indinavir, saquinavir and tipranavir**; manufacturers advise avoid concomitant use of rivaroxaban with **lopinavir**; plasma concentration of rivaroxaban increased by **ritonavir**—avoid concomitant use
- Cobicistat: anticoagulant effect of rivaroxaban possibly enhanced by **cobicistat**—avoid concomitant use

**Rifaximin**
- Antibacterials: effects of rifaximin inhibited by **rifampicin** (manufacturer of rifaximin advises avoid concomitant use)
- Antidepressants: metabolism of rifaximin inhibited by **fluvoxamine**
- Antiepileptics: effects of rifaximin possibly inhibited by **carbamazepine, phenobarbital and phenytoin** (manufacturer of rifaximin advises avoid concomitant use)
- Theophylline: manufacturer of rifaximin advises avoid concomitant use with **theophylline**
- Ulcer-healing Drugs: metabolism of rifaximin inhibited by **cimetidine**

**Ropinirole**
- Antidepressants: metabolism of ropinirole inhibited by **fluvoxamine** (increased plasma concentration)
- Antipsychotics: manufacturer of ropinirole advises avoid concomitant use of **antipsychotics** (agonism of effect)
- Memantine: effects of dopaminegics possibly enhanced by **memantine**
- Methyldopa: antiparkinsonian effect of dopaminegics antagonised by **methyldopa**
- Metoclopramide: manufacturer of ropinirole advises avoid concomitant use of **metoclopramide** (agonism of effect)
- Oestrogens: plasma concentration of ropinirole increased by **oestrogens**

**Ropivacaine**
- Antiarhythmic: increased myocardial depression when ropivacaine given with **anti-arrhythmics**
- Antidepressants: metabolism of ropivacaine inhibited by **fluvoxamine**—avoid prolonged administration of ropivacaine

**Rosuvastatin**
- See Statins

**Rufinamide**
- Antidepressants: possible increased serotonergic effects when **St John’s wort** given with duloxetine or **venlafaxine**; **St John’s wort** reduces plasma concentration of duloxetine; **St John’s wort** reduces plasma concentration of venlafaxine
- Antidepressants: possible increased serotonergic effects when **St John’s wort** given with duloxetine or **venlafaxine**; **St John’s wort** reduces plasma concentration of duloxetine; **St John’s wort** reduces plasma concentration of venlafaxine
- Antiepileptics: **St John’s wort** possibly reduces plasma concentration of carbamazepine; **St John’s wort** possibly reduces plasma concentration of carbamazepine
- Antifungals: **St John’s wort** reduces plasma concentration of carbamazepine; **St John’s wort** reduces plasma concentration of carbamazepine

**Rufinamide (continued)**
- Antidepressants: plasma concentration of rufinamide possibly reduced by **St John’s wort**—manufacturer of rufinamide advises monitor for signs of thrombosis
- Antiepileptics: plasma concentration of rufinamide possibly reduced by **carbamazepine, phenobarbital and phenytoin**—manufacturer of rufinamide advises monitor for signs of thrombosis
- Antifungals: manufacturer of rufinamide advises avoid concomitant use with **itraconazole, posaconazole and voriconazole**
- Antivirals: manufacturer of rufinamide advises avoid concomitant use with **atazanavir, darunavir, fosamprenavir, indinavir, saquinavir and tipranavir**; manufacturers advise avoid concomitant use of rufinamide with **lopinavir**; plasma concentration of rufinamide increased by **ritonavir**—avoid concomitant use
- Cobicistat: anticoagulant effect of rufinamide possibly enhanced by **cobicistat**—avoid concomitant use

**Rivastigmine**
- see Parasympathomimetics

**Rizatriptan**
- see SHT1-receptor Agonists (under HT)

**Rocuronium**
- see Muscle Relaxants

**Roffumilast**
- Antibacterials: effects of roffumilast inhibited by **ampicin** (manufacturer of roffumilast advises avoid concomitant use)
- Antidepressants: metabolism of roffumilast inhibited by **fluvoxamine**
- Antiepileptics: effects of roffumilast possibly inhibited by **carbamazepine, phenobarbital and phenytoin** (manufacturer of roffumilast advises avoid concomitant use)
- Theophylline: manufacturer of roffumilast advises avoid concomitant use with **theophylline**
- Ulcer-healing Drugs: metabolism of roffumilast inhibited by **cimetidine**

**Roflumilast**
- Antiepileptics: anticonvulsant effect of antiepileptics antagonised by **rufinamide**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by **antipsychotics** (convulsive threshold lowered)
- Oestrogens: rufinamide accelerates metabolism of **oestrogens** (reduced contraceptive effect—see p. 536)
- Orlistat: possible increased risk of convulsions when antiepileptics given with **orlistat**
- Progestogens: rufinamide accelerates metabolism of **progestogens** (reduced contraceptive effect—see p. 536)

**Rupatadine**
- see Antihistamines

**Ruxolitinib**
- Antibacterials: manufacturer of ruxolitinib advises dose reduction when ruxolitinib given with **clarithromycin and telithromycin**—consult ruxolitinib product literature; plasma concentration of ruxolitinib reduced by **rifampicin**
- Antifungal: manufacturer of ruxolitinib advises dose reduction when ruxolitinib given with **itraconazole, telaprevir, posaconazole and voriconazole**—consult ruxolitinib product literature
- Antipsychotics: avoid concomitant use of cytoxotics with **clozapine** (increased risk of agranulocytosis)
- Antivirals: manufacturer of ruxolitinib advises dose reduction when ruxolitinib given with **boceprevir, indinavir, lopinavir, ritonavir, saquinavir and telaprevir**—consult ruxolitinib product literature

**St John’s Wort**
- Analgesics: **St John’s wort** possibly reduces plasma concentration of **methadone**
- Anti-arhythmic: **St John’s wort** possibly reduces plasma concentration of **dronedarone**—avoid concomitant use
- Antibacterials: **St John’s wort** reduces plasma concentration of **ethambutol** (avoid during and for 2 weeks after **St John’s wort**)
- Anticoagulants: **St John’s wort** possibly reduces plasma concentration of **apixaban**; **St John’s wort** reduces anticoagulant effect of **coumarins** (avoid concomitant use); **St John’s wort** possibly reduces plasma concentration of **dabigatran**—manufacturer of dabigatran advises avoid concomitant use; **St John’s wort** possibly reduces plasma concentration of **dabigatran**—manufacturer of dabigatran advises avoid concomitant use; **St John’s wort** possibly reduces plasma concentration of **dabigatran**—manufacturer of dabigatran advises avoid concomitant use
- Antidepressants: possible increased serotonergic effects when **St John’s wort** given with duloxetine or **venlafaxine**; **St John’s wort** reduces plasma concentration of duloxetine; **St John’s wort** reduces plasma concentration of duloxetine; **St John’s wort** reduces plasma concentration of duloxetine
- Antifungals: **St John’s wort** reduces plasma concentration of **itraconazole**—avoid concomitant use
Calcium-channel Blockers:

**Aprepitant:**
- Avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature.

Antivirals:
- St John’s Wort: possible increased risk of convulsions when given with atomoxetine.
- Calcium-channel Blockers: St John’s Wort: possible increased risk of ventricular arrhythmias when given with amiodarone.
- Cardiac Glycosides: St John’s Wort: possible increased risk of ventricular arrhythmias when given with amiodarone.
- Antihistamines: St John’s Wort: possible increased risk of ventricular arrhythmias when given with amiodarone.
- Antileukemics: St John’s Wort: possible increased risk of ventricular arrhythmias when given with amiodarone.

Antimalarials:
- **St John’s Wort:** possibly reduces plasma concentration of saquinavir. Avoid concomitant use.
- Avoidance of **St John’s wort** advised by manufacturer of **atazanavir**.

Antidepressants:
- **St John’s wort** reduces plasma concentration of **divalprox** and **etonipride**—avoid concomitant use; avoidance of **St John’s wort** advised by manufacturer of **lithium**.
- **St John’s wort** reduces plasma concentration of **emtricitabine**—avoid concomitant use; avoidance of **St John’s wort** advised by manufacturer of **emtricitabine**.
- Avoidance of **St John’s wort** advised by manufacturer of **emtricitabine**—consult **emtricitabine** product literature.

Anxiolytics and Hypnotics:
- **St John’s wort** possibly reduces plasma concentration of **oral midazolam**.

Apirepitant:
- Avoidance of **St John’s wort** advised by manufacturer of **aprepitant**.

Atomoxetine:
- Possible increased risk of convulsions when given with atomoxetine.

Calcium-channel Blockers:
- St John’s Wort: possible increased risk of ventricular arrhythmias when given with atomoxetine.
- St John’s Wort: possible increased risk of ventricular arrhythmias when given with atomoxetine.
- St John’s Wort: possible increased risk of ventricular arrhythmias when given with atomoxetine.

Cardiac Glycosides:
- St John’s Wort: possible increased risk of ventricular arrhythmias when given with amiodarone.
- St John’s Wort: possible increased risk of ventricular arrhythmias when given with amiodarone.

Ciclosporin:
- St John’s Wort: possible increased risk of ventricular arrhythmias when given with amiodarone.

Cobicistat:
- St John’s Wort: possible increased risk of ventricular arrhythmias when given with amiodarone.

Cytotoxics:
- St John’s Wort: possible increased risk of ventricular arrhythmias when given with amiodarone.

Dapoxetine:
- Possible increased risk of serotonergic effects when St John’s Wort given with **dapoxetine** (manufacturer of dapoxetine advises St John’s Wort should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping St John’s Wort).

Diuretics:
- St John’s Wort: possible increased risk of ventricular arrhythmias when given with **furosemide**—avoid concomitant use.

Fingolimod:
- St John’s Wort: possible increased risk of ventricular arrhythmias when given with **fingolimod**—manufacturer of fingolimod advises St John’s Wort.

Hormone Antagonists:
- St John’s Wort: possible increased risk of ventricular arrhythmias when given with **fingolimod**—manufacturer of fingolimod advises St John’s Wort.

5HT1-receptor Agonists:
- St John’s Wort: possible increased risk of ventricular arrhythmias when given with **5HT1-receptor Agonists**—avoid concomitant use.

Ivabradine:
- St John’s Wort: possible increased risk of ventricular arrhythmias when given with **ivabradine**—avoid concomitant use.

Ivacaftor:
- Manufacturer of **ivacaftor**—consult **ivacaftor** product literature.

Lipid-regulating Drugs: St John’s Wort: possible increased risk of ventricular arrhythmias when given with **lipid-regulating Drugs**—consult **lipid-regulating Drugs** product literature.

Antimalarials:
- **St John’s Wort** possibly reduces plasma concentration of **artether with lumefantrine**
- **piperaquine with arteminol**

Antipsychotics:
- St John’s Wort: possibly reduces plasma concentration of **aripiprazole**—consult aripiprazole product literature

Antivirals:
- St John’s Wort: possibly reduces plasma concentration of **atazanavir**
- **darunavir**
- **efavirenz**
- **cobicistat**—manufacturer of cobicistat advises St John’s Wort.
- **etanercept**
- **etoposide**
- **ivosartan** and **saquinavir**—avoid concomitant use; avoidance of **St John’s wort** advised by manufacturer of **dolutegravir**.
- **olarsaitavir, etravirine, sofosbuvir and sofosbuvir**
- **Saquinavir**—avoid concomitant use; avoidance of **St John’s wort** advised by manufacturer of **nelfinavir**.

Hormone Antagonists:
- **Cytotoxics:** St John’s Wort: possible increased risk of convulsions when given with atomoxetine.

Antimalarials:
- **St John’s Wort** possibly reduces plasma concentration of **etanercept**—avoid concomitant use.

Antidepressants:
- **St John’s wort** reduces plasma concentration of **emetine**—consult **emetine** product literature.

Anxiolytics and Hypnotics:
- **St John’s wort** possibly reduces plasma concentration of **oral midazolam**.

Apirepitant:
- Avoidance of **St John’s wort** advised by manufacturer of **aprepitant**.

Atomoxetine:
- Possible increased risk of convulsions when given with atomoxetine.

Calcium-channel Blockers:
- St John’s Wort: possible increased risk of convulsions when given with atomoxetine.

Cardiac Glycosides:
- St John’s Wort: possible increased risk of convulsions when given with atomoxetine.

Ciclosporin:
- St John’s Wort: possible increased risk of convulsions when given with atomoxetine.

Cobicistat:
- St John’s Wort: possible increased risk of convulsions when given with atomoxetine.

Cytotoxics:
- St John’s Wort: possible increased risk of convulsions when given with atomoxetine.

Dapoxetine:
- Possible increased risk of serotonergic effects when St John’s Wort given with **dapoxetine** (manufacturer of dapoxetine advises St John’s Wort should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping St John’s Wort).

Diuretics:
- St John’s Wort: possible increased risk of convulsions when given with atomoxetine.

Fingolimod:
- St John’s Wort: possible increased risk of convulsions when given with atomoxetine.

Hormone Antagonists:
- St John’s Wort: possible increased risk of convulsions when given with **fingolimod**—manufacturer of fingolimod advises St John’s Wort.

5HT1-receptor Agonists:
- St John’s Wort: possible increased risk of convulsions when given with **5HT1-receptor Agonists**—avoid concomitant use.

Ivabradine:
- St John’s Wort: possible increased risk of convulsions when given with **ivabradine**—avoid concomitant use.
**Appendix 1: Interactions**

### Saquinavir (continued)
- Antipsychotics: increased risk of ventricular arrhythmias when saquinavir given with clozapine, haloperidol or ephedra/ephedrine—avoid concomitant use; saquinavir possibly increases plasma concentration of eripiprazole (reduce dose of eripiprazole—consult eripiprazole product literature); saquinavir possibly increases plasma concentration of ziprasidone (increased risk of ventricular arrhythmias—avoid concomitant use); saquinavir possibly increases plasma concentration of quetiapine—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: increased risk of ventricular arrhythmias when saquinavir given with etravirine or lopinavir—avoid concomitant use; saquinavir reduces plasma concentration of darunavir; plasma concentration of saquinavir significantly reduced by efavirenz; plasma concentration of saquinavir increased by indinavir and ritonavir; saquinavir increases plasma concentration of enaravir (consider reducing dose of maraviroc); plasma concentration of saquinavir reduced by otezolastivir
- Anxiolytics and Hypnotics: saquinavir increases plasma concentration of midazolam (risk of prolonged sedation—avoid concomitant use of oxal(midazolam)
- Avanafil: saquinavir possibly increases plasma concentration of avanafil—manufacturer of avanafil advises avoid concomitant use
- Beta-blockers: increased risk of ventricular arrhythmias when saquinavir given with etoposide—avoid concomitant use
- Ciclosporin: plasma concentration of both drugs increased when saquinavir given with ciclosporin
- Corticosteroids: plasma concentration of saquinavir possibly reduced by dexamethasone
- Cytoxics: saquinavir possibly increases the plasma concentration of afatinib—manufacturer of afatinib advises separating administration of afatinib by 6 to 12 hours; saquinavir possibly increases plasma concentration of afatinib (reduce dose of afatinib—consult afatinib product literature); saquinavir possibly increases the plasma concentration of bosutinib and cabazitaxel—manufacturer of bosutinib and cabazitaxel advises avoid or consider reducing dose of bosutinib and cabazitaxel; saquinavir possibly increases plasma concentration of erlotinib and everolimus—manufacturer of erlotinib and everolimus advises avoid concomitant use; avoidance of saquinavir advised by manufacturer of lapatinib; increased risk of ventricular arrhythmias when saquinavir given with epazopanib—avoid concomitant use; manufacturer of ruxolitinib advises dose reduction when saquinavir given with ruxolitinib—consult ruxolitinib product literature
- Dapoxetine: avoidance of saquinavir advised by manufacturer of dapoxetine (increased risk of toxicity) Diuretics: saquinavir increases plasma concentration of eplerenone (reduce dose of eplerenone)
- Domperidone: possible increased risk of ventricular arrhythmias when saquinavir given with domperidone
- Ergot alkaloids: increased risk of ergotism when saquinavir given with ergotamine—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when saquinavir given with atorvastatin; possible increased risk of myopathy when saquinavir given with rosuvastatin—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when saquinavir given with simvastatin (avoid concomitant use); avoidance of saquinavir advised by manufacturer of lomitapide (plasma concentration of lomitapide possibly increased)

### Saquinavir (continued)
- Oralists: absorption of saquinavir possibly reduced by orlistat
- Pentamidine isethionate: increased risk of ventricular arrhythmias when saquinavir given with pentamidine isethionate—avoid concomitant use
- Ranolazine: saquinavir possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: increased risk of ventricular arrhythmias when saquinavir given with sildenafil—avoid concomitant use
- Tacrolimus: saquinavir increases plasma concentration of tacrolimus (consider reducing dose of tacrolimus)
- Tadalafil: increased risk of ventricular arrhythmias when saquinavir given with tadalafil—avoid concomitant use
- Ulcer-healing Drugs: plasma concentration of saquinavir possibly increased by cimetidine; plasma concentration of saquinavir possibly increased by esomeprazole, lanoprazole, pantoprazole and rabeprazole—manufacturer of saquinavir advises avoid concomitant use; plasma concentration of saquinavir increased by rabeprazole—manufacturer of saquinavir advises avoid concomitant use; Vardenafil: increased risk of ventricular arrhythmias when saquinavir given with vardenafil—avoid concomitant use

### Saxagliptin see Antidiabetics

#### Selegeline
**Note** Selegeline is a MAO-B inhibitor
- Analgesics: hyperpyrexia and CNS toxicity reported when selegeline given with methadone (avoid concomitant use); manufacturer of selegeline advises avoid concomitant use with opioid analgesics
- Antidepressants: manufacturer of selegeline advises avoid concomitant use with citalopram and escitalopram; increased risk of hypertension and CNS excitation when selegeline given with fluoxetine (selegeline should not be started until 5 weeks after stopping fluoxetine, avoid fluoxetine for 2 weeks after stopping selegeline); increased risk of hypertension and CNS excitation when selegeline given with fluvoxamine, sertraline or venlafaxine (selegeline should not be started until 1 week after stopping fluvoxamine, sertraline or venlafaxine, avoid fluvoxamine, sertraline or venlafaxine for 2 weeks after stopping selegeline); increased risk of hypertension and CNS excitation when selegeline given with paroxetine (selegeline should not be started until 2 weeks after stopping paroxetine, avoid paroxetine for 2 weeks after stopping selegeline); enhanced hypotensive effect when selegeline given with MAOIs—manufacturer of selegeline advises avoid concomitant use; avoid concomitant use of selegeline with moclobemide; CNS toxicity reported when selegeline given with tricyclics
- Dopaminergic: max. dose of 10mg selegeline advised by manufacturer of entacapone if used concomitantly; selegeline enhances effects and increases toxicity of levodopa (reduce dose of levodopa)
- 5HT2-receptor Antagonists: manufacturer of selegeline advises avoid concomitant use with 5HT2 receptor antagonists Memantine: effects of dopaminergics and selegeline possibly enhanced by memantine
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa
- Oestrogens: plasma concentration of selegeline increased by oestrogens—manufacturer of selegeline advises avoid concomitant use
- Progestogens: plasma concentration of selegeline increased by progestogens—manufacturer of selegeline advises avoid concomitant use
- Sympathomimetics: manufacturer of selegeline advises avoid concomitant use with sympathomimetics; risk
BNF 68

Appendix 1: Interactions

981

Selegiline
- Sympathomimetics (continued)
  of hypertensive crisis when selegiline given with dopamine
Selenium
Eltrombopag: selenium possibly reduces absorption of eltrombopag (give at least 4 hours apart)
Vitamins: absorption of selenium possibly reduced by ascorbic acid (give at least 4 hours apart)
Sertraline see Antidepressants, SSRIs
Sevelamer
- Antibacterials: sevelamer reduces bioavailability of ciprofloxacin
  Ciclosporin: sevelamer possibly reduces plasma concentration of ciclosporin
  Mycophenolate: sevelamer possibly reduces plasma concentration of mycophenolate
Tacroplimus: sevelamer possibly reduces plasma concentration of tacrolimus
Thyroid Hormones: sevelamer possibly reduces absorption of levothyroxine
Vitamins: sevelamer reduces absorption of calcitriol (give at least 1 hour before or 3 hours after sevelamer)
Sevoflurane see Anaesthetics, General
Sildenafil
- Alpha-blockers: enhanced hypotensive effect when sildenafil given with alpha-blockers (avoid alpha-blockers for 4 hours after sildenafil)—see also p. 558
  Anti-arrhythmics: avoidance of sildenafil advised by manufacturer of dipyridamole (risk of ventricular arrhythmias)
  Antibacterials: plasma concentration of sildenafil increased by clarithromycin (consider reducing dose of sildenafil); plasma concentration of sildenafil increased by erythromycin—reduce initial dose of sildenafil; plasma concentration of sildenafil possibly increased by telithromycin—reduce initial dose of sildenafil
  Antifungals: plasma concentration of sildenafil increased by itraconazole—reduce dose of sildenafil
  Antivirals: side-effects of sildenafil possibly increased by atazanavir; plasma concentration of sildenafil reduced by etravirine; plasma concentration of sildenafil possibly increased by fosamprenavir; plasma concentration of sildenafil increased by indinavir—reduce initial dose of sildenafil; plasma concentration of sildenafil significantly increased by ritonavir—avoid concomitant use; increased risk of ventricular arrhythmias when sildenafil given with saquinavir—avoid concomitant use; avoidance of sildenafil advised by manufacturer of elaprevir
  Bosentan: plasma concentration of sildenafil reduced by bosentan, also plasma concentration of bosentan increased
  Calcium-channel Blockers: enhanced hypotensive effect when sildenafil given with amiodipine
  Cobicistat: plasma concentration of sildenafil possibly increased by cobicistat—manufacturer of cobicistat advises avoid concomitant use of sildenafil for pulmonary arterial hypertension or reduce dose of sildenafil for erectile dysfunction—consult cobicistat product literature
  Dapoxetine: avoidance of sildenafil advised by manufacturer of dapoxetine
  Grapefruit juice: plasma concentration of sildenafil possibly increased by grapefruit juice
  Nicorandil: sildenafil significantly enhances hypotensive effect of nicorandil (avoid concomitant use)
  Nitrates: sildenafil significantly enhances hypotensive effect of nitrates (avoid concomitant use)
  Riociguat: enhanced hypotensive effect when sildenafil given with riociguat—avoid concomitant use
Sildenafil (continued)
Ulcercelling Drugs: plasma concentration of sildenafil increased by cimetidine (consider reducing dose of sildenafil)
Simvastatin see Statins
Sirolimus
- Anti-arrhythmics: caution with sirolimus advised by manufacturer of dronedarone
  Antibacterials: plasma concentration of sirolimus increased by clarithromycin and telithromycin—avoid concomitant use; plasma concentration of both drugs increased when sirolimus given with erythromycin; plasma concentration of sirolimus reduced by rifabutin and rifampicin—avoid concomitant use
  Antifungals: plasma concentration of sirolimus possibly increased by miconazole; plasma concentration of sirolimus possibly increased by flucanazole and posaconazole; plasma concentration of sirolimus increased byitraconazole and voriconazole—avoid concomitant use
  Antivirals: plasma concentration of sirolimus possibly increased by atazanavir and lopinavir; plasma concentration of sirolimus increased by boceprevir (increased risk of toxicity—reduce sirolimus dose); plasma concentration of both drugs increased when sirolimus given with everapamil
  Ciclosporin: plasma concentration of sirolimus increased by ciclosporin
  Cytotoxics: caution with sirolimus advised by manufacturer of micrftab
  Grapefruit juice: plasma concentration of sirolimus increased by grapefruit juice—avoid concomitant use
Sitagliptin see Antidiabetics
Sodium Aurothiomalate
- ACE Inhibitors: flushing and hypotension reported when sodium aurothiomalate given with ACE inhibitors
  Penicillamine: avoidance of sodium aurothiomalate advised by manufacturer of penicillamine (increased risk of toxicity)
Sodium Benzoate
Antiepileptics: effects of sodium benzoate possibly reduced by valproate
Antipsychotics: effects of sodium benzoate possibly reduced by haloperidol
Corticosteroids: effects of sodium benzoate possibly reduced by corticosteroids
Probencid: excretion of conjugate formed by sodium benzoate possibly reduced by probenecid
Sodium Bicarbonate see Antacids
Sodium Citrate
- Antibacterials: avoid concomitant use of sodium citrate with methenamine
  Ulcer-healing Drugs: avoidance of sodium citrate advised by manufacturer of sucralfate
Sodium Clofodrate see Bisphosphonates
Sodium Nitroprusside see Vasodilator Anti-hypertensives
Sodium Oxibate
- Analgesics: effects of sodium oxibate enhanced by opioid analgesics (avoid concomitant use)
  Antidepressants: increased risk of side-effects when sodium oxibate given with tricyclics
  Antipsychotics: manufacturer of sodium oxibate advises avoid concomitant use with phenobarbital
  Antipsychotics: effects of sodium oxibate possibly enhanced by antipsychotics
Appendix 1: Interactions

**Sodium Oxylate** (continued)
- Antiarrhythmics: effects of sodium oxylate increased by β-blockers; plasma concentration of oxylate increased by β-blocking agents (avoid concomitant use)

**Sodium Phenylbutyrate**
- Antiepileptics: effects of sodium phenylbutyrate possibly reduced by valproate
- Antipsychotics: effects of sodium phenylbutyrate possibly reduced by haloperidol
- Corticosteroids: effects of sodium phenylbutyrate possibly reduced by corticosteroids
- Probenecid: excretion of conjugate formed by sodium phenylbutyrate possibly reduced by probenecid

**Sodium Stibogluconate**
- Antiinflammas: possible increased risk of arrhythmias when sodium stibogluconate given before amphotericin—manufacturer of sodium stibogluconate advises giving 14 days apart

**Sodium Valproate** see Valproate

**Sofosbuvir**
- Antibacterials: manufacturer of sofosbuvir advises avoiding concomitant use with rifampicin
- Antidepressants: manufacturer of sofosbuvir advises avoid concomitant use with St John’s wort
- Antipsychotics: manufacturer of sofosbuvir advises avoid concomitant use with cariprazine
- Antifungals: manufacturer of sofosbuvir advises avoid concomitant use with fluconazole or miconazole
- Corticosteroids: effects of sodium phenylbutyrate possibly reduced by probenecid

**Somatropin** see Somatropin

**Sodium Valproate** see Valproate

**Solutions** see Antimuscarinics

**Somatropin**
- Antiinflammas: growth-promoting effect of somatropin may be inhibited by corticosteroids
- Oestrogens: increased doses of somatropin may be needed when given with oestrogens (when used as oral replacement therapy)

**Sorafenib**
- Antibacterials: bioavailability of sorafenib reduced by neomycin; plasma concentration of sorafenib reduced by rifampicin
- Anticoagulants: sorafenib possibly enhances anticoagulant effect of coumarins
- Antipsychotics: avoid concomitant use of cytoxics with olanzapine (increased risk of agranulocytosis)
- Antivirals: avoidance of sorafenib advised by manufacturers of boceprevir
- Cytotoxicantic: sorafenib possibly increases plasma concentration of doxorubicin and irinotecan; sorafenib increases plasma concentration of docetaxel

**Sotalol** see Beta-blockers

**Spirinolactone** see Diuretics

**Statins**
- Antibacterials: increased risk of myopathy when simvastatin given with amlodipine; plasma concentration of rosuvastatin increased by amlodipine (or both)
- Antihyperlipidemics: increased risk of myopathy when atorvastatin or pravastatin given with dalfopristin or pradugastat; plasma concentration of atorvastatin possibly increased by dalfopristin (or both)
- Antivirals: increased risk of myopathy when atorvastatin or pravastatin given with avoid concomitant use with St John’s wort
- Antithrombotics: increased risk of myopathy when atorvastatin given with aspirin; plasma concentration of atorvastatin possibly increased by aspirin
- Anticoagulants: increased risk of myopathy when atorvastatin given with clopidogrel; plasma concentration of atorvastatin possibly increased by clopidogrel
- Anticoagulants: increased risk of myopathy when simvastatin given with rivaroxaban; plasma concentration of atorvastatin possibly increased by rivaroxaban
- Anticoagulants: increased risk of myopathy when simvastatin given with dabigatran; plasma concentration of atorvastatin possibly increased by dabigatran
- Anticoagulants: increased risk of myopathy when atorvastatin given with apixaban; plasma concentration of atorvastatin possibly increased by apixaban
- Anticoagulants: increased risk of myopathy when atorvastatin given with edoxaban; plasma concentration of atorvastatin possibly increased by edoxaban
- Anticoagulants: increased risk of myopathy when atorvastatin given with rivaroxaban; plasma concentration of atorvastatin possibly increased by rivaroxaban
- Anticoagulants: increased risk of myopathy when atorvastatin given with apixaban; plasma concentration of atorvastatin possibly increased by apixaban
- Anticoagulants: increased risk of myopathy when atorvastatin given with dabigatran; plasma concentration of atorvastatin possibly increased by dabigatran
Statins

- Calcium-channel Blockers (continued) and diltiazem (see Dose under Simvastatin, p. 173); plasma concentration of atorvastatin increased by diltiazem—possible increased risk of myopathy; increased risk of myopathy when simvastatin given with verapamil (see Dose under Simvastatin, p. 173)

Cardiac Glycosides: atorvastatin possibly increases plasma concentration of digoxin
- Cilicospin: increased risk of myopathy when rosuvastatin or simvastatin given with cilicospin (avoid concomitant use); increased risk of myopathy when atorvostatin given with cilicospin (see Dose under Atorvostatin, p. 171); increased risk of myopathy when fluvastatin or pravastatin given with cilicospin
- Cobicistat: plasma concentration of atorvostatin possibly increased by cobicistat—manufacturer of cobicistat advises reduce dose of atorvostatin; avoidance of simvastatin advised by manufacturer of cobicistat
- Colchicine: possible increased risk of myopathy when statins given with colchicine

Cytotoxics: plasma concentration of simvastatin possibly increased by dasatinib; plasma concentration of simvastatin increased by imatinib
- Etorbropag: plasma concentration of rosuvastatin increased by etorbropag—adjust dose of rosuvastatin (consult product literature)
- Grapefruit juice: plasma concentration of atorvostatin possibly increased by grapefruit juice; plasma concentration of simvastatin increased by grapefruit juice—avoid concomitant use
- Hormone Antagonists: possible increased risk of myopathy when simvastatin given with danazol—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when simvastatin given with bezafibrate and ciprofibrate (see Dose under Simvastatin, p. 173); when given with statins reduce maximum dose of fenofibrate—see Dose under Fenofibrate, p. 176; increased risk of myopathy when atorvostatin, fluvastatin or pravastatin given with gemfibrozil (preferably avoid concomitant use); increased risk of myopathy when simvastatin given with gemfibrozil (avoid concomitant use); plasma concentration of rosuvastatin increased by ezetimibe—adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when statins given with fibrates; plasma concentration of simvastatin increased by simvastatin (see Dose under Simvastatin, p. 173); increased risk of myopathy when statins given with fibrates; plasma concentration of simvastatin increased by nondones—manufacturer of sugammadex advises additional contraceptive precautions
- Oestrogens: atorvostatin and rosuvastatin increase plasma concentration of ethinyloestradiol
- Progestogens: atorvostatin increases plasma concentration of norethisterone; rosuvastatin increases plasma concentration of active metabolite of norgestimate; rosuvastatin increases plasma concentration of norgestrel
- Ranolazine: plasma concentration of simvastatin increased by ranolazine (see Dose under Simvastatin, p. 173)
- Retinoids: plasma concentration of simvastatin reduced by alitretinoin
- Teriflunomide: plasma concentration of rosuvastatin increased by teriflunomide (consider reducing dose of rosuvastatin)
- Ticagrelor: plasma concentration of simvastatin increased by ticagrelor (increased risk of toxicity)

Appendix 1: Interactions

Stavudine

- Antivirals: increased risk of side-effects when stavudine given with didanosine; increased risk of toxicity when stavudine given with abacavir; effects of stavudine possibly inhibited by zidovudine (manufacturers advise avoid concomitant use)
- Cytotoxics: effects of stavudine possibly inhibited by doxorubicin; increased risk of toxicity when stavudine given with hydroxyurea—avoid concomitant use
- Orlistat: absorption of stavudine possibly reduced by orlistat

Striptentol

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (conpressive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIs and tricyclics (conpressive threshold lowered)
- Antiepileptics: stiripentol increases plasma concentration of carbamazepine, phenobarbital and phenytoin
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by metloquine
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by antipsychotics (conpressive threshold lowered)
- Anxiolytics and Hypnotics: stiripentol increases plasma concentration of clonazepam
- Orlistat: possible increased risk of convulsions when antiepileptics given with orlistat

Streptomycin see Aminoacides

Strontium Ranelate

Antibacterials: strontium ranelate reduces absorption of quinolones and tetracyclines (manufacturer of strontium ranelate advises avoid concomitant use)

Sucralfate

Antibacterials: sucralfate reduces absorption of ciproflaxacin, levoflaxacin, moxiflaxacin, ofloxacin and tetracyclines; sucralfate reduces absorption of norflaxacin (give at least 2 hours apart)
- Anticoagulants: sucralfate possibly reduces absorption of coumarins (reduced anticoagulant effect)
- Antiepileptics: sucralfate reduces absorption of phenytoin
- Antipsychotics: sucralfate reduces absorption of sulpiride
- Cardiac Glycosides: sucralfate possibly reduces absorption of cardiac glycosides
- Potassium Salts: manufacturer of sucralfate advises avoid concomitant use with potassium citrate
- Sodium Citrate: manufacturer of sucralfate advises avoid concomitant use with sodium citrate
- Theophylline: sucralfate possibly reduces absorption of theophylline (give at least 2 hours apart)
- Thryroid Hormones: sucralfate reduces absorption of levothyroxine

Sugammadex

Antibacterials: response to sugammadex possibly reduced by fusidic acid

Progestogens: sugammadex possibly reduces plasma concentration of progestogens—manufacturer of sugammadex advises additional contraceptive precautions

Sulfadiazine see Sulfonamides
Sulfadoxine see Sulfonamides
Sulfamethoxazole see Sulfonamides
Sulfasalazine see Aminosalicylates

Sulfipyrazone

Analgesics: effects of sulfipyrazone antagonised by aspirin
- Antibacterials: sulfipyrazone reduces excretion of nitrofurantoion (increased risk of toxicity); sulfipyra-
Appendix 1: Interactions

Sulfinpyrazone

Antibacterials (continued)
zone reduces excretion of penicillins; effects of sulfinpyrazone antagonised by pyrazinamide

● Anticoagulants: increased risk of bleeding when sulfinpyrazone given with apixaban; sulfinpyrazone enhances anticoagulant effect of <e comunars; possible increased risk of bleeding when sulfinpyrazone given with dabigatran

● Antidiabetics: sulfinpyrazone enhances effects of sulfonylureas

● Antiepileptics: sulfinpyrazone increases plasma concentration of phenytoin

Calcium-channel Blockers: sulfinpyrazone reduces plasma concentration of theophylline

Ciclosporin: sulfinpyrazone reduces plasma concentration of ciclosporin

Theophylline: sulfinpyrazone reduces plasma concentration of theophylline

Sulfonamides

Anaesthetics, General: sulfonamides enhance effects of thiopental

● Anaesthetics, Local: effects of sulfonamides possibly inhibited by chloroprocaine (manufacturer of chloroprocaine advises avoid concomitant use); increased risk of methaemoglobinemia when sulfonamides given with prilocaine

Anti-arrhythmics: possible increased risk of ventricular arrhythmias when sulfamethoxazole (as co-trimoxazole) given with amiодarone—manufacturer of amiодarone advises avoid concomitant use of co-trimoxazole

● Antibacterials: increased risk of crystalluria when sulfonamides given with metethamine

● Anticoagulants: sulfonamides enhance anticoagulant effect of comunars; sulfonamides possibly inhibit metabolism of phenindione

Antidiabetics: sulfonamides rarely enhance the effects of sulfonylureas

Antiepileptics: sulfonamides possibly increase plasma concentration of phenytoin

● Antiinflammatory: increased antifolate effect when sulfonamides given with pyrimethamine

Antipsychotics: avoid concomitant use of sulfonamides with clozapine (increased risk of agranulocytosis)

Azathioprine: increased risk of haematological toxicity when sulfamethoxazole (as co-trimoxazole) given with azathioprine

Ciclosporin: increased risk of nephrotoxicity when sulfonamides given with ciclosporin; sulfadiazine possibly reduces plasma concentration of ciclosporin

Cytoxotics: increased risk of haematological toxicity when sulfamethoxazole (as co-trimoxazole) given with mercaptopurine or methotrexate; sulfonamides increase risk of methotrexate toxicity

Potassium Aminobenzoate: effects of sulfonamides inhibited by potassium aminobenzoate

Vaccines: antibiotics inactivate oral typhoid vaccine—see p. 850

Sulfonylureas see Antidiabetics

Sulindac see NSAIDs

Sulpiride see Antipsychotics

Sumatriptan see 5HT1-receptor Agonists (under HT)

Sunitinib

Antibacterials: metabolism of sunitinib accelerated by rifampicin (reduced plasma concentration)

● Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)

● Antivirals: avoidance of sunitinib advised by manufacturer of boceprevir

Suxamethonium see Muscle Relaxants

Sympathomimetics

● Adrenergic Neurone Blockers: ephedrine, isomethamphetamine, metamiramin, methylenepridate, noradren-
Antibacterials:

Analgesics:

Tacrolimus

Antivirals:

Sympathomimetics, Beta2

Dopaminergics:

Sympathomimetics (continued)

BNF 68 Appendix 1: Interactions 985

Tacrolimus

Antibacterials (continued)

mycin; possible increased risk of nephrotoxicity when tacrolimus given with vancomycin

Anticoagulants: tacrolimus possibly increases plasma concentration of dabigatan—manufacturer of dabigatan advises avoid concomitant use

Antidepressants: plasma concentration of tacrolimus reduced by St John’s wort—avoid concomitant use

Antiepileptics: plasma concentration of tacrolimus reduced by phenobarbital; plasma concentration of tacrolimus reduced by phenytoin, also plasma concentration of phenytoin possibly increased

Antifungals: plasma concentration of tacrolimus possibly increased by miconazole oral gel; increased risk of nephrotoxicity when tacrolimus given with amphotericin; plasma concentration of tacrolimus increased by fucnozale, etracnozale, posaco- nazole and vorconazole (consider reducing dose of tacrolimus); plasma concentration of tacrolimus reduced by caspofungin

Antipsychotics: avoidance of tacrolimus advised by manufacturer of droperidol (risk of ventricular arrhythmias)

Antivirals: possible increased risk of nephrotoxicity when tacrolimus given with aciclovir or ganciclovir; plasma concentration of tacrolimus possibly increased by etazanivir and ritonavir; plasma concentration of tacrolimus increased by efocarnavir (reduce dose of tacrolimus); plasma concentration of tacrolimus increased by saquinavir (consider reducing dose of tacrolimus); plasma concentration of both drugs increased when tacrolimus given with etaprevir (reduce dose of tacrolimus)

Calcium-channel Blockers: plasma concentration of tacrolimus possibly increased by felodipine, nicar- dipine and verapamil; plasma concentration of tacrolimus increased by diltiazem and nifedipine

 Ciclosporin: tacrolimus increases plasma concentra- tion of ciclosporin (increased risk of nephrotoxicity)—avoid concomitant use

Colestilan: manufacturer of colestilan advises give tacrolimus at least 1 hour before or 3 hours after colestilan

Cytotoxics: tacrolimus possibly increases the plasma concentration of afatinib—manufacturer of afatinib advises separating administration of tacrolimus by 6 to 12 hours; caution with tacrolimus advised by manufacturer of crizotinib; plasma concentration of tacrolimus increased by imatinib

Diuretics: increased risk of hyperkalaemia when tacrolimus given with potassium-sparking diuretics and aldosterone antagonists

Grapefruit juice: plasma concentration of tacrolimus increased by grapefruit juice

Hormone Antagonists: plasma concentration of tacrolimus possibly increased by danazol

Mifamurtide: avoidance of tacrolimus advised by manufacturer of mifamurtide

Drostogens: plasma concentration of tacrolimus possi- bly increased by ethinylestradiol

Potassium Salts: increased risk of hyperkalaemia when tacrolimus given with potassium-sparing diuretics

Fosamprinavir; plasma concentration of tacrolimus increased by fosamprinavir; plasma concentration of tacrolimus increased by saquinavir (consider reducing dose of tacrolimus); plasma concentration of both drugs increased when tacrolimus given with etaprevir (reduce dose of tacrolimus)

Muscle Relaxants: bantobuter enhances effects of saxumethonium

Theophylline: increased risk of hyperkalaemia when high doses of beta2 sympathomimetics given with theophylline—see Hyperkalaemia, p. 196

Corticosteroids: increased risk of nephrotoxicity when tacrolimus given with NSAIDs; increased risk of nephrotoxicity when tacrolimus given with ibuprofen

Anti-arrhythmics: caution with tacrolimus advised by manufacturer of crizotinib

Anti-bacterials: plasma concentration of tacrolimus increased by clarithromycin and erythromycin; plasma concentration of tacrolimus possibly reduced by rifabutin; plasma concentration of tacrolimus reduced by lopinavir; increased risk of nephrotoxicity when tacrolimus given with ciprofloxacin; plasma concentration of tacrolimus possibly increased by chloramphenicol and telithro-
Appendix 1: Interactions

Tadalafil

- Alpha-blockers (continued)
  - Tadalafil advises avoid concomitant use; enhanced hypotensive effect when tadalafil given with α-blockers—see also p. 558
  - Anti-arrhythmics: avoidance of tadalafil advised by manufacturer of disopyramide (risk of ventricular arrhythmias)
  - Antibacterials: plasma concentration of tadalafil possibly increased by clarithromycin and erythromycin; plasma concentration of tadalafil reduced by rifampicin—manufacturer of tadalafil advises avoid concomitant use
  - Antifungals: plasma concentration of tadalafil possibly increased by itraconazole
  - Antivirals: plasma concentration of tadalafil possibly increased by fosamprenavir and indinavir; plasma concentration of tadalafil increased by ritonavir—manufacturer of tadalafil advises avoid concomitant use; increased risk of ventricular arrhythmias when tadalafil given with saquinavir—avoid concomitant use; avoidance of high doses of tadalafil advised by manufacturer of telaprevir—consult product literature
  - Bosentan: plasma concentration of tadalafil reduced by bosentan
  - Cobicistat: plasma concentration of tadalafil possibly increased by cobicistat—manufacturer of cobicistat advises reduce dose of tadalafil (consult cobicistat product literature)
  - Dapoxetine: avoidance of tadalafil advised by manufacturer of dapoxetine
  - Grapefruit juice: plasma concentration of tadalafil possibly increased by grapefruit juice
  - Nicardipine: tadalafil significantly enhances hypotensive effect of nicardipine (avoid concomitant use)
  - Nitrates: tadalafil significantly enhances hypotensive effect of nitrates (avoid concomitant use)
  - Riociguat: possible enhanced hypotensive effect when tadalafil given with riociguat—avoid concomitant use
  - Tamoxifen
    - Antibacterials: metabolism of tamoxifen accelerated by rifampicin (reduced plasma concentration)
    - Anticoagulants: tamoxifen enhances anticoagulant metabolism of tamoxifen to active metabolite possibly inhibited by fluoxetine and paroxetine (avoid concomitant use)
    - Antipsychotics: avoidance of tamoxifen enhanced by manufacturer of droperidol (risk of ventricular arrhythmias)
    - Bupropion: metabolism of tamoxifen to active metabolite possibly inhibited by bupropion (avoid concomitant use)
    - Cinacalcet: metabolism of tamoxifen to active metabolite possibly inhibited by cinacalcet (avoid concomitant use)
  - Tamsulosin see Alpha-blockers
  - Tapentadol see Opioid Analgesics
  - Taxanes see Cisplatin, Docetaxel, and Paclitaxel
  - Telagafur see Flavonuranil
  - Teliposide
    - Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850
  - Telaprevir
    - Alpha-blockers: manufacturer of telaprevir advises avoid concomitant use with alfuzosin
    - Analgesics: manufacturer of telaprevir advises caution with methadone (risk of ventricular arrhythmias)
    - Anti-arrhythmics: manufacturer of telaprevir advises avoid concomitant use with amiodarone and disopyramide (risk of ventricular arrhythmias); manufacturer of telaprevir advises caution with flecanide and propafenone (risk of ventricular arrhythmias)
    - Antirhinitics: caution with intravenous lidocaine
    - Antibacterials: plasma concentration of both drugs possibly increased when telaprevir given with clarithromycin, erythromycin and etelithromycin (increased risk of ventricular arrhythmias); manufacturer of telaprevir advises avoid concomitant use with telaprevir—plasma concentration of telaprevir significantly reduced by rifampicin—avoid concomitant use
    - Anticoagulants: telaprevir possibly affects plasma concentration of warfarin; telaprevir possibly increases plasma concentration of dabigatran
    - Antidepressants: telaprevir possibly increases plasma concentration of trazodone; manufacturer of telaprevir advises concomitant use with St John’s wort
    - Antiepileptics: manufacturer of telaprevir advises avoid concomitant use with carbamazepine, phenobarbital and phenytoin
    - Antifungals: telaprevir possibly increases plasma concentration of itraconazole; telaprevir possibly increases plasma concentration of posaconazole (increased risk of ventricular arrhythmias); telaprevir possibly affects plasma concentration of voriconazole (possible increased risk of ventricular arrhythmias)
    - Antipsychotics: manufacturer of telaprevir advises avoid concomitant use with ziprasidone; telaprevir possibly increases plasma concentration of equetia pine—manufacturer of quetiapine advises avoid concomitant use
    - Antivirals: plasma concentration of telaprevir possibly reduced by atazanavir, also plasma concentration of atazanavir possibly increased; avoid concomitant use of telaprevir with darunavir; plasma concentration of telaprevir reduced by efavirenz—increases dose of telaprevir; manufacturers advise avoid concomitant use of telaprevir with fosamprenavir and lopinavir; telaprevir increases plasma concentration of maraviroc (consider reducing dose of maraviroc); plasma concentration of telaprevir possibly reduced by nevirapine—consider increasing dose of telaprevir; plasma concentration of telaprevir possibly reduced by ritonavir; telaprevir increases plasma concentration of tenofovir
    - Anxiolytics and Hypnotics: telaprevir possibly increases plasma concentration of midazolam (risk of prolonged sedation—avoid concomitant use of oral midazolam)
    - Beta-blockers: manufacturer of telaprevir advises avoid concomitant use with isotalol (risk of ventricular arrhythmias)
    - Bosentan: plasma concentration of telaprevir possibly reduced by bosentan, also plasma concentration of bosentan possibly increased
    - Calcium-channel Blockers: telaprevir increases plasma concentration of amiodarone (consider reducing dose of amiodarone); manufacturer of telaprevir advises caution with diltiazem, felodipine, nicardipine, nifedipine and verapamil
    - Cardiac Glycosides: telaprevir increases plasma concentration of digoxin
    - Ciclosporin: plasma concentration of both drugs increased when telaprevir given with ciclosporin (reduce dose of ciclosporin)
    - Cilostazol: telaprevir possibly increases plasma concentration of cilostazol (see Dose under Cilostazol, p. 140)
    - Colchicine: telaprevir possibly increases risk of colchicine toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
**Appendix 1: Interactions**

### Telaprevir (continued)

Corticosteroids: telaprevir possibly increases plasma concentration of *inhaled* and *intranasal* budesonide and fluticasone; plasma concentration of telaprevir possibly reduced by dexamethasone

- Cytotoxins: telaprevir possibly increases the plasma concentration of *bosutinib*—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; manufacturer of ruxolitinib advises dose reduction when telaprevir given with *bosutinib*—consult ruxolitinib product literature
- Domeridone: possible increased risk of ventricular arrhythmias when telaprevir given with *domeridone*—avoid concomitant use
- Ergot Alkaloids: manufacturer of telaprevir advises avoid concomitant use with *ergot alkaloids*
- Lipid-regulating Drugs: manufacturer of telaprevir advises avoid concomitant use with *atorvastatin;* manufacturers advise avoid concomitant use of telaprevir with *simvastatin;* avoidance of telaprevir advised by manufacturer of *simvastatin*—avoid concomitant use with *simvastatin* (reduce dose of sirolimus)
- Sirolimus: plasma concentration of both drugs increased when telaprevir given with *sirolimus*—consult product literature
- Tadalafil: manufacturer of telaprevir advises avoid concomitant use with *tadalafil*
- Sympathomimetics, Beta 2: telaprevir possibly increases plasma concentration of *telithromycin* and *tacrolimus*—avoid concomitant use

### Telithromycin

- Antipsychotics: *telithromycin* possibly increases plasma concentration of *quetiapine*
- Norvir: manufacturer of telithromycin advises avoid concomitant use with *atazanavir, fosamprenavir, indinavir, lopinavir,* and *ritonavir* and *etipranavir* in severe renal and hepatic impairment; telithromycin possibly increases plasma concentration of *atazanavir* (consider reducing dose of maraviroc); manufacturer of telithromycin advises avoid concomitant use with *saquinavir* (risk of ventricular arrhythmias); plasma concentration of both drugs possibly increased when telithromycin given with *telaprevir*—increased risk of ventricular arrhythmias
- Anxiolytics and Hypnotics: telithromycin inhibits metabolism of *midazolam* (increased plasma concentration with increased sedation)
- Aprepitant: telithromycin possibly increases plasma concentration of *aprepitant*
- Avanafil: telithromycin possibly increases plasma concentration of *avanafil*—manufacturer of avanafil advises avoid concomitant use
- Calcium-channel Blockers: telithromycin possibly inhibits metabolism of *calcium-channel blockers* (increased risk of side-effects)
- Cardiac Glycosides: telithromycin possibly increases plasma concentration of *digoxin*
- Ciclosporin: telithromycin possibly increases plasma concentration of *ciclosporin*
- Colchicine: telithromycin possibly increases risk of *colchicine* toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Cytotoxics: telithromycin possibly increases plasma concentration of *axitinib* (reduce dose of axitinib—consult axitinib product literature); telithromycin possibly increases plasma concentration of *bosutinib* and *cabazitaxel*—manufacturer of bosutinib and cabazitaxel advises avoid or consider reducing dose of bosutinib and cabazitaxel; telithromycin possibly increases plasma concentration of *cristinib* and *everolimus*—manufacturer of cristinib and everolimus advises avoid concomitant use; avoidance of telithromycin advised by manufacturer of *apatinib and nilotinib;* telithromycin possibly increases plasma concentration of *pazopanib* (reduce dose of pazopanib); manufacturer of ruxolitinib advises dose reduction when telithromycin given with *ruxolitinib*—consult ruxolitinib product literature
- Dapoxetine: avoidance of telithromycin advised by manufacturer of *dapoxetine* (increased risk of toxicity)
- Diuretics: telithromycin increases plasma concentration of *spironolactone*—avoid concomitant use
- Domeridone: possible increased risk of ventricular arrhythmias when telithromycin given with *domeridone*—avoid concomitant use
- Ergot Alkaloids: increased risk of ergotism when telithromycin given with *ergotamine*—avoid concomitant use
- Ivabradine: telithromycin possibly increases plasma concentration of *ivabradine*—avoid concomitant use
- Iverapin: telithromycin possibly increases plasma concentration of *iverapin* (see Dose Under Iverapin, p. 216)
- Lipid-regulating Drugs: increased risk of myopathy when telithromycin given with *atorvastatin or simvastatin* (avoid concomitant use); possible increased risk of myopathy when telithromycin given with pravastatin; avoidance of telithromycin advised by manufacturer of *lomitapide* (plasma concentration of lomitapide possibly increased)
Telithromycin (continued)

- Pentamidine isethionate: possible increased risk of ventricular arrhythmias when telithromycin given with parenteral pentamidine isethionate.
- Ranolazine: telithromycin possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use.
- Sildenafil: telithromycin possibly increases plasma concentration of sildenafil—reduce initial dose of sildenafil.
- Sirolimus: telithromycin increases plasma concentration of sirolimus—avoid concomitant use.
- Tacrolimus: telithromycin possibly increases plasma concentration of tacrolimus—consider increasing dose of tacrolimus.
- Telmisartan: avoidance of telithromycin advised by manufacturer of telmisartan.

Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850

Telmisartan see Angiotensin-II Receptor Antagonists

Temazepam see Anxiolytics and Hypnotics

Temocillin see Penicillins

Temozolomide

Antiepileptics: plasma concentration of temozolomide increased by valproate.

Antipsychotics: avoid concomitant use of cytoxycs with clozapine (increased risk of agranulocytosis).

Tensirolimus

Note: The main active metabolite of tensirolimus is sirolimus—see also interactions of sirolimus and consult product literature.

- Antibacterials: plasma concentration of active metabolite of tensirolimus reduced by rifampicin—avoid concomitant use.
- Antifungals: manufacturer of tensirolimus advises avoid concomitant use with itraconazole (plasma concentration of tensirolimus possibly increased).
- Antipsychotics: avoid concomitant use of cytoxycs with clozapine (increased risk of agranulocytosis).

Tenofovir

- Antivirals: manufacturer of tenofovir advises avoid concomitant use with adeovir; tenofovir reduces plasma concentration of atazanavir, also plasma concentration of tenofovir possibly increased; manufacturers advise avoid concomitant use of tenofovir with adeovir; tenofovir increases plasma concentration of didanosine (increased risk of toxicity)—avoid concomitant use; plasma concentration of tenofovir increased by lopinavir and telaprevir.
- Oralistat: absorption of tenofovir possibly reduced by orlistat.

Teriflunomide

- Antibacterials: plasma concentration of teriflunomide reduced by rifampicin.

Antidepressants: teriflunomide possibly increases plasma concentration of paroxetine and tricyclics.

Antifungals: teriflunomide increases plasma concentration of fluconazole.

Ciclosporin: teriflunomide possibly reduces plasma concentration of ciclosporin.

Estradiogens: occasional reports of breakthrough bleeding when teriflunomide given with estradiogens (when used for contraception).

Progestogens: occasional reports of breakthrough bleeding when teriflunomide given with progestogens (when used for contraception).

Ulcers: plasma concentration of teriflunomide increased by cimetidine.

Terbutaline see Sympathomimetics, Beta2

Teriflunomide

Antibacterials: teriflunomide increases plasma concentration of cefaclor; plasma concentration of teriflunomide reduced by rifampicin.

Antidiabetics: teriflunomide increases plasma concentration of repaglinide.

- Lipid-regulating Drugs: the effect of teriflunomide is significantly decreased by colestyramine (enhanced elimination)—avoid unless drug elimination desired; teriflunomide increases plasma concentration of rosuvastatin (consider reducing dose of rosuvastatin).

Oestrogens: teriflunomide increases plasma concentration of ethinylestradiol.

Progestogens: teriflunomide increases plasma concentration of levonorgestrel.

Vaccines: avoid concomitant use of teriflunomide with live vaccines (see p. 828).

Testolactone

- Anticoagulants: testolactone enhances anticoagulant effect of coumarins and phenindione.

Testosterone

- Anticoagulants: testosterone enhances anticoagulant effect of coumarins and phenindione.

Antidiabetics: testosterone possibly enhances hypoglycaemic effect of antidiabetics.

Tetrabenazine

- Antidepressants: risk of CNS toxicity when tetrabenazine given with MAOIs (avoid tetrabenazine for 2 weeks after MAOIs).

Antipsychotics: increased risk of extrapyramidal side-effects when tetrabenazine given with antipsychotics.

Dopaminergics: increased risk of extrapyramidal side-effects when tetrabenazine given with metoclopramide.

Tetracosactide see Corticosteroids

Tetracycline see Tetracyclines

Tetracyclines

ACE inhibitors: absorption of tetracyclines reduced by quinapril tablets (quinapril tablets contain magnesium carbonate).

Adsorbents: absorption of tetracyclines possibly reduced by kaolin.

Antacids: absorption of tetracyclines reduced by antacids.

Antibacterials: plasma concentration of doxycycline reduced by rifampicin—consider increasing dose of doxycycline; tetracyclines possibly antagonise effects of penicillins.

Anticoagulants: tetracyclines possibly enhance antiocoagulant effect of coumarins and phenindione.

Antidiabetics: tetracyclines possibly enhance hypoglycaemic effect of sulfonylureas.

Antiepileptics: metabolism of doxycycline accelerated by carbamazepine (reduced effect); metabolism of doxycycline accelerated by phenobarbital and phenytoin (reduced plasma concentration).

Atovaquone: tetracycline reduces plasma concentration of atovaquone.

Calcium Salts: absorption of tetracycline reduced by calcium salts.

Cytotoxics: doxycycline or tetracycline increase risk of methotrexate toxicity.

Daily Products: absorption of tetracyclines (except doxycycline and minocycline) reduced by dairy products.

Diuretics: manufacturer of lymecycline advises avoid concomitant use with diuretics.

Ergot Alkaloids: increased risk of ergotism when tetracyclines given with ergotamine.

Iron: absorption of tetracyclines reduced by oral iron, also absorption of oral iron reduced by tetracyclines.
Antivirals:

- Retinoids: possible increased risk of benign intracranial hypertension when tetracyclines given with retinoids (avoid concomitant use)
- Strontium Ranelate: absorption of tetracyclines reduced by strontium ranelate (manufacturer of strontium ranelate advises avoid concomitant use)
- Ulcer-healing Drugs: absorption of tetracyclines reduced by sucralfate and tripotassium dicitratobismuthate

Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850

Theophylline:

- Allopurinol: plasma concentration of theophylline possibly increased by allopurinol
- Anaesthetics, General: increased risk of convulsions when theophylline given with ketamine
- Anti-arrhythmics: theophylline antagonises anti-arrhythmic effect of adenosine—manufacturer of adenosine advises avoid theophylline for 24 hours before adenosine; plasma concentration of theophylline increased by propafenone
- Antibacterials: plasma concentration of theophylline possibly increased by clarithromycin and isoniazid; plasma concentration of theophylline increased by erythromycin (also theophylline may reduce absorption of oral erythromycin); plasma concentration of theophylline increased by ciprofloxacin and norfloxacin; metabolism of theophylline accelerated by rifampicin (reduced plasma concentration); possible increased risk of convulsions when theophylline given with quinolones
- Antidepressants: plasma concentration of theophylline increased by fluvoxamine (concomitant use should usually be avoided, but where not possible halve theophylline dose and monitor plasma-theophylline concentration); plasma concentration of theophylline possibly reduced by St John’s wort
- Antiepileptics: metabolism of theophylline accelerated by carbamazepine and phenobarbital (reduced effect); plasma concentration of both drugs reduced when theophylline given with phenytoin
- Antifungals: plasma concentration of theophylline possibly increased by fluconazole
- Anti-inflammatories: plasma concentration of theophylline possibly increased by aciclovir; metabolism of theophylline accelerated by ritonavir (reduced plasma concentration)
- Anticoagulants: metabolism of theophylline inhibited by warfarin
- Anticoagulants: metabolism of theophylline inhibited by warfarin
- Antidepressants: metabolism of theophylline inhibited by fluvoxamine, increased risk of agranulocytosis when theophylline given with high doses of beta; sympathomimetics—see Hypokalaemia, p. 186
- Antiepileptics: metabolism of theophylline inhibited by interferon alfa (consider reducing dose of theophylline)
- Leukotriene Receptor Antagonists: plasma concentration of theophylline possibly increased by zafirlukast, also plasma concentration of zafirlukast reduced
- Lithium: theophylline increases excretion of lithium (reduced plasma concentration)
- Oestrogens: plasma concentration of theophylline increased by oestrogens (consider reducing dose of theophylline)
- Pentoxifylline: plasma concentration of theophylline increased by pentoxifylline
- Roflumilast: avoidance of theophylline advised by manufacturer of roflumilast
- Sulfinpyrazone: plasma concentration of theophylline reduced by sulfinpyrazone

Sympathomimetics: manufacturer of theophylline advises avoid concomitant use with ephedrine in children

Sympathomimetics, Beta2: increased risk of hypokalaemia when theophylline given with high doses of beta; sympathomimetics—see Hypokalaemia, p. 186

Thiabendazoles see Antiparasitic Drugs

Thiopental see Anaesthetics, General

Thiopetea:
- Antipsychotics: avoids concomitant use of cytotoxic drugs and sucralfate (give at least 2 hours apart)

Thioxythanes see Antipsychotics

Thyroid Hormones:
- Antacids: absorption of levothyroxine possibly reduced by antacids
- Anti-arhythmic: for concomitant use of thyroid hormones and amiodarone see p. 97
- Anti-inflammatories: metabolism of levothyroxine accelerated by rifampicin (may increase requirements for levothyroxine in hypothyroidism)
- Anticoagulants: thyroid hormones enhance anti-coagulant effect of coumarins and phenindione
- Antidepressants: thyroid hormones enhance effects of amitriptyline and imipramine; thyroid hormones possibly enhance effects of tricyclics
- Antiepileptics: metabolism of thyroid hormones accelerated by carbamazepine and phenobarbital (may increase requirements for thyroid hormones in hypothyroidism); metabolism of thyroid hormones accelerated by phenytoin (may increase requirements in hypothyroidism), also plasma concentration of phenytoin possibly increased
- Beta-blockers: levthyroxine accelerates metabolism of propranolol
- Calcium Salts: absorption of levothyroxine reduced by calcium salts
- Colestilan: manufacturer of colestilan advises avoid levthyroxine at least 1 hour before or 3 hours after colestilan
- Cytotoxic drugs: plasma concentration of levthyroxine possibly reduced by mitomycin C, also increased risk of hypokalaemia when theophylline given with mitomycin C
- Disulfram: metabolism of theophylline inhibited by disulfram (increased risk of toxicity)
- Diuretics: increased risk of hypokalaemia when theophylline given with acetazolamide, loop diuretics or thiazides and related diuretics
- Droxapram: increased CNS stimulation when theophylline given with doxapram
- Diltiazem: plasma concentration of theophylline increased by diltiazem; plasma concentration of both drugs reduced when theophylline given with diltiazem
- Disopropylcarbamilate: increased risk of hypokalaemia when theophylline given with disopropylcarbamilate
- Disulfiram: increased risk of hypokalaemia when theophylline given with disulfiram
- Disopyramide: plasma concentration of theophylline increased by disopyramide
- Doxapram: increased CNS stimulation when theophylline given with doxapram
- Sulfapyridine: increased risk of tetracycline toxicity when theophylline given with sulfapyridine
Thyroid Hormones (continued)
Oestrogens: requirements for thyroid hormones in hypothyroidism may be increased by oestrogens
Orlistat: possible increased risk of hypothyroidism when levothyroxine given with orlistat
Polystyrene Sulfonate Resins: absorption of levothyroxine reduced by polystyrene sulfonate resins
Sevelamer: absorption of levothyroxine possibly reduced by sevelamer
Ulcer-healing Drugs: absorption of levothyroxine reduced by cimetidine and sucralfate

Ticagrelor
● Antidepressants: possible increased risk of bleeding when ticagrelor given with citalopram, paroxetine or sertraline
● Antiepileptics: possible increased risk of convulsions when ticagrelor given with carbamazepine, phenobarbital or phenytoin

Tigecycline
Anticoagulants: possible increased risk of bleeding when ticagrelor given with dexamethasone, phenytoin or aspirin

Tinidazole
Alcohol: possibility of disulfiram-like reaction when tinidazole given with alcohol

Tinidazole (continued)
Antibacterials: plasma concentration of tinidazole possibly reduced by rifampicin
Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850

Tinzaparin
see Heparins

Tiagabine
● Antiepileptics: anticonvulsant effect of antiepileptics antagonised by dolasetron, granisetron, ondansetron, rizatriptan or topotecan

Tipranavir
● Antipsychotics: tipranavir possibly increases plasma concentration of clozapine—avoid concomitant use; avoidance of concomitant tipranavir in severe renal and hepatic impairment advised by manufacturer of tipranavir
● Antidepressants: tipranavir increases plasma concentration of escitalopram—manufacturer of tipranavir advises avoid concomitant use; plasma concentration of tipranavir possibly increased by St John’s wort—avoid concomitant use

Tiprolimus see Antimicrobials

Tirapazamine
Analgescics: plasma concentration of tirapazamine possibly reduced by buprenorphine

Antiepileptics:
● Antibacterials: tipranavir increases plasma concentration of clarithromycin (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by rifampicin
● Antidepressants: tipranavir increases plasma concentration of citalopram, paroxetine or sertraline
● Antiepileptics: possible increased risk of convulsions when tipranavir given with carbamazepine, phenobarbital or phenytoin
● Antidepressants: possible increased risk of bleeding when tipranavir given with dexamethasone, phenytoin or aspirin

Tobramycin
● Antidepressants: tipranavir increases plasma concentration of amitriptyline—manufacturer of tipranavir advises avoid concomitant use; plasma concentration of tipranavir increased (avoid concomitant use)

Togaine
● Antimicobial Agents: possible increased risk of convulsions when tobramycin given with carbamazepine, phenobarbital or phenytoin

Trastuzumab
● Antiepileptics: possible increased risk of convulsions when trastuzumab given with carbamazepine, phenobarbital or phenytoin

Trifluperidol
● Antidepressants: possible increased risk of convulsions when trifluperidol given with carbamazepine, phenobarbital or phenytoin

Triglyceride
● Anticoagulants: possible increased risk of bleeding when ticagrelor given with dexamethasone, phenytoin or aspirin

Ticlopidine
● Anticoagulants: possible increased risk of bleeding when ticlopidine given with dexamethasone, phenytoin or aspirin

Tricyclic Antidepressants
● Anticoagulants: possible increased risk of bleeding when tricyclic antidepressants given with dexamethasone, phenytoin or aspirin

Tricyclic Antidepressants (continued)
● Anticoagulants: possible increased risk of bleeding when tricyclic antidepressants given with dexamethasone, phenytoin or aspirin

Trichloroacetic Acid
● Anticoagulants: possible increased risk of bleeding when trichloroacetic acid given with dexamethasone, phenytoin or aspirin

Titanium
● Anticoagulants: possible increased risk of bleeding when titanium given with dexamethasone, phenytoin or aspirin

Titinostat
● Anticoagulants: possible increased risk of bleeding when titinostat given with dexamethasone, phenytoin or aspirin

Tipranavir
● Antipsychotics: tipranavir possibly increases plasma concentration of clozapine—avoid concomitant use; avoidance of concomitant tipranavir in severe renal and hepatic impairment advised by manufacturer of tipranavir

Tipranavir (continued)
● Antipsychotics: tipranavir possibly increases plasma concentration of clozapine—avoid concomitant use; avoidance of concomitant tipranavir in severe renal and hepatic impairment advised by manufacturer of tipranavir

Tiproycine see Antimicrobials

Tizanidine
● Antihypertensives: possible increased risk of hypotension when tizanidine given with clonidine

Tizanidine (continued)
● Antihypertensives: possible increased risk of hypotension when tizanidine given with clonidine

Tobramycin
● Antiepileptics: possible increased risk of convulsions when tobramycin given with carbamazepine, phenobarbital or phenytoin

Trastuzumab
● Antiepileptics: possible increased risk of convulsions when trastuzumab given with carbamazepine, phenobarbital or phenytoin

Trifluperidol
● Antidepressants: possible increased risk of convulsions when trifluperidol given with carbamazepine, phenobarbital or phenytoin

Triclopyr
● Anticoagulants: possible increased risk of bleeding when triclopyr given with dexamethasone, phenytoin or aspirin

Trifluperidol (continued)
● Anticoagulants: possible increased risk of bleeding when trifluperidol given with dexamethasone, phenytoin or aspirin

Triglyceride
● Anticoagulants: possible increased risk of bleeding when triglyceride given with dexamethasone, phenytoin or aspirin

Trastuzumab
● Antiepileptics: possible increased risk of convulsions when trastuzumab given with carbamazepine, phenobarbital or phenytoin

Trifluperidol (continued)
● Anticoagulants: possible increased risk of bleeding when trifluperidol given with dexamethasone, phenytoin or aspirin

Triclopyr
● Anticoagulants: possible increased risk of bleeding when triclopyr given with dexamethasone, phenytoin or aspirin

Trizol
● Anticoagulants: possible increased risk of bleeding when trizol given with dexamethasone, phenytoin or aspirin
Antipsychotics: [continued]
- Orlistat: absorption of tipranavir possibly reduced by orlistat
- Ranolazine: tipranavir possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use
- Sympathomimetics, Beta₂: manufacturer of tipranavir advises avoid concomitant use with salmeterol
- Ulcer-healing Drugs: tipranavir reduces plasma concentration of esomeprazole and omeprazole
  Vardenafil: manufacturer of tipranavir advises caution with vardenafil
- Vitamins: increased risk of bleeding when tipranavir given with high doses of vitamin E

Tirofiban
- Iloprost: increased risk of bleeding when tirofiban given with iloprost

Tizanidine see Muscle Relaxants

Tobramycin see Aminoglycosides

Tocolzumab
- Vaccines: avoid concomitant use of tocolzumab with live vaccines (see p. 828)

Tolazoline see Alpha-blockers

Tolbutamide see Antidiabetics

Tolcapone
- Antidepressants: avoid concomitant use of tolcapone with MAOIs
- Memantine: effects of dopaminergics possibly antagonised by memantine
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa

Tolafenac Acid see NSAIDs

Tolterodine see Antimuscarinics

Tolvaptan
- Antibacterials: plasma concentration of tolvaptan reduced by rifampicin
- Cardiac Glycosides: tolvaptan increases plasma concentration of digoxin (increased risk of toxicity)
- Grapefruit Juice: plasma concentration of tolvaptan increased by grapefruit juice—avoid concomitant use

Topiramate [continued]
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIs and tricyclics (convulsive threshold lowered)
- Antidiabetics: topiramate possibly increases plasma concentration of metformin; topiramate possibly reduces plasma concentration of glibenclamide
- Antiepileptics: plasma concentration of topiramate often reduced by carbamazepine; topiramate reduces plasma concentration of perampanel; plasma concentration of topiramate possibly reduced by phenobarbital; topiramate increases plasma concentration of phenytoin (also plasma concentration of topiramate reduced); hyperammonaemia and CNS toxicity reported when topiramate given with valproate
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by emetine
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by antipsychotics (convulsive threshold lowered)
- Diuretics: plasma concentration of topiramate possibly increased by hydrochlorothiazide
- Lithium: topiramate possibly affects plasma concentration of lithium
- Oestrogens: topiramate accelerates metabolism of oestrogens (reduced contraceptive effect—see p. 536)
- Orlistat: possible increased risk of convulsions when antiepileptics given with orlistat

Topiramate (continued)
- Progestogens: topiramate accelerates metabolism of progestogens (reduced contraceptive effect—see p. 536)

Torasemide see Diuretics

Toremifene
- Anticoagulants: toremifene possibly enhances anticoagulant effect of coumarins
- Antiepileptics: metabolism of toremifene possibly accelerated by carbamazepine (reduced plasma concentration); metabolism of toremifene possibly accelerated by phenobarbital (reduced plasma concentration); metabolism of toremifene possibly accelerated by phenytoin
- Cytotoxic: possible increased risk of ventricular arrhythmias when toremifene given with vandetanib—avoid concomitant use
- Diuretics: increased risk of hypercalcaemia when toremifene given with thiazides and related diuretics

Trabectedin
- Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)
- Tamradol see Opioid Analgesics
- Trandolapril see ACE Inhibitors
- Tranilxypromine see MAOIs
- Trastuzumab
- Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)
- Trazodone see Antidepressants, Tricyclic (related)
- Tretinoin see Retinoids
- Triamcinolone see Corticosteroids
- Triamterene see Diuretics
- Trienterine
- Iron: trienterine reduces absorption of oral iron
- Zinc: trienterine reduces absorption of zinc, also absorption of trienterine reduced by zinc
- Trifluoperazine see Antipsychotics
- Trihexyphenidyl see Antimuscarinics
- Trimethoprim
- ACE Inhibitors: possible increased risk of hyperkalaemia when trimethoprim given with ACE inhibitors
- Angiotensin-II Receptor Antagonists: possible increased risk of hyperkalaemia when trimethoprim given with angiotensin-II receptor antagonists
- Anti-arrhythmics: possible increased risk of ventricular arrhythmias when trimethoprim (as co-trimoxazole) given with amiodarone—manufacturer of amiodarone advises avoid concomitant use of co-trimoxazole
- Antibacterials: plasma concentration of trimethoprim possibly reduced by rifampicin; plasma concentration of both drugs may increase when trimethoprim given with dapsoné
- Anticoagulants: trimethoprim possibly enhances anticoagulant effect of coumarins
- Antidiabetics: trimethoprim possibly enhances hypoglycaemic effect of repaglinide—manufacturer advises avoid concomitant use; trimethoprim rarely enhances the effects of sulfonylureas
- Antiepileptics: trimethoprim increases plasma concentration of phenytoin (also increased antifolate effect)
- Antimalarials: increased antifolate effect when trimethoprim given with pyrimethamine
- Antivirals: trimethoprim (as co-trimoxazole) increases plasma concentration of lamivudine—avoid concomitant use of high-dose co-trimoxazole
- Azathioprine: increased risk of haematological toxicity when trimethoprim (also with co-trimoxazole) given with azathioprine
- Cardiac Glycosides: trimethoprim possibly increases plasma concentration of digoxin
- Ciclosporin: increased risk of nephrotoxicity when trimethoprim given with ciclosporin, also plasma
Appendix 1: Interactions

Trimethoprim
- Ciclosporin (continued) concentration of ciclosporin reduced by intravenous trimethoprin
- Cytotoxics: increased risk of haematological toxicity when trimethoprin (also with co-trimoxazole) given with ciclosporin or methotrexate

Diuretics: increased risk of hyperkalaemia when trimethoprin given with spironolactone

Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850

Trimipramine see Antidepressants, Tricyclic

Tripotassium Dicitratabisumethate
Antibacterials: tripotassium dicitratabisumethate reduces absorption of tetracyclines

Tropicamide see Antimuscarnics

Trospium see Antimuscarinics

Typhoid Vaccine (oral) see Vaccines

Typhoid Vaccine (parenteral) see Vaccines

Ubdicarenone
Anticoagulants: ubdicarenone may enhance or reduce anticoagulant effect of warfarin

Ulcer-healing Drugs see Histamine H2-antagonists, Proton Pump Inhibitors, Sucralfate, and Tripotassium Dicitratabisumethate

Ulipristal
- Antacids: manufacturer of ulipristal advises give antacids (contraceptive effect of ulipristal possibly reduced)
- Antibacterials: manufacturer of ulipristal advises avoid concomitant use with clarithromycin and telithromycin; plasma concentration of ulipristal increased by erythromycin—manufacturer of ulipristal advises avoid concomitant use; manufacturer of ulipristal advises avoid concomitant use with ampicillin (contraceptive effect of ulipristal possibly reduced)
- Anticoagulants: manufacturer of ulipristal advises give dabigatran at least 1.5 hours before or after ulipristal
- Antidepressants: manufacturer of ulipristal advises avoid concomitant use with St John’s wort (contraceptive effect of ulipristal possibly reduced)
- Antiepileptics: manufacturer of ulipristal advises avoid concomitant use with carbamazepine, phenobarbital and phenytoin (contraceptive effect of ulipristal possibly reduced)
- Antifungals: manufacturer of ulipristal advises avoid concomitant use with itraconazole
- Antihistamines: manufacturer of ulipristal advises give fexofenadine at least 1.5 hours before or after ulipristal
- Antivirals: manufacturer of ulipristal advises avoid concomitant use with tenofovir (contraceptive effect of ulipristal possibly reduced)

Calcium-channel Blockers: manufacturer of ulipristal advises avoid concomitant use with verapamil

Cardiac Glycosides: manufacturer of ulipristal advises give digoxin at least 1.5 hours before or after ulipristal

Grapefruit Juice: manufacturer of ulipristal advises avoid concomitant use with grapefruit juice

Progestogens: ulipristal possibly reduces contraceptive effect of progestogens

Ulcer-healing Drugs: manufacturer of ulipristal advises avoid concomitant use with histamine H2-antagonists and proton pump inhibitors (contraceptive effect of ulipristal possibly reduced)

Ursodeoxycholic Acid see Bile Acids

Ustekinumab
- Vaccines: avoid concomitant use of ustekinumab with live vaccines (see p. 828)

Vaccines
Note For a general warning on live vaccines and high doses of corticosteroids or other immunosuppressive drugs, see p. 828; for advice on live vaccines and immunoglobulins, see under Normal Immunoglobulin, p. 852

- Abatacept: avoid concomitant use of live vaccines with abatacept (see p. 828)
- Adalimumab: avoid concomitant use of live vaccines with adalimumab (see p. 828)
- Alectuzumab: avoid concomitant use of live vaccines with alectuzumab (see p. 828)
- Anakinra: avoid concomitant use of live vaccines with anakinra (see p. 828)

Antibacterials: oral typhoid vaccine inactivated by antibacterials—see p. 850

Anticoagulants: influenzavirus possibly enhances anticoagulant effect of warfarin

Antiepileptics: influenzavirus enhances effects of phenytoin

Antimalarials: oral typhoid vaccine inactivated by antimalarials—see p. 850

- Belimumab: avoid concomitant use of live vaccines with belimumab (see p. 828)
- Certolizumab pegol: avoid concomitant use of live vaccines with certolizumab pegol (see p. 828)
- Corticosteroids: immune response to vaccines impaired by high doses of corticosteroids, avoid concomitant use with live vaccines (see p. 828)

- Cytotoxics: avoid concomitant use of live vaccines with paxitroline (see p. 828)
- Etanercept: avoid concomitant use of live vaccines with etanercept (see p. 828)
- Golimumab: avoid concomitant use of live vaccines with golimumab (see p. 828)
- Infliximab: avoid concomitant use of live vaccines with infliximab (see p. 828)

Interferons: avoidance of vaccines advised by manufacturer of interferon gamma

- Leflunomide: avoid concomitant use of live vaccines with leflunomide (see p. 828)

- Teriflunomide: avoid concomitant use of live vaccines with teriflunomide (see p. 828)

Theophylline: influenzavirus possibly increases plasma concentration of theophylline

- Tolizumab: avoid concomitant use of live vaccines with tolizumab (see p. 828)

- Ustekinumab: avoid concomitant use of live vaccines with ustekinumab (see p. 828)

Valaciclovir see Aciclovir

Valganciclovir see Ganciclovir

Valproate
Analgesics: effects of valproate enhanced by aspirin

Antibacterials: metabolism of valproate possibly inhibited by erythromycin (increased plasma concentration); avoidance of valproate advised by manufacturer of pivmecillinam; plasma concentration of valproate reduced by carbapenems—avoid concomitant use

Anticoagulants: valproate possibly enhances anticoagulant effect of coumarins

Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIs and tricyclics (convulsive threshold lowered)

Antiepileptics: plasma concentration of valproate reduced by carbamazepine, also plasma concentration of active metabolite of carbamazepine increased; valproate possibly increases plasma concentration of ethosuximide; valproate increases plasma concentration of lamotrigine (increased risk of toxicity—reduce lamotrigine dose); valproate sometimes reduces plasma concentration of an active metabolite of oxcarbazepine; valproate increases plasma concentration of...
Valproate
- Antiepileptics (continued)
  - phenobarbital (also plasma concentration of valproate reduced); valproate increases or possibly decreases plasma concentration of phenytoin, also plasma concentration of valproate reduced; valproate possibly increases plasma concentration of rifampicin (reduce dose of rifampicin); hyperammonaemia and CNS toxicity reported when valproate given with rifampicin.
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by emetine.
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by quetiapine (convulsive threshold lowered); valproate possibly increases or decreases plasma concentration of clozapine; increased risk of side-effects including neutropenia when valproate given with clozapine.
- Antivirals: plasma concentration of valproate possibly reduced by ritonavir; valproate possibly increases plasma concentration of zidovudine (increased risk of toxicity).
- Anxiolytics and Hypnotics: plasma concentration of valproate possibly increased by clonazepam; increased risk of side-effects when valproate given with clonazepam; valproate possibly increases plasma concentration of diazepam and lorazepam.
- Buproprion: valproate inhibits the metabolism of buproprion.
- Cytotoxics: valproate increases plasma concentration of temozolomide.
- Lipid-regulating Drugs: absorption of valproate possibly reduced by colestyramine.
- Oestrogens: plasma concentration of valproate possibly reduced by ethinylestradiol.
- Orlistat: possible increased risk of convulsions when antiepileptics given with orlistat.
- Sodium Benzoate: valproate possibly reduces effects of sodium benzoate.
- Sodium Phenylbutyrate: valproate possibly reduces effects of sodium phenylbutyrate.
- Ulcer-healing Drugs: metabolism of valproate inhibited by esomeprazole.
Valsartan see Angiotensin-II Receptor Antagonists
Vancomycin
- Anaesthetics, General: hypersensitivity-like reactions can occur when intravenous vancomycin given with general anaesthetics.
- Antibacterials: increased risk of nephrotoxicity and ototoxicity when vancomycin given with aminoglycosides, capreomycin or colistimethate sodium; increased risk of nephrotoxicity when vancomycin given with polymyxins.
- Antifungals: possible increased risk of nephrotoxicity when vancomycin given with amphotericin B.
- Ciclosporin: increased risk of nephrotoxicity when vancomycin given with ciclosporin.
- Cytotoxics: possible increased risk of nephrotoxicity and possibly of otoxicity when vancomycin given with cisplatin.
- Diuretics: increased risk of otoxicity when vancomycin given with loop diuretics.
- Lipid-regulating Drugs: effects of oral vancomycin antagonised by colestyramine.
- Muscle Relaxants: vancomycin enhances effects of succinylcholine.
- Tacrolimus: possible increased risk of nephrotoxicity when vancomycin given with tacrolimus.
- Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850.
Vandetanib
- Analgesics: possible increased risk of ventricular arrhythmias when vandetanib given with methadone—avoid concomitant use.
- Antibacterials: possible increased risk of ventricular arrhythmias when vandetanib given with amiodarone or dapsone (consider reducing initial dose of vardenafil); plasma concentration of vardenafil increased by erythromycin (reduce dose of vardenafil).
- Antiarrhythmics: possible increased risk of ventricular arrhythmias when vandetanib given with sotalol; possible increased risk of ventricular arrhythmias when vandetanib given with sparfloxacin—avoid concomitant use; plasma concentration of vandetanib reduced by rifampicin—manufacturer of vandetanib advises avoid concomitant use.
- Antidepressants: manufacturer of vandetanib advises avoid concomitant use with St John’s wort (plasma concentration of vandetanib possibly reduced).
- Antiinfective: vandetanib possibly increases plasma concentration of metformin (consider reducing dose of metformin).
- Antiepileptics: manufacturer of vandetanib advises avoid concomitant use with carbamazepine and phenobarbital (plasma concentration of vandetanib possibly reduced).
- Antihistamines: possible increased risk of ventricular arrhythmias when vandetanib given with mizolastine—avoid concomitant use.
- Antimalarials: possible increased risk of ventricular arrhythmias when vandetanib given with eprinomectin—avoid concomitant use.
- Antipsychotics: possible increased risk of ventricular arrhythmias when vandetanib given with amisulpride, chlorpromazine, haloperidol, pimozide, sulpiride or zuclopenthixol—avoid concomitant use; avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis).
- Beta-blockers: possible increased risk of ventricular arrhythmias when vandetanib given with metoprolol—avoid concomitant use.
- Cardiac Glycosides: vandetanib increases plasma concentration of digoxin—possible increased risk of bradycardia.
- Cytotoxics: possible increased risk of ventricular arrhythmias when vandetanib given with aerolite (increased risk of ventricular arrhythmias when vandetanib given with toremifene—avoid concomitant use).
- Hormone Antagonists: possible increased risk of ventricular arrhythmias when vandetanib given with toremifene—avoid concomitant use.
- Pentamidine (isoni¬date): possible increased risk of ventricular arrhythmias when vandetanib given with pentamidine isethionate—avoid concomitant use.
Vardenafil
- Alpha-blockers: enhanced hypotensive effect when vardenafil given with alpha-blockers—separate doses by 6 hours (except with tamsulosin)—see also p. 558.
- Antiarrhythmics: avoidance of vardenafil advised by manufacturer of disopyramide (risk of ventricular arrhythmias).
- Antibacterials: plasma concentration of vardenafil possibly increased by clarithromycin (consider reducing initial dose of vardenafil); plasma concentration of vardenafil increased by erythromycin (reduce dose of vardenafil).
- Antifungals: plasma concentration of vardenafil possibly increased byitraconazole—avoid concomitant use.
- Antiinfectives: vardenafil advised by manufacturer of fosamprenavir; plasma concentration of vardenafil increased by indinavir and ritonavir—avoid concomitant use; increased risk of ventricular arrhythmias when vardenafil given with saquinavir—avoid concomitant use; avoidance of vardenafil advised by manufacturer of elt㈲previr;
Appendix 1: Interactions

Vasodilator Antihypertensives

ACE Inhibitors: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with adrenergic neurone blockers

Alcohol: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with alcohol

Aldesleukin: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with aldesleukin

Alpha-blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with alpha-blockers

Anaesthetics, General: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with general anaesthetics

Analgesics: hypotensive effect of hydralazine, minoxidil and sodium nitroprusside antagonised by NSAIDs

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with angiotensin-II receptor antagonists

Antidepressants: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with MAOIs; enhanced hypotensive effect when hydralazine or sodium nitroprusside given with tricyclic-related antidepressants

Antipsychotics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with phenothiazines

Anxiolytics and Hypnotics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with anxiolytics and hypnotics

Beta-blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with beta-blockers

Calcium-channel Blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with calcium-channel blockers

Clonidine: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with clonidine

Corticosteroids: hypotensive effect of hydralazine, minoxidil and sodium nitroprusside antagonised by corticosteroids

Diazoxide: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with diazoxide

Diuretics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with diuretics

Dopaminergics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with levodopa

Methyldopa: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with methyldopa

Moxisylyte: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with moxisylyte

Maxonidine: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with maxonidine

Muscle Relaxants: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with alprostadil

Nicorandil: possible enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with nicorandil

Nicorandil: possible enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with nicorandil

Progestogens: manufacturer of vemurafenib advises contraceptive effect of progestogens possibly reduced

Venlafaxine: increased risk of bleeding when venlafaxine given with NSAIDs or aspirin; possible increased serotonergic effects when SSRI-related antidepressants given with fentanyl; possible increased serotonergic effects when venlafaxine given with tramadol

Antidepressants: possible increased serotonergic effects when venlafaxine given with St John’s Wort, duloxetine or mirtazapine; enhanced CNS effects and toxicity when venlafaxine given with...
Antifungals:
- Antipsychotics:
  - Vildagliptin

Antipsychotics:
- Antifungals:
  - Dopaminergics:
    - Methylthioninium:
      - Plasma concentration of vinblastine possibly increased by ritonavir—manufacturer of vinflunine advises avoid concomitant use with 

Antimalarials:
- Antibacterials:
  - Orlistat:

Antidepressants:
- Vindesine

Dopaminergics:
- Anticoagulants:
  - Anticoagulants: plasma concentration of vinflunine possibly reduced by 

Calcium-channel Blockers:
- Calcium-channel Blockers: metabolism of vincristine possibly inhibited by nifedipine

Cardiac Glycosides: vincristine possibly reduces absorption of digoxin tablets

Antifungals:
- Antipsychotics:
  - Vildagliptin

Antidepressants:
- Antimalarials:
  - Antifungals:

Antipsychotics:
- Anticoagulants:
  - Anticoagulants: vitamin E possibly enhances anti-

Antibacterials:
- Antibacterials: plasma concentration of vinflunine possibly reduced by 

Anticoagulants:
- Anticoagulants: vitamin E possibly inhibited by nelfinavir

Antivirals:
- Antivirals: increased risk of bleeding when high doses of vitamin E given with 

Appendix 1: Interactions
Appendix 1: Interactions

**Antivirals**
- Zidovudine
  - Antivirals (continued)
  - T Crash occurrence or decrease in the plasma concentration of zidovudine by ATV
  - Orlistat: absorption of zidovudine possibly reduced by orlistat
  - Probencid: increase of zidovudine reduced by probenecid (increased plasma concentration and risk of toxicity)
  - Zinc: reduce absorption of zidovudine possibly reduced by orlistat

**Vitamins**
- Zinc: reduce absorption of zidovudine possibly reduced by orlistat

**Antifungals**
- Zidovudine
  - Anti-fungals (continued)
  - Zidovudine: orlistat; plasma concentration of zidovudine reduced by orlistat

**Voriconazole** see Antifungals, Triazole
**Warfarin** see Coumarins
**Xipamide** see Diuretics
**Xylenetidoxazine** see Sympathomimetics
**Zaleplon** see Anxiolytics and Hypnotics

**Zidovudine**
- Retinoids: increased risk of toxicity with nephrotic and myelosuppressive drugs—for further details consult product literature
- Analgesics: reduced plasma concentration of zidovudine by valproate (increased risk of toxicity)
- Antiepileptics: zidovudine increases or decreases plasma concentration of phenytoin; plasma concentration of zidovudine possibly increased by valproate (increased risk of toxicity)
- Antifungals: plasma concentration of zidovudine increased by flucytosine (increased risk of toxicity)
- Antimalarials: increased antifolate effect when zidovudine given with pyrimethamine
- Antivirals: profound myelosuppression when zidovudine given with ganciclovir (if possible avoid concomitant use; plasma concentration of zidovudine reduced by efavirenz; orlistat: absorption of zidovudine possibly reduced by orlistat

**Appendix 1: Interactions** BNF 68
A2.1 Enteral feeds (non-disease specific) 998
A2.1.1 Enteral feeds (non-disease specific): less than 5 g protein/100 mL 998
A2.1.2 Enteral feeds (non-disease specific): 5 g (or more) protein/100 mL 1000
A2.1.3 Enteral feeds (non-disease specific): Child under 12 years 1004
A2.2 Nutritional supplements (non-disease specific) 1004
A2.2.1 Nutritional supplements: less than 5 g protein/100 mL 1004
A2.2.2 Nutritional supplements: 5 g (or more) protein/100 mL 1005
A2.3 Specialised formulas 1010
A2.3.1 Specialised formulas: Infant and child 1010
A2.3.2 Specialised formulas for specific clinical conditions 1010
A2.4 Feed supplements 1015
A2.4.1 High-energy supplements 1015
A2.4.2 Fibre, vitamin, and mineral supplements 1020
A2.5 Feed additives 1021
A2.5.1 Special additives for conditions of intolerance 1021
A2.5.2 Feed thickeners and pre-thickened drinks 1021
A2.5.3 Flavouring preparations 1021
A2.6 Foods for special diets 1022
A2.6.1 Gluten-free foods 1022
A2.6.2 Low-protein foods 1024
A2.7 Nutritional supplements for metabolic diseases 1025

In certain conditions some foods (and toilet preparations) have characteristics of drugs and the Advisory Committee on Borderline Substances (ACBS) advises as to the circumstances in which such substances may be regarded as drugs. Prescriptions issued in accordance with the Committee’s advice and endorsed ‘ACBS’ will normally not be investigated.

General Practitioners are reminded that the ACBS recommends products on the basis that they may be regarded as drugs for the management of specified conditions. Doctors should satisfy themselves that the products can safely be prescribed, that patients are adequately monitored and that, where necessary, expert hospital supervision is available.

Foods which may be prescribed on FP10, GP10 (Scotland), or WP10 (Wales) All the food products listed in this appendix have ACBS approval. The clinical condition for which the product has been approved is included with each entry. Note Foods included in this appendix may contain cariogenic sugars and patients should be advised to take appropriate oral hygiene measures.

Enteral feeds and supplements For most enteral feeds and nutritional supplements, the main source of carbohydrate is either maltodextrin or glucose syrup; other carbohydrate sources are listed in the relevant table, below. Feeds containing residual lactose (less than 1 g lactose/100 mL formula) are described as ‘clinically lactose-free’ or ‘lactose-free’ by some manufacturers. The presence of lactose (including residual lactose) in feeds is indicated in the relevant table, below. The primary sources of protein or amino acids are included with each product entry. The fat or oil content is derived from a variety of sources such as vegetables, soya bean, corn, palm nuts, and seeds; where the fat content is derived from animal or fish sources, this information is included in the relevant table, below. The presence of medium chain triglycerides (MCT) is also noted where the quantity exceeds 30% of the fat content.

Enteral feeds and nutritional supplements can contain varying amounts of vitamins, minerals, and trace elements—the manufacturer’s product literature should be consulted for more detailed information. For further information on enteral nutrition, see section 9.4.2.

The suitability of food products for patients requiring a vegan, kosher, halal, or other compliant diet should be confirmed with individual manufacturers. For details of enteral feeds, nutritional supplements, and specialised formulas suitable for infants and children under 12 years see BNF for Children.

Note Feeds containing more than 6 g/100 mL protein or 2 g/100 mL fibre should be avoided in children unless recommended by an appropriate specialist or dietician.

Standard ACBS indications Disease-related malnutrition, intractable malabsorption, pre-operative preparation of malnourished patients, dysphagia, proven inflammatory bowel disease, following total gastrectomy, short-bowel syndrome, bowel fistula

Prices quoted in Appendix 2 are basic NHS net prices; for further information see Prices in the BNF.
### A2.1 Enteral feeds (non-disease specific)

#### A2.1.1 Enteral feeds (non-disease specific): less than 5 g protein/100 mL

Not suitable for use in child under 1 year unless otherwise stated; not recommended for child 1–6 years

## A2.4 Feed supplements

### A2.4.1 High-energy supplements

#### A2.4.1.1 High-energy supplements: carbohydrate

Flavoured carbohydrate supplements are not suitable for children under 1 year; liquid supplements should be diluted before use in children under 5 years.

**ACBS Indications:** disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high or readily available carbohydrate supplement.

A2.5 Feed additives

A2.5.1 Special additives for conditions of intolerance

Colief® (Forum)
Liquid, lactase 50 000 units/g. Net price 7-mL dropper bottle = £8.40
For the relief of symptoms associated with lactose intolerance in infants, provided that lactose intolerance is confirmed by the presence of reducing substances and/or excessive acid in stools, a low concentration of the corresponding disaccharide enzyme on intestinal biopsy or by breath hydrogen test or lactose intolerance test. For dosage and administration details, consult product literature.

Fructose
(Laevulose)
For proven glucose/galactose intolerance

Glucose
(Dextrose monohydrate)
Net price 500 g = £1.53
For use as an energy supplement in sucrase-isomaltase deficiency

VSL#3® (Ferring)
Powder, containing 8 strains of live, freeze-dried, lactic acid bacteria. Contains traces of soya, gluten, and lactose. Net price 30 × 4.4-g sachets = £32.98 Nutritional supplement for use under the supervision of a physician, for the maintenance of remission of ileoanal pouchitis induced by antibacterials in adults. For dosage and administration details, consult product literature.

A2.5.2 Feed thickeners and pre-thickened drinks

For pre-thickened infant feeds see BNF for Children.

Carobel, Instant® (Cow & Gate)
Powder, carob seed flour. Net price 135 g = £2.80
For thickening feeds in the treatment of vomiting

Multi-thick® (Abbott)
Powder, modified maize starch, gluten- and lactose-free, net price 250 g = £4.83
For thickening of liquids or foods in dysphagia. Not suitable for children under 3 years

Nutilis® Clear (Nutricia Clinical)
Powder, maltodextrin, xanthan gum, guar gum, gluten- and lactose-free, net price 175 g = £8.46
For thickening of liquids or foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive

Nutilis® Powder (Nutricia Clinical)
Powder, modified maize starch, gluten- and lactose-free, net price 20 × 12-g sachets = £6.40; 300 g = £4.92
For thickening of foods in dysphagia. Not suitable for children under 3 years

Resource® Thickened Drink (Nestlé)
Liquid, carbohydrate 22 g, energy: orange 382 kJ (90 kcal); apple 375 kJ (89 kcal)/100 mL. Syrup and custard consistencies. Gluten- and lactose-free, net price 12 × 114-mL cups = £7.80
For dysphagia. Not suitable for children under 1 year

Resource® ThickenUp® (Nestlé)
Powder, modified maize starch. Gluten- and lactose-free, net price 225 g = £4.55; 75 × 4.5-g sachet = £17.44
For thickening of foods in dysphagia. Not suitable for children under 1 year

Resource® ThickenUp Clear (Nestlé)
Powder, maltodextrin, xanthan gum, gluten- and lactose-free, net price 125 g = £8.46; 24 × 1.2-g sachets = £5.28
For thickening of liquids or foods in dysphagia. Not suitable for children under 3 years

SLO Drinks® (SLO Drinks)
Powder, carbohydrate content varies with flavour and chosen consistency (3 consistencies available), see product literature. Flavours: black currant, lemon, orange; (hot drinks) chocolate, white coffee, apple tea, net price 25 × 115 mL = £7.50. Nutritional supplement for patient hydration in the dietary management of dysphagia. Not suitable for children under 3 years

Thick and Easy® (M & A Pharmachem)
Powder, modified maize starch, maltodextrin, gluten- and lactose-free, net price 225 g = £3.71; 100 × 9-g sachets = £22.40
For thickening of foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive

Thicken Aid® (Sutherland)
Powder, modified maize starch, gluten-free. Net price 375-g tub = £7.15.
For thickening of foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive

Thixo-D® (SHS)
Powder, modified maize starch, gluten-free. Net price 375-g tub = £7.15.
For thickening of foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive

Vitaquick® (Vitafo)
Powder. Modified maize starch. Net price 300 g = £6.67; 2 kg = £37.93; 6 kg = £98.22.
For thickening of foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive

A2.5.3 Flavouring preparations

Flavour Mix® (Nestlé)
Powder, flavours: banana, chocolate, coffee, lemon-lime, strawberry. Net price 60 g = £7.17

FlavourPac® (Vitafo)
Powder, flavours: black currant, lemon, orange, tropical or raspberry, net price 30 × 4-g sachets = £13.29
For use with Vitafo’s range of unflavoured protein substitutes for metabolic diseases; not suitable for child under 1 year

Modjul® Flavour System (SHS)
Powder, flavours: black currant, orange, pineapple, cherry-vanilla, grapefruit, lemon-lime, apple × 5-g sachets = £11.80
For use with unflavoured SHS products based on peptides or amino acids; not suitable for child under 6 months
Appendix 2: Borderline substances

A2.6 Foods for special diets

A2.6.1 Gluten-free foods

ACBS indications: established gluten-sensitive enteropathies including steatorrhoea due to gluten sensitivity, coeliac disease, and dermatitis herpetiformis.

Bread

Loaves

Barkat® (Gluten Free Foods Ltd)

Gluten-free. Loaf, multigrain 500 g = £5.73. Loaf, sliced, wholemeal 500 g = £3.98. Loaf, sliced, part-baked, country-style 250 g = £4.35. Loaf, sliced, part-baked, white 300 g = £4.13. Rice bread, brown 500 g = £5.73; white 500 g = £5.73

Dietary Specials® (Nutrition Point)

Gluten-free. Loaf, sliced, multigrain, brown 400 g = £3.10; white 400 g = £3.10.

Ener-G® (General Dietary)

Gluten-free. Loaf, sliced Seattle brown 600 g = £6.04. Rice bread, sliced, brown 474 g = £5.41; white 456 g = £5.41. Rice loaf, sliced 612 g = £5.41.

Genius Gluten Free® (Genius Foods)

Gluten-free. Loaf, unsliced, brown 400 g = £2.59; white 400 g = £2.59. Loaf, sliced, brown 400 g = £2.69; white 400 g = £2.69. Sandwich bread, sliced, brown 535 g = £3.48; white 535 g = £3.48.

Glutafin® (Nutrition Point)

Gluten-free. Loaf, sliced, fibre 400 g = £3.77; white 400 g = £3.77.

Glutafin® Select (Nutrition Point)

Gluten-free. Loaf, sliced, fresh, brown 400 g = £3.43; white 400 g = £3.43. Loaf, sliced, fibre 400 g = £3.36; white 400 g = £3.36. Loaf, seeded 400 g = £3.65.

Juvela® (juvela)

Gluten-free. Loaf, sliced, fresh, fibre 400 g = £3.39; white 400 g = £3.69. Loaf, sliced, fibre 400 g = £3.59; fibre 400 g = £3.54. Loaf, white 400 g = £3.54; fibre 400 g = £3.54. Loaf, part-baked, fibre 400 g = £3.80; white 400 g = £3.95.

Lifestyle® (Ultrapharm)

Gluten-free. Loaf, sliced, brown 400 g = £2.82; high fibre 400 g = £2.82; white 400 g = £2.82. Loaf, brown 400 g = £2.82; high fibre 400 g = £2.82; white 400 g = £2.82.

Livwell® (Livwell)

Gluten-free. Loaf, sliced, brown (seeded) 200 g = £2.25; white 200 g = £2.25.

Proceli® (Proceli)

Gluten-free. Loaf, sliced, white 165 g = £2.30; sandwich 155 g = £2.32. Rice bread, brown 220 g = £2.30; sandwich 220 g = £2.30.

Ultra® (Ultrapharm)

Gluten-free. Loaf, white 400 g = £2.46; high fibre 500 g = £3.35.

Warburtons® (Warburtons)

Gluten-free. Loaf, sliced, brown 400 g = £2.99; white 400 g = £2.99.

Wellfoods® (Wellfoods)

Gluten-free. Loaf, sliced 600 g = £4.95; unsliced 600 g = £4.85.

Baguettes, buns and rolls

Barkat® (Gluten Free Foods Ltd)

Gluten-free. Baguette, part-baked 200 g = £4.35. Rolls, part-baked 2 x 100 g = £3.98; 6 x 50 g = £4.35.

Ener-G® (General Dietary)

Gluten-free. Rolls, dinner × 6 = £3.67; white, long 4 × 55 g = £2.95; round 4 × 55 g = £2.95.

Glutafin® (Nutrition Point)

Gluten-free. Baguette 2 × 175 g = £3.44. Rolls, fibre 4 × 50 g = £3.61; white 4 × 50 g = £3.61.

Glutafin® Select (Nutrition Point)

Gluten-free. Rolls, part-baked, white 4 × 50 g = £3.61; long 2 × 75 g = £2.76.

Juvela® (juvela)

Gluten-free. Rolls, fresh, fibre 5 × 85 g = £4.42; white 5 × 85 g = £4.42. Rolls, fibre 5 × 85 g = £4.77; white 5 × 85 g = £4.77. Rolls, part-baked, fibre 5 × 75 g = £4.94; white 5 × 75 g = £4.94.

Lifestyle® (Ultrapharm)

Gluten-free. Rolls, brown 5 × 80 g = £2.82; high fibre 5 × 80 g = £2.82. white 5 × 80 g = £2.82.

Livwell® (Livwell)

Gluten-free. Baguette, white 140 g = £2.15. Buns, toasting 4 × 45 g = £2.40. Rolls, white 4 = £2.25. Rolls, part-baked, circle (bagel) 2 × 70 g = £2.50. dinner (square) 2 × 80 g = £2.09.

Proceli® (Proceli)

Warburtons® (Warburtons)

Gluten-free. Baguette, 2 × 75 g = £2.79. Rolls, brown 3 × 100 g = £2.49; white 3 × 100 g = £2.49.

Wellfoods® (Wellfoods)

Gluten-free. Burger buns 4 × 75 g = £3.95. Rolls 4 × 70 g = £3.65.

Speciality breads

Livwell® (Livwell)

Gluten-free. Flat bread (pitta) 4 = £3.00. Tear-drop shape (naan) 2 × 90 g = £3.00.

Cereals

Juvela® (juvela)

Gluten-free. Fibre flakes 300 g = £2.78; flakes 300 g = £2.78; pure oats 500 g = £2.78.

Nairns® (Nairns)

Gluten-free. Oat porridge 500 g = £2.89.
Cookies and biscuits

Barkat® (Gluten Free Foods Ltd)
Gluten-free. Biscuits, coffee-style 200 g = £3.38; digestive 175 g = £2.61

Ener-G® (General Dietary)
Gluten-free. Cookies, vanilla 435 g = £6.16

Glutafin® (Nutrition Point)
Gluten-free. Biscuits, plain 200 g = £4.06; digestive 150 g = £2.09; savoury shorts 150 g = £2.75; shortbread 150 g = £1.89; sweet (without chocolate or sultanas) 150 g = £2.09; tea 150 g = £2.05

Juvela® (Juvela)
Gluten-free. Biscuits, digestive 150 g = £3.05; savoury 150 g = £3.82; sweet 150 g = £2.88, tea 150 g = £2.05

Crackers, crispbreads, and breadsticks

Barkat® (Gluten Free Foods Ltd)
Gluten-free. Crackers, round (matzo) 200 g = £3.52

Dietary Specials® (Nutrition Point)
Gluten-free. Cracker bread 150 g = £2.09

Glutafin® (Nutrition Point)
Gluten-free. Crackers, high fibre 200 g = £2.84; plain 200 g = £3.39; mini 175 g = £2.90.

Juvela® (Juvela)
Gluten-free. Crispbread, plain 200 g = £4.64

Ultra® (Ultrapharm)
Gluten-free. Crackerbread 200 g = £1.77

Warburtons® (Warburtons)
Gluten-free. Crackers, bran 150 g = £2.29

Flour mixes and xanthan gum

Barkat® (Gluten Free Foods Ltd)
Gluten-free. Flour mix, bread 500 g = £6.81. Plain 750 g = £6.98

Finax® (Drossa)
Gluten-free. Flour mix, bread, fibre 1 kg = £9.92. Flour mix 900 g = £8.66; coarse 900 g = £8.66

Glutafin® (Nutrition Point)
Gluten-free. Flour mix, fibre 500 g = £6.53; white 500 g = £6.53

Glutafin Select® (Nutrition Point)
Gluten-free. Flour mix, bread, fibre 500 g = £6.53; white 500 g = £6.53. Fibre 500 g = £6.53; white 500 g = £6.53

Heron Foods® (Gluten Free Foods Ltd)
Gluten-free. Flour mix, organic, bread, standard 500 g = £8.96; high fibre 500 g = £8.96

Juvela® (Juvela)
Gluten-free. Flour mix, fibre 500 g = £7.35; plain 500 g = £7.35; harvest 500 g = £7.35

Mrs Cribbles® (Stiletto Foods)
Gluten-free. Bread mix, net price 275 g = £1.04. Pastry mix, net price 200 g = £1.04

Orgran® (Community)
Gluten-free. Flour mix, bread 450 g = £3.10. Self-raising 500 g = £3.10. Pastry and pizza 375 g = £3.80

Procel® (Procel)
Gluten-free. Flour mix, white 1 kg = £9.95

Pure® (Innovative)
Gluten-free. Flour mix, blended 1 kg = £4.23. Potato starch 500 g = £1.68. Rice, brown 500 g = £1.58; white 500 g = £1.68. Tapioca starch 500 g = £2.26. Teff, brown 1 kg = £4.77; white 1 kg = £4.77

Tobia® (Tobia Teff)
Gluten-free. Flour mix, tefl, brown 1 kg = £3.30; white 1 kg = £3.30

Tritamyl® (Gluten Free Foods Ltd)
Gluten-free. Flour mix, bread, fibre 500 g = £6.53; white 500 g = £6.53. Fibre 500 g = £6.53; white 500 g = £6.53

Heron Foods® (Gluten Free Foods Ltd)
Gluten-free. Bread mix, net price 275 g = £1.04. Pastry mix, net price 200 g = £1.04

Orgran® (Community)
Gluten-free. Flour mix, bread 450 g = £3.10. Self-raising 500 g = £3.10. Pastry and pizza 375 g = £3.80

Procel® (Procel)
Gluten-free. Flour mix, white 1 kg = £9.95

Pure® (Innovative)
Gluten-free. Flour mix, blended 1 kg = £4.23. Potato starch 500 g = £1.68. Rice, brown 500 g = £1.58; white 500 g = £1.68. Tapioca starch 500 g = £2.26. Teff, brown 1 kg = £4.77; white 1 kg = £4.77

Tobia® (Tobia Teff)
Gluten-free. Flour mix, tefl, brown 1 kg = £3.30; white 1 kg = £3.30

Tritamyl® (Gluten Free Foods Ltd)
Gluten-free. Flour mix, bread, fibre 500 g = £6.53; white 500 g = £6.53. Fibre 500 g = £6.53; white 500 g = £6.53

Wellfoods® (Wellfoods)
Gluten-free. Flour mix, plain 1 kg = £7.65

Xanthan gum

Ener-G® (General Dietary)
Gluten-free. Xanthan gum 170 g = £5.97

Ener-G® (General Dietary)
Gluten-free. Xanthan gum 170 g = £5.97

Pure® (Innovative)
Gluten-free. Xanthan gum 100 g = £5.97

Pasta

Barkat® (Gluten Free Foods Ltd)
Gluten-free. Pasta, animal shapes 500 g = £5.88; macaroni 500 g = £5.88; spaghetti 500 g = £5.88; tagliatelle 500 g = £5.88. Buckwheat, penne 250 g = £2.93; spirals 250 g = £2.93

BiAlimenta® (Drossa)
Gluten-free. Pasta, acini di pepe 500 g = £5.97; formati misti 500 g = £5.97; penne 500 g = £5.97; saghette 500 g = £5.97; spirali 500 g = £5.97; tubetti 500 g = £5.90; potato-based, gnocchi 500 g = £5.59; perle di gnocchi 500 g = £5.60.

Dietary Specials® (Nutrition Point)
Gluten-free. Pasta, fusilli 500 g = £3.54; penne 500 g = £3.54; spaghetti 500 g = £3.54

Ener-G® (General Dietary)
Gluten-free. Pasta, rice-based, lasagne 454 g = £5.03; macaroni 454 g = £5.03; shells, small 454 g = £5.03; spaghetti 454 g = £5.03; vermicelli 300 g = £5.03

Glutafin® (Nutrition Point)
Gluten-free. Pasta, lasagne 250 g = £3.46; macaroni penne 500 g = £6.60; shells 500 g = £6.60; spirals 500 g = £6.60; spaghetti, long 500 g = £6.60; tagliatelle 250 g = £3.46

Juvela® (Juvela)
Gluten-free. Pasta, fusilli 500 g = £7.21; lasagne 250 g = £3.68; macaroni 500 g = £7.21; spaghetti 500 g = £7.21; tagliatelle 250 g = £3.47. Fibre, linguine 500 g = £5.79; penne 500 g = £6.61
A2.6.2 Low-protein foods

Appendix 2: Borderline substances

Pizza bases

Barkat® (Gluten Free Foods Ltd)
Gluten-free. Pizza crust, rice, brown 150 g = £5.00; white 150 g = £5.00

Dietary Specials® (Nutrition Point)
Gluten-free. Pizza base 2 × 150 g = £5.68

Glutafin® (Nutrition Point)
Gluten-free. Pizza base 2 × 150 g = £6.43

Juvela® (Juvela)
Gluten-free. Pizza base 2 × 180 g = £8.78

Proceli® (Proceli)
Gluten-free. Pizza base 2 × 250 g = £3.90

Ultra® (Ultrapharm)
Gluten-free. Pizza base 2 × 200 g = £2.65

Wellfoods® (Wellfoods)
Gluten-free. Pizza base 2 × 300 g = £8.95

A2.6.1.1 Gluten- and wheat-free foods

ACBS indications: established gluten-sensitive enteropathies with coexisting established wheat sensitivity only.

Ener-G® (General Dietary)
Gluten-free, wheat-free. Bread loaf, six flour 576 g = £4.54. Rolls, Seattle brown, round (hamburger) 4 × 119 g = £3.96; long (hot dog) 4 × 119 g = £3.96. Pizza base, 3 × 124 g = £4.74

Glutafin® (Nutrition Point)
Gluten-free, wheat-free. Flour mix, bread 500 g = £8.55; fibre 500 g = £8.55. Crispbread 150 g = £3.19

Heron Foods® (Gluten Free Foods Ltd)
Gluten-free, wheat-free. Flour mix, organic, bread, fibre 500 g = £8.96. Bread and cake mix 500 g = £8.96

A2.6.2 Low-protein foods

ACBS indications: inherited metabolic disorders, renal or liver failure, requiring a low-protein diet

Bread

Ener-G® (General Dietary)
Low protein. Rice bread, 600 g = £5.54

Juvela® (Juvela)
Low protein. Loaf, sliced 400 g = £3.64. Rolls 5 × 70 g = £4.52

Loprofin® (SHS)
Low protein. Loaf, part-baked, sliced 400 g = £3.80. Rolls, part-baked 4 × 65 g = £4.00

PK Foods® (Gluten Free Foods Ltd)
Low protein. Loaf, white, sliced 550 g = £4.75

Cake, biscuits, and snacks

Harifen® (Ultrapharm)
Low protein. Cracker toast, 200 g = £2.75

Juvela® (Juvela)
Low protein. Cookies, cinnamon 125 g = £7.62; chocolate chip 110 g = £7.62; vanilla 100 g = £2.46. Crackers 150 g = £3.45; herb 150 g = £3.45

Loprofin® (SHS)
Low protein. Wafers, chocolate 100 g = £2.46; vanilla 100 g = £2.46. Crackers 150 g = £3.80; orange 150 g = £3.80. Rusks 200 g = £5.04. Cripsbread 75 g = £2.42

Promin® (Firstplay Dietary)
Low protein. Fried maize and potato starch ‘Snax’, cheese and onion 12 × 25 g = £9.84; jalapeno 12 × 25 g = £9.84; ready-salted 12 × 25 g = £9.84; salt and vinegar 12 × 25 g = £9.84

Taranis® (Firstplay Dietary)
Low protein. Cake bars, apricot 6 × 40 g = £5.91, lemon 6 × 40 g = £5.91, pear 6 × 40 g = £5.91

Vita Bite® (Vitaflo)
Low protein. Bar, protein 30 mg (less than 2.5 mg phenylalanine), carbohydrate 15.35 g, fat 8.4 g, energy 572 kJ (137 kcal)/25 g. Chocolate flavoured, 25 g = £1.06. Not recommended for any child under 1 year

Vitaﬂo Choices® (Vitaflo)
Low protein. Mini crackers, 40 g = £0.82. Not suitable for child under 3 years

Cereals

Loprofin® (SHS)
Low protein. Breakfast cereal flakes, apple 375 g = £7.60; chocolate 375 g = £7.60; strawberry 375 g = £7.60. Cereal loops 375 g = £7.88
Flour mixes and egg substitutes

**Ener-G®** (General Dietary)
**Low-protein.** Egg replacer 454 g = £5.11

**Fate®** (Fate)
**Low protein.** All purpose mix 500 g = £6.97. Cake mix, 2 × 250 g = £6.97; chocolate-flavour 2 × 250 g = £6.97

**Juvela®** (Juvela)
**Low-protein.** Mix 500 g = £7.79

**Loprofin®** (SHS)
**Low-protein.** Mix, plain 500 g = £8.03; chocolate 500 g = £8.50; lemon 500 g = £8.50. Egg replacer 2 × 250 g = £14.78. Egg-white replacer 100 g = £9.50

**PK Foods®** (Gluten Free Foods Ltd)
**Low-protein.** Flour mix 750 g = £10.71. Egg replacer 350 g = £5.04

Pasta

**Loprofin®** (SHS)
**Low protein.** Pasta, animal shapes 500 g = £8.09; spirals 500 g = £8.41; lasagne 250 g = £4.09; macaroni elbows 250 g = £4.04; penne 500 g = £8.41; spaghetti 500 g = £8.41; tagliatelle 250 g = £4.04; vermicelli 250 g = £4.17. Rice, imitation 500 g = £8.16

**Promin®** (Firstplay Dietary)
**Low-protein.** Pasta, alphabet shapes 500 g = £6.80; lasagne sheets 200 g = £2.95; macaroni 500 g = £6.80; noodles, flat 500 g = £6.80; shells 500 g = £6.80; spaghetti, short-cut 500 g = £6.80; spirals 500 g = £6.80. Rice, imitation 500 g = £6.80. Tricolour pasta, alphabet shapes 500 g = £6.80; shells 500 g = £6.80; spirals 500 g = £6.80.

Pizza bases

**Juvela®** (Juvela)
**Low-protein.** Pizza base 2 × 180 g = £6.61

**Savoury meals and mixes**

**Promin®** (Firstplay Dietary)
**Low-protein.** Burger mix 2 × 62 g = £6.18; lamb & mint 2 × 62 g = £6.18. Couscous 500 g = £6.80. Pasta elbows in cheese and broccoli sauce 4 × 66 g = £8.08. Pasta meal 500 g = £6.80. Pasta shells in tomato, pepper, and herb sauce 4 × 72 g = £8.08. Pasta spirals in Moroccan sauce 4 × 72 g = £8.08. Sausage mix, apple & sage 4 × 30 g = £6.95; original 4 × 30 g = £6.95; tomato & basil 4 × 30 g = £6.95. Mac pot, cheese 4 × 61 g = £18.60; tomato 4 × 61 g = £18.60. Potato pot, cabbage and bacon 4 × 50 g = £15.95; onion 4 × 50 g = £15.95; sausage 4 × 50 g = £15.95. Xpot, all day scramble 4 × 60 g = £20.36; beef and tomato 4 × 60 g = £20.36; chip shop curry 4 × 60 g = £20.36; rogan josh curry 4 × 60 g = £20.36

**Spreads**

**Taranis®** (Firstplay Dietary)
**Low-protein.** Spread, hazelnut 230 g = £7.65

**Glutaric aciduria (type 1)**

**GA1 Anamix®** Infant (SHS)
**Powder.** protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 3.5 g, energy 98.3 kJ (23 kcal)/100 mL; with vitamins, minerals, and trace elements, standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 0.9 g, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £37.07 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven glutaric aciduria (type 1) in children from birth to 3 years

**GA Gel®** (Vitafoam)
**Gel,** protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 10 g, carbohydrate 10.3 g, fat trace, energy 339 kJ (81 kcal)/24 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see FlavourPac®, p. 1021), net price 30 × 24-g sachets = £204.80

Nutritional supplement for dietary management of type 1 glutaric aciduria in children 6 months–18 years

**XLYS, Low TRY, Maxamaid®** (SHS)
**Powder,** protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see Modjul® Flavour System, p. 1021), net price 500 g = £93.59

Nutritional supplement for the dietary management of type 1 glutaric aciduria

1. Maxamaid products are generally intended for use in children 1–8 years

- **HCU Anamix Infant (SHS)**
  - **Powder**
  - Protein equivalent (essential and non-essential amino acids except methionine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.
  - Unflavoured, net price 400 g = £37.07 (5-g measuring scoop provided)
  - Nutritional supplement for the dietary management of proven vitamin B6 non-responsive homocystinuria or hypermethioninaemia in children from birth to 3 years

- **HCU cooler® 15 (Vitaflo)**
  - **Liquid**
  - Protein (essential and non-essential amino acids except methionine) 15 g, carbohydrate 7 g, fat 500 mg, energy 590 kJ (139 kcal)/130 mL, with vitamins, minerals, and trace elements. Orange or red flavour, net price 30 × 130-mL pouch = £289.80
  - A methionine-free protein substitute for use as a nutritional supplement in patients over 3 years of age with homocystinuria

- **HCU Express® 15 (Vitaflo)**
  - **Powder**
  - Protein (essential and non-essential amino acids except methionine) 15 g, carbohydrate 3.8 g, fat 30 mg, energy 315 kJ (75.3 kcal)/25 g with vitamins, minerals, and trace elements. Unflavoured (flavouring: see FlavourPac®, p. 1021), net price 30 × 25-g sachets = £318.03
  - A methionine-free protein substitute for use as a nutritional supplement in patients over 8 years of age with homocystinuria

- **HCU Express® 20 (Vitaflo)**
  - **Powder**
  - Protein (essential and non-essential amino acids except methionine) 20 g, carbohydrate 4.7 g, fat 70 mg, energy 416 kJ (99 kcal)/34 g with vitamins, minerals, and trace elements. Unflavoured (flavouring: see FlavourPac®, p. 1021), net price 30 × 34-g sachets = £410.89
  - A methionine-free protein substitute for use as a nutritional supplement in patients over 8 years with homocystinuria

## Homocystinuria or hypermethioninaemia

### HCU Anamix® Infant (SHS)

- **Powder**
  - Protein equivalent (essential and non-essential amino acids except methionine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.
  - Unflavoured, net price 400 g = £37.07 (5-g measuring scoop provided)
  - Nutritional supplement for the dietary management of proven vitamin B6 non-responsive homocystinuria or hypermethioninaemia in children from birth to 3 years

### HCU LV® (SHS)

- **Powder**
  - Protein (essential and non-essential amino acids except methionine) 20 g, carbohydrate 2.5 g, fat 190 mg, energy 380 kJ (92 kcal)/27.8-g sachet, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see Modju® Flavour System, p. 1021) or tropical flavour (formulation varies slightly), net price 30 × 27.8-g sachets = £469.80
  - A nutritional supplement for the dietary management of hypermethioninaemia or vitamin B6 non-responsive homocystinuria in patients over 8 years.

### HCU Lophlex® LQ 20 (Nutricia Clinical)

- **Liquid**
  - Protein equivalent (essential and non-essential amino acids except methionine) 20 g, carbohydrate 2.5 g, fat 190 mg, energy 380 kJ (92 kcal)/27.8-g sachet, with vitamins, minerals, and trace elements. Juicy berries flavour, net price 125 mL = £15.29
  - A nutritional supplement for the dietary management of hypermethioninaemia or vitamin B6 non-responsive homocystinuria in patients over 8 years.

### XMET Homidon® (SHS)

- **Powder**
  - Protein equivalent (essential and non-essential amino acids except methionine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. Unflavoured (flavouring: see Modju® Flavour System, p. 1021), net price 500 g = £171.63
  - A nutritional supplement for the dietary management of hypermethioninaemia or homocystinuria in children and adults.

### XMET Maxamaid® (SHS)

- **Powder**
  - Protein equivalent (essential and non-essential amino acids except methionine) 25 g, carbohydrate 5.1 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see Modju® Flavour System, p. 1021), net price 500 g = £93.59
  - A nutritional supplement for the dietary management of hypermethioninaemia or homocystinuria

### XMET Maxamum® (SHS)

- **Powder**
  - Protein equivalent (essential and non-essential amino acids except methionine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see Modju® Flavour System, p. 1021), net price 500 g = £150.02
  - A nutritional supplement for the dietary management of hypermethioninaemia or homocystinuria

---

1. Maxamaid products are generally intended for use in children 1–8 years.
2. Maxamum products are generally intended for use in children over 8 years and adults.
Hyperlysinaemia

HYPER LYS Anamix® Infant (SHS)
Powder, protein equivalent (essential and non-essential amino acids except lysine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £37.07 (5-g measuring scoop provided)
Nutritional supplement for the dietary management of proven hyperlysinaemia in children from birth to 3 years

Isovaleric acidaemia

IVA Anamix® Infant (SHS)
Powder, protein equivalent (essential and non-essential amino acids except leucine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see Modjul® Flavour System, p. 1021), net price 500 g = £93.59
Nutritional supplement for the dietary management of hyperlysinaemia

XLEU Faladon® (SHS)
Powder, protein equivalent (essential and non-essential amino acids except leucine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, net price 400 g = £37.07 (5-g measuring scoop provided)
Nutritional supplement for the dietary management of proven isovaleric acidaemia in children from birth to 3 years

Maple syrup urine disease

MSUD Aid III® (SHS)
Powder, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £37.07 (5-g measuring scoop provided)
Nutritional supplement for the dietary management of proven maple syrup urine disease in children from birth to 3 years

MSUD Anamix® Infant (SHS)
Powder, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see Modjul® Flavour System, p. 1021), net price 30 x 25-g sachets = £198.00
Nutritional supplement for the dietary management of proven maple syrup urine disease in children 1–10 years

MSUD Anamix® Junior (SHS)
Liquid, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 6.4 g, carbohydrate 11 g, net price 125-mL carton = £8.59
Nutritional supplement for the dietary management of proven maple syrup urine disease in children 1–10 years

MSUD Anamix® Junior LQ (SHS)
Liquid, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 310 mg, energy 474 kJ (113 kcal)/29-g sachet, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see Modjul® Flavour System, p. 1021), net price 30 x 29-g sachets = £198.00
Nutritional supplement for the dietary management of proven maple syrup urine disease in children 1–10 years

MSUD express® 15 (Vitaflo)
Liquid, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 15 g, carbohydrate 7 g, fat 500 mg, energy 393 kJ (92 kcal)/130-mL pouch, with vitamins, minerals, and trace elements. Orange or red flavour, net price 125-mL carton = £8.59
Nutritional supplement for the dietary management of proven maple syrup urine disease in children over 3 years and adults

MSUD cooler® 15 (Vitaflo)
Liquid, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 15 g, carbohydrate 7 g, fat 500 mg, energy 393 kJ (92 kcal)/130-mL pouch, with vitamins, minerals, and trace elements. Orange or red flavour, net price 30 x 130-mL = £289.80
Nutritional supplement for the dietary management of maple syrup urine disease in children over 3 years and adults

1. Maxamaid products are generally intended for use in children 1–8 years
Appendix 2: Borderline substances

2. Maxamum products are generally intended for use in children 1–8 years and adults.

1. Maxamaid products are generally intended for use in children from birth to 3 years and adults.

### MSUD express® 20 (Vitaflor)
**Powder**, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 20 g, carbohydrate 4.7 g, fat less than 100 mg, energy 416 kJ (99 kcal)/34 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see FlavourPac®, p. 1021), net price 30 x 34-g sachets = £410.89

Nutritional supplement for the dietary management of maple syrup urine disease in children over 8 years and adults.

### MSUD Gel® (Vitaflor)
**Powder**, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 10 g, carbohydrate 10.5 g, fat less than 500 mg, energy 339 kJ (81 kcal)/24 g with vitamins, minerals, and trace elements. Unflavoured (flavouring: see FlavourPac®, p. 1021), net price 30 x 24-g sachets = £207.15

Nutritional supplement for the dietary management of maple syrup urine disease in children 1–10 years.

### MSUD Lophlex® LQ 20 (Nutricia Clinical)
**Liquid**, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 20 g, carbohydrate 8.8 g, fat less than 500 mg, energy 339 kJ (81 kcal)/24 g with vitamins, minerals, and trace elements. Juicy berries flavour, net price 125 mL = £15.29

Nutritional supplement for the dietary management of maple syrup urine disease in children over 3 years and adults.

### MSUD Maxamaid® (SHS)
**Powder**, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 25 g, carbohydrate 34 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see Modjul® Flavour System, p. 1021), net price 500 g = £93.59

Nutritional supplement for the dietary management of maple syrup urine disease.

### MSUD Maxamum® (SHS)
**Powder**, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 25 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Orange flavour or unflavoured (flavouring: see Modjul® Flavour System, p. 1021), net price 500 g = £150.02

Nutritional supplement for the dietary management of maple syrup urine disease.

1. Maxamaid products are generally intended for use in children 1–8 years.
2. Maxamum products are generally intended for use in children over 8 years and adults.

### Methylmalonic or propionic acidaemia

#### MMA/PA Anamix® Infant (SHS)
**Powder**, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; **standard dilution** (15%), provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £37.07 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven methylmalonic acidaemia or propionic acidaemia in children from birth to 3 years.

#### XMTVI Asadon® (SHS)
**Powder**, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. Unflavoured, (flavouring: see Modjul® Flavour System, p. 1021), net price 200 g = £70.91

Nutritional supplement for the dietary management of methylmalonic acidaemia or propionic acidaemia in children and adults.

#### XMTVI Maxamaid® (SHS)
**Powder**, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see Modjul® Flavour System, p. 1021), net price 500 g = £93.59

Nutritional supplement for the dietary management of methylmalonic acidaemia or propionic acidaemia in children and adults.

#### XMTVI Maxamax® (SHS)
**Powder**, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Orange flavour or unflavoured (flavouring: see Modjul® Flavour System, p. 1021), net price 500 g = £150.02

Nutritional supplement for the dietary management of methylmalonic acidaemia or propionic acidaemia in children and adults.

### Other inborn errors of metabolism

#### Cystine500® (Vitaflor)
**Powder**, cystine 500 mg, carbohydrate 3.3 g, fat nil, energy 63 kJ (15 kcal)/4 g, net price 30 x 4-g sachets = £52.03

Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth.

#### DocOmega® (Vitaflor)
**Powder**, protein (cows’ milk, soya protein) 100 mg, carbohydrate 3.2 g, fat 500 mg (of which docosahexaenoic acid 200 mg), fibre nil, energy 74 kJ (18 kcal)/4 g, with minerals, net price 30 x 4-g sachets = £37.66

Nutritional supplement for the dietary management of inborn errors of metabolism for adults and children from birth.
### EAA® Supplement (Vitaflo)

**Powder**, protein equivalent (essential amino acids) 5 g, carbohydrate 4 g, fat nil, energy 151 kJ (36 kcal)/12.5 g, with vitamins, minerals, and trace elements. Tropical flavour, net price 50 x 12.5-g sachets = £196.32

Nutritional supplement for the dietary management of disorders of protein metabolism including urea cycle disorders. Not suitable for children under 3 years

### Isoleucine50® (Vitaflo)

**Powder**, isoleucine 50 mg, carbohydrate 3.8 g, fat nil, energy 63 kJ (15 kcal)/4 g, net price 30 x 4-g sachets = £52.03

Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth

### KeyOmega® (Vitaflo)

**Powder**, protein (cows’ milk, soya) 170 mg, carbohydrate 2.8 g, fat 800 mg (of which arachidonic acid 200 mg, docosahexaenoic acid 100 mg), energy 80 kJ (19 kcal)/4 g, net price 30 x 4-g sachets = £38.50

A nutritional supplement for the dietary management of inborn errors of metabolism

### Leucine100® (Vitaflo)

**Powder**, leucine 100 mg, carbohydrate 3.7 g, fat nil, energy 63 kJ (15 kcal)/4 g, net price 30 x 4-g sachets = £52.03

Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth

### Low protein drink (Milupa)

**Powder**, protein (cows’ milk) 4.5 g (phenylalanine 100 mg), carbohydrate 59.5 g, fat 29.9 g, fibre nil, energy 2194 kJ (528 kcal)/100 g, with vitamins, minerals, and trace elements. Contains lactose. Net price 400 g = £8.80 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children over 1 year

**Note** Termed Milupa lp-drink by manufacturer

### Phenylalanine50® (Vitaflo)

**Powder**, phenylalanine 50 mg, carbohydrate 3.8 g, fat nil, energy 63 kJ (15 kcal)/4 g, net price 30 x 4-g sachets = £50.52

Nutritional supplement for use in the dietary management of inborn errors of metabolism in adults and children from birth

### ProZero® (Vitaflo)

**Liquid**, carbohydrate 8.1 g (of which sugars 3.5 g), fat 3.8 g, energy 278 kJ (66 kcal)/100 mL. Contains lactose. Net price 18 x 250 mL = £22.68; 6 L = £30.30

A protein-free nutritional supplement for the dietary management of inborn errors of metabolism in children over 6 months and adults

### Tyrosine1000® (Vitaflo)

**Powder**, tyrosine 1 g, carbohydrate 2.9 g, fat nil, energy 63 kJ (15 kcal)/4-g sachet, net price 30 x 4-g sachets = £4.77

Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth

### Valine50® (Vitaflo)

**Powder**, valine 50 mg, carbohydrate 3.8 g, fat nil, energy 63 kJ (15 kcal)/4 g, net price 30 x 4-g sachets = £52.03

Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth

#### Phenylketonuria

### Add-Ins® (SHS)

**Powder**, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate nil, fat 5.1 g, energy 359 kJ (86 kcal)/18.2-g sachet, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see Modju® Flavour System, p. 1021), net price 60 x 18.2-g sachets = £357.60

Nutritional supplement for the dietary management of proven phenylketonuria. Not suitable for children under 4 years

### Easyphen® (SHS)

**Liquid**, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 6.7 g, carbohydrate 5.1 g, fat 2.9 g, energy 275 kJ (65 kcal)/100 mL with vitamins, minerals, and trace elements. Flavours: forest berries, orange, or tropical fruit, net price 250-mL carton = £9.19

Nutritional supplement for the dietary management of proven phenylketonuria. Not suitable for children under 8 years

### Lophlex® (SHS)

**Powder**, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 2.5 g, fat 60 mg, fibre 220 mg, energy 385 kJ (91 kcal)/27.8-g sachet, with vitamins, minerals, and trace elements. Flavours: berry, orange or unflavoured, net price 30 x 27.8-g sachets = £276.00

Nutritional supplement for the dietary management of proven phenylketonuria in children over 8 years and adults including pregnant women

### Loprofin® PKU Drink (SHS)

**Liquid**, protein (cows’ milk) 400 mg (phenylalanine 10 mg), lactose 9.4 g, fat 2 g, energy 165 kJ (40 kcal)/100 mL. Net price 200-mL carton = 72p.

Nutritional supplement for the dietary management of phenylketonuria in children over 1 year and adults

### Loprofin® Sno-Pro (SHS)

**Liquid**, protein (cows’ milk) 220 mg (phenylalanine 12.5 mg), carbohydrate 8 g, fat 3.8 g, energy 273 kJ (65 kcal)/100 mL. Contains lactose. Net price 200 mL= £1.19p

Nutritional supplement for the dietary management of phenylketonuria, chronic renal failure, and other inborn errors of amino acid metabolism

### Milupa PKU 2-prima® (Milupa)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 60 g, carbohydrate 10 g, fat nil, energy 1190 kJ (280 kcal)/100 g, with vitamins, minerals, and trace elements. Vanilla flavour, net price 500 g = £149.25

Nutritional supplement for the dietary management of phenylketonuria in children 1–8 years

1. Nutritional values vary with flavour—consult product literature
Appendix 2: Borderline substances

PKU Anamix® (Milupa)
**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 70 g, carbohydrate 6.8 g, fat nil, energy 1306 kJ (307 kcal)/100 g, with vitamins, minerals, and trace elements. Vanilla flavour, net price 500 g = £174.12
Nutritional supplement for the dietary management of phenylketonuria in children 9–14 years

Milupa PKU 3-advanta® (Milupa)
**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 70 g, carbohydrate 4.7 g, fat nil, energy 1270 kJ (299 kcal)/100 g, with vitamins, minerals, and trace elements. Vanilla flavour, net price 500 g = £174.12
Nutritional supplement for the dietary management of phenylketonuria in patients 15 years and over

Phlexy-10® Exchange System (SHS)
**Capsules**, protein equivalent (essential and non-essential amino acids except phenylalanine) 16.5 mg/capsule, net price 200-cap pack = £40.55
**Tablets**, protein equivalent (essential and non-essential amino acids except phenylalanine), 833 mg/tablet, net price 75-tab pack = £26.26
**Drink Mix**, powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 8.33 g, carbohydrate 8.8 g/20-g sachet. Apple-black currant, citrus, or tropical flavour, net price 30 × 20-g sachet = £122.40
Nutritional supplement for the dietary management of phenylketonuria

Phlexy-Vits® (SHS)
**Powder**, vitamins, minerals, and trace elements, net price 30 × 7-g sachets = £88.10
**Tablets**, vitamins, minerals, and trace elements, net price 180-tab pack = £77.35
For use as a vitamin and mineral component of restricted therapeutic diets in children 11 years and over and adults with phenylketonuria and similar amino acid abnormalities

PK Aid-4® (SHS)
**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 79 g, carbohydrate 4.5 g, fat nil, energy 1420 kJ (334 kcal)/100 g. Unflavoured, (flavouring: see Modjufl®, Flavour System, p. 1021), net price 500 g = £136.28 (5-g measuring scoop provided).
Nutritional supplement for the dietary management of phenylketonuria in children and adults

PKU Anamix® Infant (SHS)
**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; **standard dilution** (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £33.69 (5-g measuring scoop provided)
Nutritional supplement for the dietary management of proven phenylketonuria in children from birth to 3 years

PKU Anamix® Junior (SHS)
**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 8.4 g, carbohydrate 9.9 g, fat 3.9 g, energy 455 (108 kcal)/29-g sachet, with vitamins, minerals, and trace elements. Chocolate, pineapple-vanilla. Unflavoured (carbohydrate 11 g, energy 474 kJ (113 kcal)/29-g sachet), net price 30 × 29-g sachets = £120.30
Nutritional supplement for the dietary management of phenylketonuria in children 1–10 years

PKU Anamix® Junior LQ (SHS)
**Liquid**, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 310 mg, energy 497 kJ (118 kcal)/125 mL, with vitamins, minerals, and trace elements. Lactose-free. Flavours: Berry, orange, or unflavoured, net price 125-mL carton = £5.55
Nutritional supplement for the dietary management of phenylketonuria in children 1–10 years

PKU cooler 10® (Vitaflo)
**Liquid**, protein equivalent (essential and non-essential amino acids except phenylalanine) 15 g, carbohydrate 7.8 g, energy 386 kJ (92 kcal)/75-mL pouch, with vitamins, minerals, and trace elements. Unflavoured (white) or flavoured (orange, purple, or red), net price 30 × 75 mL = £117.90
Nutritional supplement for the dietary management of phenylketonuria. Not recommended for children under 3 years

PKU cooler 15® (Vitaflo)
**Liquid**, protein equivalent (essential and non-essential amino acids except phenylalanine) 15 g, carbohydrate 7.8 g, energy 386 kJ (92 kcal)/150-mL pouch, with vitamins, minerals, and trace elements. Unflavoured (white) or flavoured (orange, purple, or red), net price 30 × 150 mL = £175.80
Nutritional supplement for the dietary management of phenylketonuria. Not recommended for children under 3 years

PKU cooler 20® (Vitaflo)
**Liquid**, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 10.2 g, energy 517 kJ (124 kcal)/175-mL pouch, with vitamins, minerals, and trace elements. Unflavoured (white) or flavoured (orange, purple, or red), net price 30 × 175 mL = £236.10
Nutritional supplement for the dietary management of phenylketonuria. Not recommended for children under 3 years

PKU express 15® (Vitaflo)
**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 15 g, carbohydrate 2.4 g, energy 293 kJ (70 kcal)/25-g sachet, with vitamins, minerals, and trace elements. Lemon, orange, tropical or unflavoured (carbohydrate 3.4 g, energy 310 kJ (74 kcal)/25 g), (flavouring: see FlavourPac®, p. 1021), net price 30 × 25-g sachets = £192.81
Nutritional supplement for the dietary management of phenylketonuria. Not recommended for children under 3 years
PKU express® (Vitaflo)
Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 3.3 g, energy 389 kJ (93 kcal)/34-g sachet, with vitamins, minerals, and trace elements. Lemon, orange, tropical, or unflavoured (carbohydrate 4.7 g, energy 416 kJ (99 kcal)/34 g), (flavours: see FlavourPac®, p. 1021), net price 30 × 34-g sachets = £249.10 Nutritional supplement for the dietary management of phenylketonuria. Not recommended for children under 3 years

PKU gel® (Vitaflo)
Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 8.9 g, fat less than 100 mg, energy 318 kJ (76 kcal)/24-g sachet, with vitamins, minerals, and trace elements. Orange, raspberry, or unflavoured (carbohydrate 10.3 g, energy 339 kJ (81 kcal)/24 g), (flavours: see FlavourPac®, p. 1021), net price 30 × 24-g sachets = £133.39 Nutritional supplement for use as part of the low-protein dietary management of phenylketonuria in children 1–10 years

PKU Lophlex® LQ 10 (SHS)
Liquid, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 4.4 g, fibre 250 mg, energy 245 kJ (58 kcal)/62.5 mL, with vitamins, minerals, and trace elements. Flavours: berry, citrus, orange, or tropical, net price 62.5-mL carton = £4.93; juicy berries, juicy orange (energy 246 kJ (58 kcal)/62.5 mL), 62.5-mL carton = £4.93 Nutritional supplement for the dietary management of phenylketonuria in children over 4 years and adults including pregnant women

PKU Lophlex® LQ 20 (SHS)
Liquid, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 8.6 g, fibre 230 mg, energy 490 kJ (115 kcal)/125 mL, with vitamins, minerals, and trace elements. Flavours: berry, citrus, orange, or tropical, net price 125-mL carton = £9.84; juicy berries, juicy orange (energy 491 kJ (116 kcal)/125 mL), 125-mL carton = £9.84 Nutritional supplement for the dietary management of phenylketonuria in children over 4 years and adults including pregnant women

PKU Lophlex® Sensation 20 (SHS)
Semi-solid, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 20.2 g, fibre 1 g, energy 706 kJ (166 kcal)/100 g, with vitamins, minerals, and trace elements. Flavours: berry or orange, net price 3 × 109-g pot = £31.44 Nutritional supplement for the dietary management of phenylketonuria in children over 4 years and adults including pregnant women

PKU squeezie® (Vitaflo)
Liquid, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 22.5 g, fat 500 mg, energy 565 kJ (135 kcal)/85 g, with vitamins, minerals, and trace elements. Flavour: apple-banana, net price 30 × 85-g pouch = £127.52 Nutritional supplement for the dietary management of phenylketonuria in children from 6 months to 10 years

PKU Start® (Vitaflo)
Liquid, protein equivalent (essential and non-essential amino acids except phenylalanine) 2 g, carbohydrate 8.3 g, fat 2.9 g, energy 286 kJ (68 kcal)/100 mL with vitamins, minerals, and trace elements. Contains lactose and fish oil. Net price 500-mL bottle = £6.53 Nutritional supplement for the dietary management of phenylketonuria in children under 1 year

L-Tyrosine (SHS)
Powder, L-tyrosine 20 g, carbohydrate 76.8 g, fat nil, energy 1612 kJ (379 kcal)/100 g, net price 100 g = £20.87 Nutritional supplement for the dietary management of phenylketonuria in pregnant women with low plasma tyrosine concentrations

XP Maxamaid® (SHS)
Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Flavours: orange, unflavoured (flavours: see Modju®, Flavour System, p. 1021), net price 500 g = £55.37 Nutritional supplement for the dietary management of phenylketonuria in children 1–8 years

XP Maxamum® (SHS)
Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Flavours: orange, unflavoured (flavours: see Modju®, Flavour System, p. 1021). Net price 500 × 50-g sachets = £256.80, 500 g = £85.63 Nutritional supplement for the dietary management of phenylketonuria in children over 8 years and adults

Tyrosinaemia
Methionine-free TYR Anamix® Infant (SHS)
Powder, protein equivalent (essential and non-essential amino acids except methionine, phenylalanine, and tyrosine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL Unflavoured, net price 400 g = £37.07 (5-g measuring scoop provided) Nutritional supplement for the dietary management of proven tyrosinaemia type 1 in children from birth to 3 years

TYR Anamix® Infant (SHS)
Powder, protein equivalent (essential and non-essential amino acids except phenylalanine, and tyrosine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL Unflavoured, net price 400 g = £37.07 (5-g measuring scoop provided) Nutritional supplement for the dietary management of proven tyrosinaemia where plasma-methionine concentrations are normal in children from birth to 3 years

1. Maxamaid products are generally intended for use in children 1–8 years
2. Maxamum products are generally intended for use in children over 8 years and adults
TYR Anamix® Junior (SHS)
Powder, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 8.4 g, carbohydrate 11 g, fat 3.9 g, energy 475 kJ (113 kcal)/29-g sachet, with vitamins, minerals, and trace elements. Unflavoured, net price 30 × 29-g sachets = £196.50
Nutritional supplement for the dietary management of proven tyrosinaemia in children 1–10 years

TYR Anamix® Junior LQ (SHS)
Liquid, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 310 mg, energy 500 kJ (119 kcal)/125 mL., with vitamins, minerals, and trace elements. Orange flavour, net price 36 × 125-mL bottle = £272.79
Nutritional supplement for the dietary management of tyrosinaemia type 1 (when nitisinone (NTBC) is used, see section 9.8.1), type II, and type III, in children over 1 year

TYR express20® (Vitaflor)
Liquid, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 15 g, carbohydrate 7 g, fat 500 mg, energy 393 kJ (92 kcal)/130 mL, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see FlavourPac®, p. 1021), net price 30 × 25-g sachets = £318.03
Nutritional supplement for the dietary management of tyrosinaemia in children over 3 years and adults

TYR express15® (Vitaflor)
Powder, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 15 g, carbohydrate 3.4 g, fat less than 100 mg, energy 310 kJ (74 kcal)/25 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see FlavourPac®, p. 1021), net price 30 × 130-mL pouch = £289.80
Nutritional supplement for the dietary management of tyrosinaemia in children over 8 years and adults

TYR express20® (Vitaflor)
Powder, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 20 g, carbohydrate 4.7 g, fat less than 100 mg, energy 416 kJ (99 kcal)/34 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see FlavourPac®, p. 1021), net price 30 × 24-g sachets = £410.89
Nutritional supplement for the dietary management of tyrosinaemia. Not recommended for children under 8 years

TYR Gel® (Vitaflor)
Gel, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 10 g, carbohydrate 10.3 g, fat less than 100 mg, energy 359 kJ (81 kcal)/24 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see FlavourPac®, p. 1021), net price 30 × 24-g sachets = £204.75
Nutritional supplement for the dietary management of tyrosinaemia in children 1–10 years

TYR Lophlex® LQ 20 (Nutricia Clinical)
Liquid, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 20 g, carbohydrate 8.8 g, fat less than 500 mg, fibre 500 mg, energy 509 kJ (120 kcal)/125 mL., with vitamins, minerals, and trace elements. Juicy berries flavour, net price 125 mL = £15.29
Nutritional supplement for the dietary management of tyrosinaemia in children over 3 years and adults

\[1\] Maxamaid products are generally intended for use in children 1–8 years

Conditions for which ACBS products can be prescribed

**Birthmarks**
See Disfiguring skin lesions, below

**Dermatitis**
Avene® Bath Oil; Avene® Cream; Avene® Lotion; E45® Emollient Bath Oil; E45® Emollient Wash Cream; E45® Lotion
For details of preparations see section 13.2.1, p. 781

**Dermatitis herpetiformis**
See also Gluten-free foods, p. 1022

**Disfiguring skin lesions (birthmarks, mutilating lesions, scars, vitiligo)**
Covermark® classic foundation and finishing powder; Dermablend® Ultra corrective foundation; Dermacolor® Camouflage cream and fixing powder; Keromask® masking cream and finishing powder; Veil® Cover cream and Finishing Powder. (Cleansing Creams, Cleansing Mills, and Cleansing Lotions are excluded)
For details of preparations see section 13.8.2, p. 814

**Disinfectants (antiseptics)**
May be prescribed on an FP10 only when ordered in such quantities and with such directions as are appropriate for the treatment of patients, but not for general hygienic purposes.

**Dry mouth (xerostomia)**
For patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome.
A.S. Saliva Orthand®; Biothe Orallbalance®; BioXtra®; Glandosane®; Salivate®
For details of preparations see section 12.3.5, p. 778
Eczema  See Dermatitis, above

Photodermatoses (skin protection in)  Anthelios® XL SPF 50+ Melt-in cream; Sunsense® Ultra; Uvistat® Lipscreen SPF 50, Uvistat® Suncream SPF 30 and 50.

For details of preparations see section 13.8.1, p. 812

Pruritus  See Dermatitis, above
Appendix 3: Cautionary and advisory labels

In general, no label recommendations are made to the code numbers of the cautionary labels that pharmacists are recommended to add when dispensing. It is also expected that pharmacists will counsel patients when necessary.

Counselling needs to be related to the age, experience, background, and understanding of the individual patient. The pharmacist should ensure that the patient understands how to take or use the medicine and how to follow the correct dosage schedule. Any effects of the medicine on driving or work, any foods or medicines to be avoided, and what to do if a dose is missed should also be explained. Other matters, such as the possibility of staining of the clothes or skin by a medicine should also be mentioned.

For some preparations there is a special need for counselling, such as an unusual method or time of administration or a potential interaction with a common food or domestic remedy, and this is indicated where necessary.

Original packs Most preparations are dispensed in unbroken original packs that include further advice for the patient in the form of patient information leaflets. Label 10 may be of value where appropriate. More general labels advising on the administration of preparations such as eye drops, eye ointments, inhalers, and suppositories are also available.

Scope of labels In general, no label recommendations have been made for injections on the assumption that they will be administered by a healthcare professional or a well-instructed patient. The labelling is not exhaustive and pharmacists are recommended to use their professional discretion in labelling new preparations and those for which no labels are shown.

Individual labelling advice is not given on the administration of the large variety of antacids. In the absence of instructions from the prescriber, and if on enquiry the patient has had no verbal instructions, the directions given under ‘Dose’ should be used on the label.

It is recognised that there may be occasions when pharmacists will use their knowledge and professional discretion and decide to omit one or more of the recommended labels for a particular patient. In this case counselling is of the utmost importance. There may also be an occasion when a prescriber does not wish additional cautionary labels to be used, in which case the prescription should be endorsed ‘NCL’ (no cautionary labels). The exact wording that is required instead should then be specified on the prescription.

Pharmacists label medicines with various wordings in addition to those directions specified on the prescription. Such labels include ‘Shake the bottle’, ‘For external use only’, and ‘Store in a cool place’, as well as ‘Discard . . . days after opening’ and ‘Do not use after . . . .’

Recommended label wordings

1 Warning: This medicine may make you sleepy

To be used on preparations for children containing antihistamines, or other preparations given to children where the warnings of label 2 on driving or alcohol would not be appropriate.
2 Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines. Do not drink alcohol.

To be used on preparations for adults that can cause drowsiness, thereby affecting coordination and the ability to drive and operate hazardous machinery; label 1 is more appropriate for children. It is an offence to drive while under the influence of drink or drugs.

Some of these preparations only cause drowsiness in the first few days of treatment and some only cause drowsiness in higher doses.

In such cases the patient should be told that the advice applies until the effects have worn off. However many of these preparations can produce a slowing of reaction time and a loss of mental concentration that can have the same effects as drowsiness.

Avoidance of alcoholic drink is recommended because the effects of CNS depressants are enhanced by alcohol. Strict prohibition however could lead to some patients not taking the medicine. Pharmacists should therefore explain the risk and encourage compliance, particularly in patients who may think they already tolerate the effects of alcohol (see also label 3). Queries from patients with epilepsy regarding fitness to drive should be referred back to the patient’s doctor.

Side-effects unrelated to drowsiness that may affect a patient’s ability to drive or operate machinery safely include blurred vision, dizziness, or nausea. In general, no label has been recommended to cover these cases, but the patient should be suitably counselled.

3 Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines.

To be used on preparations containing monoamine-oxidase inhibitors; the warning to avoid alcohol and dealkalised (low alcohol) drink is covered by the patient information leaflet.

Also to be used as for label 2 but where alcohol is not an issue.

4 Warning: Do not drink alcohol.

To be used on preparations where a reaction such as flushing may occur if alcohol is taken (e.g. metronidazole). Alcohol may also enhance the hypoglycaemia produced by some oral antidiabetic drugs but routine application of a warning label is not considered necessary.

Patients should be advised not to drink alcohol for as long as they are receiving/use a course of medication, and in some cases for a period of time after the course is finished.

5 Do not take indigestion remedies 2 hours before or after you take this medicine.

To be used with label 25 on preparations coated to resist gastric acid (e.g. enteric-coated tablets). This is to avoid the possibility of premature dissolution of the coating in the presence of an alkaline pH.

Label 5 also applies to drugs such as gabapentin where the absorption is significantly affected by antacids. Pharmacists will be aware (from a knowledge of physiology) that the usual time during which indigestion remedies should be avoided is at least 2 hours before and after the majority of medicines have been taken, when a manufacturer advises a different time period, this can be followed, and should be explained to the patient.

6 Do not take indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine.

To be used on preparations containing ofloxacin and some other quinolones, doxycycline, lymecycline, minocycline, and penicillamine. These drugs chelate calcium, iron, and zinc and are less well absorbed when taken with calcium containing antacids or preparations containing iron or zinc. Pharmacists will be aware (from a knowledge of physiology) that these incompatible preparations should be taken at least 2 hours apart for the majority of medicines; when a manufacturer advises a different time period, this can be followed, and should be explained to the patient.

7 Do not take milk, indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine.

To be used on preparations containing ciprofloxacin, norfloxacin, or tetracyclines that chelate calcium, iron, magnesium, and zinc, and are thus less available for absorption. Pharmacists will be aware (from a knowledge of physiology) that these incompatible preparations should be taken at least 2 hours apart for the majority of medicines; when a manufacturer advises a different time period, this can be followed, and should be explained to the patient. Doxycycline, lymecycline, and minocycline are less liable to form chelates and therefore only require label 6 (see above).

8 Warning: Do not stop taking this medicine unless your doctor tells you to stop.

To be used on preparations that contain a drug which is required to be taken over long periods without the patient necessarily perceiving any benefit (e.g. antituberculous drugs).

Also to be used on preparations that contain a drug whose withdrawal is likely to be a particular hazard (e.g. clonidine for hypertension). Label 10 (see below) is more appropriate for corticosteroids.

9 Space the doses evenly throughout the day. Keep taking this medicine until the course is finished, unless you are told to stop.

To be used on preparations where a course of treatment should be completed to reduce the incidence of relapse or failure of treatment.

The preparations are antimicrobial drugs given by mouth. Very occasionally, some may have severe side-effects (e.g. diarrhoea in patients receiving clindamycin) and in such cases the patient may need to be advised of reasons for stopping treatment quickly and returning to the doctor.

10 Warning: Read the additional information given with this medicine.

To be used particularly on preparations containing anticoagulants, lithium, and oral corticosteroids. The appropriate treatment card should be given to the patient and any necessary explanations given.

This label may also be used on other preparations to remind the patient of the instructions that have been given.

11 Protect your skin from sunlight—even on a bright but cloudy day. Do not use sunbeds.

To be used on preparations that may cause phototoxic or photoallergic reactions if the patient is exposed to ultraviolet radiation. Many drugs other than those listed in Appendix 3 (e.g. phenothiazines and sulphonamides) may, on rare occasions, cause reactions in susceptible patients. Exposure to high intensity ultraviolet radiation from sun-lamp and sunbeds is particularly likely to cause reactions.

12 Do not take anything containing aspirin while taking this medicine.

To be used on preparations containing probenecid and sulfapyridine where the activity is reduced by aspirin.

Label 12 should not be used for anticoagulants since label 10 is more appropriate.

13 Dissolve or mix with water before taking.

To be used on preparations that are intended to be dissolved in water (e.g. soluble tablets) or mixed with water (e.g. powders, granules) before use. In a few cases other liquids such as fruit juice or milk may be used.

14 This medicine may colour your urine. This is harmless.

To be used on preparations that may cause the patient’s urine to turn an unusual colour. These include triamterene (blue under some lights), levodopa (dark reddish), and rifampicin (red).

15 Caution: flammable. Keep your body away from fire or flames after you have put on the medicine.

To be used on preparations containing sufficient flammable solvent to render them flammable if exposed to a naked flame.

16 Dissolve the tablet under your tongue—do not swallow. Store the tablets in this bottle with the cap tightly closed. Get a new supply 8 weeks after opening.

To be used on glyceryl trinitrate tablets to remind the patient not to transfer the tablets to plastic or less suitable containers.

17 Do not take more than . . . in 24 hours.

To be used on preparations for the treatment of acute migraine except those containing ergotamine, for which label 18 is used. The dose form should be specified, e.g.
Appendix 3: Cautionary and advisory labels for dispensed medicines

18 Do not take more than . . . in 24 hours. Also, do not take more than . . . in any one week
To be used on preparations containing ergotamine. The dose form should be specified, e.g. tablets or suppositories.

19 Warning: This medicine makes you sleepy. If you still feel sleepy the next day, do not drive or use tools or machines. Do not drink alcohol
To be used on preparations containing hypnotics (or some other drugs with sedative effects) prescribed to be taken at night. On the rare occasions when hypnotics are prescribed for daytime administration (e.g. nitrazepam in epilepsy), this label would clearly not be appropriate. Also to be used as an alternative to the label 2 wording (the choice being at the discretion of the pharmacist) for anxiolytics prescribed to be taken at night.
It is hoped that this wording will convey adequately the problem of residual morning sedation after taking 'sleeping tablets'.

20 Take with or just after food, or a meal
To be used on preparations that are liable to cause gastric irritation, or those that are better absorbed with food.
Patients should be advised that a small amount of food is sufficient.

21 Take 30 to 60 minutes before food
To be used on some preparations whose absorption is thereby improved.
Most oral antibacterials require label 23 instead (see below).

22 Take this medicine when your stomach is empty.
This means an hour before food or 2 hours after food.
Patients should be advised that some oral antibacterials require label 23 instead (see below).

23 Take this medicine when your stomach is empty.
This means an hour before food or 2 hours after food.
To be used on oral antibacterials whose absorption may be reduced by the presence of food and acid in the stomach.

24 Suck or chew this medicine
To be used on preparations that should be sucked or chewed. The pharmacist should use discretion as to which of these words is appropriate.

25 Swallow this medicine whole. Do not chew or crush
To be used on preparations that are enterico-coated or designed for modified-release.
Also to be used on preparations that taste very unpleasant or may damage the mouth if not swallowed whole.
Patients should be advised (where relevant) that some modified-release preparations can be broken in half, but that the halved tablet should still be swallowed whole, and not chewed or crushed.

26 Dissolve this medicine under your tongue
To be used on preparations designed for sublingual use.
Patients should be advised to hold under the tongue and avoid swallowing until dissolved. The buccal mucosa between the gum and cheek is occasionally specified by the prescriber.

27 Take with a full glass of water
To be used on preparations that should be well diluted (e.g. chloral hydrate), where a high fluid intake is required (e.g. sulfonamides), or where water is required to aid the action (e.g. methylcellulose). The patient should be advised that 'a full glass' means at least 150 mL. In most cases fruit juice, tea, or coffee may be used.

28 Spread thinly on the affected skin only
To be used on external preparations that should be applied sparingly (e.g. corticosteroids, dithranol).

29 Do not take more than 2 at any one time. Do not take more than 8 in 24 hours
To be used on containers of dispensed solid dose preparations containing paracetamol for adults when the instruction on the label indicates that the dose can be taken on an 'as required' basis. The dose form should be specified, e.g. tablets or capsules.

30 Contains paracetamol. Do not take anything else containing paracetamol while taking this medicine.
Talk to a doctor at once if you take too much of this medicine, even if you feel well.
To be used on all containers of dispensed preparations containing paracetamol.

31 Contains aspirin. Do not take anything else containing aspirin while taking this medicine.
To be used on containers of dispensed preparations containing aspirin where the name on the label does not include the word ‘aspirin’.

Intravenous additives policies

A local policy on the addition of drugs to intravenous fluids should be drawn up by a multi-disciplinary team in each Strategic Health Authority (or equivalent) and issued as a document to the members of staff concerned.

Centralised additive services are provided in a number of hospital pharmacy departments and should be used in preference to making additions on wards.

The information that follows should be read in conjunction with local policy documents.

Guidelines

1. Drugs should only be added to infusion containers when constant plasma concentrations are needed or when the administration of a more concentrated solution would be harmful.
2. In general, only one drug should be added to any infusion container and the components should be compatible. Ready-prepared solutions should be used whenever possible. Drugs should not normally be added to blood products, mannitol, or sodium bicarbonate. Only specially formulated additives should be used with fat emulsions or amino-acid solutions (section 9.3).
3. Solutions should be thoroughly mixed by shaking and checked for absence of particulate matter before use.
4. Strict asepsis should be maintained throughout and in general the giving set should not be used for more than 24 hours (for drug admixtures).
5. The infusion container should be labelled with the patient’s name, the name and quantity of additives, and the date and time of addition (and the new expiry date or time). Such additional labelling should not interfere with information on the manufacturer’s label that is still valid. When possible, containers should be retained for a period after use in case they are needed for investigation.
6. It is good practice to examine intravenous infusions from time to time while they are running. If cloudiness, crystallisation, change of colour, or any other sign of interaction or contamination is observed the infusion should be discontinued.

Problems

Microbial contamination

The accidental entry of micro-organisms converts the infusion fluid pathway into a potential vehicle for infection with micro-organisms, particularly species of Candida, Enterobacter, and Klebsiella. Ready-prepared infusions containing the additional drugs, or infusions prepared by an additive service (when available) should therefore be used in preference to making extemporeaneous additions to infusion containers on wards etc. However, when this is necessary strict aseptic procedure should be followed.

Incompatibility

Physical and chemical incompatibilities may occur with loss of potency, increase in toxicity, or other adverse effect. The solutions may become opalescent or precipitation may occur, but in many instances there is no visual indication of incompatibility. Interaction may take place at any point in the infusion fluid pathway, and the potential for incompatibility is increased when more than one substance is added to the infusion fluid.

Common incompatibilities

Precipitation reactions are numerous and varied and may occur as a result of pH, concentration changes, ‘salting-out’ effects, complexation or other chemical changes. Precipitation or other particle formation must be avoided since, apart from lack of control of dosage on administration, it may initiate or exacerbate adverse effects. This is particularly important in the case of drugs which have been implicated in thrombophlebitis. Other thrombophlebitis (e.g. dexamethasone) or in skin sloughing or necrosis caused by extravasation (e.g. sodium bicarbonate and certain cytotoxic drugs). It is also especially important to effect solution of colloidal drugs and to prevent their subsequent precipitation in order to avoid a pyrogenic reaction (e.g. amphotericin).

It is considered undesirable to mix beta-lactam antibiotics, such as semi-synthetic penicillins and cephalosporins, with proteinaceous materials on the grounds that immunogenic and allergenic conjugates could be formed.

A number of preparations undergo significant loss of potency when added singly or in combination to large volume infusions. Examples include ampicillin in infusions that contain glucose or lactates. The breakdown products of dacarbazine have been implicated in adverse effects.

Blood

Because of the large number of incompatibilities, drugs should not normally be added to blood and blood products for infusion purposes. Examples of incompatibility with blood include hypertonic mannitol solutions (irreversible crenation of red cells), dextran solutions (rouleaux formation and interference with cross-matching), glucose (clumping of red cells), and oxytocin (inactivated).

If the giving set is not changed after the administration of blood, but used for other infusion fluids, a fibrin clot may form which, apart from blocking the set, increases the likelihood of microbial growth.

Intravenous fat emulsions

These may break down with coalescence of fat globules and separation of phases when additions such as antibacterials or electrolytes are made, thus increasing the possibility of embolism. Only specially formulated products such as Vistaplen® (section 9.3) may be added to appropriate intravenous fat emulsions.

Other infusions

Infusions that frequently give rise to incompatibility include amino acids, mannitol, and sodium bicarbonate.

Bactericides

Bactericides such as chlorocresol 0.1% or phenylmercuric nitrate 0.001% are present in some injection solutions. The total volume of such solutions
Appendix 4: Intravenous additives

addition via the drip tubing.

intermittent infusion; continuous infusion; The table lists preparations given by three methods:

Use of table
The table lists preparations given by three methods:

+ continuous infusion;
+ intermittent infusion;
+ addition via the drip tubing.

Drugs for continuous infusion must be diluted in a large volume infusion. Penicillins and cephalosporins are not usually given by continuous infusion because of stability problems and because adequate plasma and tissue concentrations are best obtained by intermittent infusion. Where it is necessary to administer them by continuous infusion, detailed literature should be consulted.

Drugs that are both compatible and clinically suitable may be given by intermittent infusion in a relatively small volume of infusion over a short period of time, e.g. 100 mL in 30 minutes. The method is used if the product is incompatible or unstable over the period necessary for continuous infusion; the limited stability of ampicillin or amoxicillin in large volume glucose or lactate infusions may be overcome in this way.

Intermittent infusion is also used if adequate plasma and tissue concentrations are not produced by continuous infusion as in the case of drugs such as dacarbazine, gentamicin, and ticarcillin.

An in-line burette may be used for intermittent infusion techniques in order to achieve strict control over the time and rate of administration, especially for infants and children and in intensive care units. Intermittent infusion may also make use of the ‘piggy-back’ technique provided that no additions are made to the primary infusion. In this method the drug is added to a small secondary container connected to a Y-type injection site on the primary infusion giving set; the secondary solution is usually infused within 30 minutes.

Addition via the drip tubing is indicated for a number of cytotoxic drugs in order to minimise extravasation. The preparation is added aseptically via the rubber septum of the injection site of a fast-running infusion. In general, drug preparations intended for a bolus effect should be given directly into a separate vein where possible. Failing this, administration may be made via the drip tubing provided that the preparation is compatible with the infusion fluid when given in this manner.

Table of drugs given by intravenous infusion

Covers addition to Glucose intravenous infusion 5 and 10%, and Sodium chloride intravenous infusion 0.9%.

Compatibility with glucose 5% and with sodium chloride 0.9% indicates compatibility with Sodium chloride and glucose intravenous infusion. Infusion of a large volume of hypotonic solution should be avoided therefore care should be taken if water for injections is used. The information in the Table relates to the proprietary preparations indicated; for other preparations suitability should be checked with the manufacturer.

Abatacept (Orencia®) Intermittent in Sodium chloride 0.9%
Reconstitute each vial with 10 mL water for injections using the silicone-free syringe provided; dilute requisite dose in infusion fluid to 100 mL (using the same silicone-free syringe); give over 30 minutes through a low protein-binding filter (pore size 0.2–1.2 micron).

Abciximab (ReoPro®) Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute requisite dose in infusion fluid and give via infusion pump; filter upon dilution with infusion fluid through a non-pyrogenic low protein-binding 0.2, 0.22, or 5 micron filter or upon administration through an in-line non-pyrogenic low protein-binding 0.2 or 0.22 micron filter.
Appendix 4: Intravenous additives

**Acetylcysteine** *(Parvolex®)*
Continuous in Glucose 5% or Sodium chloride 0.9%
Glucose 5% is preferable—see Emergency Treatment of Poisoning

**Aciclovir (as sodium salt)** *(Zovirax IV®, Aciclovir IV, Hospira; Aciclovir IV, Genus; Aciclovir Sodium, Zurich)*
Intermittent in Sodium chloride 0.9% or Sodium chloride and glucose
For Zovirax IV®, Aciclovir IV (Genus) initially reconstitute to 25 mg/mL in water for injections or sodium chloride 0.9%; then dilute to not more than 5 mg/mL with the infusion fluid; to be given over 1 hour; alternatively, may be administered in a concentration of 25 mg/mL using a suitable infusion pump and given over 1 hour; for Aciclovir IV® (Hospira) dilute to not more than 5 mg/mL with infusion fluid; give over 1 hour

**Agalsidase alfa** *(Replagal®)*
Intermittent in Sodium chloride 0.9%
Dilute requisite dose with 100 mL infusion fluid and give over 40 minutes using an in-line filter; use within 3 hours of dilution

**Agalsidase beta** *(Fabrazyme®)*
Intermittent in Sodium chloride 0.9%
Reconstitute with water for injections (35 mg in 7.2 mL, 5 mg in 1.1 mL) to produce a solution containing 5 mg/mL, dilute with infusion fluid (for doses less than 35 mg dilute with at least 50 mL, doses 35–70 mg dilute with at least 100 mL, doses 70–100 mg dilute with at least 250 mL, doses greater than 100 mg dilute with 500 mL and give through an in-line low protein-binding 0.2 micron filter at an initial rate of no more than 15 mg/hour; for subsequent infusions, infusion rate may be increased gradually once tolerance has been established

**Alfentanil (as hydrochloride)** *(Rapifen®)*
Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%

**Alglucosidase alfa** *(Myozyme®)*
Intermittent in Sodium chloride 0.9%
Reconstitute 50 mg with 10.3 mL water for injections to produce 5 mg/mL solution; gently rotate vial without shaking; dilute requisite dose with infusion fluid to give a final concentration of 0.5–4 mg/mL, give through a low protein-binding in-line filter (0.2 micron) at an initial rate of 1 mg/kg/hour increased by 2 mg/kg/hour every 30 minutes to max. 7 mg/kg/hour

**Alteplase** *(Actilyse®)*
Continuous or intermittent in Sodium chloride 0.9%
Dissolve in water for injections to a concentration of 1 mg/mL or 2 mg/mL and infuse intravenously; alternatively dilute the solution further in the infusion fluid to a concentration of not less than 200 micrograms/mL, not to be infused in glucose solution

**Amifostine** *(Ethyl®)*
Intermittent in Sodium chloride 0.9%
Reconstitute 500-mg vial with 9.7 mL sodium chloride 0.9% to produce a 50 mg/mL solution

**Amikacin sulfate** *(Amikin®)*
Intermittent in Glucose 5% or Sodium chloride 0.9%
To be given over 30 minutes

**Aminophylline** Continuous in Glucose 5% or Sodium chloride 0.9%

**Amiodarone hydrochloride** *(Cordarone X®)*
Continuous or intermittent in Glucose 5%
Suggested initial infusion volume 250 mL given over 20–120 minutes; for repeat infusions up to 1.2 g in max. 500 mL, infusion in extreme emergency see section 2.7.3; should not be diluted to less than 600 micrograms/mL; incompatible with sodium chloride infusion, avoid equipment containing the plasticizer di-2-ethylhexylphthalate (DEHP)

**Amoxicillin (as sodium salt)** *(Amoxil®)*
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes via drip tubing in Glucose 5% or Sodium chloride 0.9%
Continuous infusion not usually recommended

**Amphoterin (liposomal)** *(Abelcet®)*
Intermittent in Glucose 5%
Allow suspension to return to room temperature, shake gently to ensure no yellow settlement, withdraw requisite dose (using 17–19 gauge needle) into one or more 20-mL syringes, replace needle on syringe with a 5-micron filter needle provided (fresh needle for each syringe) and dilute to a concentration of 1 mg/mL (2 mg/mL can be used in fluid restriction and in children); preferably give via an infusion pump at a rate of 2.5 mg/kg/hour (initial test dose of 1 mg given over 15 minutes); an in-line filter (pore size no less than 15 micron) may be used, do not use sodium chloride or other electrolyte solutions, flush existing intravenous line with glucose 5% or use separate line

**Amphotericin (lipid complex)** *(Ambisome®)*
Intermittent in Glucose 5%
Reconstitute each vial with 12 mL water for injections and shake vigorously to produce a preparation containing 4 mg/mL; withdraw requisite dose from vial and introduce into infusion fluid through the 5 micron filter provided to produce a final concentration of 0.2–2 mg/mL, infuse over 30–60 minutes, or if non-anaphylactic infusion-related reactions occur infuse over 2 hours (initial test dose 1 mg over 10 minutes); an in-line filter (pore size no less than 1 micron) may be used, incompatible with sodium chloride solutions, flush existing intravenous line with glucose 5% or 10%, or use separate line

**Amphotericin (as sodium deoxycholate complex)** *(Fungizone®)*
Intermittent in Glucose 5%
Reconstitute each vial with 10 mL water for injections and shake immediately to produce a 5 mg/mL colloidial solution, dilute further in infusion fluid to a concentration of not less than 100 micrograms/mL, pH of the glucose must not be below 4.2 (check each container—consult product literature for details of buffer); infuse over 2–4 hours, or longer if not tolerated (initial test dose 1 mg over 20–30 minutes); begin infusion immediately after dilution and protect from light; incompatible with sodium chloride solutions, flush existing intravenous line with glucose 5% or use separate line, an in-line filter (pore size no less than 1 micron) may be used

**Ampicillin sodium** *(Penbritin®)*
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes via drip tubing in Glucose 5% or Sodium chloride 0.9%
Continuous infusion not usually recommended

**Ampidifungin** *(Ecalta®)*
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute each 100 mg with 30 mL water for injections, allow up to 5 minutes for reconstitution; dilute dose in infusion fluid to a concentration of 770 micrograms/mL, give at a rate not exceeding 1.1 mg/minute
Note Follow product information if using stock supplied with ethanol solvent

**Antithymocyte immunoglobulin** *(Thymoglobuline®)*
Continuous in Glucose 5% or Sodium chloride 0.9%
Reconstitute each vial with 5 mL water for injections to produce a solution of 5 mg/mL, gently rotate to dissolve. Dilute requisite dose with infusion fluid to a total volume of 50–500 mL (usually 50 mL/vial); begin infusion immediately after dilution; give through an in-line filter (pore size 0.22 micron) and not to be given with unfractionated heparin and hydrocortisone in glucose infusion as precipitation reported
Appendix 4: Intravenous additives

**Argatroban monohydrate (Exembo®)**
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute each 2.5-mL vial with 250 mL infusion fluid

**Atenolol (Tenormin®)**
Intermittent in Glucose 5% or Sodium chloride 0.9%
Suggested infusion time 20 minutes

**Atosiban (Tractocile® concentrate for intravenous infusion)**
Continuous in Glucose 5% or Sodium chloride 0.9%
Withdraw 10 mL infusion fluid from 100-mL bag and replace with 10 mL atosiban concentrate (7.5 mg/mL) to produce a final concentration of 750 micrograms/mL.

**Atracurium besilate (Tracrium®, Atracurium besilate injection, Hospira; Atracurium injection/infusion, Genus)**
Continuous in Glucose 5% or Sodium chloride 0.9%
Stability varies with diluent; dilute requisite dose with infusion fluid to a concentration of 0.5–5 mg/mL.

**Azathioprine (as sodium salt) (Imuran®)**
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute 50 mg with 5–15 mL water for injections; dilute requisite dose to a volume of 20–200 mL with infusion fluid

**Aztreonam (Azactam®)**
Intermittent in Glucose 5% or Sodium chloride 0.9%
Dissolve initially in water for injections (1 g per 3 mL) then dilute to a concentration of less than 20 mg/mL to be given over 20–60 minutes

**Basiliximab (Simulect®)**
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute 10 mg with 2.5 mL water for injections then dilute to at least 25 mL with infusion fluid; reconstitute 20 mg with 5 mL water for injections then dilute to at least 50 mL with infusion fluid; give over 20–30 minutes

**Belimumab (Benlysta®)**
Intermittent in Sodium chloride 0.9%
Reconstitute with water for injections (120 mg in 1.5 mL, 400 mg in 4.8 mL) to produce a solution containing 80 mg/mL; gently swirl vial for 60 seconds, then allow to stand; swirl vial (without shaking) for 60 seconds every 5 minutes until dissolved; dilute requisite dose with infusion fluid to a final volume of 250 mL and give over 1 hour

**Benzylenpenicillin sodium (Crystopen®)**
Intermittent in Glucose 5% or Sodium chloride 0.9%
Suggested volume 100 mL given over 30–60 minutes
Continuous infusion not usually recommended

**Betamethasone (as sodium phosphate) (Betnesol®)**
Continuous or intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%

**Bivalirudin (Angiox®)**
Continuous in Glucose 5% or Sodium chloride 0.9%
Reconstitute each 250-mg vial with 5 mL water for injections then withdraw 5 mL and dilute to 50 mL with infusion fluid

**Bumetanide**
Intermittent in Glucose 5% or Sodium chloride 0.9%
Suggested volume 500 mL given over 30–60 minutes; concentrations above 25 micrograms/mL may cause precipitation

**Calcitonin (salmon) (Miacalcic®)**
Intermittent in Sodium chloride 0.9%
Diluted solution given without delay; dilute in 500 mL and give over at least 6 hours; glass or hard plastic containers should not be used; some loss of potency on dilution and administration

**Calcium gluconate**
Continuous in Glucose 5% or Sodium chloride 0.9%
Avoid bicarbonates, phosphates, or sulfates

**Caspofungin (Cancidas®)**
Intermittent in Sodium chloride 0.9%
Allow vial to reach room temperature; initially reconstitute each vial with 10.5 mL water for injections, mixing gently to dissolve then dilute requisite dose in 250 mL infusion fluid (35- or 50-mg doses may be diluted in 100 mL infusion fluid if necessary); give over 60 minutes; incompatible with glucose solutions

**Cefotaxime (as sodium salt)**
Intermittent in Glucose 5% or Sodium chloride 0.9%
Suggested volume 40–100 mL given over 20–60 minutes; incompatible with alkaline solutions

**Ceftriaxone (as sodium salt)**
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute 600 mg with 20 mL water for injections, then dilute with 250 mL infusion fluid (in fluid restriction, may be diluted with 50–100 mL infusion fluid); give over 60 minutes

**Ceftazidime (as pentahydrate) (Fortum®, Kefadim®)**
Intermittent or via drip tubing in Glucose 5% or 10% or Sodium chloride 0.9%
Dissolve 2 g initially in 10 mL (3 g in 15 mL) infusion fluid; for Fortum® dilute further to a concentration of 40 mg/mL; for Kefadim® dilute further to a concentration of 20 mg/mL; give over up to 30 minutes

**Ceftriaxone (as sodium salt) (Rocephin®, Ceftriaxone Injection, Genus)**
Intermittent or via drip tubing in Glucose 5% or 10% or Sodium chloride 0.9%
Reconstitute 2-g vial with 40 mL infusion fluid, give intermittent infusion over at least 30 minutes (60 minutes in neonates); not to be given simultaneously with total parenteral nutrition or infusion fluids containing calcium, even by different infusion lines, may be infused sequentially with infusion fluids containing calcium if flush with sodium chloride 0.9% between infusions or give infusions by different infusion lines at different sites

**Chloramphenicol (as sodium succinate) (Remicetine®)**
Intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%

**Ciclosporin (Sandimmun®)**
Intermittent or continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of 50 mg in 20–100 mL; give intermittent infusion over 2–6 hours; not to be used with PVC equipment

**Cidofovir (Vistide®)**
Intermittent in Sodium chloride 0.9%
Dilute requisite dose with 100 mL infusion fluid; infuse over 1 hour

**Cisatracurium (Nimbex®, Nimbex Forte®)**
Continuous in Glucose 5% or Sodium chloride 0.9%
Solutions of 2 mg/mL and 5 mg/mL may be infused undiluted; alternatively dilute with infusion fluid to a concentration of 0.1–2 mg/mL

**Clarithromycin (Klacid® I. V.)**
Intermittent in Glucose 5% or Sodium chloride 0.9%
Dissolve initially in water for injections (500 mg in 10 mL) then dilute to a concentration of 2 mg/mL; give over 60 minutes
Cyclophosphamide (as phosphate) (Dolacino® C Phosphate) Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%
Dilute to not more than 18 mg/mL and give over 10–60 minutes at a rate not exceeding 30 mg/mL (1.2 g over at least 60 minutes, higher doses by continuous infusion)

Co-amoxiclav (Augmentin®) Intermittent in Sodium chloride 0.9%
Reconstitute 600 mg initially with 10 mL water for injections, then dilute with 50 mL infusion fluid, reconstitute 1.2 g initially with 20 mL water for injections, then dilute with 100 mL infusion fluid, give over 30–40 minutes via drip tubing in Sodium chloride 0.9%

Co-fluamipicil (as sodium salts) (Magnapen®) Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes via drip tubing in Glucose 5% or Sodium chloride 0.9%

Colistimethate sodium (Colymycin®, Promixin®) Intermittent in Sodium chloride 0.9% (or Glucose 5% for Promixin® brand only)
Dilute with 50 mL infusion fluid and give over 30 minutes

Co-trimoxazole (Septin® for infusion) Intermittent in Glucose 5% or 10% or Sodium chloride 0.9%
Dilute contents of 1 ampoule (5 mL) to 125 mL, 2 ampoules (10 mL) to 250 mL, or 3 ampoules (15 mL) to 500 mL suggested duration of infusion 60–90 minutes (but may be adjusted according to fluid requirements); if fluid restriction necessary, 1 ampoule (5 mL) may be diluted with 75 mL glucose 5% and infused over max. 60 minutes

Cyclophosphamide (Cyclophosphamide injection, Baxter) via drip tubing in Glucose 5% or Sodium chloride 0.9%
Reconstitute 500 mg with 25 mL sodium chloride 0.9%; reconstitute 1 g with 50 mL sodium chloride 0.9%

Danaparoid sodium (Orgaran®) Continuous in Glucose 5% or Sodium chloride 0.9%

Daptomycin (Cubicin®) Intermittent in Sodium chloride 0.9%
Reconstitute with sodium chloride 0.9% (350 mg in 7 mL, 500 mg in 10 mL); gently rotate vial without shaking; allow to stand for at least 10 minutes then rotate gently to dissolve dilute requisite dose in 50 mL infusion fluid and give over 30 minutes

Desferrioxamine mesilate (Desferal®) Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute with water for injections to a concentration of 100 mg/mL, dilute with infusion fluid

Desmopressin (DDAVP®, Octim®) Intermittent in Sodium chloride 0.9%
Dilute with 50 mL and give over 20 minutes

Dexamethasone sodium phosphate (Dexamethasone, Hospira; Dexamethasone, Organon) Continuous or intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%

Dexametadomidine (as hydrochloride) (Dexor®) Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of 4 micrograms/mL

Dexrazoxane (Cardoxane®) Intermittent in Compound sodium lactate
Reconstitute each vial with 25–100 mL infusion fluid, give requisite dose over 15 minutes

Dexrazoxane (Savene®) Intermittent in Savene® diluent
Reconstitute 500 mg with 25 mL of water for injections then dilute in 500 mL Savene® diluent, give over 1–2 hours into a large vein in an area other than the one affected

Diamorphine hydrochloride (Diamorphine Injection, Wockhardt) Continuous in Glucose 5% or Sodium chloride 0.9%
Glucose is preferred as infusion fluid

Diazepam (solution) (Diazepam, Wockhardt) Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of not more than 10 mg in 200 mL, adsorbed to some extent by the plastics of bags and infusion sets

Diazepam (emulsion) (Diazemuls®) Continuous in Glucose 5% or 10%
May be diluted to a max. concentration of 200 mg in 500 mL, max. 6 hours between addition and completion of administration; adsorbed to some extent by the plastics of the infusion set via drip tubing in Glucose 5% or 10% or Sodium chloride 0.9%
Adsorbed to some extent by the plastics of the infusion set

Diclofenac sodium (Voltarol®) Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%
Dilute 75 mg with 100–500 mL infusion fluid (previously buffered with 0.5 mL sodium bicarbonate 8.4% solution or with 1 mL sodium bicarbonate 4.2% solution), for intermittent infusion give 25–50 mg over 15–60 minutes or 75 mg over 30–120 minutes; for continuous infusion give at a rate of 5 mg/hour

Digoxin (Lanoxin®) Intermittent in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of not more than 62.5 micrograms/mL. To be given over at least 2 hours

Digoxin-specific antibody fragments (DigiFab®) Intermittent in Sodium chloride 0.9%
Reconstitute with water for injections (4 mL/vial), then dilute with infusion fluid and give over 30 minutes

Dinoprostone (Prostin E2®) Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%

Disopyramide (as phosphate) (Rythmodan®) Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%
Max. rate by continuous infusion 20–30 mg/hour (or 400 micrograms/kg/hour)

Dobutamine (as hydrochloride) Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of 0.5–1 mg/mL and give via an infusion pump, give higher concentration (max. 5 mg/mL) through central venous catheter, incompatible with bicarbonate and other strong alkaline solutions

Dopamine hydrochloride Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to max. concentration of 3.2 mg/mL, incompatible with bicarbonate

Dopexamine hydrochloride (Dopacard®) Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of 400 or 800 micrograms/mL, max. concentration via large peripheral vein 1 mg/mL, concentrations up to 4 mg/mL may be infused via central vein, give via infusion pump or other device which provides accurate control of rate, contact with metal should be minimised; incompatible with bicarbonate
Eculizumab (Soliris®)
Continuous or intermittent in Sodium chloride 0.9%
Reconstitute each 150-mg vial with 5 mL sodium chloride 0.9% gently without shaking to avoid foaming, then dilute in 100 mL infusion fluid and give over at least 4 hours.

Flaxapen (Flloxapen®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Continuous infusion not usually recommended.

Foscarnet (Foscavir®)
Either solution may be used, but give through a 0.2 micron in-line filter. Give over 60 minutes for once daily dose regimen.

Fosphenytoin Sodium (Pro-Epanutin®)
Continuous in Sodium chloride 0.9%
Dilute requisite dose to 25–50 mL infusion fluid and give over 1–2 minutes.

Fosaprepitant (Vemend®)
Continuous in Sodium chloride 0.9%
Reconstitute each 150-mg vial with 5 mL sodium chloride 0.9% gently without shaking to avoid foaming, then dilute in 145 mL infusion fluid, give over 20–30 minutes.

Fosphenytoin Sodium (Pro-Epanutin®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of 12 mg/mL for infusion into peripheral vein (undiluted solution via central venous line only), infuse over at least 1 hour (infuse doses greater than 60 mg/kg over 2 hours).

Furosemide (as sodium salt) (Lasix®)
Continuous in Sodium chloride 0.9%
Infusion pH must be above 5.5 and rate should not exceed 4 mg/minute, glucose solutions are unsuitable.

Galsulfase (Naglazyme®)
Continuous in Sodium chloride 0.9%
Dilute requisite dose with infusion fluid to final volume of 100 mL; give over 20–30 minutes (given over 60 minutes for once daily dose regimen).

Ganciclovir (as sodium salt) (Cymevene®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to not more than 10 mg/mL with infusion fluid (usually 100 mL); give over 1 hour.

Gentamicin (as sulfate) (Cidomycin®, Gentamicin Paediatric Injection, Beacon; Gentamicin Injection, Hospira)
Continuous or via drip tubing in Glucose 5% or Sodium chloride 0.9%
Suggested volume for intermittent infusion 50–100 mL given over 20–30 minutes (given over 60 minutes for once daily dose regimen).

Glyceril trinitrate (Nitroglycerin®, Nitronal®)
Continuous in Glucose 5% or Sodium chloride 0.9%
For Nitroglycerin® suggested infusion concentration 100 micrograms/mL, incompatible with polyvinyl chloride infusion containers such as Viflex® or Sterifix®, use glass or polyethylene containers or give via a syringe pump.

Granisetron (as hydrochloride)
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to up to 3 mL in 20–50 mL infusion fluid (up to 3 mL in a total volume of 10–30 mL for children); give over 5 minutes.

Haem arginate (Normosang®)
Continuous in Sodium chloride 0.9%
Dilute requisite dose in 100 mL infusion fluid in glass bottle and give over at least 30 minutes through a filter via large antebachral or central vein, administer within 1 hour after dilution.

Heparin sodium
Continuous in Glucose 5% or Sodium chloride 0.9%
Administration with a motorised pump advisable.
Hydralazine hydrochloride
Continuous in Sodium chloride 0.9%
Suggested infusion volume 500 mL

Hydrocortisone (as sodium phosphate) (Eforcortef®)
Continuous or intermittent or via drip tubing in
Glucose 5% or Sodium chloride 0.9%

Hydrocortisone (as sodium succinate) (SoluCortef®)
Continuous or intermittent or via drip tubing in
Glucose 5% or Sodium chloride 0.9%

Hydroxocobalamin (Cyanokid®)
Intermittent in Sodium chloride 0.9%
Reconstitute each 5-g vial with 200 mL infusion fluid; gently
invert vial for at least 1 minute to mix; do not shake

Ibandronic acid (Bondronat®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Dilute requisite dose in 500 mL infusion fluid and give over
1–2 hours

Idursulfase (Elaprase®)
Intermittent in Sodium chloride 0.9%
Dilute requisite dose in 100 mL infusion fluid and mix gently
(do not shake); give over 3 hours (gradually reduced to 1 hour
if no infusion-related reactions)

Imiglucerase (Cerezyme®)
Intermittent in Sodium chloride 0.9%
Initially reconstitute with water for injections (200 units in
5.1 mL, 400 units in 10.2 mL) to give 40 units/mL solution;
dilute requisite dose with infusion fluid to a final volume of
100–200 mL and give initial dose at a rate not exceeding
0.5 units/kg/hour, subsequent doses to be given at a rate not
exceeding 1 unit/kg/hour, administer within 3 hours
after reconstitution

Imipenem with cilastatin (as sodium salt)
(Primaxin®)
Intermittent in Sodium chloride 0.9%
Dilute to a concentration of 5 mg (as imipenem)/mL, infuse
500 mg (as imipenem) over 25–30 minutes, dose greater than
500 mg (as imipenem) over 40–60 minutes

Infliximab (Remicade®)
Intermittent in Sodium chloride 0.9%
Reconstitute each 100-mg vial with 10 mL water for
injections using a 21-gauge or smaller needle; gently swirl
vial without shaking to dissolve; allow to stand for 5 minutes;
dilute requisite dose with infusion fluid to a final volume of
250 mL and give through a low protein-binding filter
(0.2 micron or less) over at least 2 hours (adults over 18 years
who have tolerated 3 initial 2-hour infusions may be given
increasing gradually every 15 minutes to max. 43 units/kg/
hour); start infusion within 3 hours of reconstitution

Insulin (soluble)
Continuous in Sodium chloride 0.9%
AdSORbed to some extent by plastics of infusion set; see also
section 6.1.3; ensure insulin is not injected into ‘dead space’
of injection port of the infusion bag

Insulin aspart
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to 0.05–1 unit/mL with infusion fluid; adsorbed to
some extent by plastics of infusion set

Insulin glulisine (Apidra®)
Continuous in Sodium chloride 0.9%
Dilute to 1 unit/mL with infusion fluid, use a co-extruded
polyolefin/polyamide plastic infusion bag with a dedicated
infusion line

Insulin lispro
Continuous in Glucose 5% or Sodium chloride 0.9%
AdSORbed to some extent by plastics of infusion set

Iron dextran (Cosmefor®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Dilute 100–200 mg in 100 mL infusion fluid, give 25 mg over
15 minutes initially, then give at a rate not exceeding
6.67 mg/minute; total dose infusion diluted in 500 mL infusion
fluid and given over 4–6 hours (initial dose 25 mg over
15 minutes)

Iron isomaltoside 1000 (Monofer®)
Intermittent in Sodium chloride 0.9%
For details consult product literature

Iron sucrose (Venofer®)
Intermittent in Sodium chloride 0.9%
Dilute 100 mg in up to 100 mL infusion fluid; give 25 mg over
15 minutes initially, then give at a rate not exceeding
3.33 mg/minute

Isosorbide dinitrate (Isoket 0.05%, Isoket 0.1%®)
Continuous in Glucose 5% or Sodium chloride 0.9%
AdSORbed to some extent by polyvinyl chloride infusion
containers; preferably use glass or polyethylene containers
or give via a syringe pump. Isoket 0.05%® can alternatively
be administered undiluted using a syringe pump with a glass
or rigid plastic syringe

Itraconazole (Sporanox®)
Intermittent in Sodium chloride 0.9%
Dilute 250 mg in 50 mL infusion fluid and infuse only 60 mL
through an in-line filter (0.2 micron) over 60 minutes

Ketamine (as hydrochloride) (Ketalar®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to 1 mg/mL, microdrip infusion for maintenance of
anaesthesia

Labetalol hydrochloride
Intermittent in Sodium chloride 0.9% or glucose
dilute to a concentration of 1 mg/mL; suggested volume
200 mL, adjust rate with in-line burette

Lacosamide (Vimpat®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
May be administered undiluted

Laronidase (Alizyme®)
Intermittent in Sodium chloride 0.9%
Body-weight under 20 kg, use 100 mL infusion fluid, body-
weight over 20 kg use 250 mL infusion fluid, withdraw
volume of infusion fluid equivalent to volume of laronidase
concentrate being added; give through an in-line filter
(0.2 micron) at an initial rate of 2 units/kg/hour then
increasing gradually every 15 minutes to max. 43 units/kg/
hour

Lenograstim (Granocyte®)
Intermittent in Sodium chloride 0.9%
Initially reconstitute with 1 mL water for injection provided
(do not shake vigorously) then dilute with up to 50 mL
infusion fluid for each vial of Granocyte-13 or up to 100 mL
infusion fluid for Granocyte-34; give over 30 minutes

Levetiracetam (Keppra®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Dilute requisite dose with at least 100 mL of infusion fluid;
give over 15 minutes

Magnesium sulfate injection, BP
Continuous in Glucose 5% or Sodium chloride 0.9%
Suggested concentration up to 200 mg/mL (20%) (0.8 mmol/mL Mg2+) magnesium sulfate heptahydrate; max.
rate 150 mg/minute (0.6 mmol/minute Mg2+)

Meropenem (Meronem®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Dilute dose in infusion fluid to a final concentration of 1–
20 mg/mL; give over 15–30 minutes
Appendix 4: Intravenous additives

**Noradrenaline/Norepinephrine**
Continuous or intermittent via drip tubing in Glucose 5% or Sodium chloride 0.9%
Suggested volume 500 mL

**Methyldprednisolone (as sodium succinate) (Solu-Medrone®)**
Continuous or intermittent via drip tubing in Glucose 5% or Sodium chloride 0.9%
Reconstitute initially with water for injections; doses up to 250 mg should be given over at least 5 minutes, high doses over at least 30 minutes

**Micafungin (Mycamine®)**
Continuous in Glucose 5% or Sodium chloride 0.9%
Reconstitute each vial with 5 mL infusion fluid, gently rotate vial, without shaking, to dissolve; dilute requisite dose with infusion fluid to 100 mL (final concentration 0.5–2 mg/mL); protect infusion from light; give over 60 minutes

**Midazolam (Hypnovel®)**
Continuous in Glucose 5% or Sodium chloride 0.9%
For neonates and children under 15 kg dilute to a maximum concentration of 1 mg/mL

**Minirone (Primacor®)**
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to a suggested concentration of 200 micrograms/mL

**Mivacurium (as chloride) (Mivacron®)**
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of 500 micrograms/mL, may also be given undiluted

**Mycophenolate mofetil (as hydrochloride) (CellCept®)**
Continuous in Glucose 5%
Reconstitute each 500-mg vial with 14 mL glucose 5% and infused fluid to 100 mL (final concentration 0.5–2 mg/mL); stable for 3 hours in glucose 5%

**Naloxone (Minijet® Naloxone Hydrochloride)**
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of up to 200 micrograms/mL, and administer via an infusion pump, see Emergency Treatment of Poisoning

**Natalizumab (Tysabri®)**
Continuous in Sodium chloride 0.9%
Dilute 300 mg in 100 mL infusion fluid; gently invert to mix, do not shake. Use within 8 hours of dilution and give over 1 hour

**Nimodipine (Nimotop®) via drip tubing in Glucose 5% or Sodium chloride 0.9%**
Not to be added to infusion container; administer via an infusion pump through a Y-piece into a central catheter; incompatible with polyvinyl chloride giving sets or containers; protect infusion from light

**Nizatidine (Axid®)**
Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%
For continuous infusion, dilute 300 mg in 150 mL and give at a rate of 10 mg/hour; for intermittent infusion, dilute 100 mg in 50 mL and give over 15 minutes

**Noradrenaline/Norepinephrine**
Continuous in Glucose 5% or Sodium chloride and glucose
Give via controlled infusion device; for administration via syringe pump, dilute 2 mg (2 mL of solution) noradrenaline base with 48 mL infusion fluid, for administration via drip counter dilute 20 mg (20 mL of solution) noradrenaline base with 480 mL infusion fluid, give through a central venous catheter; incompatible with alkalai

1 mg of noradrenaline base is equivalent to 2 mg noradrenaline acid tartrate

**Omeprazole (as sodium salt) (Losec®)**
Intermittent or continuous in Glucose 5% or Sodium chloride 0.9%
Reconstitute each 40 mg vial with infusion fluid and dilute to 100 mL; for intermittent infusion, give 40 mg over 20–30 minutes; stable for 3 hours in glucose 5% or 12 hours in sodium chloride 0.9%

**Ondansetron (as hydrochloride) (Zofran®)**
Continuous or intermittent in Glucose 5% or Sodium chloride 0.9% with potassium chloride 0.3% or Sodium chloride 0.9% with potassium chloride 0.3% or Mannitol 10% or Ringers solution
For intermittent infusion, dilute the required dose in 50–100 mL of infusion fluid and give over at least 15 minutes

**Oxycodone hydrochloride (OxyNorm®)**
Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of 1 mg/mL

**Oxytocin (Syntocinon®)**
Continuous in Glucose 5% or Sodium chloride 0.9%
Preferably given via a variable-speed infusion pump in a concentration appropriate to the pump, if given by drip infusion for induction or enhancement of labour, dilute 5 units in 500 mL infusion fluid or for higher doses, 10 units in 500 mL, for treatment of postpartum uterine haemorrhage dilute 40 units in 500 mL; if high doses given for prolonged period (e.g. for inevitable or missed abortion or for postpartum haemorrhage), use low volume of an electrolyte-containing infusion fluid (not Glucose 5%) given at higher concentration than for induction or enhancement of labour; close attention to patient’s fluid and electrolyte status essential

**Pamidronate disodium (Aredia®, Pamidronate disodium, Hospira, Medac, Wockhardt)**
Continuous in Glucose 5% or Sodium chloride 0.9%
For Aredia®, reconstitute initially with water for injections (15 mg in 5 mL, 30 mg or 90 mg in 10 mL); for Pamidronate disodium (Wockhardt), dilute with infusion fluid to a concentration of not more than 60 mg in 250 mL, for Aredia®, Pamidronate disodium (Medac, Hospira) dilute with infusion fluid to a concentration of not more than 90 mg in 250 mL, give at a rate not exceeding 1 mg/minute; not to be given with infusion fluids containing calcium

**Pantoprazole (as sodium sesquihydrate) (Protonix®)**
Continuous in Glucose 5% or Sodium chloride 0.9%
Reconstitute 40 mg with 10 mL sodium chloride 0.9% and dilute with 100 mL of infusion fluid, give 40 mg over 15 minutes

**Paracetamol (Perfalgan®)**
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of not less than 1 mg/mL and use within 1 hour; may also be given undiluted

**Pentamidine isetionate (Pentacarinat®)**
Continuous in Glucose 5% or Sodium chloride 0.9%
Dissolve initially in water for injections (300 mg in 3–5 mL), then dilute in 50–250 mL give over at least 60 minutes

**Phenoxybenzamine hydrochloride**
Continuous in Sodium chloride 0.9%
Dilute in 200–500 mL infusion fluid; give over at least 2 hours; max. 4 hours between dilution and completion of administration

**Phenytoin hydrochloride**
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute 10 mg in 500 mL infusion fluid
Phenytoin sodium (Epanutin®)
Intermittent in Sodium chloride 0.9%.
Flush intravenous line with Sodium chloride 0.9% before and after infusion, dilute in 50–100 mL infusion fluid (final concentration not to exceed 10 mg/mL) and give into a large vein through an in-line filter (0.22–0.50 micron) at a rate not exceeding 1 mg/kg/minute (max. 50 mg/minute); complete administration within 1 hour of preparation.

Phytoenadione (in mixed micelles vehicle) (Konakion® MM)
Intermittent in Glucose 5%
Dilute with 55 mL, may be injected into lower part of infusion apparatus.

Piperacillin with tazobactam (as sodium salts)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute initially (2.25 g in 10 mL, 4.5 g in 20 mL) with water for injections, or glucose 5% (Tazocin® brand only), or sodium chloride 0.9%, then dilute to 50–150 mL with infusion fluid, give over 30 minutes.

Potassium chloride
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute in a large-volume infusion; mix thoroughly to avoid ‘layering’, especially in non-rigid infusion containers; use ready-prepared solutions when possible.

Propofol (emulsion) (Diprivan®, Propofol-Lipuro®)
Shake before use; microbiological filter not recommended; may be administered via a Y-piece close to injection site co-administered with Glucose 5% or Sodium chloride 0.9%
0.5% emulsion
Intermittent
May be administered undiluted, or diluted with Glucose 5% or Sodium chloride 0.9%; dilute to a concentration not less than 1 mg/mL.
1% emulsion
Continuous or intermittent
May be administered undiluted, or diluted with Sodium Chloride 0.9% (Propofol-Lipuro® only) or Glucose 5%; dilute to a concentration not less than 2 mg/mL, use within 6 hours of preparation.
2% emulsion
Continuous
Do not dilute.

Quinine dihydrochloride
Continuous in Glucose 5% or Sodium chloride 0.9%
To be given over 4 hours; see also section 5.4.1

Ranitidine (as hydrochloride) (Zantac®)
Intermittent in Glucose 5% or Sodium chloride 0.9%

Rasburicase (Fasturtex®)
Intermittent in Sodium chloride 0.9%.
Reconstitute with solvent provided; gently swirl vial without shaking to dissolve; dilute requisite dose to 50 mL with infusion fluid and give over 30 minutes.

Remifentanil (Ultivra®)
Continuous in Glucose 5% or Sodium chloride 0.9%
or Water for injections
Reconstitute with infusion fluid to a concentration of 1 mg/mL then dilute further to a concentration of 20–250 micrograms/mL (50 micrograms/mL recommended for general anaesthesia, 20–25 micrograms/mL recommended for children 1–12 years; 20–50 micrograms/mL recommended when used with target controlled infusion (TCI) device).

Rifampicin (Rifadin®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute with solvent provided then dilute with 500 mL infusion fluid, give over 2–3 hours.

Rituximab (MabThera®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Dilute to 1–4 mg/mL and gently invert bag to avoid foaming.

Rocuronium bromide (Esmeron®)
Continuous or via drip tubing in Glucose 5% or Sodium chloride 0.9%

Salbutamol (as sulfate) (Ventolin® For Intravenous Infusion)
Continuous in Glucose 5%
For bronchodilatation dilute to a concentration of 200 micrograms/mL with glucose 5% or sodium chloride 0.9%; for premature labour dilute with glucose 5% to a concentration of 200 micrograms/mL for use in a syringe pump or for other infusion methods (preferably via controlled infusion device), dilute to a concentration of 20 micrograms/mL; close attention to patient's fluid and electrolyte status essential.

Sodium nitroprusside
Continuous in Glucose 5%
Infuse via infusion device to allow precise control; protect infusion from light. For further details consult product literature.

Sodium valproate (Epilim®, Episenta®)
Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute Epilim® with solvent provided then dilute with infusion fluid.

Streptokinase (Streptase®)
Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute with sodium chloride 0.9%, then dilute further with infusion fluid.

Tacrolimus (Prograf®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute concentrate in infusion fluid to a final concentration of 4–100 micrograms/mL; give over 24 hours; incompatible with PVC.

Teicoplanin (Targocid®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute initially with water for injections provided; infuse over 30 minutes.
Continuous infusion not usually recommended.

Temocillin (Negabac®)
Intermittent in Glucose 5% or 10% or Sodium chloride 0.9%
Reconstitute 1 g with 10 mL water for injections then dilute with 50–150 mL infusion fluid, give over 30–40 minutes.

Terbutaline sulfate (Bricanyl®)
Continuous in Glucose 5%
For bronchodilatation dilute 1.5–2.5 mg with 500 mL glucose 5% or sodium chloride 0.9% and give over 8–10 hours; for premature labour dilute in glucose 5% and give via controlled infusion device preferably a syringe pump; if syringe pump available dilute to a concentration of 100 micrograms/mL if syringe pump not available dilute to a concentration of 10 micrograms/mL; close attention to patient's fluid and electrolyte status essential.

Ticarcillin sodium with clavulanic acid (Timentin®)
Intermittent in Glucose 5%
Suggested volume (depending on dose) 100–150 mL; give over 30–40 minutes.

Tigecycline (Tygazid®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute each vial with 5.3 mL infusion fluid to produce a 10 mg/mL solution; dilute requisite dose in 100 mL infusion fluid and give over 30–60 minutes.
Tirofiban (Aggrastat®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Withdraw 50 mL infusion fluid from 250-mL bag and replace with 50 mL tirofiban concentrate (250 micrograms/mL) to give a final concentration of 50 micrograms/mL

Tobramycin (as sulfate) (Nebcin®)
Intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%
For adult intermittent infusion suggested volume 50–100 mL (children proportionately smaller volume) given over 20–60 minutes

Tocilizumab (RoActemra®)
Intermittent in Sodium chloride 0.9%
Dilute requisite dose to a volume of 100 mL with infusion fluid and give over 1 hour

Tramadol hydrochloride (Zydol®)
Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%

Tranexamic acid (Cyklokapron®)
Continuous in Glucose 5% or Sodium chloride 0.9%

Urokinase (Syner-KINASE®)
Continuous or intermittent in Sodium chloride 0.9%

Vancomycin (as hydrochloride) (Vancocin®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute each 500 mg with 10 mL water for injections and dilute with infusion fluid to a concentration of up to 5 mg/mL (10 mg/mL in fluid restriction but increased risk of infusion-related effects); give over at least 60 minutes (rate not to exceed 10 mg/minute for doses over 500 mg); use continuous infusion only if intermittent not feasible

Vasopressin, synthetic (argipressin)
Intermittent in Glucose 5%
Suggested concentration 20 units/100 mL given over 15 minutes

Vecuronium bromide (Norcuron®)
Continuous or via drip tubing in Glucose 5% or Sodium chloride 0.9%
Reconstitute each vial with 5 mL water for injections to give 2 mg/mL solution; alternatively reconstitute with up to 10 mL glucose 5% or sodium chloride 0.9% or water for injections—unsuitable for further dilution if not reconstituted with water for injections. For continuous intravenous infusion, dilute to a concentration up to 40 micrograms/mL

Velaglucerase alfa (VPRIV®)
Intermittent in Sodium chloride 0.9%
Reconstitute each 400-unit vial with 4.3 mL water for injections to produce a 100 units/mL solution; dilute requisite dose in 100 mL infusion fluid, give over 60 minutes through a 0.22 micron filter; start infusion within 24 hours of reconstitution

Verteporfin (Visudyne®)
Intermittent in Glucose 5%
Reconstitute each 15 mg with 7 mL water for injections to produce a 2 mg/mL solution then dilute requisite dose with infusion fluid to a final volume of 30 mL and give over 10 minutes; protect infusion from light and administer within 4 hours of reconstitution. Incompatible with sodium chloride infusion

Vitamins B & C (Pabrinex® I/V High potency)
Intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%
Ampoule contents should be mixed, diluted, and administered without delay, give over 30 minutes (see MHRA/CHM advice, section 9.6.2)

Wound dressings  The correct dressing for wound management depends not only on the type of wound but also on the stage of the healing process. The principal stages of healing are:
- cleansing, removal of debris;
- granulation, vascularisation;
- epithelialisation.

The ideal dressing for moist wound healing needs to ensure that the wound remains:
- moist with exudate, but not macerated;
- free of clinical infection and excessive slough;
- free of toxic chemicals, particles or fibres;
- at the optimum temperature for healing;
- undisturbed by the need for frequent changes;
- at the optimum pH value.

As wound healing passes through its different stages, different types of dressings may be required to satisfy better one or other of these requirements. Under normal circumstances, a moist environment is a necessary part of the wound healing process; exudate provides a moist environment and promotes healing, but excessive exudate can cause maceration of the wound and surrounding healthy tissue. The volume and viscosity of exudate changes as the wound heals. There are certain circumstances where moist wound healing is not appropriate (e.g. gangrenous toes associated with vascular disease).

Advanced wound dressings, (section A5.2) are designed to control the environment for wound healing, for example to donate fluid (hydrogels), maintain hydration (hydrocolloids), or to absorb wound exudate (alginates, foams).
Practices such as the use of irritant cleansers and desloughing agents may be harmful and are largely obsolete; removal of debris and dressing remnants should need minimal irrigation with lukewarm sterile sodium chloride 0.9% solution or water.

Hydrogel, hydrocolloid, and medical grade honey dressings can be used to deslough wounds by promoting autolytic debridement; there is insufficient evidence to support any particular method of debridement for difficult-to-heal surgical wounds. Sterile larvae (maggots) are also available for biosurgical removal of wound debris.

There have been few clinical trials able to establish a clear advantage for any particular product. The choice between different dressings depends not only on the type and stage of the wound, but also on patient preference or tolerance, site of the wound, and cost. For further information, see buyers’ guide: Advanced wound dressings (October 2008); NHS purchasing and supply agency, Centre for evidence-based purchasing.

Prices quoted in Appendix 5 are basic NHS net prices; for further information see prices in the BNF.

### A5.1 Basic wound contact dressings

#### A5.1.1 Low adherence dressings

Low adherence dressings are used as interface layers under secondary absorbent dressings. Placed directly on the wound bed, non-absorbent, low adherence dressings are suitable for clean, granulating, lightly exuding wounds without necrosis, and protect the wound bed from direct contact with secondary dressings. Care must be taken to avoid granulation tissue growing into the weave of these dressings.

Tulle dressings are manufactured from cotton or viscose fibres which are impregnated with white or yellow soft paraffin to prevent the fibres from sticking, but this

**Note:** In each section of this table the dressings are listed in order of increasing absorbency. Some wound contact (primary) dressings require a secondary dressing.
is only partly successful and it may be necessary to change the dressings frequently. The paraffin reduces absorbency of the dressing. Dressings with a reduced content (light loading) of soft paraffin are less liable to interfere with absorption; dressings with ‘normal loading’ (such as Jelonet®) have been used for skin graft transfer.

Knitted viscose primary dressing is an alternative to tulle dressings for exuding wounds; it can be used as the initial layer of multi-layer compression bandaging in the treatment of venous leg ulcers.

Knitted Viscose Primary Dressing, BP 1993
Warp knitted fabric manufactured from a bright viscose monofilament—
N-A Dressing®, 9.5 cm × 9.5 cm = 35p (Systagenix)
N-A Ultra® (silicone-coated), 9.5 cm × 9.5 cm = 33p, 9.5 cm × 19 cm = 63p (Systagenix)
Profore®, 14 cm × 20 cm = 30p (S&N Hlth.)
Tricotex®, 9.5 cm × 9.5 cm = 32p (S&N Hlth.)

Paraffin Gauze Dressing, BP 1993
(Tulle Graa). Fabric of leno weave, wool and warp threads of cotton and/or viscose yarn, impregnated with white or yellow soft paraffin, 10 cm × 10 cm, (light loading); BSN Medical—
Cutiplast® 6 cm × 5 cm = 8p, 8 cm × 10 cm = 10p, 10 cm × 15 cm = 16p, 10 cm × 20 cm = 30p, 10 cm × 25 cm = 34p, 10 cm × 30 cm = 42p, 10 cm × 35 cm = 50p (Medicareplus International)
Cosmopore ®, 5 cm × 7.2 cm = 8p, 8 cm × 10 cm = 16p, 8 cm × 15 cm = 26p, 10 cm × 20 cm = 43p, 10 cm × 25 cm = 53p, 10 cm × 35 cm = 74p (Hartmann)
Cutiplast® Steril, 5 cm × 7.2 cm = 5p, 8 cm × 10 cm = 10p, 8 cm × 15 cm = 23p, 10 cm × 20 cm = 29p, 10 cm × 25 cm = 30p, 10 cm × 30 cm = 40p (S&N Hlth.)

A5.1.2 Absorbent dressings

Perforated film absorbent dressings are suitable only for wounds with mild to moderate amounts of exudate; they are not appropriate for leg ulcers or for other lesions that produce large quantities of viscous exudate. Dressings with an absorbent cellulose or polymer wadding layer are suitable for use on moderately to heavily exuding wounds.

For lightly exuding wounds

Absorbent Perforated Dressing with Adhesive Border
Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.
Adapore®, 7 cm × 8 cm = 8p, 10 cm × 10 cm = 10p, 10 cm × 15 cm = 16p, 10 cm × 20 cm = 30p, 10 cm × 25 cm = 34p, 10 cm × 30 cm = 42p, 10 cm × 35 cm = 50p (Medicareplus International)
Cosmopore ®, 5 cm × 7.2 cm = 8p, 8 cm × 10 cm = 16p, 8 cm × 15 cm = 26p, 10 cm × 20 cm = 43p, 10 cm × 25 cm = 53p, 10 cm × 35 cm = 74p (Hartmann)
Cutiplast® Steril, 5 cm × 7.2 cm = 5p, 8 cm × 10 cm = 10p, 8 cm × 15 cm = 23p, 10 cm × 20 cm = 29p, 10 cm × 25 cm = 30p, 10 cm × 30 cm = 40p (S&N Hlth.)

For moderately to heavily exuding wounds

Absorbent Cellulose Dressing with Fluid Repellent Backing
CelluDress®, 10 cm × 10 cm = 19p, 10 cm × 15 cm = 20p, 10 cm × 20 cm = 22p, 15 cm × 20 cm = 30p, 20 cm × 25 cm = 40p, 20 cm × 30 cm = 85p (Medicareplus International)
Appendix 5: Wound Management

Eulyse®, 15 cm × 15 cm = £9.76, 20 cm × 20 cm = £13.38 (Advancis)
Exu-Dry®, 10 cm × 15 cm = £1.06, 15 cm × 23 cm = £2.17, 23 cm × 38 cm = £5.04 (S&N Hlth.)
Mesorb®, cellulose wadding pad with gauze wound contact layer and non-woven repellent backing, 10 cm × 10 cm = £0.94, 15 cm × 15 cm = £0.96, 10 cm × 20 cm = £1.36, 20 cm × 25 cm = £2.14, 20 cm × 30 cm = £2.43 (Mohlycke)
Telfa Max®, 22.8 cm × 38 cm = £4.62, 38 cm × 45.7 cm = £5.61, 38 cm × 60.9 cm = £8.16 (Covidien)
Kuraray® E, non-sterile, 10 cm × 10 cm = £0.60, 10 cm × 20 cm = £4.45, 20 cm × 20 cm = £6.27, 20 cm × 30 cm = £8.50, 30 cm x 30 cm = £10.83 (Hartmann)

For heavily exuding wounds

Curea® (Bullen) Super absorbent cellulose and polymer primary dressing
Curea P1®, 7.5 cm × 7.5 cm = £1.68, 10 cm × 10 cm = £2.10, 10 cm × 20 cm = £3.56, 10 cm × 30 cm = £5.98, 20 cm × 20 cm = £6.74, 20 cm × 30 cm = £9.81, 12 cm × 12 cm (drain) = £2.59
Curea P2® (non-sterile) 10 cm × 20 cm = £9.52, 11 cm × 11 cm = £5.70, 20 cm × 20 cm = £16.51, 20 cm × 30 cm = £24.77
Cutisorb® Ultra (BSN Medical) Super absorbent cellulose and polymer primary dressing, 10 cm × 10 cm = £0.01, 20 cm × 20 cm = £6.32, 10 cm × 20 cm = £3.37, 20 cm × 30 cm = £9.53

DryMax® Extra (Aspen Medical) Super absorbent cellulose and polymer primary dressing, 10 cm × 10 cm = £1.80, 20 cm × 20 cm = £4.20, 10 cm × 20 cm = £2.38, 20 cm × 30 cm = £4.60

ELECT Superabsorber® (S&N) Super absorbent cellulose and polymer primary dressing, 10 cm × 10 cm = £0.30, 10 cm × 20 cm = £0.50, 20 cm × 20 cm = £0.96, 20 cm × 30 cm = £2.47
Zetuvit® Plus (Hartmann) Super absorbent cellulose primary dressing, 10 cm × 10 cm = £0.70, 10 cm × 20 cm = £0.95, 20 cm × 20 cm = £1.30, 20 cm × 40 cm = £2.00

Advanced wound dressings can be used for both acute and chronic wounds. Categories for dressings in this section (A5.2) start with the least absorptive, moisture-donating hydrogel dressings, followed by increasingly more absorptive dressings. These dressings are classified according to their primary component; some dressings are comprised of several components.

Hydrogel dressings

Hydrogel dressings are most commonly supplied as an amorphous, cohesive topical application that can take up the shape of a wound. A secondary, non-absorbent dressing is needed. These dressings are generally used to donate liquid to dry sloughy wounds and facilitate autolytic debridement of necrotic tissue; some also have the ability to absorb very small amounts of exudate. Hydrogel products that do not contain propylene glycol should be used if the wound is to be treated with larval therapy.

Hydrogel sheets have a fixed structure and limited fluid-handling capacity; hydrogel sheet dressings are best avoided in the presence of infection, and are unsuitable for heavily exuding wounds.

Hydrogel sheet dressings

ActiFormCool® (Activa) Hydrogel dressing, 5 cm × 6.5 cm = £1.70, 10 cm × 10 cm = £2.49, 20 cm × 20 cm = £7.51, 10 cm × 15 cm = £3.58
Aqualfo® (Covidien) Hydrogel dressing, 7.5 cm diameter = £2.55, 12 cm diameter = £5.26
Coolie® (ZeroDerma) Hydrogel dressing (without adhesive border), disc 7 cm diameter = £1.96
Gel FX® (Synergy Healthcare) Hydrogel dressing (without adhesive border) 10 cm × 10 cm = £1.60, 15 cm × 15 cm = £3.20
Geliperm® (Geistlich) Hydrogel sheets, 10 cm × 10 cm = £2.48

Hydrosorb® (Hartmann) Absorbent, transparent, hydrogel sheets containing polyurethane polymers covered with a semi-permeable film, 5 cm × 7.5 cm = £1.49, 10 cm × 10 cm = £2.12, 20 cm × 20 cm = £6.37

Hydrosorb® Comfort (with adhesive border, waterproof) 4.5 cm × 6.5 cm = £1.76, 7.5 cm × 10 cm = £2.33, 12.5 cm × 12.5 cm = £3.40

Intrasite Conformable® (S&N Hlth.) Soft non-woven dressing impregnated with Intrasite® gel, 10 cm × 10 cm = £1.70, 10 cm × 20 cm = £2.30, 10 cm × 40 cm = £4.10

Novogel® (Ford) Glycerol-based hydrogel sheets, 10 cm × 10 cm = £3.07, 30 cm × 30 cm, standard = £13.00, thin = £12.27, 5 cm × 7.5 cm = £1.95, 15 cm × 20 cm = £5.86, 20 cm × 40 cm = £11.16, 7.5 cm diameter = £2.79
ActivHeal® Hydrogel

Hydrogel containing guar gum and propylene glycol, 8 g = £1.23, 15 g = £1.41

Aquafilm® (Aspen Medical)

Hydrogel containing modified starch copolymer, 8 g = £1.61, 15 g = £1.96

Askina® Gel (B. Braun)

Hydrogel containing modified starch and glycerol, 15 g = £1.92

Cutimed® (BSN Medical)

Hydrogel, 8 g = £1.58, 15 g = £1.92, 25 g = £2.83

Flexigran® (A1 Pharmaceuticals)

Hydrogel containing starch polymer and glycerol, 15 g = £1.90

GranuGel® (Convatec)

Hydrogel containing carboxymethylcellulose, pectin, and propylene glycol, 15 g = £2.19

Intrasite® Gel (S&N Hlth.)

Hydrogel containing modified carrageenan polymer and propylene glycol, 8 g sachet = £1.70, 15-g sachet = £2.28, 25-g sachet = £3.38

Nu-Gel® (Systagenix)

Hydrogel containing alginate and propylene glycol, 15 g = £2.09

Purilon® Gel (Coloplast)

Hydrogel containing carboxymethylcellulose and calcium alginate, 8 g = £1.64, 15 g = £2.14

A5.2.1.1 Sodium hyaluronate dressings

The hydrating properties of sodium hyaluronate promote wound healing, and dressings can be applied directly to the wound, or to a primary dressing (a secondary dressing should also be applied). The iodine and potassium iodide in these dressings prevent the bacterial decay of sodium hyaluronate in the wound.

Hydrolide® (H&R)

Sodium hyaluronate 1.5%, potassium iodide 0.15%, iodine 0.1%, in a viscous solution, 22-g = £19.95, 50-g = £35.00

Cautions: thyroid disorders

A5.2.2 Vapour-permeable films and membranes

Vapour-permeable films and membranes allow the passage of water vapour and oxygen but are impermeable to water and micro-organisms, and are suitable for lightly exuding wounds. They are highly conformable, provide protection, and a moist healing environment; transparent film dressings permit constant observation of the wound. Water vapour loss can occur at a slower rate than exudate is generated, so that fluid accumulates under the dressing, which can lead to tissue maceration and to wrinkling at the adhesive contact site (with risk of bacterial entry). Newer versions of these dressings have increased moisture vapour permeability. Despite these advances, vapour-permeable films and membranes are unsuitable for infected, large heavily exuding wounds, and chronic leg ulcers.

Vapour-permeable films and membranes are suitable for partial-thickness wounds with minimal exudate, or wounds with eschar. Most commonly, they are used as a secondary dressing over alginates or hydrogels; film dressings can also be used to protect the fragile skin of patients at risk of developing minor skin damage caused by friction or pressure.

A5.2.2.1 Vapour-permeable Adhesive Film Dressing

Extensible, waterproof, water vapour permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces.

Askina® Derm (B.Braun)

Film dressing, 6 cm × 7 cm = 36p, 10 cm × 12 cm = £1.04, 10 cm × 20 cm = £1.97, 15 cm × 20 cm = £2.39, 20 cm × 30 cm = £4.27

Biocclusive® (Systagenix)

Film dressing, 10.2 cm × 12.7 cm = £1.54

C-View® (Aspen Medical)

Film dressing, 6 cm × 7 cm = 38p, 10 cm × 12 cm = £1.02, 12 cm × 12 cm = £1.09, 15 cm × 20 cm = £2.36

Dressfilm® (St George’s Medical)

Film dressing, 6 cm × 7 cm = 30p, 12 cm × 12 cm = 93p, 15 cm × 20 cm = £1.90

Hydrofilm® (Hartmann)

Film dressing, 6 cm × 7 cm = 21p, 10 cm × 12.5 cm = 40p, 10 cm × 15 cm = 50p, 10 cm × 25 cm = 77p, 12 cm × 25 cm = 81p, 15 cm × 20 cm = 92p, 20 cm × 30 cm = £1.52

Hypafix® Transparent (BSN Medical)

Film dressing, 10 cm × 2 m = £8.24

Leukomed T® (BSN Medical)

Film dressing, 7.2 cm × 5 cm = 35p, 8 cm × 10 cm = 66p, 10 cm × 12.5 cm = 96p, 11 cm × 14 cm = £1.16, 15 cm × 20 cm = £2.23, 15 cm × 25 cm = £2.38

Mepitel® Film (Mölnlycke)

Film dressing, 6.5 cm × 7 cm = 49p, 10.5 cm × 12 cm = £1.31, 10.5 cm × 25 cm = £2.55, 15.5 cm × 20 cm = £3.24

Mepore® Film (Mölnlycke)

Film dressing, 6 cm × 7 cm = 44p, 10 cm × 12 cm = £1.18, 10 cm × 25 cm = £2.29, 15 cm × 20 cm = £2.91

OpSite® Flexifix (S&N Hlth.)

Film dressing, 5 cm × 1 m = £3.69, 10 cm × 1 m = £6.22; OpSite® Flexigrid, 6 cm × 7 cm = 37p, 12 cm × 12 cm = £1.06, 15 cm × 20 cm = £2.69

PolySkin® II (Covidien)

Film dressing, 4 cm × 4 cm = 36p, 5 cm × 7 cm = 39p, 10 cm × 12 cm = £1.01, 15 cm × 20 cm = £2.00, 15 cm × 20 cm = £2.31, 20 cm × 25 cm = £4.03

Clearpore

Vellafilm

Tegaderm®

Suprasorb F®

ProtectFilm® (Wallace Cameron)
Film dressing, 6 cm × 7 cm = £1.19, 10 cm × 12 cm = £2.38, 10 cm × 30 cm = £2.88

Suprasorb F® (Activa)
Film dressing, 5 cm × 7 cm = £0.44, 10 cm × 12 cm = £2.37

Tegaderm® (3M)
Film dressing, 6 cm × 7 cm = £0.64, 10 cm × 12 cm = £1.19

Vacuskin® (Protex)
Film dressing, 6 cm × 7 cm = £0.44, 10 cm × 12 cm = £2.19

VelaSkin® (Advancis)
Film dressing, 12 cm × 12 cm = £1.10, 12 cm × 35 cm = £2.75, 15 cm × 20 cm = £2.10

Vapour-permeable Adhesive Film Dressing with absorbent pad

Adpore® Ultra (Medicare)
Film dressing, with absorbent pad, 7 cm × 8 cm = 12p, 10 cm × 10 cm = 14p, 10 cm × 15 cm = £2.80, 10 cm × 20 cm = 25p, 10 cm × 25 cm = 35p, 10 cm × 30 cm = 52p, 10 cm × 35 cm = 63p, 10 cm × 40 cm = £1.98, 15 cm × 20 cm = £2.44

Clearpore® (Richardson)
Film dressing, with absorbent pad, 6 cm × 7 cm = 12p, 6 cm × 10 cm = 15p, 10 cm × 10 cm = 20p, 10 cm × 20 cm = 35p, 10 cm × 25 cm = 35p, 10 cm × 30 cm = 52p

C-View® Post-Op (Aspen Medical)
Film dressing, with absorbent pad, 6 cm × 7 cm = £0.40, 10 cm × 12 cm = £1.10, 10 cm × 25 cm = £1.60, 10 cm × 35 cm = £2.60

Hydrofilm® Plus (Hartmann)
Film dressing, with absorbent pad, 5 cm × 7.2 cm = 15p, 9 cm × 10 cm = 20p, 9 cm × 15 cm = 22p, 10 cm × 10 cm = 25p, 10 cm × 25 cm = 35p, 10 cm × 30 cm = 54p

Leukomed T® Plus (BSN Medical)
Film dressing, with absorbent pad, 7.2 cm × 5 cm = 25p, 8 cm × 10 cm = 51p, 8 cm × 15 cm = 76p, 10 cm × 20 cm = £1.26, 10 cm × 25 cm = £1.42, 10 cm × 30 cm = £2.38, 10 cm × 35 cm = £2.88

Mepore® (Mölnlycke)
Mepore® Film & Pad, film dressing, with absorbent pad, 4 cm × 5 cm = 24p, 5 cm × 7 cm = 24p, 9 cm × 10 cm = 62p, 9 cm × 15 cm = 92p, 10 cm × 20 cm = £1.36, 9 cm × 25 cm = £1.50, 9 cm × 30 cm = £2.00, 9 cm × 35 cm = £2.49

Mepore® Ultra, film dressing, with absorbent pad, 7 cm × 8 cm = 40p, 9 cm × 20 cm = £1.50, 9 cm × 25 cm = £1.65, 9 cm × 30 cm = £2.73, 10 cm × 11 cm = 79p, 11 cm × 15 cm = £1.16

OpSite® (S&N Hlth.)
OpSite® Plus, film dressing, with absorbent pad, 6.5 cm × 5 cm = 30p, 9.5 cm × 8.5 cm = 83p, 10 cm × 12 cm = £1.13, 10 cm × 20 cm = £1.90, 35 cm × 10 cm = £2.15

OpSite® Post-op, film dressing, with absorbent pad, 8.5 cm × 9.5 cm = 82p, 6.5 cm × 15.5 cm = £1.13, 10 cm × 12 cm = £1.11, 10 cm × 20 cm = £1.86, 10 cm × 25 cm = £2.35, 10 cm × 30 cm = £2.78, 10 cm × 35 cm = £3.09

Pharmapore-PU® (Wallace Cameron)
Film dressing, with absorbent pad, 8.5 cm × 15.5 cm = 20p, 10 cm × 25 cm = 38p, 10 cm × 30 cm = 58p

PremierPore VP® (Shermond)
Film dressing, with absorbent pad, 5 cm × 7 cm = 13p, 10 cm × 10 cm = 16p, 10 cm × 15 cm = 24p, 10 cm × 20 cm = 36p, 10 cm × 25 cm = 38p, 10 cm × 30 cm = 57p, 10 cm × 35 cm = 69p

Tegaderm® (3M)
Film dressing, with absorbent pad, 5 cm × 7 cm = 25p, 9 cm × 10 cm = 63p, 9 cm × 15 cm = 93p, 9 cm × 20 cm = £1.36, 9 cm × 25 cm = £1.53, 9 cm × 35 cm = £2.53

Tegaderm® Absorbent Clear, film dressing, with clear acrylic polymer oval-shaped pad, 7.6 cm × 9.5 cm = £3.02, 11.1 cm × 12.7 cm = £9.91, 14.2 cm × 15.8 cm = £5.51; rectangular pad, 14.9 cm × 15.2 cm = £8.26, 20 cm × 20.3 cm = £13.26, 16.8 cm × 19 cm (sacral) = £9.89

For inavenous and subcutaneous catheter sites

Central Gard® (Unomedical)
Vapour-permeable transparent film dressing with adhesive foam border, 16 cm × 7 cm (central venous catheter) = 94p, 16 cm × 8.8 cm (central venous catheter) = £1.03

EasiL-V® (Convatec)
Vapour-permeable transparent film dressing with adhesive foam border, 7 cm × 7.5 cm (intravenous peripheral cannula) = 38p

Hydrofilm® I.V. Control (Hartmann)
Vapour-permeable, transparent, adhesive film dressing, 7 cm × 9 cm = 29p

IV3000® (S&N Hlth.)
Vapour-permeable, transparent, adhesive film dressing, 5 cm × 6 cm (1-hand) = 40p, 6 cm × 7 cm (non-winged peripheral catheter) = 52p, 7 cm × 9 cm (ported peripheral catheter) = 69p, 9 cm × 12 cm (PICC line) = £1.37, 10 cm × 12 cm (central venous catheter) = £1.32

Mepore® IV (Mölnlycke)
Vapour-permeable, transparent, adhesive film dressing, 5 cm × 5.5 cm = 29p, 8 cm × 9 cm = 38p, 10 cm × 11 cm = 99p

Niko Fix® (Unomedical)
Non-woven fabric dressing with viscose-rayon pad, 7 cm × 8.5 cm (intravenous ported peripheral catheter) = 19p

Pharmapore-PU® IV (Wallace Cameron)
Vapour-permeable, transparent, adhesive film dressing, 8.5 cm × 7 cm = 7p, 6 cm × 7 cm (ported peripheral cannula) = 8p, 7 cm × 9 cm (peripheral cannula, hand) = 17p
Tegaderm® IV (3M)
Vapour-permeable, transparent, adhesive film dressing, 7 cm × 8.5 cm (peripheral catheter) = £8.5p, 8.5 cm × 10.5 cm (central venous catheter) = £1.12, 10 cm × 15.5 cm (peripherally inserted central venous catheter) = £1.62

**A5.2.3 Soft polymer dressings**

Dressings with soft polymer, often a soft silicone polymer, in a non-adherent or gently adherent layer are suitable for use on lightly to moderately exuding wounds. For moderately to heavily exuding wounds, an absorbent secondary dressing can be added, or a soft polymer dressing with an absorbent pad can be used.

Wound contact dressings coated with soft silicone have gentle adhesive properties and can be used on fragile skin areas or where it is beneficial to reduce the frequency of primary dressing changes.

Soft polymer dressings should not be used on heavily bleeding wounds; blood clots can cause the dressing to adhere to the wound surface.

For silicone keloid dressings see section A5.4.2.

### Without absorbent pad

**Adaptic® Touch** (Systagenix)
Non-adherent soft silicone wound contact dressing, 5 cm x 7.6 cm = £1.13, 7.6 cm x 11 cm = £2.25, 12.7 cm x 15 cm = £4.65, 20 cm x 32 cm = £12.50

**Askina® SilNet** (B. Braun)
Soft silicone-coated wound contact dressing, 5 cm x 7.5 cm = £1.08, 7.5 cm x 10 cm = £2.20, 10 cm x 18 cm = £4.80, 20 cm x 30 cm = £11.75

**Mepitel®** (Mölnlycke)
Soft silicone, semi-transparent wound contact dressing, 5 cm x 7 cm = £1.57, 8 cm x 10 cm = £3.13, 12 cm x 15 cm = £6.34, 20 cm x 30 cm = £16.61

**Mepitel® One**, soft silicone, thin, transparent wound contact dressing, 6 cm × 7 cm = £1.79, 9 cm × 10 cm = £3.36, 13 cm × 15 cm = £6.54, 24 cm × 27.5 cm = £16.79

**Physiotulle®** (Coloplast)
Non-adherent soft polymer wound contact dressing, 10 cm x 10 cm = £2.13, 15 cm x 20 cm = £6.50

**Silfix®** (Advancis)
Soft silicone-coated polyester wound contact dressing, 5 cm × 7 cm = £1.25, 8 cm × 10 cm = £2.55, 12 cm × 15 cm = £5.15, 20 cm × 30 cm = £13.25, 35 cm × 60 cm = £39.54

**Silon-TSR®** (Obsskin)
Soft silicone polymer wound contact dressing, 13 cm × 13 cm = £3.52, 13 cm × 25 cm = £5.47, 28 cm × 30 cm = £7.37

**A5.2.3 Soft polymer dressings**

**Sorbion® Contact** (H&H)
Non-adherent soft polymer wound contact dressing, 7.5 cm × 7.5 cm = £1.49, 10 cm × 10 cm = £1.99, 10 cm × 20 cm = £3.99, 20 cm × 20 cm = £6.99, 20 cm × 30 cm = £9.99

**Tegaderm® Contact** (3M)
Non-adherent soft polymer wound contact dressing, 7.5 cm × 10 cm = £2.17, 7.5 cm × 20 cm = £4.25, 20 cm × 25 cm = £10.35

**Urgotul®** (Urgo)
Non-adherent soft polymer wound contact dressing, 5 cm × 5 cm = £1.50, 10 cm × 10 cm = £3.00, 10 cm × 20 cm = £10.08, 15 cm × 15 cm = £6.45, 15 cm × 20 cm = £8.49, 20 cm × 30 cm = £13.65

### With absorbent pad

**Advazorb® Border** (Advancis)
Soft silicone wound contact dressing, with polyurethane foam film backing and adhesive border, 7.5 cm × 7.5 cm = £1.19, 10 cm × 10 cm = £2.10, 10 cm × 20 cm = £2.90, 10 cm × 30 cm = £4.25, 12.5 cm × 12.5 cm = £2.58, 15 cm × 15 cm = £3.15, 20 cm × 20 cm = £5.46

**Advazorb® Border Lite**, soft silicone wound contact dressing, with polyurethane foam film backing and adhesive border, 7.5 cm × 7.5 cm = £1.07, 10 cm × 10 cm = £1.89, 10 cm × 20 cm = £2.61, 10 cm × 30 cm = £3.83, 12.5 cm × 12.5 cm = £3.22, 15 cm × 15 cm = £2.84, 20 cm × 20 cm = £4.91

**Advazorb® Silfix** (Advancis)
Soft silicone wound contact dressing, with polyurethane foam film backing, 7.5 cm × 7.5 cm = £0.89, 10 cm × 10 cm = £1.67, 10 cm × 20 cm = £2.86, 12.5 cm × 12.5 cm = £2.33, 15 cm × 15 cm = £3.02, 20 cm × 20 cm = £4.48

**Allevyn® Gentle** (S&N Hlth.)
Soft gel wound contact dressing, with polyurethane foam film backing, 5 cm × 5 cm = £1.21, 10 cm × 10 cm = £2.40, 10 cm × 20 cm = £3.86, 15 cm × 15 cm = £4.03, 20 cm × 20 cm = £6.44

**Allevyn® Gentle Border**, silicone gel wound contact dressing, with polyurethane foam film backing, 7.5 cm × 7.5 cm = £1.43, 10 cm × 10 cm = £2.10, 12.5 cm × 12.5 cm = £2.57, 17.5 cm × 17.5 cm = £5.07, 23 cm × 23.2 cm (heel) = £9.24

**Allevyn® Gentle Border Lite**, silicone gel wound contact dressing, with polyurethane foam film backing, 5 cm × 5 cm = 86p, 5.5 cm × 12 cm = £1.77, 7.5 cm × 7.5 cm = £1.33, 8 cm × 15 cm = £3.29, 10 cm × 10 cm = £2.07, 15 cm × 15 cm = £3.65

**Allevyn® Life** (S&N Hlth)
Soft silicone wound contact dressing, with central mesh screen, polyurethane foam film backing and adhesive border, 10.3 cm × 10.3 cm = £1.65, 12.9 cm × 12.9 cm = £2.42, 15.4 cm × 15.4 cm = £2.96, 21 cm × 21 cm = £5.83
Appendix 5: Wound Management

Cutimed® Siltec (BSN Medical)
Soft silicone wound contact dressing, with polyurethane foam film backing, 5 cm × 6 cm = £1.24, 10 cm × 10 cm = £2.33, 10 cm × 20 cm = £3.84, 15 cm × 15 cm = £4.35, 20 cm × 20 cm = £6.59, 16 cm × 24 cm (heel) = £8.77; with adhesive border, 17.5 cm × 17.5 cm ( sacrum) = £4.31, 23 cm × 23 cm ( sacrum) = £7.02.

Cutimed® Siltec B, with adhesive border, for lightly to moderately exuding wounds, 7.5 cm × 7.5 cm = £1.45, 12.5 cm × 12.5 cm = £3.06, 15 cm × 15 cm = £4.71, 17.5 cm × 17.5 cm = £4.97, 22.5 cm × 22.5 cm = £8.16.

Cutimed® Siltec L, for lightly to moderately exuding wounds, 5 cm × 6 cm = 99p, 10 cm × 10 cm = £2.00, 15 cm × 15 cm = £3.30.

Eclipse® Adherent (Advancis)
Soft silicone wound contact layer with absorbent pad and film-backing, 10 cm × 10 cm = £2.99, 20 cm × 20 cm = £6.80, 10 cm × 20 cm = £3.61, 20 cm × 30 cm = £9.62.

Fivasorb® (Activa)
Absorbent polymer dressing with non-adherent wound contact layer and adhesive border, 12 cm × 12 cm = £3.25, 15 cm × 15 cm = £4.45.

Mepilex® (Mölnlycke)
Absorbent soft silicone dressing with polyurethane foam film and adhesive border, 7 cm × 7.5 cm = £1.39, 10 cm × 12.5 cm = £2.72, 10 cm × 20 cm = £3.69, 10 cm × 30 cm = £5.55, 15 cm × 17.5 cm = £4.74, 17 cm × 20 cm = £6.07, 15 cm × 15 cm ( sacrum) = £3.34, 18 cm × 18 cm ( sacrum) = £4.85, 23 cm × 23 cm ( sacrum) = £7.91, 15 cm × 22 cm ( heel) = £6.62.

Mepilex® Border, absorbent soft silicone dressing with polyurethane foam and adhesive border, 7 cm × 7.5 cm = £1.39, 10 cm × 12.5 cm = £2.01, 10 cm × 10 cm = £2.53, 15 cm × 15 cm = £4.13.

Mepilex® Lite, thin absorbent soft silicone dressing with polyurethane foam, 6 cm × 8.5 cm = £1.82, 10 cm × 10 cm = £2.17, 15 cm × 15 cm = £4.22, 20 cm × 50 cm = £6.66.

Mepilex® Transfer, soft silicone exudate transfer dressing, 7.5 cm × 8.5 cm = £2.23, 10 cm × 12 cm = £3.51, 15 cm × 20 cm = £10.64, 20 cm × 50 cm = £27.20.

Sorbion® Sana (H&R)
Non-adherent polyethylene wound contact dressing with absorbent core, 8.5 cm × 8.5 cm = £5.00, 12 cm × 12 cm = £6.78, 12 cm × 22 cm = £12.56, 22 cm × 22 cm = £20.14.

Urgotul® Duo (Urgo)
Non-adherent, soft polymer wound contact dressing with absorbent pad, 5 cm × 10 cm = £2.33, 10 cm × 12 cm = £3.61, 15 cm × 20 cm = £8.38.

Urgotul® Duo Border, soft polymer wound contact dressing with absorbent pad and adhesive polyurethane film backing, 8 cm × 8 cm = £2.27, 10 cm × 12 cm = £3.52, 15 cm × 20 cm = £8.17.

Cellulose dressings

Sorbion® Sachet (H&R)
Absorbent bandages in cellulose matrix, hypoallergenic polypropylene envelope, with adhesive border (for moderately to heavily exuding wounds), 5 cm × 5 cm = £1.45, 7.5 cm × 7.5 cm = £1.78, 10 cm × 10 cm = £2.25, 15 cm × 20 cm = £3.73, 20 cm × 20 cm = £7.00, 30 cm × 20 cm = £9.99.

Sorbion® Sachet Drainage, absorbent polymers in cellulose matrix, hypoallergenic polypropylene envelope (‘V’ shaped dressing), 10 cm × 10 cm = £2.64.

Sorbion® Sachet EXTRA, absorbent polymers in cellulose matrix, hypoallergenic polypropylene envelope (for moderately to heavily exuding wounds), 5 cm × 5 cm = £1.45, 7.5 cm × 7.5 cm = £1.78, 10 cm × 10 cm = £2.25, 10 cm × 20 cm = £3.73, 20 cm × 20 cm = £7.00, 30 cm × 20 cm = £9.99.

Sorbion® Sachet Multi Star, absorbent polymers in cellulose matrix, hypoallergenic polypropylene envelope (for moderately to heavily exuding wounds), 8 cm × 8 cm = £2.99, 14 cm × 14 cm = £4.89.

Suprasorb® X (Activa)
Biosynthetic cellulose fibre dressing (for lightly to moderately exuding wounds), 5 cm × 5 cm = £1.93, 9 cm × 9 cm = £4.02, 14 cm × 20 cm = £7.96, 21 cm × 21 cm ( rope) = £6.19.

Hydrocolloid dressings

Hydrocolloid dressings are usually presented as a hydrocolloid layer on a vapour-permeable film or foam pad. Semi-permeable to water vapour and oxygen, these dressings form a gel in the presence of exudate to facilitate rehydration in lightly to moderately exuding wounds and promote autolytic debridement of dry, sloughy, or necrotic wounds; they are also suitable for promoting granulation.

Hydrocolloid-fibre dressings made from modified carmellose fibres resemble alginate dressings; hydrocolloid-fibre dressings are more absorptive and suitable for moderately to heavily exuding wounds.

Without adhesive border

ActivHeal® Hydrocolloid (MedLogic)
Semi-permeable polyurethane film backing, hydrocolloid wound contact layer, 5 cm × 5 cm = £7.6p, 10 cm × 10 cm = £1.55, 15 cm × 15 cm = £3.37, 15 cm × 18 cm ( sacral) = £3.91; with polyurethane foam layer, 5 cm × 7.5 cm = £66p, 10 cm × 10 cm = £1.52, 15 cm × 15 cm = £2.86, 15 cm × 18 cm ( sacral) = £3.30.
A5.2.4 Hydrocolloid dressings

**Biatain® Super** (Coloplast)
Semi-permeable hydrocolloid dressing with adhesive border, 10 cm × 10 cm = £3.12, 12.5 cm × 12.5 cm = £4.29, 12 cm × 20 cm = £5.63, 15 cm × 15 cm = £5.43, 20 cm × 20 cm = £8.10

**Granuflex® BORDERED** (Convatec)
Hydrocolloid wound contact layer bonded to plastic foam layer, with outer semi-permeable polyurethane film, 6 cm × 6 cm = £1.66, 10 cm × 10 cm = £3.14, 15 cm × 15 cm = £5.99, 10 cm × 13 cm (triangular) = £3.71, 15 cm × 18 cm (triangular) = £5.78

**Hydrocol® Border** (Hartmann)
Hydrocolloid dressing with adhesive border and absorbent wound contact pad, 5 cm × 5 cm = 95p, 7.5 cm × 7.5 cm = £1.57, 10 cm × 10 cm = £2.29, 15 cm × 15 cm = £4.30; 6 cm × 12 cm (concave) = £2.01; 12 cm × 18 cm (sacral) = £3.42

**Versiva® XC** (Convatec)
Hydrocolloid gelling foam dressing, without adhesive border, 7.5 cm × 7.5 cm = £1.39, 11 cm × 11 cm = £2.31, 15 cm × 15 cm = £4.26, 20 cm × 20 cm = £6.37; with adhesive border, 10 cm × 10 cm = £2.36, 14 cm × 14 cm = £3.19, 19 cm × 19 cm = £5.09, 22 cm × 22 cm = £5.65, 18.5 cm × 20.5 cm (heel) = £5.65, 21 cm × 25 cm (sacral) = £6.06

---

**Askinda® Biofilm Transparent** (B. Braun)
Semi-permeable, polyurethane film dressing with hydrocolloid adhesive, 10 cm × 10 cm = £1.02, 20 cm × 20 cm = £3.02

**Biatain®** (Coloplast)
Semi-permeable hydrocolloid dressing without adhesive border, 10 cm × 10 cm = £3.12, 12.5 cm × 12.5 cm = £4.29, 12 cm × 20 cm = £5.63, 15 cm × 15 cm = £5.43, 20 cm × 20 cm = £8.10

**Comfeel® Plus** (Coloplast)
Hydrocolloid dressings containing carmellose sodium and calcium alginate.

- **contour**, 6 cm × 8 cm = £2.08, 9 cm × 11 cm = £3.61; **ulcer**, 4 cm × 6 cm = 90p, 10 cm × 10 cm = £2.29, 15 cm × 15 cm = £4.91, 18 cm × 20 cm (triangular) = £5.35, 20 cm × 20 cm = £7.08; **transparent**, 5 cm × 7 cm = 63p, 5 cm × 15 cm = £1.48, 5 cm × 25 cm = £2.41, 9 cm × 14 cm = £2.28, 9 cm × 25 cm = £3.24, 10 cm × 10 cm = £1.20, 15 cm × 15 cm = £3.12, 15 cm × 20 cm = £3.17, 20 cm × 20 cm = £3.19; **pressure relieving**, 7 cm diameter = £3.24, 10 cm diameter = £4.34, 15 cm diameter = £6.54

**DuoDERM® Extra Thin** (Convatec)
Semi-permeable hydrocolloid dressing, 5 cm × 10 cm = 72p, 7.5 cm × 7.5 cm = 75p, 10 cm × 10 cm = £1.24, 9 cm × 15 cm = £1.66, 9 cm × 25 cm = £2.66, 9 cm × 35 cm = £3.72, 15 cm × 15 cm = £2.68

**DuoDERM® Signal**, hydrocolloid dressing with 'Time to change' indicator, 10 cm × 10 cm = £2.00, 14 cm × 14 cm = £3.52, 20 cm × 20 cm = £6.99, 11 cm × 19 cm (oval) = £3.05, 18.5 cm × 19.5 cm (heel) = £4.92, 22.5 cm × 20 cm (sacral) = £5.74

**Flexigran®** (A1 Pharmaceuticals)
Semi-permeable hydrocolloid dressing without adhesive border, 10 cm × 10 cm = £2.19; **thin**, 10 cm × 10 cm = £1.08

**Granuflex®** (Convatec)
Hydrocolloid wound contact layer bonded to plastic foam layer, with outer semi-permeable polyurethane film, 10 cm × 10 cm = £2.64, 15 cm × 15 cm = £5.00, 15 cm × 20 cm = £5.42, 20 cm × 20 cm = £7.52

**Hydrocoll® Basic** (Hartmann)
Hydrocolloid dressing with absorbent wound contact pad, 10 cm × 10 cm = £2.32; **thin**, 7.5 cm × 7.5 cm = 66p, 10 cm × 10 cm = £1.09, 15 cm × 15 cm = £2.46

**NU DERM®** (Nystagenix)
Semi-permeable hydrocolloid dressing, 5 cm × 5 cm = 85p, 10 cm × 10 cm = £1.56, 15 cm × 15 cm = £3.18, 20 cm × 20 cm = £6.36, 8 cm × 12 cm (heel/elbow) = £3.18, 15 cm × 18 cm (sacral) = £4.45; **thin**, 10 cm × 10 cm = £1.06

**Tegaderm® Hydrocolloid** (3M)
Hydrocolloid dressing without adhesive border, 10 cm × 10 cm = £2.30, 15 cm × 15 cm = £4.46; **thin**, semi-permeable, clear film dressing with hydrocolloid, 10 cm × 10 cm = £1.51

**Ultec Pro®** (Covidien)
Semi-permeable hydrocolloid dressing; without adhesive border 10 cm × 10 cm = £2.23, 15 cm × 15 cm = £4.36, 20 cm × 20 cm = £6.56

**A5.2.4 Hydrocolloid dressings**
Appendix 5: Wound Management

A5.2.5 Foam dressings

Polyurethane matrix dressing

Cutinova® Hydro (S&N Hlth.)
Polyurethane matrix with absorbent particles and waterproof polyurethane film, 5 cm x 6 cm = £1.19, 10 cm x 10 cm = £2.40, 15 cm x 20 cm = £5.07.

A5.2.5 Foam dressings

Dressings containing hydrophilic polyurethane foam (adhesive or non-adhesive), with or without plastic film-backing, are suitable for all types of exuding wounds, but not for dry wounds; some foam dressings have a moisture-sensitive film backing with variable permeability dependent on the level of exudate.

Foam dressings vary in their ability to absorb exudate; some are suitable only for lightly to moderately exuding wounds, others have greater fluid-handling capacity and are suitable for heavily exuding wounds. Saturated foam dressings can cause maceration of healthy skin if left in contact with the wound.

Foam dressings can be used in combination with other primary wound contact dressings. If used under compression bandaging or compression garments, the fluid-handling capacity of the foam dressing may be reduced.

For moderately to heavily exuding wounds

Polyurethane Foam Dressing

Transorbent®, self-adhesive, 5 cm x 7 cm = £1.04; 10 cm x 10 cm = £1.98; 15 cm x 15 cm = £3.60; 20 cm x 20 cm = £5.75 (B. Braun)
UrgoCell® TLC, soft-adherent, 6 cm x 6 cm = £1.82, 10 cm x 10 cm = £2.65, 15 cm x 20 cm = £6.01, 12 cm x 19 cm (heel) = £4.73 (Urgo)

For lightly exuding wounds

Polyurethane Foam Film Dressing with Adhesive Border

Allevyn®, 7 cm x 7 cm (tube) = £1.70, 9 cm x 9 cm (tube) = £2.15, size 1 (finger/toe) = £2.50, size 2 (finger/toe) = £2.50, size 3 (finger/toe) = £2.50 (Aspen Medical)

For lightly to moderately exuding wounds

Polyurethane Foam Dressing

Cutinova® Cavity, 5 cm x 6 cm = £1.76, 10 cm x 10 cm = £2.92, 15 cm x 2 cm = £1.63, 15 cm x 15 cm = £4.39 (BSN Medical)
Kendall®, 5 cm x 5 cm = £0.71, 7.5 cm x 7.5 cm = £1.21, 10 cm x 10 cm = £1.06, 12.5 cm x 12.5 cm = £1.80, 15 cm x 15 cm = £2.60, 20 cm x 20 cm = £3.01, 10 cm x 20 cm = £2.05, 8.5 cm x 7.5 cm (fenestrated) = 20.91 (Covidien)

Polyurethane Foam Dressing with Adhesive Border

ActivHeal® Foam Adhesive, 7.5 cm x 7.5 cm = £1.18, 10 cm x 10 cm = £1.60, 12.5 cm x 12.5 cm = £1.68, 15 cm x 15 cm = £2.15, 20 cm x 20 cm = £4.42 (MedLogic)
Allevyn® Adhesive, 7.5 cm x 7.5 cm = £1.43, 10 cm x 10 cm = £2.10, 12.5 cm x 12.5 cm = £2.57, 17.5 cm x 17.5 cm = £5.07, 12.5 cm x 22.5 cm = £4.00, 22.5 cm x 22.5 cm = £7.38; (sacral) 17 cm x 17 cm = £3.80, 22 cm x 22 cm = £5.47 (S&N Hlth.)
Allevyn® Plus Adhesive, 12.5 cm x 12.5 cm = £3.16; 17.5 cm x 17.5 cm = £6.10; 22.5 cm x 22.5 cm = £5.60; (sacral) 17 cm x 17 cm = £4.61, 22 cm x 22 cm = £6.67 (S&N Hlth.)
Biatain® Adhesive, 10 cm x 10 cm = £1.65, 12.5 cm x 12.5 cm = £2.41, 18 cm x 18 cm = £4.86, 18 cm x 28 cm = £7.20, 23 cm x 23 cm (sacral) = £4.16, 19 cm x 20 cm (heel) = £4.85; 17 cm diameter (contour) = £4.67 (Coloplast)
Biatain® Silicone, 7.5 cm x 7.5 cm = £1.41, 10 cm x 10 cm = £2.27, 12.5 cm x 12.5 cm = £2.90, 15 cm x 15 cm = £3.98, 17.5 cm x 17.5 cm = £5.49 (Coloplast)
Kendall® Island, 10 cm x 10 cm = £1.51, 15 cm x 15 cm = £2.84, 20 cm x 20 cm = £5.36 (Covidien)
PermaFoam®, 16.5 cm x 18 cm (concave) = £3.82; 18 cm x 18 cm (sacral) = £3.14; 22 cm x 22 cm (sacral) = £3.61; PermaFoam Comfort® 8 cm x 8 cm = £1.06, 10 cm x 20 cm = £3.18, 11 cm x 11 cm = £2.02, 15 cm x 15 cm = £3.29, 20 cm x 20 cm = £4.78 (Hartmann)
PolyMem®, 5 cm x 5 cm = £1.12, 8.8 cm x 12.7 cm = £1.99, 10 cm x 13 cm = £2.11, 15 cm x 15 cm = £2.84, 16.5 cm x 20.9 cm = £6.54, 18.4 cm x 20 cm (sacral) = £4.39 (Aspen Medical)
Tegaderm® Foam Adhesive, 6.9 cm x 7.6 cm = £1.42, 10 cm x 11 cm = £2.33, 14.3 cm x 14.3 cm = £3.44, 14.3 cm x 15.6 cm = £4.12, 19 cm x 22.5 cm = £8.76, 19 cm x 6.9 cm (soft cloth border) = £1.66, 13.9 cm x 13.9 cm (heel) = £4.14 (3M)
Tielle® Plus, 11 cm x 11 cm = £2.63; 15 cm x 15 cm = £4.30; 15 cm x 20 cm = £5.39; 15 cm x 15 cm (sacrum) = £3.13; 20 cm x 26.5 cm (heel) = £4.45 (Systagenix)
Trufafoam®: 11 cm × 11 cm = £2.18, 15 cm × 15 cm = £3.64, 7 cm × 9 cm = £1.14, 15 cm × 20 cm = £4.57 (Aspen Medical)

Polyurethane Foam Film Dressing without Adhesive Border

ActivHeal® Foam Non-Adhesive, 5 cm × 5 cm = £0.75, 10 cm × 10 cm = £1.13, 10 cm × 17.8 cm = £2.34, 10 cm × 20 cm = £2.34, 20 cm × 20 cm = £3.92, 18 cm × 12 cm (heel) = £3.48 (MedLogic)

Advazorb®, 5 cm × 5 cm = £0.65, 7.5 cm × 7.5 cm = £0.78, 10 cm × 10 cm = £1.08, 10 cm × 20 cm = £3.35, 12.5 cm × 12.5 cm = £1.59, 15 cm × 15 cm = £2.10, 20 cm × 20 cm = £3.75, 17 cm × 21 cm (heel) = £4.75 (Advancis)

Allevyn® Cavity, circular, 5 cm diameter = £3.97, 10 cm diameter = £9.46; tubular, 9 cm × 2.5 cm = £3.85, 12 cm × 4 cm = £6.78 (S&N Hlth.)

Allevyn® Compression, 5 cm × 6 cm = £1.18, 10 cm × 10 cm = £2.43, 15 cm × 15 cm = £4.12, 15 cm × 20 cm = £4.62 (S&N Hlth.)

Allevyn® Non-Adhesive, 5 cm × 5 cm = £1.21, 10 cm × 10 cm = £2.40, 10 cm × 20 cm = £3.86, 20 cm × 20 cm = £6.44, 10.5 cm × 13.5 cm (heel) = £4.81 (S&N Hlth.)

Allevyn® Plus Cavity, 5 cm × 6 cm = £1.78, 10 cm × 10 cm = £2.97, 15 cm × 20 cm = £5.95 (S&N Hlth., Hth.)

Askina® Foam, 10 cm × 10 cm = £2.10, 10 cm × 20 cm = £3.31, 20 cm × 20 cm = £5.53, 12 cm × 20 cm (heel) = £4.48; cavity dressing, 2.4 cm × 40 cm = £2.34 (B. Braun)

Biatain® -ibu Non-Adhesive, impregnated with ibuprofen 0.5 mg/cm², 5 cm × 7 cm = £1.62, 10 cm × 12 cm = £3.12, 10 cm × 22.5 cm = £4.91. 15 cm × 15 cm = £4.91, 20 cm × 20 cm = £8.34 (Coloplast)

Note for cautions and contra-indications of ibuprofen see section 10.1

Biatain® -ibu Soft-Hold, impregnated with ibuprofen 0.5 mg/cm², 10 cm × 12 cm = £3.12, 10 cm × 22.5 cm = £4.91, 15 cm × 15 cm = £4.91, 20 cm × 20 cm = £8.34 (Coloplast)

Note for cautions and contra-indications of ibuprofen see section 10.1

Biatain® Non-Adhesive, 10 cm × 10 cm = £2.24, 10 cm × 20 cm = £3.70, 15 cm × 15 cm = £4.13, 20 cm × 20 cm = £6.13, 5 cm × 7 cm = £1.23.

Biatain® Soft-Hold, 10 cm × 10 cm = £2.44, 15 cm × 15 cm = £4.05, 5 cm × 7 cm = £1.22, 10 cm × 20 cm = £3.70 (Coloplast)

Kendall® Plus, 5 cm × 5 cm = 80p, 7.5 cm × 7.5 cm = £1.39, 10 cm × 10 cm = £1.44, 15 cm × 15 cm = £3.32, 20 cm × 20 cm = £3.96, 10 cm × 20 cm = £2.64, 8.5 cm × 7.5 cm (fenestrated) = £1.22 (Covidien)

Kerraboot®, (clear or white), foot-shaped, extra small = £14.54, small = £14.83, large = £14.83, extra large = £14.54 (Crawford)

Lyfoam® Extra, 10 cm × 10 cm = £2.08, 17.5 cm × 10 cm = £3.52, 20 cm × 15 cm = £4.56 (Molnlycke)

Lyfoam® Max, 7.5 cm × 8.5 cm = £1.05, 10 cm × 10 cm = £1.10, 10 cm × 20 cm = £1.94, 15 cm × 15 cm = £2.07, 15 cm × 20 cm = £2.61, 20 cm × 20 cm = £3.84 (Molnlycke)

PermaFoam®, 10 cm × 10 cm = £2.02, 10 cm × 20 cm = £3.45, 15 cm × 15 cm = £3.82, 20 cm × 20 cm = £5.84; 6 cm diameter = £1.04, 8 cm × 8 cm (fenestrated) = £1.19; cavity dressing, 10 cm × 10 cm = £1.91 (Hartmann)

PolyMem®, 8 cm × 8 cm = £1.54, 10 cm × 10 cm = £2.39, 13 cm × 13 cm = £3.99, 17 cm × 19 cm = £5.90, 10 cm × 61 cm = £12.70, 20 cm × 60 cm = £30.55; PolyMem® W/F 8 cm × 8 cm (cavity) = £3.58, PolyMem® Max 11 cm × 11 cm = £2.88, 20 cm × 20 cm = £11.55 (Aspen Medical)

Tegaderm® Foam, 8.8 cm × 8.8 cm (fenestrated) = £1.17, 10 cm × 10 cm = £2.13, 10 cm × 20 cm = £3.61, 20 cm × 20 cm = £5.76, 10 cm × 60 cm = £12.19 (3M)

Tielle® Plus Borderless, 11 cm × 11 cm = £3.04; 15 cm × 20 cm = £5.51 (Systagenix)

Tielle® Xtra, 11 cm × 11 cm = £2.24; 15 cm × 15 cm = £3.37, 15 cm × 20 cm = £5.51 (Systagenix)

Trufoam® NA, 5 cm × 5 cm = £1.09, 10 cm × 10 cm = £2.07, 15 cm × 15 cm = £3.81 (Aspen Medical)

Cavi-Care® (S&N Hlth.)

Soft, conforming cavity wound dressing prepared by mixing thoroughly for 15 seconds immediately before use and allowing to expand its volume within the cavity. 20 g = £18.62

A5.2.6 Alginate dressings

Non-woven or fibrous, non-occlusive, alginate dressings, made from calcium alginate, or calcium sodium alginate, derived from brown seaweed, form a soft gel in contact with wound exudate.

Alginate dressings are highly absorbent and suitable for use on exuding wounds, and for the promotion of autolytic debridement of debris in very moist wounds. Alginate dressings also act as a haemostatic, but caution is needed because blood clots can cause the dressing to adhere to the wound surface. Alginate dressings should not be used if bleeding is heavy and extreme caution is needed if used for tumours with friable tissue.

Alginate sheets are suitable for use as a wound contact dressing for moderately to heavily exuding wounds and can be layered into deep wounds; alginate rope can be used in sinus and cavity wounds to improve absorption of exudate and prevent maceration. If the dressing does not have an adhesive border or integral adhesive plastic film backing, a secondary dressing will be required.

ActivHeal® (MedLogic)

ActivHeal® Alginate, calcium sodium alginate dressing, 5 cm × 5 cm = 58p, 10 cm × 10 cm = £1.13, 10 cm × 20 cm = £2.78; cavity dressing, 2 cm × 30 cm = £2.09

ActivHeal Aquafiber®, non-woven, calcium sodium alginate dressing, 5 cm × 5 cm = 74p, 10 cm × 10 cm = £1.77, 15 cm × 15 cm = £3.34; cavity dressing, 2 cm × 42 cm = £1.78

Algiste® M (S&N Hlth.)

Calcium alginate fibre, non-woven dressing, 5 cm × 5 cm = £1.27, 8.8 cm × 8.8 cm (fenestrated) = £1.17, 10 cm × 10 cm = £2.13, 10 cm × 20 cm = £3.61, 20 cm × 20 cm = £5.76, 10 cm × 60 cm = £12.19 (3M)

Algosteril® (S&N Hlth.)

Calcium alginate dressing, 5 cm × 5 cm = 87p, 10 cm × 10 cm = £1.98, 10 cm × 20 cm = £3.34; cavity dressing, 2 g, 30 cm = £3.57
Appendix 5: Wound Management

**A5.2.7 Capillary-action dressings**

**Biatain® Alginite** (Coloplast)
Alginite and carboxymethylcellulose dressing, highly absorbent, gelling dressing, 5 cm × 5 cm = £9.6p, 10 cm × 10 cm = £2.28, 15 cm × 15 cm = £4.32; gelling filler, 44 cm = £2.69

**Cutimed® Alginite** (BSN Medical)
Calcium sodium alginate dressing, 5 cm × 5 cm = 73p, 10 cm × 10 cm = £1.54, 10 cm × 20 cm = £2.89

**Kaltostat®** (Convatec)
Calcium alginate fibre, non-woven, 5 cm × 5 cm, = 90p, 7.5 cm × 12 cm = £1.96, 10 cm × 20 cm = £3.84, 15 cm × 25 cm = £6.61; cavity dressing, 2 g = £3.60

**Kendall®** (Covidien)
Calcium alginate dressing, 5 cm × 5 cm = £1.49, 10 cm × 14 cm = £2.41, 10 cm × 20 cm = £2.93, 15 cm × 25 cm = £5.15, 30 cm × 61 cm = £27.03; cavity dressing, 30 cm = £2.94, 61 cm = £4.98, 91 cm = £5.36

**Kendall® Plus**
calcium alginate dressing, 10 cm × 10 cm = £2.04

**Kendall® Zn**
calcium alginate and zinc dressing, 5 cm × 5 cm = 80p, 10 cm × 10 cm = £1.68, 10 cm × 20 cm = £3.30

**Melgisor®** (Mölnlycke)
Calcium sodium alginate fibre, highly absorbent, gelling dressing, non-woven, 5 cm × 5 cm = 86p, 10 cm × 10 cm = £1.79, 10 cm × 20 cm = £3.36; cavity dressing, 32 cm × 2.2 cm, (2 g) = £3.39

**Sorbalgon®** (Hartmann)
Calcium alginate dressing, 5 cm × 5 cm = 77p, 10 cm × 10 cm = £1.62; Sorbalgon® T, cavity dressing, 2 g, 30 cm = £3.30

**Sorbson®** (Aspen Medical)
Sorbson® Flat, calcium alginate fibre, highly absorbent, flat non-woven pads, 5 cm × 5 cm = 80p, 10 cm × 10 cm = £1.68, 10 cm × 20 cm = £3.15

**Sorbson® Plus**, alginate dressing bonded to a secondary absorbent viscose pad, 7.5 cm × 10 cm = £1.70, 10 cm × 15 cm = £3.01, 10 cm × 20 cm = £3.84, 15 cm × 20 cm = £5.33

**Sorbson® Ribbon**, 40 cm (with probe) = £2.04

**Sorbson® Surgical Packing**, 30 cm (2 g, with probe) = £3.47

**Suprasorb® A** (Activa)
Calcium alginate dressing, 5 cm × 5 cm = 59p, 10 cm × 10 cm = £1.16; cavity dressing, 30 cm (2 g) = £2.15

**Tegaderm® Alginite** (3M)
Calcium alginate dressing, 5 cm × 5 cm = 78p, 10 cm × 10 cm = £1.64; cavity dressing, 2 cm × 30.4 cm = £2.74

**Urgosorb®** (Urgo)
Alginite and carboxymethylcellulose dressing without adhesive border, 5 cm × 5 cm = 83p, 10 cm × 10 cm = £1.99, 10 cm × 20 cm = £3.64; cavity dressing, 30 cm = £2.65

**A5.2.7 Capillary-action dressings**

Capillary-action dressings consist of an absorbent core of hydrophilic fibres sandwiched between two low-adherent wound-contact layers to ensure no fibres are shed on to the wound surface. Wound exudate is taken up by the dressing and retained within the highly absorbent central layer.

The dressing may be applied intact to relatively superficial areas, but for deeper wounds or cavities it may be cut to shape to ensure good contact with the wound base. Multiple layers may be applied to heavily exuding wounds to further increase the fluid-absorbing capacity of the dressing. A secondary adhesive dressing is necessary.

Capillary-action dressings are suitable for use on all types of exuding wounds, but particularly on sloughy wounds where removal of fluid from the wound aids debridement; capillary-action dressings are contra-indicated for heavily bleeding wounds or arterial bleeding.

**Advadraw®** (Advancis)
Non-adherent dressing consisting of a soft viscose and polyester absorbent pad with central wicking layer between two perforated permeable wound contact layers. 5 cm × 7.5 cm = 57p, 10 cm × 10 cm = 88p, 10 cm × 15 cm = £1.19, 15 cm × 20 cm = £1.57

**Advadraw Spiral®, 0.5 cm × 40 cm = 82p**

**Cerdak® Basic** (CliniMed)
Non-adhesive wound contact sachet containing ceramic spheres, 5 cm × 5 cm = 70p, 10 cm × 10 cm = £1.56, 10 cm × 15 cm = £2.08; cavity dressing, 10 cm × 10 cm = £2.10, 10 cm × 15 cm = £2.63

**Cerdak® Aeroscloth**, non-adhesive wound contact sachet containing ceramic spheres, with non-woven fabric adhesive backing, 5 cm × 5 cm = £1.57, 5 cm × 10 cm = £1.94

**Cerdak® Aerofilm**, non-adhesive wound contact sachet containing ceramic spheres, with waterproof transparent adhesive film backing, 5 cm × 5 cm = £1.51, 5 cm × 10 cm = £2.07

**Sumar®** (Lantor)

**Sumar® Lite**, for light to moderately exuding wounds and cavities, 5 cm × 5 cm = 93p, 10 cm × 10 cm = £1.59, 10 cm × 15 cm = £2.12

**Sumar® Max**, for heavily exuding wounds, 5 cm × 5 cm = 95p, 10 cm × 10 cm = £1.61, 10 cm × 15 cm = £2.15

**Sumar®Spiral, 0.5 cm × 40 cm = £1.57**

**Vacutex®** (Protex)
Low-adherent dressing consisting of two external polyester wound contact layers with central wicking polyester/cotton mix absorbent layer. 5 cm × 5 cm = 94p, 10 cm × 10 cm = £1.66, 10 cm × 15 cm = £2.23, 10 cm × 20 cm = £2.68, 15 cm × 20 cm = £3.14, 20 cm × 20 cm = £4.28

**A5.2.8 Odour absorbent dressings**

Dressings containing activated charcoal are used to absorb odour from wounds. The underlying cause of wound odour should be identified. Wound odour is most
effectively reduced by debridement of slough, reduction in bacterial levels, and frequent dressing changes.

Fungating wounds and chronic infected wounds produce high volumes of exudate which can reduce the effectiveness of odour absorbent dressings. Many odour absorbent dressings are intended for use in combination with other dressings; odour absorbent dressings with a suitable wound contact layer can be used as a primary dressing.

**Askina® Carbosorb (B. Braun)**  
Activated charcoal and non-woven viscose rayon dressing, 10 cm x 10 cm = £2.77, 10 cm x 20 cm = £5.34

**CarboFLEX® (Convatec)**  
Dressing in 5 layers: wound-facing absorbent layer containing alginate and hydrocolloid; water-resistant second layer; third layer containing activated charcoal; non-woven absorbent fourth layer; water-resistant backing layer. 10 cm x 10 cm = £3.01, 8 cm x 15 cm = £3.61, 15 cm x 20 cm = £6.85

**Carbobad® VC (Synergy Healthcare)**  
Activated charcoal non-absorbent dressing, 10 cm x 10 cm = £1.59, 10 cm x 20 cm = £2.15

**CliniSorb® Odour Control Dressings (CliniMed)**  
Activated charcoal cloth enclosed in viscose rayon with outer polyamide coating. 10 cm x 10 cm = £1.78, 10 cm x 20 cm = £2.37, 15 cm x 25 cm = £3.81

**SorbSan® Plus Carbon (Aspen Medical)**  
Alginate dressing with activated carbon, 7.5 cm x 10 cm = £2.48, 10 cm x 15 cm = £4.81, 10 cm x 20 cm = £5.76, 15 cm x 20 cm = £6.63

### A.5.3 Antimicrobial dressings

Spreading infection at the wound site requires treatment with systemic antibacterials. For local wound infection, a topical antimicrobial dressing can be used to reduce the level of bacteria at the wound surface but will not eliminate a spreading infection. Some dressings are designed to release the antimicrobial into the wound, others act upon the bacteria after absorption from the wound. The amount of exudate present and the level of infection should be taken into account when selecting an antimicrobial dressing.

**Medical grade honey** (section A.5.3.1), has antimicrobial and anti-inflammatory properties. Dressings impregnated with *iodine* (section A.5.3.2), can be used to treat clinically infected wounds. Dressings containing *silver* (section A.5.3.3), should be used only when clinical signs or symptoms of infection are present.

Dressings containing other antimicrobials (section A.5.3.4) such as polihexanide (polyhexamethylene biguanide) or dialkylcarbamoyl chloride are available for use on infected wounds. Although hypersensitivity is unlikely with chlorhexidine impregnated tulle dressing, the antibacterial efficacy of these dressings has not been established.

**Medical grade honey** has antimicrobial and anti-inflammatory properties and can be used for acute or chronic wounds. Medical grade honey has osmotic properties, producing an environment that promotes autolytic debridement; it can help control wound mal-odour. Honey dressings should not be used on patients with extreme sensitivity to honey, bee stings or bee products. Patients with diabetes should be monitored for changes in blood-glucose concentrations during treatment with topical honey or honey-impregnated dressings.

**Sheet dressing**

**Actilite®** (Advancis)  
Knitted viscose impregnated with medical grade manuka honey and manuka oil, 10 cm x 10 cm = £2.13, 10 cm x 10 cm = £3.59

**Activon Tulle**® (Advancis)  
Knitted viscose impregnated with medical grade manuka honey, 5 cm x 5 cm = £1.82, 10 cm x 10 cm = £3.06

Where no size stated by the prescriber the 5 cm size to be supplied

**Algivon®** (Advancis)  
Absorbent, non-adherent calcium alginate dressing impregnated with medical grade manuka honey, 5 cm x 5 cm = £1.96, 10 cm x 10 cm = £3.36, 2.5 cm x 20 cm (ribbon with with probe) = £3.36

**Medihoney®** (Derma Sciences Europe)  
Antibacterial Honey Tulle, woven fabric impregnated with medical grade manuka honey, 10 cm x 10 cm = £2.98

**Gel sheet**; sodium alginate dressing impregnated with medical grade honey, 5 cm x 5 cm = £1.75, 10 cm x 10 cm = £4.20

**Antibacterial Honey Apinata®,** non-adherent calcium alginate dressing, impregnated with medical grade honey, 5 cm x 5 cm = £2.00, 10 cm x 10 cm = £3.40, 1.9 cm x 30 cm (rope) = £4.20

**Melladerm® Plus Tulle** (Danetre)  
Knitted viscose impregnated with medical grade honey (Bulgarian, mountain flower) 45% in a basis containing polyethylene glycol, 10 cm x 10 cm = £2.10

**MelMax®** (CliniMed)  
Acetate wound contact layer impregnated with buckwheat honey 75% in ointment basis, 5 cm x 6 cm = £4.82, 8 cm x 10 cm = £9.90, 8 cm x 20 cm = £19.79

**Mesitran®** (Aspen Medical)  
Hydrogel, semi-permeable dressing impregnated with medical grade honey, 10 cm x 10 cm = £2.55, 15 cm x 20 cm = £5.31; with adhesive border, 10 cm x 10 cm = £2.66, 15 cm x 13 cm (sacral) = £4.50, 15 cm x 15 cm = £4.70

**Mesitran® Mesh,** hydrogel, non-adherent wound contact layer, without adhesive border, 10 cm x 10 cm = £2.45
Appendix 5: Wound Management

### Iodine

#### Honey-based topical application

Medical grade honey is applied directly to the wound and covered with a primary low adherence wound dressing; an additional secondary dressing may be required for exuding wounds.

**Actidyn®** (Advancis)
- Honey, (medical grade, manuka), 25-g tube = £2.02

**MANUKApl®** (Manuka Medical)
- Honey, (medical grade, manuka), 15-g tube = £2.95

**Medihoney®** (Derma Sciences Europe)
- *Antibacterial Medical Honey*, honey (medical grade, *Leptospermum* sp.), 20-g tube = £3.96, 50-g tube = £9.90

**Antibacterial Wound Gel**, honey (medical grade, *Leptospermum* sp.), 80% in natural waxes and oils, 10-g tube = £2.69, 20-g tube = £4.02

**Note** *Antibacterial Wound Gel* is not recommended for use in deep wounds or body cavities where removal of waxes may be difficult.

**Melladerm® Plus** (SanoMed)
- Honey, (medical grade; Bulgarian, mountain flower) 45% in basis containing polyethylene glycol, 20-g tube = £3.98, 50-g tube = £8.50

**Mesitran®** (Aspen Medical)
- *Ointment*, honey (medical grade) 47%, 15-g tube = £3.47, 50-g tube = £9.55

**Excipients** include lanolin

- *Ointment 5*, honey (medical grade) 40%, 15-g tube = £3.46

**Excipients** include lanolin

### Iodosorb®

**Ointment**, iodine 0.9% as cadexomer–iodine in an ointment basis, 10 g = £4.29; 20 g = £8.58

**Powder**, iodine 0.9% as cadexomer–iodine microbeads, 3-g sachet = £1.84

**Uses** for treatment of chronic exuding wounds; max. single application 50 g, max. weekly application 150 g, max. duration up to 3 months in any single course of treatment

**Cautions** iodine may be absorbed, particularly from large wounds or during prolonged use; severe renal impairment; history of thyroid disorder

**Contra-indications** children; patients receiving lithium; thyroid disorders; pregnancy and breast-feeding

### Iodozyme®

**Hydrogel** (two-component dressing containing glucose oxidase and iodide ions), 6.5 cm × 5 cm = £7.50, 10 cm × 10 cm = £12.50

**Uses** antimicrobial dressing for lightly to moderately exuding wounds

**Cautions** children; pregnancy and breast-feeding

**Contra-indications** thyroid disorders; patients receiving lithium

### Povidone–iodine Fabric Dressing

(Drug Tariff specification 43). Knitted viscose primary dressing impregnated with povidone–iodine ointment 10%, 5 cm × 5 cm = 32p; 9.5 cm × 9.5 cm = 48p (Systagenix—Inadine®)

**Uses** wound contact layer for abrasions and superficial burns

**Cautions** iodine may be absorbed particularly if large wounds treated; children under 6 months; thyroid disease

**Contra-indications** severe renal impairment; pregnancy; breast-feeding

### Silver

Antimicrobial dressings containing silver should be used only when infection is suspected as a result of clinical signs or symptoms (see also p. 1073). Silver ions exert an antimicrobial effect in the presence of wound exudate; the volume of wound exudate as well as the presence of infection should be considered when selecting a silver-containing dressing. Silver-impregnated dressings should not be used routinely for the management of uncomplicated ulcers. It is recommended that these dressings should not be used on acute wounds as there is some evidence to suggest they delay wound healing.

Dressings impregnated with silver sulfadiazine have broad antimicrobial activity; if silver sulfadiazine is applied to large areas, or used for prolonged periods, there is a risk of blood disorders and skin discoloration (see section 13.10.1.1). The use of silver sulfadiazine-impregnated dressings is contra-indicated in neonates, in pregnancy, and in patients with significant renal or hepatic impairment, sensitivity to sulfonamides, or G6PD deficiency. Large amounts of silver sulfadiazine applied topically may interact with other drugs—see Appendix 1 (sulfonamides).
Low adherence dressings

Acticoat® (S&N Hlth.)
Three-layer antimicrobial barrier dressing consisting of a polyester core between low adherent silver-coated high density polyethylene mesh (for 3-day wear), 5 cm × 5 cm = £3.30, 10 cm × 10 cm = £8.07, 10 cm × 20 cm = £12.62, 20 cm × 40 cm = £43.18

Acticoat® 7 five-layer antimicrobial barrier dressing consisting of a polyester core between low adherent silver-coated high density polyethylene mesh (for 7-day wear), 5 cm × 5 cm = £5.74, 10 cm × 12.5 cm = £17.11, 15 cm × 15 cm = £30.76

Acticoat® Flex 3, conformable antimicrobial barrier dressing consisting of a polyester core between low adherent silver-coated high density polyethylene mesh (for 3-day wear), 5 cm × 5 cm = £3.52, 10 cm × 10 cm = £8.10, 10 cm × 20 cm = £12.66, 20 cm × 40 cm = £43.34

Acticoat® Flex 7, conformable antimicrobial barrier dressing consisting of a polyester core between low adherent silver-coated high density polyethylene mesh (for 7-day wear), 5 cm × 5 cm = £5.77, 15 cm × 15 cm = £30.88, 10 cm × 12.5 cm = £17.18

Atrauman® Ag (Hartmann)
Non-adherent polyamide fabric impregnated with silver and neutral triglycerides, 5 cm × 5 cm = 49p, 10 cm × 10 cm = £1.19, 10 cm × 20 cm = £2.32

With charcoal

Actisorb® Silver 220 (Systagenix)
Knitted fabric of activated charcoal, with one-way stretch, with silver residues, within spun-bonded nylon sleeve. 6.5 cm × 9.5 cm = £1.64, 10.5 cm × 10.5 cm = £2.58, 10.5 cm × 19 cm = £4.70

Soft polymer dressings

Allevyn® Ag Gentle (S&N Hlth.)
Soft polymer wound contact dressing, with silver sulfadiazine impregnated polyurethane foam layer, with adhesive border, 7.5 cm × 7.5 cm = £3.99, 10 cm × 10 cm = £5.99, 12.5 cm × 12.5 cm = £7.71, 17.5 cm × 17.5 cm = £14.69; without adhesive border, 5 cm × 5 cm = £3.12, 10 cm × 10 cm = £5.82, 10 cm × 20 cm = £9.62, 15 cm × 15 cm = £10.83, 20 cm × 20 cm = £16.04

Contra-indications see notes above

Mepilex® Ag (Mölnlycke)
Soft silicone wound contact dressing with polyurethane foam backing, with silver, with adhesive border, 7 cm × 7.5 cm = £3.30, 10 cm × 12.5 cm = £5.97, 10 cm × 20 cm = £8.69, 10 cm × 25 cm = £10.88, 10 cm × 30 cm = £13.04, 15 cm × 17.5 cm = £10.96, 17 cm × 20 cm = £14.20, 18 cm × 18 cm (sacral) = £11.46, 20 cm × 20 cm (sacral) = £13.93, 23 cm × 23 cm = £18.30; without adhesive border, 10 cm × 10 cm = £5.91, 10 cm × 20 cm = £9.75, 15 cm × 15 cm = £10.98, 20 cm × 20 cm = £16.27, 20 cm × 50 cm = £61.22, 13 cm × 20 cm (heel) = £12.38, 15 cm × 22 cm = £13.87

Urgotul® Silver (Urgo)
Non-adherent soft polymer wound contact dressing, with silver, 10 cm × 12 cm = £3.34, 15 cm × 20 cm = £9.09

Urgotul® Duo Silver, non-adherent, soft polymer wound contact dressing, with silver, 5 cm × 7 cm = £1.95, 11 cm × 11 cm = £3.87, 15 cm × 20 cm = £9.35

Urgotul® SSD (Urgo)
Non-adherent, soft polymer wound contact dressing, with silver sulfadiazine, 11 cm × 11 cm = £2.99, 16 cm × 21 cm = £8.48

Contra-indications see notes above

Hydrocolloid dressings

Aquacel® Silver (Convatec)
Soft non-woven pad containing hydrocolloid fibres, (silver impregnated), 4 cm × 10 cm = £2.70, 4 cm × 20 cm = £3.52, 4 cm × 30 cm = £5.27, 5 cm × 5 cm = £1.86, 10 cm × 10 cm = £4.44, 15 cm × 15 cm = £8.36, 20 cm × 30 cm = £20.73; 1 cm × 45 cm (ribbon) = £2.97, 2 cm × 45 cm (ribbon) = £4.46

Physiotaltte® Ag (Coloplast)
Non-adherent polyester fabric with hydrocolloid and silver sulfadiazine, 10 cm × 10 cm = £2.14

Contra-indications see notes above

Foam dressings

Acticoat® Moisture Control (S&N Hlth.)
Three layer polyurethane dressing consisting of a silver coated layer, a foam layer, and a waterproof layer, 5 cm × 5 cm = £6.76, 10 cm × 10 cm = £15.82, 10 cm × 20 cm = £30.82

Allevyn® Ag (S&N Hlth.)
Silver sulfadiazine impregnated polyurethane foam film dressing with adhesive border, 7.5 cm × 7.5 cm = £3.27, 10 cm × 10 cm = £5.16, 12.5 cm × 12.5 cm = £6.78, 17.5 cm × 17.5 cm = £13.03, 17 cm × 17 cm (sacral) = £10.18, 22 cm × 22 cm (sacral) = £13.64; without adhesive border, 5 cm × 5 cm = £3.06, 10 cm × 10 cm = £5.76, 15 cm × 15 cm = £10.91, 20 cm × 20 cm = £15.99, 10.5 cm × 13.5 cm (heel) = £10.09

Contra-indications see notes above

Biatain® Ag (Coloplast)
Silver impregnated polyurethane foam film dressing with adhesive border, 12.5 cm × 12.5 cm = £8.71, 18 cm × 18 cm = £17.47, 19 cm × 20 cm (heel) = £17.23, 23 cm × 23 cm (sacral) = £18.31; without adhesive border, 10 cm × 10 cm = £7.61, 5 cm × 7 cm = £3.13, 10 cm × 20 cm = £13.99, 15 cm × 15 cm = £15.28, 20 cm × 20 cm = £21.55; 5 cm × 8 cm (cavity) = £3.79

PolyMem® Silver (Aspen Medical)
Silver impregnated polyurethane foam film dressing, with adhesive border, 5 cm × 7.6 cm (oval) = £2.20, 12.7 cm × 8.8 cm (oval) = £5.43; without adhesive border, 10.8 cm × 10.8 cm = £8.60, 17 cm × 19 cm = £17.22; 8 cm × 8 cm (cavity) = £6.84

UrgoCell® Silver (Urgo)
Non-adherent, polyurethane foam film dressing with silver in wound contact layer, 6 cm × 6 cm = £4.11, 10 cm × 10 cm = £5.65, 15 cm × 20 cm = £10.17
Appendix 5: Wound Management

A5.3.4 Other antimicrobials

Alginates
dressings

**Acticoat**<sup>®</sup> Absorbent (S&N Hlth.)
Calcium alginate dressing with a silver coated antimicrobial barrier, 5 cm × 5 cm = £5.04, 10 cm × 12.5 cm = £12.11; 2 cm × 30 cm (cavity) = £12.18

**Alginate**<sup>®</sup> Ag (S&N Hlth.)
Calcium alginate dressing, with silver, 5 cm × 5 cm = £15.56, 10 cm × 10 cm = £3.90, 10 cm × 20 cm = £7.17; 2 g, 30 cm (cavity) = £5.38

**Askina**<sup>®</sup> Calgitrol (B. Braun)
*Askina*<sup>®</sup> Calgitrol Ag, Calcium alginate and silver alginate dressing with polyurethane foam backing, 10 cm × 10 cm = £3.14, 15 cm × 15 cm = £6.08, 20 cm × 20 cm = £14.19

**Askina**<sup>®</sup> Calgitrol Thin, Calcium alginate and silver alginate matrix, for use with absorptive secondary dressings, 5 cm × 5 cm = £1.94, 10 cm × 10 cm = £4.03, 15 cm × 15 cm = £9.04, 20 cm × 20 cm = £15.97

**Melgsorb**<sup>®</sup> Ag (Mönlevyce)
Alginate and carboxymethylcellulose dressing, with ionic silver, 5 cm × 5 cm = £15.53, 10 cm × 10 cm = £3.43, 15 cm × 15 cm = £7.25; 3 cm × 44 cm (cavity) = £4.32

**Silvercel**<sup>®</sup> (Systagenix)
Alginate and carboxymethylcellulose dressing impregnated with silver, 2.5 cm × 30.5 cm = £4.45, 5 cm × 5 cm = £1.68, 10 cm × 20 cm = £7.68, 11 cm × 11 cm = £4.14

**Silvercel**<sup>®</sup> Non-adherent, alginate and carboxymethylcellulose dressing with film wound contact layer, impregnated with silver, 5 cm × 5 cm = £1.62, 11 cm × 11 cm = £3.89, 10 cm × 20 cm = £7.25; 2.5 cm × 30.5 cm (cavity) = £3.94

**Sorbact**<sup>®</sup> Silver (Aspen Medical)
**Sorbact**<sup>®</sup> Silver Flat, calcium alginate fibre, highly absorbent, flat non-woven pads, with silver, 5 cm × 5 cm = £1.57, 10 cm × 10 cm = £3.97, 10 cm × 20 cm = £7.26

**Sorbact**<sup>®</sup> Silver Plus, calcium alginate dressing with absorbent backing, with silver, 7.5 cm × 10 cm = £3.31, 10 cm × 15 cm = £5.50, 10 cm × 20 cm = £6.69, 15 cm × 20 cm = £8.98

**Sorbact**<sup>®</sup> Silver Plus SA, calcium alginate dressing with absorbent backing and adhesive border, with silver, 11.5 cm × 14 cm = £5.38, 14 cm × 19 cm = £7.73, 14 cm × 24 cm = £8.51; 19 cm × 24 cm = £9.49

**Sorbact**<sup>®</sup> Silver Ribbon, with silver, 40 cm (with probe) = £4.15

**Sorbact**<sup>®</sup> Silver Surgical Packing, with silver, 30 cm (2 g, with probe) = £5.76

**Suprasorb**<sup>®</sup> A + Ag (Activa)
Calcium alginate dressing, with silver, 5 cm × 5 cm = £15.4, 10 cm × 10 cm = £3.87, 10 cm × 20 cm = £7.14; cavity dressing, 30 cm (2 g) = £5.72

**Tegaderm**<sup>®</sup> Alginate Ag (3M)
Calcium alginate and carboxymethylcellulose dressing, with silver, 5 cm × 5 cm = £1.35, 10 cm × 10 cm = £3.15; cavity dressing 3 cm × 30 cm = £3.60

**Urgosorb**<sup>®</sup> Silver (Urgo)
Alginate and carboxymethylcellulose dressing, impregnated with silver, 5 cm × 5 cm = £1.44, 10 cm × 10 cm = £3.44, 10 cm × 20 cm = £6.48; cavity dressing, 2.5 cm × 30 cm = £3.46

A5.3.4 Other antimicrobials

**Chlorhexidine Gauze Dressing, BP 1993**
Fabric of leno weave, with and/or viscose yarn, impregnated with ointment containing chlorhexidine acetate, 5 cm × 5 cm = 28p, 10 cm × 10 cm = 58p (S&N Hlth.—Bactigrips<sup>®</sup>)

**Cutimed**<sup>®</sup> Sorbact (BSN Medical)
Low adherence acetate tissue impregnated with dialkyldiaminoethyldodecylamine chloride, (dressing pad) 7 cm × 9 cm = £3.42, 10 cm × 10 cm = £5.34, 10 cm × 12.5 cm = £8.33; (swabs) 4 cm × 6 cm = £1.60, 7 cm × 9 cm = £2.67, (round swabs) 3 cm, 5 pad pack = £3.20, (ribbon gauze, cotton) 2 cm × 50 cm = £3.92, 5 cm × 2 m = £7.72

**Gel**, hydrogel dressing impregnated with dialkyldiaminoethyldodecylamine chloride, 7.5 cm × 7.5 cm = £2.58, 7.5 cm × 15 cm = £4.35

**Cutimed**<sup>®</sup> Sorbact Hydroactive, non-adhesive gel dressing with hydropolymer matrix and acetate fabric coated with dialkyldiaminoethyldodecylamine chloride, 7 cm × 8.5 cm = £3.57, 14 cm × 14 cm = £5.21, 14 cm × 24 cm = £8.35, 19 cm × 19 cm = £9.81, 24 cm × 24 cm = £14.87

**Cutimed**<sup>®</sup> Sorbact Hydroactive B, gel dressing with hydropolymer matrix and acetate fabric coated with dialkyldiaminoethyldodecylamine chloride, with adhesive border, 5 cm × 6.5 cm = £3.86, 10 cm × 10 cm = £6.88, 10 cm × 20 cm = £11.02, 15 cm × 15 cm = £12.95, 20 cm × 20 cm = £19.63

**Cutimed**<sup>®</sup> Silfer Sorbact, polyurethane foam dressing with acetate fabric coated with dialkyldiaminoethyldodecylamine chloride, with adhesive border, 7.5 cm × 7.5 cm = £2.47, 12.5 cm × 12.5 cm = £6.33, 15 cm × 15 cm = £7.84, 17.5 cm × 17.5 cm = £10.97, 22.5 cm × 22.5 cm = £16.69, 17.5 cm × 17.5 cm (sacral) = £7.93, 23 cm × 23 cm (sacral) = £11.92

**Flaminol**<sup>®</sup> (Crawford)
**Forte gel**, alginate with glucose oxidase and lactoperoxidase, for moderately to heavily exuding wounds, 15 g = £7.26, 50 g = £24.04

**Hydro gel**, alginate with glucose oxidase and lactoperoxidase, for lightly to moderately exuding wounds, 15 g = £7.26, 50 g = £24.04

**Kendall AMD**<sup>®</sup> (Covidien)
Foam dressing with polihexanide, *without adhesive* border, 5 cm × 5 cm = £2.45, 10 cm × 10 cm = £4.62, 15 cm × 15 cm = £8.75, 20 cm × 20 cm = £12.82, 8.8 cm × 7.5 cm (fenestrated) = £4.15, 10 cm × 20 cm = £8.75

**Kendall AMD**<sup>®</sup> Plus 10 cm × 10 cm = £4.85, 8.8 cm × 7.5 cm (fenestrated) = £4.35
Ocenitin® (Schülke)
Wound gel, hydroxyethylcellulose and propylene glycol, with octenidine hydrochloride, 20 mL = £4.78

Prontosan® Wound Gel (B. Braun)
Hydrogel containing betainate surfactant and polihexanide, 30 mL = £6.12

Suprasorb® X + PHMB (Activa)
Bio-synthetic cellulose fibre dressing with polihexanide, 5 cm × 5 cm = £2.42, 9 cm × 9 cm = £4.81, 14 cm × 20 cm = £10.95; 2 cm × 21 cm (rope) = £6.82

Telfa® AMD (Covidien)
Low adherence absorbent perforated plastic film faced dressing with polihexanide, 7.5 cm × 10 cm = 17p, 7.5 cm × 20 cm = 28p

Octenilin® (Schülke)
Wound irrigation solution, aqueous solution containing glycerol, ethylhexyglycerin and octenidine hydrochloride, 350 mL = £4.60

Prontosan® Wound Irrigation Solution (B. Braun)
Aqueous solution containing betainate surfactant and polihexanide, 40 mL = £0.58, 350 mL = £4.66

A5.4 Specialised dressings

A5.4.1 Protease-modulating matrix dressings

Protease-modulating matrix dressings alter the activity of proteolytic enzymes in chronic wounds; the clinical significance of this approach is yet to be demonstrated.

Cadesorb® (S&N Hlth.)
Ointment, starch-based, 10 g = £5.10, 20 g = £8.69

Catrix® (Crane)
Powder, collagen matrix (cartilage, bovine), 1-g sachet = £3.90

Promogran® (Systagenix)
Collagen and oxidised regenerated cellulose matrix, applied directly to wound and covered with suitable dressing, 28 cm² (hexagonal) = £5.19, 123 cm² (hexagonal) = £15.62

Promogran® Prisma® Matrix, collagen, silver and oxidised regenerated cellulose matrix, applied directly to wound and covered with suitable dressing, 28 cm² (hexagonal) = £6.31, 123 cm² (hexagonal) = £17.98

Tegaderm® Matrix (3M)
Cellulose acetate matrix, impregnated with polyhydrated ionogens ointment in polyethylene glycol basis, 5 cm × 6 cm = £4.75, 8 cm × 10 cm = £9.75

URGOStart® (Urgo)
Soft adherent polymer matrix containing nano-oligosaccharide factor (NOSF), with polyurethane foam film backing. 6 cm × 6 cm = £4.30, 10 cm × 10 cm = £5.95, 15 cm × 20 cm = £10.70, 12 cm × 19 cm (heel) = £8.20

URGOStart® Contact (Urgo)
Non-adherent soft polymer wound contact dressing containing nano-oligosaccharide factor (NOSF), 5 cm × 7 cm = £2.80, 11 cm × 11 cm = £3.98, 16 cm × 21 cm = £9.50

Xelma® (Mölnlycke)
Gel, alginate and propylene glycol with extracellular matrix proteins (amologenes), 0.5-mL syringe = £56.98, 1-mL syringe = £99.72

A5.4.2 Silicone keloid dressings

Silicone gel and gel sheets are used to reduce or prevent hypertrophic and keloid scarring. They should not be used on open wounds. Application times should be increased gradually. Silicone sheets can be washed and reused.

Silicone sheets

Advasil® Conform (Advancis)
Self-adhesive silicone gel sheet with polyurethane film backing, 10 cm × 10 cm = £5.20, 10 cm × 15 cm = £9.17

BAP Scar Care T® (BAP)
Self-adhesive silicone gel sheet, 5 cm × 7 cm = £3.15, 5 cm × 30 cm = £9.00, 10 cm × 15 cm = £9.00

Cica-Care® (S&N Hlth.)
Soft, self-adhesive, semi-occlusive silicone gel sheet with backing. 6 cm × 12 cm = £13.79, 15 cm × 12 cm = £26.89

Cittech® (Su-Med)
Silicone gel sheet, 10 cm × 10 cm = £7.50, 15 cm × 15 cm = £14.00, 10 cm × 20 cm = £12.50

Dermatix® (Meda)
Self-adhesive silicone gel sheet (clear- or fabric-backed), 4 cm × 13 cm = £6.69, 13 cm × 13 cm = £15.34, 13 cm × 25 cm = £27.73, 20 cm × 30 cm = £50.49

Mepiform® (Mölnlycke)
Self-adhesive silicone gel sheet with polyurethane film backing, 5 cm × 7 cm = £3.26, 9 cm × 18 cm = £12.76, 4 cm × 31 cm = £10.31

Scarf FX® (Jobskin)
Self-adhesive, transparent, silicone gel sheet, 10 cm × 20 cm = £16.00, 25.5 cm × 30.5 cm = £60.00, 3.75 cm × 22.5 cm = £12.00, 7.5 cm diameter = £8.50, 22.5 cm × 14.5 cm = £12.00

Siligel® (Nagor)
Silicone gel sheet, 10 cm × 10 cm = £13.50; 20 cm × 20 cm = £40.00; 40 cm × 40 cm = £144.00; 10 cm × 5 cm = £7.50; 15 cm × 10 cm = £19.50; 30 cm × 5 cm = £19.50; 10 cm × 30 cm = £31.50; 25 cm × 15 cm (submammary) = £21.12; 46 cm × 8.5 cm (abdominal) = £39.46; 5.5 cm diameter (circular) = £4.00
A5.5 Adjunct dressings and appliances

### A5.5.1 Surgical absorbents

Surgical absorbents applied directly to the wound have many disadvantages—dehydration of and adherence to the wound, shedding of fibres, and the leakage of exudate (“strike through”) with an associated risk of infection. Gauze and cotton absorbent dressings can be used as secondary layers in the management of heavily exuding wounds (but see also Capillary-action dressings, section A5.2.7). Absorbent cotton gauze fabric can be used for swabbing and cleaning skin. Ribbon gauze can be used post-operatively to pack wound cavities, but adherence to the wound bed will cause bleeding and tissue damage on removal of the dressing—an advanced wound dressing (e.g. hydrocolloid-fibrous (section A5.2.4), foam (section A5.2.5), or alginate (section A5.2.6)) layered into the cavity is often more suitable.

### Gauze and tissue

**Absorbent Cotton Gauze, BP 1988**
Cotton fabric of plain weave, in rolls and as swabs (see below), usually Type 13 light, sterile, 90 cm (all) × 1 m = £1.08; 3 m = £2.26; 5 m = £3.52; 10 m = £6.73 (most suppliers). 1-m packet supplied when no size stated

**Note** Drug Tariff also includes unsterilised absorbent cotton gauze, 25 m roll = £15.42

**Absorbent Cotton and Viscose Ribbon Gauze, BP 1988**
Woven fabric in ribbon form with fast selvedge edges, warp threads of cotton, weft threads of viscose or combined cotton and viscose yarn, sterile. 5 m (both) × 1.25 cm = 81p; 2.5 cm = 90p

**Gauze and Cotton Tissue, BP 1988**
Consists of absorbent cotton enclosed in absorbent cotton gauze type 12 or absorbent cotton and viscose gauze type 2. 500 g = £7.01 (most suppliers, including Robinsons—Gamgee Tissue® (blue label))

**Gauze and Cotton Tissue**
(Drug Tariff specification 14). Similar to above. 500 g = £5.12 (most suppliers, including Robinsons—Gamgee Tissue® (pink label))

**Drug Tariff specifies to be supplied only where specifically ordered**

### Lint

**Absorbent Lint, BPC**
Cotton cloth of plain weave with nap raised on one side from warp yarns. 25 g = 89p; 100 g = £2.74; 500 g = £11.52 (most suppliers).

**Drug Tariff specifies 25-g pack supplied where no quantity stated**

**Note** Not recommended for wound management

### Pads

**Absorbent Dressing Pads, Sterile**
Drisorb®, 10 cm × 20 cm = 17p (Synergy Healthcare), PremierPad®, 10 cm × 20 cm = 18p, 20 cm × 20 cm = 25p (Shermond), Xupad®, 10 cm × 20 cm = 17p, 20 cm × 20 cm = 28p, 20 cm × 40 cm = 40p (Richardson)

### A5.5.2 Wound drainage pouches

Wound drainage pouches can be used in the management of wounds and fistulas with significant levels of exudate.

**Biotrol®** (B. Braun)
Drainra S Fistula, wound drainage pouch, mini (cut to 20 mm), 150-mL capacity = £2.44; medium (cut to 50 mm), 350-mL capacity = £3.64; large (cut to 88 mm), 500-mL capacity = £4.48

**Drainra S Vision**, wound drainage pouch, (cut to 50 mm), 150-mL capacity = £9.39; (cut to 88 mm), 250-mL capacity = £9.92; (cut to 100 mm), 300-mL capacity = £11.51
**A5.5.3 Physical debridement pads**

DebriSoft® (Activa)
- Pad, polyester fibres with bound edges and knitted outer surface coated with polyacrylate, 10 cm × 10 cm = £6.19

**A5.6 Complex adjunct therapies**

Topical negative pressure (or vacuum-assisted) therapy requires specific wound dressings for use with the vacuum-pump equipment.

Other complex adjunct therapies include sterile larvae (maggots).
## A5.7 Wound care accessories

### A5.7.1 Dressing packs

The role of dressing packs is very limited. They are used to provide a clean or sterile working surface; some packs shown below include cotton wool balls, which are not recommended for use on wounds.

**Multiple Pack Dressing No. 1**

(Wellcome) Contains absorbent cotton, absorbent cotton gauze type 13 light (sterile), open-woven bandages (banded). 1 pack = £4.09

**Non-Drug Tariff Specification Sterile Dressing Pack**

Dressit® contains vitrex gloves, large apron, disposable bag, paper towel, soft swabs, absorbent pad, sterile field = 60p (Richmond)

Nurse It® contains latex-free, powder-free nitrile gloves, sterile laminated paper sheet, large apron, non-woven swabs, paper towel, disposable bag, compartmented tray, disposable forceps, paper measuring tape = 52p (Medicare)

Polyfield® Nitrile Patient Pack contains powder-free nitrile gloves, laminate sheet, non-woven swabs, towel, polyethylene disposable bag, apron = 52p (Shermond)

Propax® SDP contains paper towel, disposable bag, gauze swabs, dressing pad, sterile field = 46p (BSN Medical)

Woundcare® contains nitrile gloves, sterile field, compartmented tray, large apron, disposable bag, non-woven swabs, drape = 44p (Frontier)

**Sterile Dressing Pack**

(Wellcome) Contains gauze and cotton tissue pad, gauze swabs, absorbent cotton wool balls, absorbent paper towel, water repellent inner wrapper. 1 pack = 51p (Synergy Healthcare—Vernaid®)

**Sterile Dressing Pack with Non-woven Pads**

---

### A5.7.2 Woven and fabric swabs

#### Gauze Swab, BP 1988

Consists of absorbent cotton gauze type 13 light or absorbent cotton and viscose gauze type 1 folded into squares or rectangles of 8-ply with no cut edges exposed, sterile, 7.5 cm × 7.5 cm, 5-pad packet = 39p; non-sterile, 10 cm × 10 cm, 100-pad packet = £1.37 (most suppliers)

#### Filmated Gauze Swab, BP 1988

As for Gauze Swab, but with thin layer of Absorbent Cotton enclosed within, non-sterile, 10 cm × 10 cm, 100-pad packet = £3.67 (Synergy Healthcare—Cotgil®)

#### Non-woven Fabric Swab

(Drug Tariff specification 28). Consists of non-woven fabric folded 4-ply, alternative to gauze swabs, type 13 light, sterile, 7.5 cm × 7.5 cm, 5-pad packet = 25p; non-sterile, 10 cm × 10 cm, 100-pad packet = 79p

#### Filmated Non-woven Fabric Swab

(Drug Tariff specification 29). Film of viscose fibres enclosed within non-woven viscose fabric folded 8-ply, non-sterile, 10 cm × 10 cm, 100-pad packet = £3.55 (Systagenix—Regal®)

### A5.7.3 Surgical adhesive tapes

Adhesive tapes are useful for retaining dressings on joints or awkward body parts. These tapes, particularly those containing rubber, can cause irritant and allergic reactions in susceptible patients; synthetic adhesives have been developed to overcome this problem, but they, too, may sometimes be associated with reactions. Synthetic adhesive, or silicon adhesive, tapes can be used for patients with skin reactions to plasters and strapping containing rubber, or undergoing prolonged treatment.

Adhesive tapes that are occlusive may cause skin maceration. Care is needed not to apply these tapes under tension, to avoid creating a tourniquet effect. If applied over joints they need to be orientated so that the area of maximum extensibility of the fabric is in the direction of movement of the limb.

#### Permeable adhesive tapes

**Elastic Adhesive Tape, BP 1988**

(Elastic Adhesive plaster). Woven fabric, elastic in warp (crepe-twisted cotton threads), weft of cotton and/or viscose threads, spread with adhesive mass containing zinc oxide. 4.5 m stretched × 2.5 cm = £1.71 (S&N—Elastoplast®)

For 5 cm width, see Elastic Adhesive Bandage

#### Permeable, Apertured Non-Woven Synthetic Adhesive Tape, BP 1988

Non-woven fabric with a polyacrylate adhesive. Chemifix®, 2.5 cm × 5 m = 90p, 5 cm × 5 m = £1.25, 10 cm × 5 m = £2.10, 2.5 cm × 10 m = £1.00, 5 cm × 10 m = £1.40, 10 cm × 10 m = £2.10 (Medicareplus International)

Hypafix®, 5 cm × 5 m = £1.36, 10 cm × 5 m = £2.28, 10 m (all): 2.5 cm = £1.58, 5 cm = £2.51, 10 cm = £4.38, 15 cm = £6.49, 20 cm = £8.61, 30 cm = £12.45 (BSN Medical)
Mefix®, 5 m (all): 2.5 cm = 98p, 5 cm = £1.72, 10 cm = £2.76, 15 cm = £3.76, 20 cm = £4.82, 30 cm = £6.91 (Molynlycke)
Omnifix®, 10 m (all): 5 cm = £2.28, 10 cm = £3.84, 15 cm = £5.66 (Hartmann)
Primafix®, 5 cm × 10 m = £1.50, 10 cm × 10 m = £2.20, 15 cm × 10 m = £3.25, 20 cm × 10 m = £4.00 (S&N Hlth.)

Permeable Non-woven Synthetic Adhesive Tape, BP 1988

Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass:

Chemipore®, 5 m (all): 1.25 cm = 27p, 2.5 cm = 45p, 5 cm = 95p; 2.5 cm × 10 m = 73p (Medicareplus International)
Clinipore®, 5 m (all) 1.25 cm = 35p, 2.5 cm = 59p, 5 cm = 99p; 2.5 cm × 10 m = 73p (Clinisupplies)
Leukofix®, 5 m (all) 1.25 cm = 52p, 2.5 cm = 84p, 5 cm = £1.47 (BSN Medical)
Leukopor®, 5 m (all) 1.25 cm = 46p, 2.5 cm = 72p, 5 cm = £1.27 (BSN Medical)
Mediplast®, 5 m (all) 1.25 cm = 30p, 2.5 cm = 50p (Neomedic)
Micropore®, 5 m (all) 1.25 cm = 60p, 2.5 cm = 89p, 5 cm = £1.57 (3M)
Scanpor®, 5 m (all) 1.25 cm = 41p, 2.5 cm = 66p, 5 cm = £1.14; 10 m (all), 1.25 cm = 53p, 2.5 cm = 88p, 5 cm = £1.68, 7.5 cm = £2.46 (BioDiagnostics)
Transpore®, 5 m (all) 1.25 cm = 51p, 2.5 cm = 82p, 5 cm = £1.44 (3M)
Where no brand stated by prescriber, net price of tape supplied not to exceed 35p (1.25 cm), 59p (2.5 cm), 99p (5 cm)

Silicone adhesive tape

Soft silicone, water-resistant, knitted fabric, polyurethane film adhesive tape

3M® Kind Removal Silicone Tape, 5 m (all): 2.5 cm = £3.52, 5 cm = £6.38 (3M)
Insiltex®, 2 cm × 3 m = £5.77, 4 cm × 1.5 m = £5.77 (Insight)
Mepitac®, 2 cm × 3 m = £6.87, 4 cm × 1.5 m = £6.87 (Molynlycke)
OptiSite® Flexifix Gentle, 5 m (all), 2.5 cm = £10.00, 5 cm = £18.75 (S&N Hlth.)
Silitepe®, 2 cm × 3 m = £5.60, 4 cm × 1.5 m = £5.60 (Advancis)

Zinc Oxide Adhesive Tape, BP 1988

(Zinc Oxide Plaster). Fabric, plain weave, warp and weft of cotton and/or viscose, spread with an adhesive containing zinc oxide. 5 m (all): 1.25 cm = 97p, 2.5 cm = £1.40; 5 cm = £2.37; 7.5 cm = £3.57 (most suppliers)

Zinc Oxide Adhesive Tape

Mediplast®, 5 m (all). 1.25 cm = 82p, 2.5 cm = £1.19, 5 cm = £1.99, 7.5 cm = £2.99 (Neomedic)
Strappal®, 5 m (all): 2.5 cm = £1.30, 5 cm = £2.20, 7.5 cm = £3.31 (BSN Medical)

Occlusive adhesive tapes

Impermeable Plastic Adhesive Tape, BP 1988

Extensible water-impermeable plastic film spread with an adhesive mass. 2.5 cm × 3 m = £1.36; 2.5 cm × 5 m = £2.03; 5 cm × 5 m = £2.57; 7.5 cm × 5 m = £3.74 (BSN Medical—Sleek®)

Impermeable Plastic Synthetic Adhesive Tape, BP 1988

Extensible water-impermeable plastic film spread with a polymeric adhesive mass. 5 m (both): 2.5 cm = £1.72; 5 cm = £3.27 (3M—Blenderm®)

A5.7.4 Adhesive dressings

Adhesive dressings (also termed ‘island dressings’) have a limited role for minor wounds only. The inclusion of an antiseptic is not particularly useful and may cause skin irritation in susceptible subjects.

Vapour permeable adhesive dressings

Vapour-permeable Waterproof Plastic Wound Dressing, BP 1993

(former Drug Tariff title: Semipermeable Waterproof Plastic Wound Dressing). Consists of absorbent pad, may be dyed and impregnated with suitable antiseptic (see under Elastic Adhesive Dressing), attached to piece of semi-permeable waterproof surgical adhesive tape, to leave suitable adhesive margin: both pad and margin covered with suitable protector (S&N Hlth.—Elastoplast Airstrip®)

A5.7.5 Skin closure dressings

Skin closure strips are used as an alternative to sutures for minor cuts and lacerations. Skin tissue adhesive (section 13.10.5) can be used for closure of minor skin wounds and for additional suture support.

Skin closure strips, sterile

Leukostrip®, 6.4 mm × 76 mm, 3 strips per envelope. 10 envelopes = £5.95 (S&N Hlth.)
Omnistrip®, 6 mm × 76 mm, 3 strips per envelope. 50 envelopes = £22.89 (Hartmann)
Steri-strip®, 6 mm × 75 mm, 3 strips per envelope. 12 envelopes = £8.52 (3M)

Drug Tariff specifies that these are specifically for personal administration by the prescriber

A5.8 Bandages

According to their structure and performance bandages are used for dressing retention, for support, and for compression.

A5.8.1 Non-extensible bandages

Bandages made from non-extensible, woven fabrics have generally been replaced by more conformable products, therefore their role is now extremely limited. Triangular calico bandage has a role as a sling.

Open-woven Bandage, Type 1 BP 1988

Cotton cloth, plain weave, warp of cotton, weft of cotton, viscose, or combination, one continuous length. 5 m (all): 2.5 cm = 31p; 5 cm = 53p; 7.5 cm = 75p; 10 cm = 98p (most suppliers)

Triangular Calico Bandage, BP 1980

Unbleached calico right-angled triangle, 90 cm × 90 cm × 1.27 m = £1.17 (most suppliers)
Appendix 5: Wound Management

A5.8.2 Light-weight conforming bandages

Lightweight conforming bandages are used for dressing retention, with the aim of keeping the dressing close to the wound without inhibiting movement or restricting blood flow. The elasticity of conforming-stretch bandages (also termed contoured bandages) is greater than that of cotton conforming bandages.

**Conforming Bandage (Synthetic)**
Fabric, plain weave, warp of polyamide, weft of viscose. 4 m stretched (all):
- **Hosipifor®**, 6 cm = 13p, 8 cm = 16p, 10 cm = 18p, 12 cm = 22p (Hartmann)

**Cotton Conforming Bandage, BP 1988**
Cotton fabric, plain weave, treated to impart some elasticity to warp and weft. 3.5 m (all): type A, 5 cm = 64p, 7.5 cm = 78p, 10 cm = 97p, 15 cm = £1.32 (BSN Medical—**Easyfix Crinx®**)

**Knitted Polyamide and Cellulose Contour Bandage, BP 1988**
Fabric, knitted warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length. 4 m stretched (all):
- **Easifix®**, 2.5 cm = 9p, 5 cm = 10p, 7.5 cm = 15p, 10 cm = 17p, 15 cm = 30p (BSN Medical)
- **K-Band®**, 5 cm = 19p, 7 cm = 24p, 10 cm = 27p, 15 cm = 47p (Urgo)
- **Knit Band®**, 5 cm = 10p, 7 cm = 15p, 10 cm = 17p, 15 cm = 30p (ClimiMed)
- **Knit Fix®**, 5 cm = 12p, 7 cm = 17p, 10 cm = 17p, 15 cm = 33p (Steriart)

**Polyamide and Cellulose Contour Bandage**
- **Peha-haft®**, cohesive, latex-free, 4 m (all) = 69p, 4 cm = 45p, 6 cm = 53p, 8 cm = 63p, 10 cm = 72p, 12 cm = 85p (Hartmann)
- **PremierBand®**, 4 m (all): 5 cm = 12p, 7.5 cm = 14p, 10 cm = 17p, 15 cm = 25p (Shermond)

**Polyamide and Cellulose Contour Bandage, BP 1998**
(Nylon and Viscose Stretch Bandage)
Fabric, plain weave, warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4 m stretched (all):
- **Acti-Wrap®**, cohesive, latex-free, 6 cm = 44p, 8 cm = 64p, 10 cm = 76p (Activa)
- **Easyfix®**, 2.5 cm = 9p, 5 cm = 33p, 7.5 cm = 40p, 10 cm = 48p, 15 cm = 81p (BSN Medical)
- **Kontou®**, cohesive, 5 cm = 28p, 7.5 cm = 35p, 10 cm = 40p, 15 cm = 66p (Easigrip)
- **Mollelast®**, latex-free, 4 cm = 28p (Activa)
- **Slinky®**, 7.5 cm = 57p, 10 cm = 68p, 15 cm = 98p (Molnycke)

**Stayform®**, 5 cm = 29p, 7.5 cm = 36p, 10 cm = 40p, 15 cm = 68p (Robinsons)

A5.8.3 Tubular bandages and garments

Tubular bandages are available in different forms, according to the function required of them. Some are used under orthopaedic casts and some are suitable for protecting areas to which creams or ointments (other than those containing potent corticosteroids) have been applied. The conformability of the elasticated versions makes them particularly suitable for retaining dressings on difficult parts of the body or for soft tissue injury, but their use as the only means of applying pressure to an oedematous limb or to a varicose ulcer is not appropriate, since the pressure they exert is inadequate.

**Compression hosiery** (section A5.9.1) reduces the recurrence of venous leg ulcers and should be considered for use after wound healing.

**Silk clothing** is available as an alternative to elasticated viscose stockinette garments, for use in the management of severe eczema and allergic skin conditions (see below).

**Elasticated**

**Elasticated Surgical Tubular Stockinette, Foam padded**
(Drug Tariff specification 25). Fabric as for Elasticated Tubular Bandage with polyurethane foam lining. Heel, elbow, knee, small = £3.00, medium = £3.23, large = £3.46; sacral, medium, and large (all) = £15.28 (Molnycke—**Tubipad®**)

Uses relief of pressure and elimination of friction in relevant area, porosity of foam lining allows normal water loss from skin surface

**Elasticated Tubular Bandage, BP 1993**
(formerly Elasticated Surgical Tubular Stockinette). Knitted fabric, elasticated threads of rubber-cored polyamide or polyester with cotton or cotton and viscose yarn, tubular. Lengths 50 cm and 1 m, widths 6.25 cm, 6.75 cm, 7.5 cm, 8.75 cm, 10 cm, 12 cm; **Synergy—****Easigrin®—**EasiGRIP®; **Salis—**Eesiban®; Molnycke—**Tubigrip®. Where no size stated by the prescriber the 50 cm length should be supplied and width endorsed

**Elasticated Viscose Stockinette**
(Drug Tariff specification 46). Lightweight plain-knitted elasticated tubular bandage. **Acti-Fast®**, 3.5 cm red line (small limb), length 1 m = 62p; 5 cm green line (medium limb), length 1 m = 65p, 3 m = £1.90, 5 m = £3.30; 7.5 cm blue line (large limb), length 1 m = 90p, 3 m = £2.50, 5 m = £4.40; 10.75 cm yellow line (child trunk), length 1 m = £1.45, 3 m = £4.10, 5 m = £7.10; 17.5 cm beige line (adult trunk), length 1 m = £2.15; 20 cm purple line (large adult trunk), length 1 m = £3.20, 5 m = £16.15 (Activa)

**CliniFast®**, 3.5 cm red line (small limb), length 1 m = 56p; 5 cm green line (medium limb), length 1 m = 58p, 3 m = £1.62, 5 m = £2.81; 7.5 cm blue line (large limb), length 1 m = 77p, 3 m = £2.13, 5 m = £3.74; 10.75 cm yellow line (child trunk), length 1 m = £1.20, 3 m = £3.49, 5 m = £6.04; 17.5 cm beige line (adult trunk), length 1 m = £2.15; 20 cm purple line (large adult trunk), length 1 m = £3.20, 5 m = £16.15 (Activa)

**Mollelast®**, 4 m (all): 5 cm = 12p, 7.5 cm = 14p, 10 cm = 17p, 15 cm = 30p (ClimiMed)

**Sallis—**Eesiban®; Molnycke—**Tubigrip®. Where no size stated by the prescriber the 50 cm length should be supplied and width endorsed

**Silk clothing** is available as an alternative to elasticated viscose stockinette garments, for use in the management of severe eczema and allergic skin conditions (see below).
child, small, medium, large = £4.99, adult, small, medium, large = £4.99; clava, 6 months–5 years = £5.85, 5–14 years = £6.75 (CliniSupplies)

Comfifast®, 3.5 cm red line (small limb), length 1 m = 56p; 5 cm green line (medium limb), length 1 m = 58p, 3 m = £1.62, 5 m = £2.61; 7.5 cm blue line (large limb), length 1 m = 77p, 3 m = £2.13, 5 m = £3.74; 10.75 cm yellow line (child trunk), length 1 m = £1.20, 3 m = £3.49, 5 m = £6.04; 17.5 cm beige line (adult trunk), length 1 m = £1.83 (Synergy Healthcare)

Coverflex, £2.49 (Synergy Healthcare)
£8.21; 17.5 cm beige line (adult trunk), length 1 m = £1.67, 3 m = £4.39, 5 m = £7.11; 17.5 cm beige line (adult trunk), length 1 m = £2.49 (Synergy Healthcare)

Easifast®, 3.5 cm red line (small limb), length 1 m = 78p; 5 cm green line (medium limb), length 1 m = 81p, 3 m = £2.38, 5 m = £4.10; 7.5 cm blue line (large limb), length 1 m = £1.13, 3 m = £2.70, 5 m = £5.35; 10.75 cm yellow line (child trunk), length 1 m = £1.78, 3 m = £5.13, 5 m = £9.02; 17.5 cm beige line (adult trunk), length 1 m = £2.38 (Hartmann)

Easifast®, 3.5 cm red line (small limb), length 1 m = 65p; 5 cm green line (medium limb), length 1 m = 69p, 3 m = £1.95, 5 m = £3.40; 7.5 cm blue line (large limb), length 1 m = 94p, 3 m = £2.60, 5 m = £4.50; 10.75 cm yellow line (child trunk), length 1 m = £1.50, 3 m = £4.25, 5 m = £7.20; 17.5 cm beige line (adult trunk), length 1 m = £1.90 (Easigrip)

Silk Clothing
Knitted, medical grade silk clothing can be used as an adjunct to normal treatment for severe eczema and allergic skin conditions. When used in combination with medical creams and ointments, care should be taken to ensure that the medication is fully absorbed into the skin before the silk clothing is worn; silk garments are not suitable for use in direct contact with emollients used in ‘wet wrapping techniques’.

DermaSilk® (Espere)
Knitted silk fabric, hypoallergenic, serumin-free, body suit, child 0–3 months (height 62 cm) = £36.18, 3–6 months (height 68 cm) = £36.82, 6–9 months (height 74 cm) = £37.87, 9–12 months (height 74 cm) = £38.25, 12–18 months (height 86 cm) = £38.92, 18–24 months (height 92 cm) = £39.29, 2–3 years (height 98 cm) = £38.71, 3–4 years (height 110 cm) = £41.03; boxer shorts, adult (male), small–XXXL = £39.95; briefs, 3–4 years = £20.95, 5–6 years = £20.95, 7–8 years = £20.95, 9–10 years = £20.95, 10–12 years = £20.95, adult (female), small–XXL = £29.39; facial mask, child (head circumference up to 47 cm) = £15.80, child (head circumference up to 50 cm) = £15.80, teen or adult = £20.19; gloves, adult (small, medium, large, or extra large) = £19.96, child (small or medium) = £14.22; leggings, child 0–3 months (height 62 cm) = £25.83, 3–6 months (height 68 cm) = £26.28, 6–9 months (height 74 cm) = £27.34, 9–12
months (height 74 cm) = £27.90; 12–18 months (height 86 cm) = £28.39; 18–24 months (height 92 cm) = £28.94; 2–3 years (height 98 cm) = £28.51; 3–4 years (height 110 cm) = £30.50, adult (male), small—XXL = £75.60, adult (female), small—XXL = £75.60; pyjamas, child 3–4 years (height 110 cm) = £68.42; 5–6 years (height 120 cm) = £72.63; 7–8 years (height 135 cm) = £75.79; 10–12 years (height 150 cm) = £78.95; skirt, roll-neck, 3–4 years = £45.56; 5–6 years = £48.49; 7–8 years = £50.51; 10–12 years = £52.54, adult, small—XXL = £74.72; shirt, round-neck, adult, (male, small)—XXL = £74.72, adult (female), small—XXL = £74.72; sleeves (tubular), length 33 cm = £26.28, 50 cm = £32.50; undersocks, (heel-less), 2 pairs standard or longer length = £23.39; undersocks, adult shoe-size 5½–6½, 7–8½, 9–10½, 11–13, child shoe-size 3–8, 9–1, 2–5, 2 pairs = £17.78

DreamSkin® (Dreamskin)
Knitted silk fabric, hypoallergenic, sericin-free, with methacrylate copolymer and zinc-based antibacterial, body suit (with foldaway mitts), child 0–3 months = £35.15, 0–6 months = £35.65, 3–6 months = £35.65, 6–9 months = £36.67, 9–12 months = £37.20, 12–18 months = £37.69, 18–24 months = £38.20, 2–3 years = £38.71, 3–4 years = £39.73; briefs or fitted boxers, 3–4 years = £20.95, 5–6 years = £20.95, 7–8 years = £20.95, 9–10 years = £20.95, 11–12 years = £20.95, adult (male) small—XXL = £32.95; adult (female) small—XXL = £32.95; eye mask, one size = £9.95; gloves, child (small or medium) = £13.98, adult (small, medium, large, or extra large) = £19.62; head mask, child up to 1 year (head circumference 39–45cm) = £15.30, child 1–8 years (head circumference 48–50cm) = £15.30, child 12–18 years = £19.96, adult = £19.96; baby leggings (with foldaway feet), child 0–3 months = £24.95, 0–6 months = £25.45, 3–6 months = £25.45, 6–9 months = £26.47, 9–12 months = £26.98, 12–18 months = £27.49, 18–24 months = £28.00, 2–3 years = £28.51, 3–4 years = £29.53; leggings (without feet; male or female styles), 3–4 years = £29.53, 5–6 years = £30.99, 7–8 years = £31.49, 9–10 years = £31.99, 11–12 years = £32.49, adult small—XXL = £74.74; pyjamas (male or female styles), 3–4 years = £66.25, 5–6 years = £70.33, 7–8 years = £73.39, 9–10 years = £74.95, 11–12 years = £76.45; shirt, polo-neck, long-sleeved (male or female styles), 3–4 years = £44.94, 5–6 years = £47.94, 7–8 years = £49.94, 9–10 years = £50.94, 11–12 years = £51.94, adult, small—XXL = £73.87; shirt, round-neck, long-sleeved (male or female styles), 3–4 years = £64.95, 5–6 years = £66.95, 7–8 years = £68.42, 8–9 years = £68.42, 9–10 years = £70.33; 10–12 years = £73.87; syringes (tubular), pair, length 33 cm = £25.83, 50 cm = £32.13; tights, adult (female) small—XL = £22.95; undersocks, (liner socks), 2 pairs, child shoe-size 3–5½, 6–8½, 9–12, 12½–3½, 4–5½ = £17.58, adult (male) shoe-size 6–8½, 9–11 = £17.58, adult (female) shoe-size 4–5½, 6–8½ = £17.58; undersocks, (heel-less), one size = £23.12

A5.8.4 Support bandages
Light support bandages, which include the various forms of crepe bandage, are used in the prevention of oedema; they are also used to provide support for mild sprains and joints but their effectiveness has not been proven for this purpose. Since they have limited extensibility, they are able to provide light support without exerting undue pressure. For a warning against injudicious compression see section A5.8.7.

Crepes Bandage, BP 1988
Fabric, plain weave, warp of wool threads and crepe-twisted cotton threads, weft of cotton threads; stretch bandage. 4.5 m stretched (all): 5 cm = 93p; 7.5 cm = £1.31; 10 cm = £1.71; 15 cm = £2.48 (most suppliers)

Cotton Crepe Bandage
Light support bandage, 4.5 m stretched (all): 5 cm = 44p; 7.5 cm = 62p; 10 cm = 80p; 15 cm = £1.17 (Hartmann—Hospicrepe® 229) 4.5 m stretched (all), 5 cm = 44p, 7.5 cm = 61p, 10 cm = 79p, 15 cm = £1.16 (Hartmann—Hospicrepe® 229)

Cotton Crepe Bandage, BP 1988
Fabric, plain weave, warp of crepe-twisted cotton threads; weft of cotton and/or viscose threads; stretch bandage. 4.5 m stretched (both): 7.5 cm = £2.93; 10 cm = £3.76 (most suppliers)

Cotton, Polyamide and Elastane Bandage
Fabric, cotton, polyamide, and elastane; light support bandage (Type 2), 4.5 m stretched (all)
Hospilite®, 5 cm = 35p, 7.5 cm = 48p, 10 cm = 58p, 15 cm = 85p (Hartmann—Drug Tariff) Neosport®, 5 cm = 54p, 7.5 cm = 73p, 10 cm = 91p, 15 cm = £1.12 (Neomedic) Profore® #2, 10 cm = £1.27, latex-free = £1.35 (S&N Hilt)
Setocrepe®, 10 cm = £1.13 (Mölnlycke) Sofcrepe®, 5 cm = 65p, 7.5 cm = 92p, 10 cm = £1.16, 15 cm = £1.69 (BSN Medical)

Cotton Stretch Bandage, BP 1988
Fabric, plain weave, warp of crepe-twisted cotton threads, weft of cotton threads; stretch bandage, lighter than cotton crepe, 4.5 m stretched (all): Hospicrepe® 233, 5 cm = 52p, 7.5 cm = 72p, 10 cm = 96p; 15 cm = £1.36 (Steraid) PremierBand®, 5 cm = 45p, 7.5 cm = 63p, 10 cm = 79p, 15 cm = £1.18 (Shermond)

Cotton Suspensory Bandage
(Drug Tariff). Type 1: cotton net bag with draw tapes and weaving waistband; small, medium, and large (all) = £1.62, extra large = £1.71. Type 2: cotton net bag with elastic edge and weaving waistband; small = £1.79, medium = £1.84, large = £1.91, extra large = £1.98. Type 3: cotton net bag with elastic edge and weaving waistband with elastic insertion; small, medium, and large (all) = £1.93; extra large = £2.00. Type supplied to be endorsed

Knitted Elastomer and Viscose Bandage
Knitted fabric, viscose and elastomer yarn. Type 2 (light support bandage)
CliniLite®, 4.5 m (all), 5 cm = 44p, 7.5 cm = 61p, 10 cm = 80p, 15 cm = £1.16 (Clinisupplies) K-Lite®, 4.5 m stretched, 5 cm = 52p, 7 cm = 73p, 10 cm = 95p, 15 cm = £1.38; 5.2 m stretched, 10 cm = £1.09 (Urgo)
Knit-Firm®, 4.5 m stretched, 5 cm = 36p, 7 cm = 51p, 10 cm = 66p, 15 cm = 96p (Steraid) Type 3a (light compression bandage)
CliniPlus®, 8.7 m × 10 cm = £1.80 (Clinisupplies)
Elastic adhesive bandages are used to provide compression in the treatment of varicose veins and for the support of injured joints; they should no longer be used for the support of fractured ribs and clavicles. They have also been used with zinc paste bandage in the treatment of venous ulcers, but they can cause skin reactions in susceptible patients and may not produce sufficient pressures for healing (significantly lower than those provided by other compression bandages).

**Elastic Adhesive Bandage, BP 1993**
Woven fabric, elastic in warp (crepe-twisted cotton threads), wet of cotton and/or viscose threads spread with adhesive mass containing zinc oxide. 4.5 m stretched (all): 5 cm = £3.56; 7.5 cm = £5.15; 10 cm = £6.85

Drug Tariff specifies 7.5 cm width supplied when size not stated.

**Cohesive bandages** adhere to themselves, but not to the skin, and are useful for providing support for sports use where ordinary stretch bandages might become displaced and adhesive bandages are inappropriate. Care is needed in their application, however, since the loss of ability for movement between turns of the bandage can lead to uneven and inadequate pressure, providing careful graduated compression. Incorrect application can lead to uneven and inadequate pressures or to hazardous levels of pressure. In particular, injudicious use of compression in limbs with arterial disease has been reported to cause severe skin and tissue necrosis (in some instances calling for amputation). Doppler testing is required before treatment with compression. Oral pentoxifylline (section 2.6.4) can be used as adjunct therapy if a chronic venous leg ulcer does not respond to compression bandaging [unlicenced indication].

**High compression bandages**
Polyamide, elastane, and cotton compression (high) extensible bandage, 3.5 m unstretched, 10 cm = £3.34 (Molynycz—Setopress®)

**VEC High Compression Bandage**
Viscose, elastane, and cotton compression (high) extensible bandage, 3 m unstretched (both); 7.5 cm = £2.56; 10 cm = £3.29 (S&N—Tensopress®)

**High Compression Bandage**
Cotton, viscose, nylon, and Lycra® extensible bandage, 3 m (unstretched), 10 cm = £3.42 (ConvaTec—SurePress®); 3 m (unstretched), 10 cm = £2.66 (Urgo—K-Three®)

**Short stretch compression bandage**
Short stretch bandages help to reduce oedema and promote healing of venous leg ulcers. They are also used to reduce swelling associated with lymphoedema. They are applied at full stretch over padding (see Sub-compression Wadding Bandage below) which protects areas of high pressure and sites at high risk of pressure damage.

**Actico® (Activa)** Bandage, cohesive, 6 m (all), 4 cm = £2.25, 6 cm = £2.64, 8 cm = £3.03, 10 cm = £3.15, 12 cm = £4.02

**Comprilan® (BSN Medical)** Bandage, 5 m (all), 6 cm = £2.55, 8 cm = £2.99; 10 cm = £3.22; 12 cm = £3.92

**Rosidal K® (Activa)** Bandage, 5 m (all), 4 cm = £1.79, 6 cm = £2.50, 8 cm = £2.90, 10 cm = £3.26, 12 cm = £3.95; 10m x 10cm = £5.67

**Silkolan® (Urgo)** Bandage, 5 m (all), 8 cm = £3.00; 10 cm = £3.39

**Sub-compression wadding bandage**
Cellona® Undercast Padding (Activa) Padding, 2.75 m unstretched (all); 5 cm = 29p, 7.5 cm = 36p; 10 cm = 44p; 15 cm = 57p

**Flexi-Ban® (Activa)** Padding, 3.5 m unstretched, 10 cm = 47p

**K-Soft® (Urgo)** Padding, absorbent, 3.5 m unstretched, 10 cm = 43p; 4.5 m unstretched, 10 cm = 53p
A5.8.8 Multi-layer compression bandaging

Multi-layer compression bandaging systems are an alternative to High Compression Bandages (section A5.8.7) for the treatment of venous leg ulcers. Compression is achieved by the combined effects of two or three extensible bandages applied over a layer of orthopaedic wadding and a wound contact dressing.

Four layer systems

K-Four® (Urgo)

K-Four® #1 (K-Soft®—see Sub-compression Wadding Bandage, p. 1085); K-Four® #2 (K-Lite®—see Knitted Elastomer and Viscose Bandage, p. 1084); K-Four® #3 (K-Plu®—see Knitted Elastomer and Viscose Bandage, p. 1084); K-Four® #4 (K-Flex®), 6 m (stretched), 10 cm = £2.84; 7 m (stretched), 10 cm = £3.25

Multi-layer compression bandaging kit, four layer system, for ankle circumference up to 18 cm = £9.58, 18–25 cm = £8.92, 25–30 cm = £7.41, above 30 cm = £11.09, latex-free, 18–25 cm = £9.53; Profore Lite® above 18 cm = £5.15, latex-free = £5.60

System 4® (Mölnlycke)

System 4® #1 (Softexe®—see Sub-compression Wadding Bandage, p. 1086); System 4® #2 (Setocrepe®—see Cotton, Polyamide and Elastane Bandage, p. 1084); System 4® #3 (Elset®—see Knitted Elastomer and Viscose Bandage, p. 1084); System 4® #4 (Mediband®)

Multi-layer compression bandaging kit, four layer system, for ankle circumference 18–25 cm = £7.46

Ultra Four® (Robinsons)

Ultra Four® #1 (Ultra Soft®—see Sub-compression Wadding Bandage, p. 1086); Ultra Four® #2 (Ultra Lite®), 10 cm × 4.5 cm (stretched) = 85p; Ultra Four® #3 (Ultra Plus®), 10 cm × 8.7 cm (stretched) = £1.89; Ultra Four® #4 (Ultra Fast®—see Cohesive Bandages, p. 1085)

Multi-layer compression bandaging kit, four layer system, for ankle circumference up to 18 cm = £6.41, 18–25 cm = £5.67; Ultra Four® RC (reduced compression) 18–25 cm = £4.14

Two layer systems

Coban® 2 (3M)

Multi-layer compression bandaging kit, two layer system (latex-free, foam bandage and cohesive compression bandage), one size = £8.08; Coban® 2 Lite (reduced compression), one size = £8.08

K-Two® (Urgo)

K-Tech® (see Sub-compression Wadding Bandages, p. 1086); K-Press® (see Cohesive bandages, p. 1085)

Multi-layer compression bandaging kit, two layer system, size 0 (short) = £8.55; 18–25 cm ankle circumference, 8 cm = £7.32, 10 cm = £7.76, 12 cm = £9.78; 25–32 cm ankle circumference, 8 cm = £7.96, 10 cm = £8.48, 12 cm = £10.69

K-Two® Reduced, K-Tech® Reduced (see Sub-compression Wadding Bandages, above); K-Press® Reduced Latex Free

Multi-layer compression bandaging kit, two layer system, for ankle circumference 18–25 cm = £8.38; 25–32 cm = £9.16

K-Two® Reduced Latex Free, K-Tech® Reduced (see Sub-compression Wadding Bandages, above); K-Press® Reduced Latex Free

Multi-layer compression bandaging kit, two layer system, for ankle circumference 18–25 cm = £7.76; 25–32 cm = £8.48

K-Two® Reduced Latex Free, K-Tech® Reduced (see Sub-compression Wadding Bandages, above); K-Press® Reduced Latex Free

Multi-layer compression bandaging kit, two layer system, for ankle circumference 18–25 cm = £8.38; 25–32 cm = £9.16

K-Two® Start, UrgoStart® Contact (see Protease-modulating matrix, p. 1077); K-Tech® (see Sub-compression Wadding Bandages, p. 1086); K-Press® (see Cohesive Bandages, p. 1085)

Multi-layer compression bandaging kit, two-layer system, for ankle circumference 18–25 cm = £9.68; 25–32 cm = £10.33
A5.8.9 Medicated bandages

**Zinc Paste Bandage** has been used with compression bandaging for the treatment of venous leg ulcers. However, paste bandages are associated with hypersensitivity reactions and should be used with caution.

Zinc paste bandages are also used with coal tar or ichthammol in chronic ichthyosed skin conditions such as chronic eczema (ichthammol often being preferred since its action is considered to be milder). They are also used with calamine in milder eczematous skin conditions.

**Zinc Paste Bandage, BP 1993**

Cotton fabric, plain weave, impregnated with suitable paste containing zinc oxide; requires additional bandaging, 6 m × 7.5 cm = £3.24. (S&N Hlth.—Viscopaste PB7®, (10%), excipients: include cetostearyl alcohol, hydroxybenzoates)

**Zinc Paste and Ichthammol Bandage, BP 1993**

Cotton fabric, plain weave, impregnated with suitable paste containing zinc oxide and ichthammol; requires additional bandaging, 6 m × 7.5 cm = £3.47. (S&N Hlth.—Ichthopaste® (6/2%), excipients: include cetostearyl alcohol

- **Uses** see section 13.5

**Steripaste®** (Molnlycke)

Cotton fabric, selvedge weave impregnated with paste containing zinc oxide (requires additional bandaging), 6 m × 7.5 cm = £3.24

- **Excipients** include polysorbate 80

- **Medicated stocking**

**Zipzoc®** (S&N Hlth.)

Sterile rayon stocking impregnated with ointment containing zinc oxide 20%. 4-pouch carton = £12.52; 10-pouch carton = £31.30

- **Note** Can be used under appropriate compression bandages or hosiery in chronic venous insufficiency

A5.9 Compression hosiery and garments

**Compression (elastic) hosiery** is used to treat conditions associated with chronic venous insufficiency, to prevent recurrence of thrombosis, or to reduce the risk of further venous ulceration after treatment with compression bandaging (section A5.8.7). Doppler testing to confirm arterial sufficiency is required before recommending the use of compression hosiery.

Before elastic hosiery can be dispensed, the quantity (single or pair), article (including accessories), and compression class must be specified by the prescriber. There are different compression values for graduated compression hosiery and lymphoedema garments (see section below). All dispensed elastic hosiery articles must state on the packaging that they conform with Drug Tariff technical specification No. 40, for further details see Drug Tariff.

- **Note** Graduated compression tights are.

A5.8.9.1 Graduated compression hosiery

**Class 1 Light Support**

Hosiery, compression at ankle 14–17 mmHg, thigh length or below knee with knitted in heel. 1 pair, circular knit (standard), thigh length = £7.61, below knee = £6.95, (made-to-measure), thigh length = £7.79, below knee = £5.16; lightweight elastic net (made-to-measure), thigh length = £20.38, below knee = £15.91

- **Uses** superficial or early varices, varicosis during pregnancy

**Class 2 Medium Support**

Hosiery, compression at ankle 18–24 mmHg, thigh length or below knee with knitted in heel. 1 pair, circular knit (standard), thigh length = £11.31, below knee = £10.16, (made-to-measure), thigh length = £7.79, below knee = £23.64; net (made-to-measure), thigh length = £20.38, below knee = £15.91; flat bed (made-to-measure, only with closed heel and open toe), thigh length = £37.79, below knee = £23.64

- **Uses** varices of medium severity, ulcer treatment and prophylaxis, mild oedema, varicosis during pregnancy

**Class 3 Strong Support**

Hosiery, compression at ankle 25–35 mmHg, thigh length or below knee open or knitted in heel. 1 pair, circular knit (standard), thigh length = £13.40, below knee = £11.52, (made-to-measure) thigh length = £13.09, below knee = £7.5 cm = £3.24 (S&N Hlth.—Ichthopaste® (6/2%), excipients: include cetostearyl alcohol

- **Uses** gross oedema, ulcer treatment and prophylaxis, ulcer treatment

**Class 4 super**

Not available

**Accessories**

In addition to the product listed below, accessories such as application aids for hosiery are available, see Drug Tariff for details

**Suspenders**

For thigh stockings = 67p, belt (specification 13), = £5.16, fitted (additional price) = 62p

**Anklets**

**Class 2 Medium Support**

Anklets, compression 18–24 mmHg, circular knit (standard and made-to-measure), 1 pair = £6.66; flat bed (standard and made-to-measure) = £13.09
A5.9.2 Lymphoedema garments

Lymphoedema compression garments are used to maintain limb shape and prevent additional fluid retention. Either flat-bed or circular knitting methods are used in the manufacture of elasticated compression garments. Seamless, circular-knitted garments (in standard sizes) can be used to prevent swelling if the lymphoedema is well controlled and if the limb is in good shape and without skin folds. Flat-knitted garments (usually made-to-measure) with a seam, provide greater rigidity and stiffness to maintain reduction of lymphoedema following treatment with compression bandages.

A standard range of light, medium, or high compression garments are available, as well as low compression (12–16 mmHg) armsleeves, made-to-measure garments up to compression 90 mmHg, and accessories—see Drug Tariff for details.

Note There are different compression values for lymphoedema garments and graduated compression hosiery, see table, p. 1087.
Dental Practitioners’ Formulary

List of Dental Preparations

The following list has been approved by the appropriate Secretaries of State, and the preparations therein may be prescribed by dental practitioners on form FP10D (GP14 in Scotland, WP10D in Wales).

Licensed sugar-free versions, where available, are preferred.
Licensed alcohol-free mouthwashes, where available, are preferred.

Aciclovir Cream, BP
Aciclovir Oral Suspension, BP, 200 mg/5 mL
Aciclovir Tablets, BP, 200 mg
Aciclovir Tablets, BP, 800 mg
Amoxicillin Capsules, BP
Amoxicillin Oral Powder, DPF
Amoxicillin Oral Suspension, BP
Artificial Saliva Gel, DPF
Artificial Saliva Oral Spray, DPF
Artificial Saliva Pastilles, DPF
Artificial Saliva Protective Spray, DPF

1 Artificial Saliva Substitutes as listed below (to be prescribed only for indications approved by ACBS):
AS Saliva Orthana®
Glandosane®
BioXtra® Gel Mouthspray
BioXtra® Moisturising Gel Salives®

2 Aspirin Tablets, Dispersible, BP
Azithromycin Capsules, 250 mg, DPF
Azithromycin Oral Suspension, 200 mg/5 mL, DPF
Azithromycin Tablets, 250 mg, DPF
Azithromycin Tablets, 500 mg, DPF
Beclometasone Pressurised Inhalation, BP, 50 micrograms/metered inhalation, CFC-free, as: 
Clenil Modulite®
Benzydamine Mouthwash, BP 0.15%
Benzydamine Oromucosal Spray, BP 0.15%
Betamethasone Soluble Tablets, 500 micrograms, DPF
Carbamazeptine Tablets, BP
Cefalexin Capsules, BP
Cefalexin Oral Suspension, BP
Cefadroxil Tablets, BP
Cefadine Capsules, BP
Cetirizine Oral Solution, BP, 5 mg/5 mL
Cetirizine Tablets, BP, 10 mg
Chlorhexidine Gluconate Gel, BP
Chlorhexidine Mouthwash, BP
Chlorhexidine Oral Spray, DPF
Chlorphenamine Oral Solution, BP
Chlorphenamine Tablets, BP
Choline Salicylate Dental Gel, BP
Clarithromycin Oral Suspension, 125 mg/5 mL, DPF
Clarithromycin Oral Suspension, 250 mg/5 mL, DPF
Clarithromycin Tablets, BP
Clindamycin Capsules, BP
Paracetamol Oral Suspension, BP
Paracetamol Tablets, BP
Paracetamol Tablets, Soluble, BP
Penciclovir Cream, DPF
Phenoxymethylpenicillin Oral Suspension, BP
Phenoxymethylpenicillin Tablets, BP
Promethazine Hydrochloride Tablets, BP
Promethazine Oral Solution, BP
Saliva Stimulating Tablets, DPF
Sodium Chloride Mouthwash, Compound, BP
Sodium Fluoride Mouthwash, BP
Sodium Fluoride Oral Drops, BP

1. Indications approved by the ACBS are: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy or sicca syndrome
2. The BP directs that when soluble aspirin tablets are prescribed, dispersible aspirin tablets should be dispensed
3. May be difficult to obtain
4. This preparation does not appear in subsequent editions of the BP
5. The BP directs that when Paediatric Paracetamol Oral Suspension or Paediatric Paracetamol Mixture is prescribed and no strength stated Paracetamol Oral Suspension 120 mg/5 mL should be dispensed

Co-amoxiclav Tablets, BP, 250/125 (amoxicillin 250 mg as trihydrate, clavulanic acid 125 mg as potassium salt)
Co-amoxiclav Oral Suspension, BP, 125/31 (amoxicillin 125 mg as trihydrate, clavulanic acid 31.25 mg as potassium salt)/5 mL
Co-amoxiclav Oral Suspension, BP, 250/62 (amoxicillin 250 mg as trihydrate, clavulanic acid 62.5 mg as potassium salt)/5 mL
 Diazepam Oral Solution, BP, 2 mg/5 mL
Diazepam Tablets, BP
Diclofenac Sodium Tablets, Gastro-resistant, BP
Dihydrocodeine Tablets, BP, 30 mg
Doxycycline Tablets, Dispersible, BP
Doxycycline Capsules, BP, 100 mg
Doxycycline Tablets, 20 mg, DPF
Ephedrine Nasal Drops, BP
Erythromycin Ethyl Succinate Oral Suspension, BP
Erythromycin Ethyl Succinate Tablets, BP
Erythromycin Stearate Tablets, BP
Fluconazole Capsules, 50 mg, DPF
Fluconazole Oral Suspension, 50 mg/5 mL, DPF
Hydrocortisone Cream, BP, 1%
Hydrocortisone Oromucosal Tablets, BP
Hydrogen Peroxide Mouthwash, BP, 6%
Ibuprofen Oral Suspension, BP, sugar-free
Ibuprofen Tablets, BP
Lansoprazole Capsules, Gastro-resistant, BP
Lidocaine Ointment, BP, 5%
Lidocaine Spray 10%, DPF
Loratadine Syrup, 5 mg/5 mL, DPF
Loratadine Tablets, BP, 10 mg
Menthol and Eucalyptus Inhalation, BP 1980
Metronidazole Oral Suspension, BP
Metronidazole Tablets, BP
Miconazole Cream, BP
Miconazole Oromucosal Gel, BP
Miconazole and Hydrocortisone Cream, BP
Miconazole and Hydrocortisone Ointment, BP
Nystatin Oral Suspension, BP
Omeprazole Capsules, Gastro-resistant, BP
Oxycodone Tablets, BP
Penciclovir Cream, DPF
Phenoxymethylpenicillin Oral Suspension, BF
Phenoxymethylpenicillin Tablets, BP
Promethazine Hydrochloride Tablets, BP
Promethazine Oral Solution, BP
Sodium Chloride Mouthwash, Compound, BP
Sodium Fluoride Mouthwash, BP
Sodium Fluoride Oral Drops, BP
Sodium Fluoride Tablets, BP
Sodium Fluoride Toothpaste 0.619%, DPF
Sodium Fluoride Toothpaste 1.1%, DPF
Sodium Fusidate Ointment, BP
Temazepam Oral Solution, BP
Temazepam Tablets, BP
Tetracycline Tablets, BP

Preparations in this list which are not included in the BP or BPC are described under Details of DPF preparations, p. 1090.
For details of preparations that can be prescribed, see individual entries under the relevant drug monographs throughout the BNF.

Details of DPF preparations
Preparations on the List of Dental Preparations which are specified as DPF are described as follows in the DPF.

Although brand names have sometimes been included for identification purposes preparations on the list should be prescribed by non-proprietary name.

Amoxicillin Oral Powder
amoxicillin (as trihydrate) 3 g sachet

Artificial Saliva Gel
(proprietary product: Biotene Oralbalance), lactoperoxidase, lactoferrin, lysozyme, glucose oxidase, xylitol in a gel basis

Artificial Saliva Oral Spray
(proprietary product: Xerolin) consists of water, sorbitol, carmellose (carboxymethylcellulose), potassium chloride, sodium chloride, potassium phosphate, magnesium chloride, calcium chloride and other ingredients, pH neutral

Artificial Saliva Pastilles
(proprietary product: Salivex), consists of acacia, malic acid, and other ingredients

Artificial Saliva Protective Spray
(proprietary product: Aquoral) consists of oxidised glycerol triesters, silicon dioxide, flavouring agents, aspartame (section 9.4.1)

Azithromycin Capsules
azithromycin 250 mg

Azithromycin Oral Suspension 200 mg/5 mL
azithromycin 200 mg/5 mL when reconstituted with water

Azithromycin Tablets
azithromycin 250 mg and 500 mg

Betamethasone Soluble Tablets
500 micrograms
betamethasone (as sodium phosphate) 500 micrograms

Chlorhexidine Oral Spray
(proprietary product: Corsodyl Oral Spray), chlorhexidine gluconate 0.2%

Clarithromycin Oral Suspension 125 mg/5 mL
clarithromycin 125 mg/5 mL when reconstituted with water

Changes to Dental Practitioners’ Formulary since September 2013

Additions
Artificial Saliva Pastilles, DPF
Artificial Saliva Protective Spray, DPF

Deletions
Ampicillin Capsules, BP
Ampicillin Oral Suspension, BP
Mouthwash Solution-tablets, DPF

Changes of title
None
## Nurse Prescribers’ Formulary for Community Practitioners

Nurse Prescribers’ Formulary Appendix (Appendix NPF). List of preparations approved by the Secretary of State which may be prescribed on form FP10P (form HS21(N) in Northern Ireland, form GP10(N) in Scotland, forms WP10CN and WP10PN in Wales) by Nurses for National Health Service patients.

Community practitioners who have completed the necessary training may only prescribe items appearing in the nurse prescribers’ list set out below. Community Practitioner Nurse Prescribers are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved generic name.

### Catheter Maintenance Solution, Sodium Chloride

(proprietary products: OptiFlo S, Uro-Tainer Sodium Chloride; Uriflex-S; sodium chloride 0.9%)

### Catheter Maintenance Solution, ‘Solution G’

(proprietary products: OptiFlo G, Uro-Tainer Suby G, Uriflex GJ, citric acid 3.23%, magnesium oxide 0.38%, sodium bicarbonate 0.7%, disodium edetate 0.01%)

### Catheter Maintenance Solution, ‘Solution R’

(proprietary products: OptiFlo R, Uro-Tainer Solution R, Uriflex R), citric acid 6%, gluconolactone 0.6%, magnesium carbonate 2.8%, disodium edetate 0.01%

### Chlorhexidine gluconate alcoholic solutions

(proprietary products: Chloraprep, Hydrex Solution; Hydrex spray), chlorhexidine gluconate in alcoholic solution

### Chlorhexidine gluconate aqueous solutions

(proprietary product: Unisept) chlorhexidine gluconate in aqueous solution

### Co-danthramer Capsules

(co-danthramer 25/200 (dantron 25 mg, poloxamer 188° 200 mg))

### Co-danthramer Capsules, Strong

(co-danthramer 37.5/500 (dantron 37.5 mg, poloxamer 188° 500 mg))

### Co-danthramer Oral Suspension

(proprietary product: Codalax), co-danthramer 25/200 in 5 mL (dantron 25 mg, poloxamer 188° 200 mg/5 mL)

### Co-danthramer Oral Suspension, Strong

(proprietary product: Codalax Forte), co-danthramer 75/1000 in 5 mL (dantron 75 mg, poloxamer 188° 1 g/5 mL)

### Co-danthrusate Oral Suspension

(proprietary product: Normax), co-danthrusate 50/60 (dantron 50 mg, docusate sodium 60 mg/5 mL)
Dimeticone barrier creams
(proprietary products: Conotrane Cream, dimeticone ‘350’ 22%, Sopel Barrier Cream, dimeticone ‘1000’ 10%), dimeticone 10–22%

Dimeticone Lotion
(proprietary product: Hedrin), dimeticone 4%

Docusate Enema
(proprietary product: Norgalax Micro-enema) docusate sodium 120 mg in 10 g

Liquid and White Soft Paraffin Ointment
liquid paraffin 50%, white soft paraffin 50%

Macrogol Oral Liquid, Compound
(proprietary product: Movicol Liquid), macrogol ‘3350’ (polyethylene glycol ‘3350’) 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/25 mL

Macrogol Oral Powder, Compound
(proprietary products: Laxido Orange, Molaxole, Movico) macrogol ‘3350’ (polyethylene glycol ‘3350’) 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/sachet

Note Amount of potassium chloride varies according to flavour of Movicol® as follows: plain-flavour (sugar-free) = 50.2 mg/sachet; lime and lemon flavour = 46.6 mg/sachet; chocolate flavour = 31.7 mg/sachet. 1 sachet when reconstituted with 125 mL water provides K⁺ 5.4 mmol/litre

Macrogol Oral Powder, Compound, Half-strength
(proprietary product: Movico-Half), macrogol ‘3350’ (polyethylene glycol ‘3350’) 6.563 g, sodium bicarbonate 89.3 g, sodium chloride 175.4 mg, potassium chloride 23.3 mg/sachet

Malathion aqueous lotions
(proprietary products: Derbac-M Liquid), malathion 0.5% in an aqueous base

Mebendazole Oral Suspension™
(proprietary product: Vermox), mebendazole 100 mg/5 mL

Mebendazole Tablets®
(proprietary products: Ovex, Vermox), mebendazole 100 mg

Mouthwash Solution-tablets
consist of tablets which may contain antimicrobial, colouring and flavouring agents in a suitable soluble effervescent basis to make a mouthwash

Nicotine Inhalation Cartridge for Oromucosal Use
(proproprietary products: NicAssist Inhalator, Nicorette Inhalator), nicotine 10 mg or 15 mg

Nicotine Lozenge
nicotine (as bitartrate) 1 mg or 2 mg (proprietary product: Nicorette Mint Lozenge, Nicotinell Mint Lozenge), or nicotine (as resinate) 1.5 mg, 2 mg, or 4 mg (proprietary product: NiQuitin Lozenges, NiQuitin Micro-tab), nicotine 1 mg/metered spray

Nicotine Nasal Spray
(proproprietary product: NicAssist Nasal Spray, Nicorette Nasal Spray), nicotine 500 micrograms/metered spray

Nicotine Oral Spray
(proproprietary product: Nicorette Quickmist), nicotine 1 mg/metered spray

Nicotine Sublingual Tablets
(proproprietary product: NicAssist Microtab, Nicorette Microtab), nicotine (as a cyclodextrin complex) 2 mg

Nicotine Transdermal Patches
releasing in each 16 hours, nicotine approx. 5 mg, 10 mg, or 15 mg (proprietary products: Boots NicAssist Patch, Nicorette Patch) or releasing in each 16 hours approx. 10 mg, 15 mg, or 25 mg (proprietary products: NicAssist Translucent Patch, Nicorette Invisi Patch), or releasing in each 24 hours nicotine approx. 7 mg, 14 mg, or 21 mg (proprietary products: Nicopatch, Nicotinell TTS, NiQuitin, NiQuitin Clear)

Permethrin Cream
(proprietary product: Lyclear Dermal Cream), permethrin 5%

Senna Oral Solution
(proproprietary product: Senokot Syrup), sennosides 7.5 mg/5 mL

Senna and Ispaghula Granules
(proproprietary product: Movicol Granules), senna fruit 12.4%, ispaghula 54.2%

Sodium Citrate Compound Enema
(proproprietary products: Nicocette Micro-enema; Microlax Micro-enema; Relaxit Micro-enema), sodium citrate 450 mg with glycerol, sorbitol and an anionic surfactant

Sodium Picosulphate Capsules
(proproprietary products: Dulcolax Perles), sodium picosulphate 2.5 mg

Sodium Picosulphate Elixir
(proproprietary products: Dulcolax Liquid), sodium picosulphate 5 mg/5 mL

Sterculia Granules
(proproprietary product: Normacol Granules), sterculia 62%

Sterculia and Frangula Granules
(proproprietary product: Normacol Plus Granules), sterculia 62%, frangula (standardised) 8%

Zinc Oxide and Dimeticone Spray
(proproprietary product: Sprilon), dimeticone 1.04%, zinc oxide 12.5% in a pressurised aerosol unit

Zinc Oxide Impregnated Medicated Bandage
(proproprietary product: Steripaste), sterile cotton bandage impregnated with paste containing zinc oxide 15%

Zinc Oxide Impregnated Medicated Stocking
(proproprietary product: Zipzoc), sterile rayon stocking impregnated with ointment containing zinc oxide 20%

1. For exemption, see p. 452
2. For use with inhalation mouthpiece; to be prescribed as either a starter pack (6 cartridges with inhalator device and holder) or refill pack (42 cartridges with inhalator device) or releasing in each 24 hours nicotine approx. 7 mg, 14 mg, or 21 mg (proprietary products: Nicopatch, Nicotinell TTS, NiQuitin, NiQuitin Clear)
3. To be prescribed as either a starter pack (2 x 15-tablet discs with dispenser) or refill pack (7 x 15-tablet discs)
4. Prescriber should specify the brand to be dispensed
A range of non-medical healthcare professionals can prescribe medicines for patients as either Independent or Supplementary Prescribers.

Independent prescribers are practitioners responsible and accountable for the assessment of patients with previously undiagnosed or diagnosed conditions and for decisions about the clinical management required, including prescribing. They are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved non-proprietary name.

Supplementary prescribing is a partnership between an independent prescriber (a doctor or a dentist) and a supplementary prescriber to implement an agreed Clinical Management Plan for an individual patient with the patient’s agreement.

Independent and Supplementary Prescribers are identified by an annotation next to their name in the relevant professional register.

Information and guidance on non-medical prescribing is available on the Department of Health website at www.dh.gov.uk/health/2012/04/prescribing-change.

For information on the mixing of medicines by Independent and Supplementary Prescribers, see Mixing of medicines prior to administration in clinical practice—responding to legislative changes, National Prescribing Centre, May 2010 (available at www.npc.nhs.uk/improving_safety/mixing_meds/resources/mixing_of_medicines.pdf).

For information on the supply and administration of medicines to groups of patients using Patient Group Directions, see p. 3.

**Nurses**

Nurse Independent Prescribers (formerly known as Extended Formulary Nurse Prescribers) are able to prescribe any medicine for any medical condition.

Nurse Independent Prescribers are able to prescribe, administer, and give directions for the administration of Schedule 2, 3, 4, and 5 Controlled Drugs. This extends to diamorphine, dippipanone, or cocaine for treating organic disease or injury, but not for treating addiction.

Nurse Independent Prescribers must work within their own level of professional competence and expertise.

For information on prescribing from the Nurse Prescribers’ Formulary for Community Practitioners, see Nurse Prescribers’ Formulary for Community Practitioners p. 1091

**Pharmacists**

Pharmacist Independent Prescribers can prescribe any medicine for any medical condition.

They are also able to prescribe, administer, and give directions for the administration of Schedule 2, 3, 4, and 5 Controlled Drugs. This extends to diamorphine,
The following is an alphabetical list of manufacturers and other companies referenced in the BNF, with their medicines information or general contact details. For information on 'special-order' manufacturers and specialist importing companies see p. 1104.

Unlicensed medicines are available from ‘special-order’ manufacturers and specialist-importing companies; the MHRA maintains a register of these companies at http://tinyurl.com/cdslke

Licensed hospital manufacturing units also manufacture ‘special-order’ products as unlicensed medicines, the principal NHS units are listed below. A database (Pro-File; www.pro-file.nhs.uk) provides information on medicines manufactured in the NHS; access is restricted to NHS pharmacy staff. The Association of Pharmaceutical Specials Manufacturers may also be able to provide further information about commercial companies (www.apsm-uk.com).

The MHRA recommends that an unlicensed medicine should only be used when a patient has special requirements that cannot be met by use of a licensed medicine

As well as being available direct from the hospital manufacturer(s) concerned, many NHS-manufactured Specials may be bought from the Oxford Pharmacy Store, owned and operated by Oxford Health NHS Foundation Trust.

# REPORT OF SUSPECTED ADVERSE DRUG REACTIONS

If you suspect an adverse reaction may be related to one or more drugs/vaccines/complementary remedies, please complete this Yellow Card. See `Adverse reactions to drugs` section in BNF or [www.mhra.gov.uk/yellowcard](http://www.mhra.gov.uk/yellowcard) for guidance. Do not be put off reporting because some details are not known.

## PATIENT DETAILS

## SUSPECTED REACTION(S)

Please describe the reaction(s) and any treatment given. (Please attach additional pages if necessary):

<table>
<thead>
<tr>
<th>Date reaction(s) started:</th>
<th>Date reaction(s) stopped:</th>
</tr>
</thead>
</table>

Do you consider the reactions to be serious? Yes / No

If yes, please indicate why the reaction is considered to be serious (please tick all that apply):

- [ ] Patient died due to reaction
- [ ] Life threatening
- [ ] Congenital abnormality
- [ ] Involved or prolonged inpatient hospitalisation
- [ ] Involved persistent or significant disability or incapacity
- [ ] Medically significant; please give details: ____________________________________________

If the reactions were not serious according to the categories above, how bad was the suspected reaction?

- [ ] Mild
- [ ] Unpleasant, but did not affect everyday activities
- [ ] Bad enough to affect everyday activities
It’s easy to report online: www.mhra.gov.uk/yellowcard

**OTHER DRUG(S) (including self-medication and complementary remedies)**

Did the patient take any other medicines/vaccines/complementary remedies in the last 3 months prior to the reaction? Yes / No
If yes, please give the following information if known:

<table>
<thead>
<tr>
<th>Drug/Vaccine (Brand if known)</th>

How to use the Cardiovascular Risk Prediction Charts for Primary Prevention

These charts are for estimating cardiovascular disease (CVD) risk (non-fatal myocardial infarction and stroke, coronary and stroke death and new angina pectoris) for individuals who have not already developed coronary heart disease (CHD) or other major atherosclerotic disease. They are an aid to making clinical decisions about how intensively to intervene on lifestyle and whether to use antihypertensive, lipid lowering and anti-platelet medication, but should not replace clinical judgment.

- The use of these charts is not appropriate for patients who have existing diseases which already put them at high risk such as:
  - coronary heart disease or other major atherosclerotic disease;
  - familial hypercholesterolaemia or other inherited dyslipidaemias;
  - renal dysfunction including diabetic nephropathy;
  - type 1 and 2 diabetes mellitus.
- The charts should not be used to decide whether to introduce antihypertensive medication when blood pressure is persistently at or above 160/100 mmHg or when target organ damage due to hypertension is present. In both cases antihypertensive medication is recommended regardless of CVD risk. Similarly the charts should not be used to decide whether to introduce lipid-lowering medication when the ratio of serum total to HDL cholesterol exceeds 6. Such medication is generally then indicated regardless of estimated CVD risk.
- To estimate an individual’s absolute 10-year risk of developing CVD choose the chart for his or her sex, lifetime smoking status and age. Within this square identify the level of risk according to the point where the coordinates for systolic blood pressure and the ratio of total cholesterol to high density lipoprotein (HDL) cholesterol meet. If no HDL cholesterol result is available, then assume this is 1.0 mmol/litre and the lipid scale can be used for total cholesterol alone.
- Higher risk individuals (red areas) are defined as those whose 10-year CVD risk exceeds 20%, which is approximately equivalent to the coronary heart disease risk of > 15% over the same period.
- The chart also assists in identifying individuals whose 10-year CVD risk is moderately increased in the range 10–20% (orange areas) and those in whom risk is lower than 10% over 10 years (green areas).
- Smoking status should reflect lifetime exposure to tobacco and not simply tobacco use at the time of assessment. For example, those who have given up smoking within 5 years should be regarded as current smokers for the purposes of the charts.
- The initial blood pressure and the first random (non-fasting) total cholesterol and HDL cholesterol can be used to estimate an individual’s risk. However, the decision on using drug therapy should generally be based on repeat risk factor measurements over a period of time.
- Men and women do not reach the level of risk predicted by the charts for the three age bands until they reach the ages 49, 59, and 69 years respectively. The charts will overestimate current risk most in the under 40s. Clinical judgement must be exercised in deciding on treatment in younger patients. However, it should be recognised that blood pressure and cholesterol tend to rise most and HDL cholesterol to decline most in younger people already with adverse levels. Left untreated, their risk at the age of 49 years is likely to be higher than the projected risk shown on the age-under-50-years chart. From age 70 years the CVD risk, especially for men, is usually ≥ 20% over 10 years and the charts will underestimate true total CVD risk.
- These charts (and all other currently available methods of CVD risk prediction) are based on groups of people with untreated levels of blood pressure, total cholesterol and HDL cholesterol. In patients already receiving antihypertensive therapy in whom the decision is to be made about whether to introduce lipid-lowering medication, or vice versa, the charts can only act as a guide. Unless recent pre-treatment risk factor values are available it is generally safest to assume that CVD risk is higher than that predicted by current levels of blood pressure or lipids on treatment.
- CVD risk is also higher than indicated in the charts for:
  - those with a family history of premature CVD (male first-degree relatives aged < 55 years and female first-degree relatives aged < 65 years) which increases the risk by a factor of approximately 1.5;
  - men with HDL cholesterol < 1 mmol/litre or women with HDL cholesterol < 1.2 mmol/litre;
  - those with raised triglyceride levels (> 1.7 mmol/litre);
  - those with BMI ≥ 30 kg/m²;
  - women with premature menopause;
  - those who are not yet diabetic, but have impaired fasting glycaemia (6.1–6.9 mmol/litre) or impaired glucose tolerance (2 hour glucose ≥ 7.8 mmol/litre but < 11.1 mmol/litre in an oral glucose tolerance test).
- The charts have not been validated in ethnic minorities and in some may underestimate CVD risk. For example, in people originating from the Indian subcontinent it is safest to assume that the CVD risk is higher than predicted from the charts (1.4 times).

(Continued over)
An individual can be shown on the chart the direction in which his or her risk of CVD can be reduced by changing smoking status, blood pressure, or cholesterol, but it should be borne in mind that the estimate of risk is for a group of people with similar risk factors and that within that group there will be considerable variation in risk. It should also be pointed out in younger people that the estimated risk will generally not be reached before the age of 50, if their current blood pressure and lipid levels remain unchanged. The charts are primarily to assist in directing intervention to those who typically stand to benefit most.

The estimation of CVD risk in NICE clinical guideline 67 (May 2008): *Lipid modification—Cardiovascular risk assessment and the modification of blood lipids for the primary and secondary prevention of cardiovascular disease* (available at [www.nice.org.uk](http://www.nice.org.uk)) differs from that shown here as follows:

<table>
<thead>
<tr>
<th>Condition</th>
<th>Factor of Increase</th>
</tr>
</thead>
<tbody>
<tr>
<td>Family history of premature CHD (male relatives aged &lt; 55 years and female relatives aged &lt; 65 years)</td>
<td>1.5</td>
</tr>
<tr>
<td>More than one first-degree relative with history of premature CHD</td>
<td>1.5–2</td>
</tr>
<tr>
<td>South Asian men</td>
<td>1.4</td>
</tr>
<tr>
<td>BMI &gt; 40 kg/m²</td>
<td></td>
</tr>
</tbody>
</table>

CVD risk is higher than estimated in those with BMI > 40 kg/m².

The NICE guideline does not include the recommendation to treat all patients with a serum total to HDL cholesterol ratio of greater than 6 with lipid-lowering drugs.

The NICE guideline advises that the following factors are also taken into account when calculating CVD risk:

- Presence of left ventricular hypertrophy

In addition, NICE advises that all patients over the age of 75 years should be considered at increased risk of CVD, and are likely to benefit from treatment.

In February 2010, NICE withdrew the recommendation that the Framingham risk equation should be the equation of choice for assessment of CVD risk, but agreed that it should be considered as one of the possible equations to use.
Nondiabetic Men

Non-smoker

Age under 50 years

Age 50–59 years

Age 60 years and over

Smoker

CVD risk <10% over next 10 years
CVD risk 10-20% over next 10 years
CVD risk >20% over next 10 years

SBP = systolic blood pressure mmHg
TC : HDL = serum total cholesterol to HDL cholesterol ratio
Nondiabetic Women

Non-smoker

Age under 50 years

Age 50–59 years

Age 60 years and over

Smoker

SBP = systolic blood pressure mmHg
TC : HDL = serum total cholesterol to HDL cholesterol ratio

CVD risk <10% over next 10 years
CVD risk 10–20% over next 10 years
CVD risk >20% over next 10 years

10% 20%

© Central Manchester and Manchester Children’s University Hospitals NHS Trust
ADULT ADVANCED LIFE SUPPORT ALGORITHM

Unresponsive?
Not breathing or only occasional gasps

Call Resuscitation Team

CPR 30:2
Attach defibrillator/monitor
Minimise interruptions

Assess rhythm

Shockable (VF/pulseless VT)
Non-shockable (PEA/Asystole)

Return of spontaneous circulation

1 Shock
Immediately resume CPR for 2 min
Minimise interruptions

Immediate post cardiac arrest treatment
- Use ABCDE approach
- Controlled oxygenation and ventilation
- 12-lead ECG
- Treat precipitating cause
- Temperature control / therapeutic hypothermia

During CPR
- Ensure high-quality CPR: rate, depth, recoil
- Plan actions before interrupting CPR
- Give oxygen
- Consider advanced airway and capnography
- Continuous chest compressions when advanced airway in place
- Vascular access (intravenous, intraosseous)
- Give adrenaline every 3-5 min
- Correct reversible causes

Reversible causes
- Hypoxia
- Hypovolaemia
- Hypo-/hyperkalaemia / metabolic
- Hypothermia
- Thrombosis - coronary or pulmonary
- Tamponade - cardiac
- Toxins
- Tension pneumothorax

Resuscitation Council (UK)

Medical emergencies in the community

Drug treatment outlined below is intended for use by appropriately qualified healthcare professionals. Only drugs that are used for immediate relief are shown; advice on supporting care is not given. Where the patient’s condition requires investigation and further treatment, the patient should be transferred to hospital promptly.

**Anaphylaxis** (section 3.4.3)

**Adrenaline** injection (1 mg/mL (1 in 1000))
- By intramuscular injection
  - **CHILD UNDER 6 YEARS** 150 micrograms (0.15 mL), repeated every 5 minutes if necessary
  - **CHILD 6–12 YEARS** 300 micrograms (0.3 mL), repeated every 5 minutes if necessary
  - **CHILD 12–18 YEARS** 500 micrograms (0.5 mL), repeated every 5 minutes if necessary; 300 micrograms (0.3 mL) if **CHILD** is small or prepubertal
  - **ADULT** 500 micrograms (0.5 mL), repeated every 5 minutes if necessary

High-flow **oxygen** (section 3.6) and **intravenous fluids** should be given as soon as available.

**Chlorphenamine** injection by intramuscular or intravenous injection (section 3.4.1) may help counter histamine-mediated vasodilation and bronchoconstriction.

**Hydrocortisone** (preferably as sodium succinate) by intravenous injection (section 6.3.2) has delayed action but should be given to severely affected patients to prevent further deterioration.

**Angina: unstable** (section 2.10.1)

**Aspirin** dispersible tablets (75 mg, 300 mg)
- By mouth (dispersed in water or chewed)
  - **ADULT** 300 mg

**Plus**

**either Glyceryl trinitrate aerosol spray** (400 micrograms/metered dose)
- Sublingually
  - **ADULT** 1–2 sprays, repeated as required

or **Glyceryl trinitrate tablets** (300 micrograms, 500 micrograms, 600 micrograms)
- Sublingually
  - **ADULT** 0.3–1 mg, repeated as required

**Asthma: acute** (section 3.1)

Regard each emergency consultation as being for **severe acute asthma** until shown otherwise; failure to respond adequately **at any time** requires immediate transfer to hospital

**Either salbutamol aerosol inhaler** (100 micrograms/metered inhalation)
- By aerosol inhalation via large-volume spacer (and a close-fitting face mask if child under 3 years)
  - **ADULT** and **CHILD 2–10 puffs each inhaled separately, repeated every 10–20 minutes or as necessary**

**or salbutamol nebuliser solution** (1 mg/mL, 2 mg/mL)
- By inhalation of nebulised solution (via oxygen-driven nebuliser if available)
  - **CHILD UNDER 5 YEARS** 2.5 mg every 20–30 minutes or as necessary
  - **CHILD 5–12 YEARS** 2.5–5 mg every 20–30 minutes or as necessary
  - **ADULT** 5 mg every 20–30 minutes or as necessary

**or terbutaline nebuliser solution** (2.5 mg/mL)
- By inhalation of nebulised solution (via oxygen-driven nebuliser if available)
  - **CHILD UNDER 5 YEARS** 5 mg every 20–30 minutes or as necessary
  - **CHILD 5–12 YEARS** 5–10 mg every 20–30 minutes or as necessary
  - **ADULT** 10 mg every 20–30 minutes or as necessary

**Plus** (in all cases)

**either prednisolone tablets** (or prednisolone soluble tablets) (5 mg)
- By mouth
  - **CHILD UNDER 6 YEARS** 1–2 mg/kg (max. 40 mg) once daily for up to 3 days or longer if necessary; if child has been taking an oral corticosteroid for more than a few days, give prednisolone 2 mg/kg (max. 60 mg) once daily
  - **ADULT** 40–50 mg once daily for at least 5 days

**or hydrocortisone** (preferably as sodium succinate)
- By intravenous injection
  - **CHILD UNDER 12 YEARS** 4 mg/kg (max. 100 mg) every 6 hours until conversion to oral prednisolone is possible; alternative dose if weight unavailable,
  - **CHILD UNDER 2 YEARS** 25 mg, 2–5 YEARS 50 mg, 5–12 YEARS 100 mg
  - **ADULT** 100 mg every 6 hours until conversion to oral prednisolone is possible

High-flow **oxygen** (section 3.6) if available (via face mask in children)

Monitor response 15 to 30 minutes after nebulisation; if any signs of acute asthma persist, arrange hospital admission. While awaiting ambulance, repeat **nebulised beta, agonist** (as above) and give with **ipratropium nebuliser solution** (250 micrograms/mL)
- By inhalation of nebulised solution (via oxygen-driven nebuliser if available)
  - **CHILD UNDER 12 YEARS** 250 micrograms, repeated every 20–30 minutes for the first 2 hours, then every 4–6 hours as necessary
  - **ADULT** 500 micrograms every 4–6 hours as necessary
Convulsive (including febrile) seizures lasting longer than 5 minutes (section 4.8.2 and section 4.8.3)

Either diazepam rectal solution (2 mg/mL, 4 mg/mL)

- By rectum
  NEONATE 1.25–2.5 mg, repeated once after 10–15 minutes if necessary
  CHILD 1 MONTH–3 YEARS 5 mg, repeated once after 10–15 minutes if necessary
  CHILD 3–12 YEARS 5–10 mg, repeated once after 10–15 minutes if necessary
  ADULT and CHILD OVER 12 YEARS 10–20 mg

or midazolam oromucosal solution

- By buccal administration, repeated once after 10 minutes if necessary
  NEONATE 300 micrograms/kg
  CHILD 1–3 MONTHS 300 micrograms/kg (max. 2.5 mg)
  CHILD 3 MONTHS–1 YEAR 2.5 mg
  CHILD 1–5 YEARS 7.5 mg
  ADULT and CHILD OVER 10 YEARS 10 mg

Meningococcal disease (Table 1, section 5.1)

Benzylenicillin sodium injection (600 mg, 1.2 g)

- By intravenous injection (or by intramuscular injection if venous access not available)
  NEONATE 300 mg
  CHILD 1 MONTH–1 YEAR 300 mg
  CHILD 1–10 YEARS 600 mg
  CHILD 10–18 YEARS 1.2 g
  ADULT 1.2 g

Note A single dose should be given before urgent transfer to hospital, so long as this does not delay the transfer

or if history of allergy to penicillin

Cefotaxime injection (1 g)

- By intravenous injection (or by intramuscular injection if venous access not available)
  NEONATE 50 mg/kg
  CHILD 1 MONTH–12 YEARS 50 mg/kg (max. 1 g)
  CHILD 12–18 YEARS 1 g
  ADULT 1 g

Note A single dose can be given before urgent transfer to hospital, so long as this does not delay the transfer

or if history of immediate hypersensitivity reaction (including anaphylaxis, angioedema, urticaria, or rash immediately after administration) to penicillin or to cephalosporins

Chloramphenicol injection (1 g)

- By intravenous injection
  CHILD 1 MONTH–18 YEARS 12.5–25 mg/kg
  ADULT 12.5–25 mg/kg

Note A single dose can be given before urgent transfer to hospital, so long as this does not delay the transfer

Diabetic hypoglycaemia (section 6.1.4)

Glucose or sucrose

- By mouth
  ADULT and CHILD OVER 2 YEARS approx. 10–20 g (55–110 mL Lucozade® Energy Original or 100–200 mL Coca-Cola—both non-diet versions or 2–4 teaspoonfuls of sugar or 3–6 sugar lumps) repeated after 10–15 minutes if necessary

or if hypoglycaemia unresponsive or if oral route cannot be used

Gluconon injection (1 mg/mL)

- By subcutaneous or intramuscular injection
  CHILD BODY-WEIGHT UNDER 25 KG 500 micrograms (0.5 mL)
  CHILD BODY-WEIGHT OVER 25 KG 1 mg (1 mL)
  ADULT 1 mg (1 mL)

or if hypoglycaemia prolonged or unresponsive to glucagon after 10 minutes

Glucose intravenous infusion (10%)

- By intravenous injection into large vein
  CHILD 1 MONTH–18 YEARS 5 mL/kg (glucose 500 mg/kg)

Metoclopramide injection (5 mg/mL)

- By intravenous injection
  ADULT (UNDER 60 KG) 18–19 YEARS 5 mg
  ADULT (OVER 60 KG) 18–19 YEARS 10 mg
  ADULT OVER 19 YEARS 10 mg
**Diamorphine injection** (5 mg powder for reconstitution)

- By slow intravenous injection (1–2 mg/minute)
  - **ADULT** 5 mg followed by a further 2.5–5 mg if necessary; **ELDERLY** or **FRAIL** patients, reduce dose by half

**or Morphine sulphate injection** (10 mg/mL)

- By slow intravenous injection (1–2 mg/minute)
  - **ADULT** 5–10 mg followed by a further 5–10 mg if necessary; **ELDERLY** or **FRAIL** patients, reduce dose by half

**Oxygen**, if appropriate

**Myocardial infarction: non-ST-segment elevation**

Treat as for **Angina: unstable**, above

1 millimetre of mercury (mmHg) = 133.3 pascals (Pa)
1 kilopascal (kPa) = 7.5 mmHg (pressure)

Plasma-drug concentrations in the BNF are expressed in mass units per litre (e.g. mg/litre). The approximate equivalent in terms of amount of substance units (e.g. micromol/litre) is given in brackets.

Prescribing for children

Weight, height, and gender

The table below shows the mean values for weight, height, and gender by age; these values have been derived from the UK-WHO growth charts 2009 and UK1990 standard centile charts, by extrapolating the 50th centile, and may be used to calculate doses in the absence of measurements. However, an individual’s weight and height might vary considerably from the values in the table and it is important to ensure that the value chosen is appropriate. In most cases the actual measurement should be obtained as soon as possible and the dose re-calculated.

Latin abbreviations

Directions should be in English without abbreviation. However, Latin abbreviations have been used when prescribing.

The following is a list of appropriate abbreviations. It should be noted that the English version is not always an exact translation.

a. c. = ante cibum (before food)
b. d. = bis die (twice daily)
o. d. = omni die (every day)
o. m. = omni mane (every morning)
o. n. = omni nocte (every night)
p. c. = post cibum (after food)
p. r. n. = pro re nata (when required)
q. d. s. = quater die sumendum (to be taken four times daily)
q. q. h. = quarta quaque hora (every four hours)
stat = immediately
t. d. s. = ter die sumendum (to be taken three times daily)
t.i.d. = ter in die (three times daily)

E numbers

The following is a list of common E numbers and the inactive ingredients to which they correspond.
