Capsules, azithromycin (as dihydrate) 250 mg, net price 4-cap pack = £9.83, 6-cap pack = £14.85.
Label: 5, 9, 23
Dental prescribing on NHS Azithromycin Capsules may be prescribed
Clarithromycin

**Indications** | respiratory-tract infections, mild to moderate skin and soft-tissue infections, otitis media; Lyme disease (see also section 5.1.1.3); prevention of pertussis (Table 2, section 5.1); Helicobacter pylori eradication (section 1.3)

**Cautions** | see notes above; interactions: Appendix 1 (macrolides)

**Hepatic impairment** | hepatic dysfunction including jaundice reported; avoid in severe impairment if renal impairment also present

**Renal impairment** | use half normal dose if eGFR less than 30 mL/minute/1.73 m²; max. duration 14 days; avoid Klaricid XL® or clarithromycin m/r preparations if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** | manufacturer advises avoid, particularly in the first trimester, unless potential benefit outweighs risk

**Breast-feeding** | manufacturer advises avoid unless potential benefit outweighs risk—present in milk

**Side-effects** | see notes above; also dyspepsia, taste disturbances, headache, insomnia, hyperhidrosis; *less commonly* gastritis, flatulence, constipation, dry mouth, stomatitis, glossitis, anorexia, chest pain, anxiety, dizziness, tremor, malaise, blood disorders (including leucopenia), myalgia, tinnitus; *also reported* confusion, psychotic disorders, depression, abnormal dreams, convulsions, paraesthesia, hypoglycaemia, renal failure, interstitial nephritis, myopathy, tooth and tongue discoloration, smell disturbances

**Dose**

- **By mouth**
  - **ADULT** and **CHILD** over 12 years, 250 mg every 12 hours, increased in pneumonia or severe infections to 500 mg every 12 hours; usual duration 7–14 days (see also Table 1, section 5.1); **CHILD** bodyweight under 8 kg, 7.5 mg/kg twice daily; 8–11 kg, 62.5 mg twice daily; 12–19 kg, 125 mg twice daily; 20–29 kg, 187.5 mg twice daily; 30–40 kg, 250 mg twice daily
  - Lyme disease (see also section 5.1.1.3), **ADULT** and **CHILD** over 12 years, 500 mg every 12 hours for 14–21 days; **CHILD** 1 month–12 years see *BNF for Children*

- **By intravenous infusion** into larger proximal vein, **ADULT** and **CHILD** over 12 years, 500 mg twice daily; max. duration 5 days (switch to oral route when appropriate); **CHILD** 1 month–12 years see *BNF for Children*

**Clarithromycin (Non-proprietary)**

**Tablets** | clarithromycin 250 mg, net price 14-tab pack = £1.64; 500 mg, 14-tab pack = £2.63. Label: 9

**Dental prescribing on NHS** | Clarithromycin Tablets may be prescribed

**Oral suspension** | clarithromycin for reconstitution with water 125 mg/5 mL, net price 70 mL = £4.05; 250 mg/5 mL, 70 mL = £6.91. Label: 9

**Dental prescribing on NHS** | Clarithromycin Oral Suspension may be prescribed

**Intravenous infusion** | powder for reconstitution, clarithromycin, net price 500-mg vial = £9.45

**Klaricid® (Abbott Healthcare)**

**Tablets** | both yellow, f/c, clarithromycin 250 mg, net price 14-tab pack = £7.00; 500 mg, 14-tab pack = £11.30, 20-tab pack = £16.15. Label: 9

**Paediatric suspension** | clarithromycin for reconstitution with water 125 mg/5 mL, net price 70 mL = £5.26, 100 mL = £9.04; 250 mg/5 mL, 70 mL = £10.51. Label: 9

**Granules** | clarithromycin 250 mg/sachet, net price 14-sachet pack = £11.68. Label: 9, 13

**Intravenous infusion** | powder for reconstitution, clarithromycin. Net price 500-mg vial = £9.45

**Electrolytes** | Na⁺ < 0.5 mmol/500-mg vial

**Modified release**

**Clarithromycin m/r preparations**

**Tablets** | m/r, clarithromycin 500 mg, net price 7 = £6.72, 14 = £13.23. Label: 9, 21, 25

**Brands include** Mylecor XL®

**Dose** **ADULT** and **CHILD** over 12 years, 500 mg once daily (doubled in severe infections) for 7–14 days

**Klaricid XL® (Abbott Healthcare)**

**Tablets** | m/r, yellow, clarithromycin 500 mg, net price 7-tab pack = £6.72, 14-tab pack = £13.23. Label: 9, 21, 25

**Dose** **ADULT** and **CHILD** over 12 years, 500 mg once daily (doubled in severe infections) for 7–14 days

**ERYTHROMYCIN**

**Indications** | susceptible infections in patients with penicillin hypersensitivity; oral infections (see notes above); campylobacter enteritis, syphilis, non-gonococcal urethritis, respiratory-tract infections (including Legionella infection), skin infections (Table 1, section 5.1); chronic prostatitis; prophyaxis of diphtheria, group A streptococcal infection, and pneumococcal infection (Table 2, section 5.1), and pertussis; acne vulgaris and rosacea (section 13.6)

**Cautions** | see notes above; neonate under 2 weeks (risk of hypertrophic pyloric stenosis); avoid in acute porphyria (section 9.8.2); interactions: Appendix 1 (macrolides)

**Hepatic impairment** | may cause idiosyncratic hepatotoxicity

**Renal impairment** | max. 1.5 g daily in severe renal impairment (ototoxicity)

**Pregnancy** | not known to be harmful

**Breast-feeding** | only small amounts in milk—not known to be harmful

**Side-effects** | see notes above
Dose

- By mouth, ADULT and CHILD over 8 years, 250–500 mg every 8 hours or 0.5–1 g every 12 hours (see notes above); up to 4 g daily in divided doses in severe infections; NEONATE 12.5 mg/kg every 6 hours; CHILD 1 month–2 years 125 mg every 6 hours or 250 mg every 12 hours, 2–8 years 250 mg every 6 hours or 500 mg every 12 hours, doses doubled for severe infections Early pyelitis, 500 mg 4 times daily for 14 days; CHILD 12–18 years see BNF for Children Uncomplicated genitonal chlamydia, non-gonococcal urethritis, 500 mg twice daily for 14 days; CHILD under 18 years see BNF for Children Lyme disease (see also section 5.1.1.3), 500 mg 4 times daily for 14–21 days; CHILD under 18 years see BNF for Children

- By intravenous infusion, ADULT and CHILD severe infections, 12.5 mg/kg every 6 hours; mild infections (when oral treatment not possible), 6.25 mg/kg every 6 hours; NEONATE see BNF for Children

Erythromycin (Non-proprietary) (BNF)

Capsules, enclosing e/c microgranules, erythromycin 250 mg, net price 28–cap pack = £5.61. Label: 5, 9, 25

Brands include Tiloryn®, Tablets, e/c, erythromycin 250 mg, net price 28 = £1.61. Label: 5, 9, 25

Dental prescribing on NHS Erythromycin Tablets e/c may be prescribed

Erythromycin Ethyl Succinate (Non-proprietary) (BNF)

Oral suspension, erythromycin (as ethyl succinate) for reconstitution with water 125 mg/5 mL, net price 100 mL = £2.79; 250 mg/5 mL, 100 mL = £4.20; 500 mg/5 mL, 100 mL = £7.14. Label: 9

Note Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription

Brands include Primacine®

Dental prescribing on NHS Erythromycin Ethyl Succinate Oral Suspension may be prescribed

Erythromycin Lactobionate (Non-proprietary) (BNF)

Intravenous suspension, for reconstitution with water 125 mg/5 mL, net price 100 mL = £2.79; 250 mg/5 mL, 100 mL = £4.20; 500 mg/5 mL, 100 mL = £7.14. Label: 9

Note Tablets are available and can be ordered by specifying ‘tablet’ on the prescription

Dental prescribing on NHS Erythromycin Lactobionate Oral Suspension may be prescribed

Erymax® (TEVA UK) (BNF)

Capsules, opaque orange/clear orange, enclosing orange and white e/c pellets, erythromycin 250 mg, net price 28–cap pack = £5.61. 112-cap pack = £22.44. Label: 5, 9, 25

Dose 1 capsule every 6 hours or 2 capsules every 12 hours; acne, 1 capsule twice daily for 1 month then 1 capsule daily

Erythromycin® (AMCo) (BNF)

Tablets, both f/c, erythromycin (as stearate), 250 mg, net price 100 = £18.20; 50 mg, 100 = £36.40. Label: 9

Dental prescribing on NHS May be prescribed as Erythromycin Stearate Tablets

Erythromycin® (AMCo) (BNF)

Suspension SF, sugar-free, banana-flavoured, erythromycin (as ethyl succinate) for reconstitution with water, 125 mg/5 mL (Suspension PI SF), net price 140 mL = £3.06; 250 mg/5 mL, 140 mL = £5.95; 500 mg/5 mL (Suspension SF Forte), 140 mL = £10.56. Label: 9

Erythromycin® Tablets, yellow, f/c, erythromycin 500 mg (as ethyl succinate). Net price 28-tab pack = £10.78. Label: 9

Dental prescribing on NHS May be prescribed as Erythromycin Ethyl Succinate Tablets

Telithromycin

The ketolide telithromycin is a derivative of erythromycin. The antibacterial spectrum of telithromycin is similar to that of macrolides and it is also active against penicillin- and erythromycin-resistant Streptococcus pneumoniae. Telithromycin should only be used to treat beta-haemolytic streptococcal pharyngitis and tonsillitis, sinusitis, community-acquired pneumonia, and exacerbations of chronic bronchitis if caused by organisms resistant to beta-lactam antibiotics and other macrolides, or if conventional treatment is contra-indicated.

TELITHROMYCIN

Indications see notes above

Cautions coronary heart disease, ventricular arrhythmias, bradycardia, hypokalaemia, hypomagnesaemia—risk of QT interval prolongation; concomitant administration of drugs that prolong QT interval; avoid in acute porphyria (section 9.8.2); interactions: Appendix 1 (telithromycin)

Hepatic disorders Patients should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, abdominal pain, jaundice, or dark urine develop

Driving Visual disturbances or transient loss of consciousness may affect performance of skilled tasks (e.g. driving); effects may occur after the first dose. Administration at bedtime may reduce these side-effects. Patients should be advised not to drive or operate machinery if affected

Contra-indications myasthenia gravis; history of telithromycin-associated hepatitis or jaundice; prolongation of QT interval; congenital or family history of QT interval prolongation (if not excluded by ECG)

Hepatic impairment manufacturer advises caution; see also Hepatic Disorders above

Renal impairment manufacturer advises avoid if possible if eGFR less than 30 mL/minute/1.73 m²—if no alternative, use alternating daily doses of 800 mg and 400 mg, starting with 800 mg dose

Pregnancy toxicity in animal studies—manufacturer advises avoid if potential benefit outweighs risk

Breast-feeding manufacturer advises avoid—present in milk in animal studies

Side-effects diarrhoea, nausea, vomiting, flatulence, abdominal pain, taste disturbances; dizziness, headache; less commonly constipation, stomatitis, anorexia, hepatitis, flushing, palpitations, drowsiness, insomnia, nervousness, eosinophilia, blurred vision, rash, urticaria, and pruritus; rarely cholestatic jaundice, arthralgia, confusion, hallucinations and arthralgia

Dose

- 800 mg once daily for 5 days for sinusitis or exacerbation of chronic bronchitis or for 7–10 days in community-acquired pneumonia; CHILD under 18 years safety and efficacy not established

- Tonsillitis or pharyngitis caused by Streptococcus pyogenes, ADULT and CHILD over 12 years, 800 mg once daily for 5 days

Ketek® (Sanofi-Aventis) (BNF)

Tablets, orange, f/c, telithromycin 400 mg, net price 10-tab pack = £18.56. Label: 9, counselling, driving, hepatic disorders
Clindamycin is active against Gram-positive cocci, including streptococci and penicillin-resistant staphylococci, and also against many anaerobes, especially *Bacteroides fragilis*. It is well concentrated in bone and excreted in bile and urine.

Clindamycin is recommended for staphylococcal joint and bone infections such as osteomyelitis, and intra-abdominal sepsis; it is an alternative to macrolides for erysipelas or cellulitis in penicillin-allergic patients. Clindamycin can also be used for infections associated with meticillin-resistant *Staphylococcus aureus* (MRSA) in bronchiectasis, bone and joint infections, and skin and soft-tissue infections.

Clindamycin has been associated with antibiotic-associated colitis; see notes above; staphylococcal bone and joint infections, peritonitis; falciparum malaria (section 9.8.2); interactions: Appendix 1 (clindamycin)

**Contra-indications** diarrhoeal states; avoid injections containing benzyl alcohol in neonates (see under preparations below)

**Pregnancy** not known to be harmful

**Breast-feeding** amount probably too small to be harmful but bloody diarrhoea reported in 1 infant

**Side-effects** diarrhoea (discontinue treatment), abdominal discomfort, oesophagitis, oesophageal ulcers, taste disturbances, nausea, vomiting, antibiotic-associated colitis; jaundice, leucopenia, eosinophilia, and thrombocytopenia reported; polyarthritides reported; rash, pruritus, urticaria, anaphylactoid reactions, Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative and vesiculobullous dermatitis reported; pain, induration, and abscess after intramuscular injection; thrombophlebitis after intravenous injection

**Dose**

- By mouth, 150–300 mg every 6 hours; up to 450 mg every 6 hours in severe infections; **NEONATE** see **BNF for Children**, **CHILD** 1 month–18 years, 3–6 mg/kg (max: 450 mg) every 6 hours

Counselling Patients should discontinue immediately and contact doctor if diarrhoea develops; capsules should be swallowed with a glass of water.

### 5.1.6 Clindamycin

- By deep intramuscular injection or by intravenous infusion, 0.6–2.7 g daily (in 2–4 divided doses); life-threatening infection, up to 4.8 g daily; single doses above 600 mg by intravenous infusion only; single doses by intravenous infusion not to exceed 1.2 g

**CHILD** over 1 month, see **BNF for Children**

**Clindamycin** (Non-proprietary) 

**Capsules**, clindamycin (as hydrochloride) 150 mg, net price 24-cap pack = £5.08. Label: 9, 27, counselling, see above (diarrhoea)

**Dental prescribing on NHS** Clindamycin Capsules may be prescribed

**Injection**, clindamycin (as phosphate) 150 mg/mL, net price 2-mL amp = £5.90, 4-mL amp = £11.80

**Dalacin C® (Pharmacia)** 

**Capsules**, clindamycin (as hydrochloride) 75 mg (green/white), net price 24-cap pack = £7.45; 150 mg (white), 24-cap pack = £13.72. Label: 9, 27, counselling, see above (diarrhoea)

**Dental prescribing on NHS** May be prescribed as Clindamycin Capsules

**Injection**, clindamycin (as phosphate) 150 mg/mL, net price 2-mL amp = £6.20, 4-mL amp = £12.35

**Excipients** include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

### 5.1.7 Some other antibacterials

Antibacterials discussed in this section include chloramphenicol, fusidic acid, glycopeptide antibiotics (vancomycin and teicoplanin), daptomycin, linezolid, fidaxomicin, the polymyxin, colistimethate sodium, and the rifamycins, rifaximin.

**Chloramphenicol**

Chloramphenicol is a potent broad-spectrum antibiotic; however, it is associated with serious haematological side-effects when given systemically and should therefore be reserved for the treatment of life-threatening infections, particularly those caused by *Haemophilus influenzae*, and also for typhoid fever.

Chloramphenicol eye drops (section 11.3.1) and chloramphenicol ear drops (section 12.1.1) are also available.

### CHLORAMPHENICOL

**Indications** see notes above

**Cautions** avoid repeated courses and prolonged treatment; blood counts required before and periodically during treatment; monitor plasma-chloramphenicol concentration in neonates (see below); interactions: Appendix 1 (chloramphenicol)

**Contra-indications** acute porphyria (section 9.8.2)

**Hepatic impairment** avoid if possible—increased risk of bone-marrow depression; reduce dose and monitor plasma-chloramphenicol concentration

**Renal impairment** avoid in severe renal impairment unless no alternative; dose-related depression of haematopoiesis

**Pregnancy** manufacturer advises avoid; neonatal ‘grey syndrome’ if used in third trimester

**Breast-feeding** manufacturer advises avoid; use another antibiotic; may cause bone-marrow toxicity in infant; concentration in milk usually insufficient to cause ‘grey syndrome’
5.1.7 Some other antibacterials

**Fusidic acid**

Fusidic acid and its salts are narrow-spectrum antibiotics. The only indication for their use is in infections caused by penicillin-resistant staphylococci, especially osteomyelitis, as they are well concentrated in bone; they are also used for staphylococcal endocarditis. A second antistaphylococcal antibiotic is usually required in combination with other antibacterials (Table 1, section 5.1).

**SODIUM FUSIDATE**

*Indications* penicillin-resistant staphylococcal infection including osteomyelitis; staphylococcal endocarditis in combination with other antibacterials (Table 1, section 5.1)

*Cautions* monitor liver function with high doses or on prolonged therapy; elimination may be reduced in biliary disease or biliary obstruction; *interactions*: Appendix 1 (fusidic acid)

**Hepatic impairment** impaired biliary excretion; possibly increased risk of hepatotoxicity; avoid or reduce dose; monitor liver function

**Pregnancy** not known to be harmful; manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** present in milk—manufacturer advises caution

**Side-effects** nausea, vomiting, abdominal pain, dyspepsia, diarrhoea, drowsiness, dizziness; less commonly anorexia, headache, malaise, rash, pruritus; also reported reversible jaundice especially after high dosage (withdraw therapy if persistent), acute renal failure (usually with jaundice), blood disorders

**Dose**

- See under Preparations, below

**Fucidin**

*Tablets, I/C* sodium fusidate 250 mg, net price 10-pack = £6.02. Label: 9

*Dose* as sodium fusidate, 500 mg every 8 hours, doubled for severe infections

**Suspension**, off-white, banana- and orange-flavoured, fusidic acid 250 mg/5 mL, net price 50 mL = £6.73. Label: 9, 21

*Dose* as fusidic acid, ADULT 750 mg every 8 hours; CHILD up to 1 year 50 mg/kg daily (in 3 divided doses), 1–5 years 250 mg every 8 hours, 5–12 years 500 mg every 8 hours

*Note* Fusidic acid is incompletely absorbed and doses recommended for suspension are proportionately higher than those for sodium fusidate tablets

**Vancomycin and teicoplanin**

The glycopeptide antibiotics *vancomycin* and *teicoplanin* have bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides. There are increasing reports of glycopeptide-resistant enterococci. They are used parenterally in the treatment of endocarditis and other serious infections caused by Gram-positive cocci. Vancomycin has a long duration of action and can therefore be given every 12 hours. Teicoplanin is similar to vancomycin, but has a significantly longer duration of action, allowing once daily administration after the loading dose. Teicoplanin is associated with a lower incidence of nephrotoxicity than vancomycin. Either vancomycin or teicoplanin (added to dialysis fluid) is used in the treatment of peritonitis associated with peritoneal dialysis (Table 1, section 5.1); this is an [unlicensed route] for vancomycin.

They are also used for surgical prophylaxis when there is a high risk of MRSA (Table 2, section 5.1). Vancomycin given by mouth for 10–14 days is effective in the treatment of *Clostridium difficile* infection (see also section 1.5); low doses are considered adequate (higher dose may be considered if the infection fails to respond or it is life threatening). Teicoplanin given by mouth is licensed for the treatment of *Clostridium difficile* infection. Vancomycin and teicoplanin should not be given by mouth for systemic infections because they are not absorbed significantly.

**Vancomycin**

*Indications* see notes above

*Cautions* avoid rapid infusion (risk of anaphylactoid reactions, see Side-effects); rotate infusion sites; elderly; avoid if history of deafness; all patients require plasma-vancomycin measurement (after 3 or 4 doses if renal function normal, earlier if renal impairment), blood counts, urinalysis, and renal function tests; monitor auditory function in elderly or if renal impairment; teicoplanin sensitivity; systemic absorption may follow oral administration especially in inflammatory bowel disorders or following multiple doses; *interactions*: Appendix 1 (vancomycin)

**Renal impairment** reduce dose—monitor plasma-vancomycin concentration and renal function regularly; see also Cautions above

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—plasma-vancomycin concentration monitoring essential to reduce risk of fetal toxicity
Breast-feeding present in milk—significant absorption following oral administration unlikely

Side-effects after parenteral administration: nephrotoxicity including renal failure and interstitial nephritis; ototoxicity (discontinue if tinnitus occurs); blood disorders including neutropenia (usually after 1 week or cumulative dose of 25 g), rarely agranulocytosis and thrombocytopenia; nausea; chills; fever; eosinophilia; anaphylaxis, rashes (including exfoliative dermatitis, Stevens-Johnson syndrome, toxic epidermal necrolysis, and vasculitis); phlebitis (irritant to tissue); on rapid infusion, severe hypotension (including shock and cardiac arrest), wheezing, dyspnoea, urticaria, pruritus, flushing of the upper body (‘red man syndrome), pain and muscle spasm of back and chest

Dose

- By mouth, Clostridium difficile infection, (see also notes above), 125 mg every 6 hours for 10–14 days (increased up to 500 mg every 6 hours if infection fails to respond or is life-threatening)
- By intravenous infusion, 1–1.5 g every 12 hours; ELDERLY over 65 years, 500 mg every 12 hours or 1 g once daily
  - Note Plasma concentration monitoring required (see Cautions above); pre-dose (‘trough’) concentration should be 10–15 mg/litre (15–20 mg/litre for endocarditis or less sensitive strains of meticillin-resistant Staphylococcus aureus or for complicated infections caused by S. aureus). An initial loading dose, by intravenous infusion, may be considered—consult local guidelines
- Surgical prophylaxis, by intravenous infusion, 1 g
- CHILD under 18 years see BNF for Children

Note Vancomycin doses in BNF may differ from those in product literature

Vancomycin (Non-proprietary) (Patent) Capsules, vancomycin (as hydrochloride) 125 mg, net price 28-cap pack = £132.47; 250 mg, 28-cap pack = £132.47. Label: 9
- Injection, powder for reconstitution, vancomycin (as hydrochloride), for use as an infusion, net price 500-mg vial = £6.25; 1-g vial = £12.99
  - Note Can be used to prepare solution for oral administration

Vancocin® (Flynn) (Patent) Matrigel capsules, vancomycin (as hydrochloride) 125 mg, net price 28-cap pack = £88.11. Label: 9
- Injection, powder for reconstitution, vancomycin (as hydrochloride), for use as an infusion, net price 500-mg vial = £6.25; 1-g vial = £12.50
  - Note Can be used to prepare solution for oral administration

TEICOPHANIN

Indications see notes above and under Dose

Cautions vancomycin sensitivity; blood counts and liver and kidney function tests required; monitor renal and auditory function during prolonged treatment in renal impairment or if other nephrotoxic or neurotoxic drugs given; monitor plasma-teicoplanin concentration during parenteral maintenance treatment if severe sepsis or burns, deep-seated staphylococcal infection (including bone and joint infection), endocarditis, renal impairment, in elderly, and in intravenous drug abusers; interactions: Appendix 1 (teicoplanin)

Renal impairment use normal dose regimen on days 1–4, then use normal maintenance dose every 48 hours if eGFR 30–80 mL/minute/1.73 m² and use normal maintenance dose every 72 hours if eGFR less than 30 mL/minute/1.73 m²; see also Cautions above

5.1.7 Some other antibiotics

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Breast-feeding no information available

Side-effects rash, pruritus; less commonly nausea, vomiting, diarrhea, bronchospasm, dizziness, headache, fever, leucopenia, thrombocytopenia, eosinophilia, tinnitus, mild hearing loss, vestibular disorders, thrombophlebitis, also reported renal failure, exfoliative dermatitis, Stevens-Johnson syndrome, toxic epidermal necrolysis

Dose

- By mouth, Clostridium difficile infection, ADULT, 100–200 mg twice daily for 10–14 days
- By intravenous injection or infusion or by intramuscular injection, ADULT body-weight under 70 kg, initially 400 mg every 12 hours for 3 doses, subsequently 400 mg once daily, body-weight over 70 kg, initially 6 mg/kg every 12 hours for 3 doses, then 6 mg/kg once daily
- Streptococcal or enterococcal endocarditis (in combination with another antibiotic, see Table 1, section 5.1), by intravenous injection or infusion, ADULT initially 10 mg/kg every 12 hours for 3–5 doses, subsequently 10 mg/kg once daily (subsequent doses can be given by intramuscular injection)
- Bone and joint infections, by intravenous injection or by intravenous infusion, ADULT, initially 12 mg/kg every 12 hours for 3–5 doses, subsequently 12 mg/kg once daily (subsequent doses can be given by intramuscular injection); increased risk of fever and rash with doses of 12 mg/kg
- Surgical prophylaxis [unlicensed indication], ADULT, by intravenous injection, 400 mg up to 30 minutes before the procedure; open fractures, by intravenous infusion, 800 mg up to 30 minutes before skeletal stabilisation and definitive soft-tissue closure
- CHILD under 18 years see BNF for Children

Note To avoid excessive dosage in obese patients, parenteral dose should be calculated on the basis of ideal weight for height. Plasma-teicoplanin concentration is not measured routinely because a relationship between plasma concentration and toxicity has not been established. However, the plasma-teicoplanin concentration can be used to optimise parenteral treatment in some patients (see Cautions). Pre-dose (‘trough’) concentrations should be greater than 10 mg/litre in endocarditis or deep-seated infection such as bone and joint infection), but less than 60 mg/litre. Teicoplanin doses in BNF may differ from those in product literature

Targocid® (Sanofi-Aventis) (Patent) Injection, powder for reconstitution, teicoplanin, net price 200-mg vial (with diluent) = £3.93; 400-mg vial (with diluent) = £7.32

Electrolytes Na⁺ < 0.5 mmol/200- and 400-mg vial

Note Can be used to prepare solution for oral administration

Daptomycin Daptomycin is a lipopeptide antibiotic with a spectrum of activity similar to vancomycin but its efficacy against enterococci has not been established. Daptomycin should be reserved for complicated skin and soft-tissue infections caused by resistant Gram-positive bacteria including meticillin-resistant Staphylococcus aureus (MRSA). It needs to be given with other antibiotics for mixed infections involving Gram-negative bacteria and some anaerobes. Daptomycin is used (in combination with other antibacterials) for staphylococcal endocarditis caused by organisms resistant to vancomycin or in patients intolerant of vancomycin.
Infections

5

The Scottish Medicines Consortium (p. 4) has advised (February 2008) that daptomycin (Cubicin®) is accepted for restricted use within NHS Scotland for the treatment of MRSA bacteraemia associated with right-sided endocarditis or with complicated skin and soft-tissue infections.

**DAPTOMYCIN**

**Indications** see under Dose

**Cautions** interference with assay for prothrombin time and INR—take blood sample immediately before daptomycin dose; **interactions**: Appendix 1 (daptomycin)

**Muscle effects** Myalgia, muscle weakness, and myositis may occur uncommonly; rhabdomyolysis is very rare. Monitor creatine kinase before treatment and then weekly during treatment (more frequently if creatine kinase elevated more than 5 times upper limit of normal before treatment, or if receiving another drug known to cause myopathy (preferably avoid concomitant use). If eGFR less than 80 mL/minute/1.73 m²). If unexplained muscle pain, tenderness, weakness, or cramps develop during treatment, measure creatine kinase every 2 days: discontinue if unexplained muscular symptoms and creatine kinase elevated markedly

**Hepatic impairment** manufacturer advises caution in severe hepatic impairment—no information available

**Renal impairment** see Muscle Effects above; also monitor renal function if eGFR less than 80 mL/minute/1.73 m²; use normal dose every 48 hours if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—no information available

**Breast-feeding** present in milk in small amounts, but absorption from gastro-intestinal tract negligible

**Side-effects** nausea, vomiting, abdominal pain, flatulence, diarrhoea (antibiotic-associated colitis reported), constipation, hypertension, hypotension, headache, anxiety, insomnia, dizziness, asthena, anaemia, arthralgia, rash, pruritus, injection-site reactions; less commonly dyspepsia, anorexia, taste disturbance, glositis, flushing, arrhythmias, tremor, paraesthesia, hyperglycaemia, renal failure, eosinophilia, thrombocythaemia, electrolyte disturbances, muscle effects (see Cautions); rarely jaundice; also reported syncope, wheezing, eosinophilic pneumonia, peripheral neuropathy

**Dose** by slow intravenous injection over 2 minutes or by intravenous infusion, complicated skin and soft-tissue infections caused by Gram-positive bacteria, **ADULT** over 18 years, 4 mg/kg once daily; increased to 6 mg/kg once daily if associated with *Staphylococcus aureus* bacteraemia

Staphylococcal endocarditis, **ADULT** over 18 years, 6 mg/kg once daily

**Note** not licensed for use in left-sided endocarditis

**Cubicin®** (Novartis) **PFI** intravenous infusion, powder for reconstitution, daptomycin, net price 350-mg vial = £62.00; 500-mg vial = £88.57

**Linezolid**

Linezolid, an oxazolidinone antibiotic, is active against Gram-positive bacteria including meticillin-resistant *Staphylococcus aureus* (MRSA), and vancomycin-resistant enterococci. Resistance to linezolid can develop with prolonged treatment or if the dose is less than that recommended. Linezolid is an option if a glycopeptide, such as vancomycin, cannot be used to treat pneumonia or severe skin and soft-tissue infections caused by MRSA. Linezolid is **not** active against Gram-negative organisms and must be given with other antibiotics if the infection also involves Gram-negative organisms (the combination should be used for mixed skin and soft tissue infections only when other treatments are not available). A higher incidence of blood disorders and optic neuropathy have been reported in patients receiving linezolid for more than the maximum recommended duration of 28 days.

**LINEZOLID**

**Indications** pneumonia, complicated skin and soft-tissue infections caused by Gram-positive bacteria (initiated under expert supervision)

**Cautions** monitor full blood count (including platelet count) weekly (see also Blood disorders below); history of seizures; unless close observation and blood-pressure monitoring possible, avoid in uncontrolled hypertension, phaeochromocytoma, carcinoid tumour, thyrotoxicosis, bipolar depression, schizophrenia, or acute confusional states; **interactions**: Appendix 1 (MAOIs)

**Blood disorders** Haematopoietic disorders (including thrombocytopaenia, anaemia, leucopenia, and pancytopenia) have been reported in patients receiving linezolid, particularly the elderly. It is recommended that full blood counts are monitored weekly. Close monitoring is recommended in patients who:

- receive treatment for more than 10–14 days;
- have pre-existing myelosuppression;
- are receiving drugs that may have adverse effects on haemoglobin, blood counts, or platelet function;
- have severe renal impairment.

If significant myelosuppression occurs, treatment should be stopped unless it is considered essential, in which case intensive monitoring of blood counts and appropriate management should be implemented.

**CHM advice (optic neuropathy)**

Severe optic neuropathy may occur rarely, particularly if linezolid is used for longer than 28 days. The CHM recommends that:

- patients should be warned to report symptoms of visual impairment (including blurred vision, visual field defect, changes in visual acuity and colour vision) immediately;
- patients experiencing new visual symptoms (regardless of treatment duration) should be evaluated promptly, and referred to an ophthalmologist if necessary;
- visual function should be monitored regularly if treatment is required for longer than 28 days.

**Monoamine oxidase inhibition** Linezolid is a reversible, non-selective monoamine oxidase inhibitor (MAOI). Patients should avoid consuming large amounts of tyramine-rich foods (such as mature cheese, yeast extracts, undistilled alcoholic beverages, and fermented soya bean products). In addition, linezolid should not be given with another MAOI or within 2 weeks of stopping another MAOI. Unless close observation and blood-pressure monitoring is possible, avoid in those receiving SSRIs, SHT, agonists (‘triptans’), tricyclic antidepressants, sympathomimetics, dopaminergics, buspirone, pethidine and possibly other opioid analgesics. For other interactions see Appendix 1 (MAOIs)
Contra-indications see Monoamine Oxidase Inhibition above
Hepatic impairment in severe hepatic impairment manufacturer advises use only if potential benefit outweighs risk
Renal impairment manufacturer advises metabolites may accumulate if eGFR less than 30 mL/minute/1.73 m²; see also Blood Disorders, above
Pregnancy manufacturer advises use only if potential benefit outweighs risk—no information available
Breast-feeding manufacturer advises avoid—present in milk in animal studies
Side-effects diarrhoea (antibiotic-associated colitis reported), nausea, vomiting, taste disturbances, headache; less commonly thirst, dry mouth, glossitis, stomatitis, tongue discoloration, abdominal pain, dyspepsia, gastroitis, constipation, pancreatitis, hypertension, fever, fatigue, dizziness, insomnia, hypoaesthesia, paraesthesia, tinnitus, polynu-ria, leucopenia, thrombocytopaenia, eosinophilia, electrolyte disturbances, blurred vision, rash, pruritis, diaphoresis, injection-site reactions; rarely tachycardia, transient ischaemic attacks, renal failure; also reported tooth discoloration, convulsions, lactic acidosis, hyponatraemia, pancytopenia, anaemia, Stevens–Johnson syndrome, toxic epidermal necrolysis; peripheral and optic neuropathy reported on prolonged therapy (see also CHM advice above)
Dose
- By mouth, 600 mg every 12 hours usually for 10–14 days (max. duration of treatment 28 days); CHILD [unlicensed] 1 week–12 years, 10 mg/kg every 8 hours; 12–18 years, adult dose
- By intravenous infusion over 30–120 minutes, 600 mg every 12 hours; CHILD [unlicensed] 1 week–12 years, 10 mg/kg every 8 hours; 12–18 years, adult dose

Zyvox® (Pharmacia) Tablets, 600 mg, price 10-tab pack = £44.50. Label: 9, 10, patient information leaflet
Suspension, yellow, linezolid 100 mg/5 mL when reconstituted with water, net price 150 mL (orange-flavoured) = £222.50. Label: 9, 10, patient information leaflet
Excipients include aspartame 20 mg/5 mL (section 9.4.1)
Intravenous infusion, linezolid 2 mg/mL, net price 300-mL Excel® bag = £44.50
Excipients include Na+ 5 mmol/300-mL bag, glucose 13.71 g/300-mL bag

Polymyxins
The polymyxin antibiotic, colistimethate sodium (colistin sulphomethate sodium), is active against Gram-negative organisms including Pseudomonas aeruginosa, Acinetobacter baumannii, and Klebsiella pneumoniae. It is not absorbed by mouth and thus needs to be given by injection for a systemic effect. Intravenous administration of colistimethate sodium should be reserved for Gram-negative infections resistant to other antibacterials; its major adverse effects are dose-related neurotoxicity and nephrotoxicity.

Colistimethate sodium is also given by inhalation as an adjunct to standard antibacterial therapy in patients with cystic fibrosis.

5.1.7 Some other antibiotics

NICE guidance
Colistimethate sodium by dry powder inhalation for pseudomonal lung infection in cystic fibrosis (March 2013)
Colistimethate sodium dry powder for inhalation is recommended for chronic pulmonary infection caused by Pseudomonas aeruginosa in patients with cystic fibrosis who would benefit from continued treatment, but do not tolerate the drug in its nebulised form. The manufacturer must provide colistimethate sodium dry powder for inhalation at the discount agreed as part of the patient access scheme to primary, secondary and tertiary care in the NHS. Patients currently receiving colistimethate sodium dry powder for inhalation can continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/T2476
Both colistimethate sodium and polymyxin B are included in some preparations for topical application.

COLISTIMETHATE SODIUM
(Colistin sulphomethate sodium)
Indications see notes above
Cautions acute porphyria (section 9.8.2); interactions: Appendix 1 (polymyxins)
Specific cautions for parenteral treatment Monitor renal function
Specific cautions for inhaled treatment Other inhaled drugs should be administered before colistimethate sodium. Measure lung function before and after initial dose of colistimethate sodium and monitor for bronchospasm; if bronchospasm occurs in a patient not using a bronchodilator, repeat test using a bronchodilator before the dose of colistimethate sodium. Severe haemoptysis—risk of further haemorrhage
Contra-indications myasthenia gravis
Renal impairment reduce dose and monitor plasma-colistimethate sodium concentration during parenteral treatment—consult product literature
Pregnancy clinical use suggests probably safe when used by inhalation; use parenteral treatment only if potential benefit outweighs risk
Breast-feeding present in milk but poorly absorbed from gut; manufacturers advise avoid (or use only if potential benefit outweighs risk)

Side-effects
Specific side-effects for parenteral treatment Neurotoxicity reported especially with excessive doses (including apnoea, perioral and peripheral paraesthesia, vertigo, headache, muscle weakness; rarely vasomotor instability, slurred speech, confusion, psychosis, visual disturbances), nephrotoxicity, rash
Specific side-effects for inhaled treatment Sore throat, sore mouth, taste disturbances, nausea, vomiting, cough, bronchospasm, dysphonia; less commonly thirst, hypersalivation

Dose
- By slow intravenous injection into a totally implan
table venous access device, or by intravenous infusion (but see notes above), ADULT and CHILD body-weight under 60 kg, 50 000–75 000 units/kg daily in 3 divided doses; body-weight over 60 kg, 1–2 million units every 8 hours
Note Plasma concentration monitoring recommended in renal impairment; recommended ‘peak’ plasma-colistimethate sodium concentration (approx. 1 hour after intravenous injection or infusion) 5–15 mg/litre, pre-dose (‘trough’) concentration 2–6 mg/litre
5.1.8 Sulfonamides and trimethoprim

- By inhalation of nebulised solution, ADULT and CHILD over 2 years, 1–2 million units twice daily; increased to 2 million units 3 times daily for subsequent respiratory isolates of *P. aeruginosa*. CHILD 1 month–2 years, 0.5–1 million units twice daily; increased to 1 million units 3 times daily for subsequent respiratory isolates of *P. aeruginosa*.
- By inhalation of powder, ADULT and CHILD over 6 years, 1.66 million units twice daily

### Colistimethate sodium (Non-proprietary) *(BN)*

**Injection**, powder for reconstitution, colistimethate sodium, net price 1 million-unit vial = £1.68

**Electrolytes** *(before reconstitution)* Na⁺ < 0.5 mmol/l; 2 million-unit vial = £3.24

**Note** Colomicyn® Injection may be used for nebulisation; administer required dose in 2-4 mL of sodium chloride 0.9%, (or water for injections) or a 1:1 mixture of sodium chloride 0.9% and water for injection

**Promixin® (Profile) *(BN)*

**Powder for nebuliser solution**, colistimethate sodium, net price 1 million-unit vial = £1.80; 2 million-unit vial = £3.60

**Electrolytes** *(before reconstitution)* Na⁺ < 0.5 mmol/l; 1 million-unit vial = £2.30

**Colobreathe® (Forest) *(BN)*

Dry powder for inhalation, hard capsule, colistimethate sodium 1.66 million units/capsule, net price 56-cap pack = £968.80. Counselling, administration

**Counselling** Rinse mouth with water after each dose

### Fidaxomicin

**Fidaxomicin** is a macrocyclic antibiotic that is poorly absorbed from the gastro-intestinal tract, and, therefore, it should not be used to treat systemic infections. It is licensed for the treatment of *Clostridium difficile* infection (see also section 1.5), but limited clinical data is available on the use of fidaxomicin in severe or life-threatening *C. difficile* infection.

The **Scottish Medicines Consortium** *(p. 4)* has advised (June 2012) that fidaxomicin (Dificlir®) is accepted for restricted use within NHS Scotland to treat the first recurrence of *C. difficile* infection, on the advice of a microbiologist or specialist in infectious diseases.

**FIDAXOMICIN**

**Indications** *Clostridium difficile* infection

**Cautions** macrolide hypersensitivity; severe or life-threatening *C. difficile* infection; inflammatory bowel disease; **Interactions**: Appendix 1 (fidaxomicin)

**Hepatic impairment** manufacturer advises caution in moderate to severe impairment—no information available

**Renal impairment** manufacturer advises caution in severe impairment—no information available

**Pregnancy** manufacturer advises avoid—no information available

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** nausea, vomiting, constipation; less commonly taste disturbance, abdominal distension, flatulence, headache, dizziness, decreased appetite, dry mouth

**Dose**
- **ADULT** over 18 years, 200 mg every 12 hours for 10 days

**Dificlir® (Astellas) *(BN)*

**Tablets**, f/c, fidaxomicin 200 mg, net price 20-tab pack = £1350.00. Label: 9

### 5.1.8 Sulfonamides and trimethoprim

The importance of the sulfonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic.
Sulfamethoxazole and trimethoprim are used in combination (as co-trimoxazole) because of their synergistic activity. However, co-trimoxazole is associated with rare but serious side-effects (e.g. Stevens-Johnson syndrome and blood dyscrasias, notably bone marrow depression and agranulocytosis especially in the elderly) (see Restrictions on the use of Co-trimoxazole below).

**Restrictions on the use of co-trimoxazole**

Co-trimoxazole is the drug of choice in the prophylaxis and treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia; it is also indicated for nocardiosis, *Stenotrophomonas maltophilia* infection (unlicensed indication), and toxoplasmosis. It should only be considered for use in acute exacerbations of chronic bronchitis and infections of the urinary tract when there is bacteriological evidence of sensitivity to co-trimoxazole and good reason to prefer this combination to a single antibacterial; similarly it should only be used in acute otitis media in children when there is good reason to prefer it. Co-trimoxazole is also used for the treatment of infections caused by *Burkholderia cepacia* in cystic fibrosis (unlicensed indication).

**Trimethoprim** can be used alone for urinary- and respiratory-tract infections and for prostatitis, shigellosis, and invasive salmonella infections. Trimethoprim has side-effects similar to co-trimoxazole but they are less severe and occur less frequently.

For **topical preparations** of sulfonamides used in the treatment of burns see section 13.10.1.1.

---

**CO-TRIMOXAZOLE**

A mixture of trimethoprim and sulfamethoxazole (sulphamethoxazole) in the proportions of 1 part to 5 parts.

**Indications** see restrictions above

**Cautions** maintain adequate fluid intake; avoid in blood disorders (unless under specialist supervision); monitor blood counts on prolonged treatment; discontinue immediately if blood disorders or rash develop; predisposition to folate deficiency or hyperkalaemia; elderly (see Restrictions on the use of Co-trimoxazole above); asthma; G6PD deficiency (section 9.1.3); avoid in infants under 6 weeks (except for treatment or prophylaxis of pneumocystis pneumonia); **Interactions**: Appendix 1 (trimethoprim, sulfamethoxazole).

**Contra-indications** acute porphyria (section 9.8.2).

**Hepatic impairment** manufacturer advises avoid in severe liver disease

**Renal impairment** use half normal dose if eGFR 15–30 mL/minute/1.73 m²; avoid if eGFR less than 15 mL/minute/1.73 m² and if plasma-sulfamethoxazole concentration cannot be monitored

**Pregnancy** teratogenic risk in first trimester (trimethoprim a folate antagonist). Neonatal haemolysis and methaemoglobinemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded

**Breast-feeding** small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants (due to sulfamethoxazole)

**Side-effects** nausea, diarrhoea; headache; hyperkalaemia; rash (very rarely including Stevens-Johnson syndrome, toxic epidermal necrolysis, photosensitivity)—discontinue immediately, less commonly vomiting; very rarely glossitis, stomatitis, anorexia, liver damage (including jaundice and hepatic necrosis), pancreatitis, antibiotic-associated colitis, myocarditis, cough and shortness of breath, pulmonary infiltrates, aseptic meningitis, depression, convulsions, peripheral neuropathy, ataxia, tinnitus, vertigo, hallucinations, hypoglycaemia, blood disorders (including leucopenia, thrombocytopenia, megaloblastic anaemia, eosinophilia), hyponatraemia, renal disorders including interstitial nephritis, arthralgia, myalgia, vasculitis, systemic lupus erythematosus and uveitis; rhabdomyolysis reported in HIV-infected patients

**Dose**
- **By mouth**, 960 mg every 12 hours; **Child**, every 12 hours, 6 weeks–5 months, 120 mg; 6 months–5 years, 240 mg; 6–12 years, 480 mg
- **By intravenous infusion**, 960 mg every 12 hours increased to 1.44 g every 12 hours in severe infections; **Child** 36 mg/kg daily in 2 divided doses increased to 54 mg/kg daily in severe infections
- **Treatment of Pneumocystis jirovecii** (*Pneumocystis carinii*) infections (undertaken where facilities for appropriate monitoring available—consult microbiologist and product literature), **by mouth** or **by intravenous infusion**; **Adult** and **Child** over 4 weeks, 120 mg/kg daily in 2–4 divided doses for 14–21 days
- **Prophylaxis of Pneumocystis jirovecii** (*Pneumocystis carinii*) infections, **by mouth**, 960 mg once daily (may be reduced to 480 mg once daily to improve tolerance) or 960 mg on alternate days (3 times a week) or 960 mg twice daily on alternate days (3 times a week)
- **Child** 6 weeks–5 months, 120 mg twice daily on 3 consecutive or alternate days per week or on 7 days per week; 6 months–5 years, 240 mg; 6–12 years, 480 mg

Note 480 mg of co-trimoxazole consists of sulfamethoxazole 400 mg and trimethoprim 80 mg

**Co-trimoxazole** (Non-proprietary) tablets, co-trimoxazole 480 mg, net price 28-tab pack = £3.74, 960 mg, 100 = £23.46. Label: 9
- **Brands include**: Fectrim®, Fectrim® Forte
- **Paediatric oral suspension**, co-trimoxazole 240 mg/5 mL, net price 100 mL = £1.12. Label: 9
- **Oral suspension**, co-trimoxazole 480 mg/5 mL. Net price 100 mL = £4.41. Label: 9

**Septin** (Aspen) Tablets, co-trimoxazole 480 mg, net price 100-tab pack = £15.52. Label: 9
- **Forte tablets**, scored, co-trimoxazole 960 mg, net price 100-tab pack = £23.46. Label: 9
- **Adult suspension**, co-trimoxazole 480 mg/5 mL, net price 100 mL (vanilla-flavoured) = £4.41. Label: 9
- **Paediatric suspension**, sugar-free, co-trimoxazole 240 mg/5 mL, net price 100 mL (banana- and vanilla-flavoured) = £2.45. Label: 9
- **Intravenous infusion**, co-trimoxazole 96 mg/mL. To be diluted before use. Net price 5-mL amp = £1.78
- **Electrolytes**: Na⁺ 1.7 mmol/5 mL
- **Excipients** include alcohol 13.2%, propylene glycol, sulphites
SULFADIAZINE (Sulphadiazine)

**Indications** prevention of rheumatic fever recurrence, toxoplasmosis [unlicensed]—see section 5.4.7

**Cautions** see under Co-trimoxazole; **interactions:** Appendix 1 (sulfonamides)

**Contra-indications** see under Co-trimoxazole

**Hepatic impairment** use with caution in mild to moderate impairment; avoid in severe impairment

**Renal impairment** use with caution in mild to moderate impairment; avoid in severe impairment; high risk of crystalluria

**Pregnancy** neonatal haemolytic and methaemo-globinaemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded

**Breast-feeding** small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants

**Side-effects** see under Co-trimoxazole; also hypersensitivity reactions including angioedema, toxic epidermal necrolysis, photosensitivity and other allergic reactions including angioedema and anaphylaxis; aseptic meningitis and uveitis reported

**Dose**
- Prevention of rheumatic fever, **by mouth**, 1 g daily (500 mg daily for patients less than 30 kg)
- **Sulfadiazine** (Non-proprietary) 
  - **Tablets**, sulfadiazine 500 mg, net price 56-tab pack = £57.15. Label: 9, 27

TRIMETHOPRIM (Non-proprietary) 

**Indications** urinary-tract infections, acute and chronic bronchitis; pneumocystis pneumonia (section 5.4.8)

**Cautions** predisposition to folate deficiency; elderly; manufacturer recommends blood counts on long-term therapy (but evidence of practical value unsatisfactory); neonates (specialist supervision required); acute porphyria (section 9.8.2); **interactions:** Appendix 1 (trimethoprim)

**Blood disorders** On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop

**Contra-indications** blood dyscrasias

**Renal impairment** use half normal dose after 3 days if eGFR 15–30 mL/minute/1.73 m²; use half normal dose if eGFR less than 15 mL/minute/1.73 m² (monitor plasma-trimethoprim concentration if eGFR less than 10 mL/minute/1.73 m²)

**Pregnancy** teratogenic risk in first trimester (folic acid antagonist); manufacturers advise avoid

**Breast-feeding** present in milk—short-term use not known to be harmful

**Side-effects** gastro-intestinal disturbances including nausea and vomiting, pruritus, rash, hyperkalaemia, depression of haematopoiesis; rarely erythema multiforme, toxic epidermal necrolysis, photosensitivity and other allergic reactions including angioedema and anaphylaxis; aseptic meningitis and uveitis reported

**Dose**
- Acute infections, 200 mg every 12 hours; **CHILD** 1 month–12 years, 4 mg/kg (max. 200 mg) every 12 hours; or 6 weeks–6 months 25 mg every 12 hours, 6 months–6 years 50 mg every 12 hours, 6–12 years 100 mg every 12 hours

5.1.9 Antituberculosis drugs

Tuberculosis is treated in two phases—an **initial phase** using 4 drugs and a **continuation phase** using 2 drugs in fully sensitive cases. Treatment requires specialised knowledge, particularly where the disease involves resistant organisms or non-respiratory organs.

The regimen given below are recommended for the treatment of tuberculosis in the UK; variations occur in other countries. Either the unsupervised regimen or the supervised regimen described below should be used; the two regimens should not be used concurrently.

**Initial phase** The concurrent use of 4 drugs during the initial phase is designed to reduce the bacterial population as rapidly as possible and to prevent the emergence of drug-resistant bacteria. The drugs are best given as combination preparations unless one of the components cannot be given because of resistance or intolerance. The treatment of choice for the initial phase is the daily use of isoniazid, rifampicin, pyrazinamide and ethambutol. Treatment should be started without waiting for culture results if clinical features or histology results are consistent with tuberculosis; treatment should be continued even if initial culture results are negative. The initial phase drugs should be continued for 2 months. Where a positive culture for M. tuberculosis has been obtained, but susceptibility results are not available after 2 months, treatment with rifampicin, isoniazid, pyrazinamide and ethambutol should be continued until full susceptibility is confirmed, even if this is for longer than 2 months.

Streptomycin is rarely used in the UK but it may be used in the initial phase of treatment if resistance to isoniazid has been established before therapy is commenced.

**Continuation phase** After the initial phase, treatment is continued for a further 4 months with isoniazid and rifampicin (preferably given as a combination preparation). Longer treatment is necessary for meningitis, direct spinal cord involvement, and for resistant organisms which may also require modification of the regimen.

**Unsupervised treatment** The following regimen should be used for patients who are likely to take antituberculous drugs reliably **without supervision**. Patients who are unlikely to comply with daily administration of antituberculous drugs should be treated with...
the regimen described under Supervised Treatment.

**Recommended dosage for standard unsupervised 6-month treatment**

**Immunocompromised patients** Multi-resistant *Mycobacterium tuberculosis* may be present in immunocompromised patients. The organism should always be cultured to confirm its type and drug sensitivity. Confirmed *M. tuberculosis* infection sensitive to first-line drugs should be treated with a standard 6-month regimen; after completing treatment, patients should be closely monitored. The regimen may need to be modified if infection is caused by resistant organisms, and specialist advice is needed.

Specialist advice should be sought about tuberculosis treatment or chemoprophylaxis in a HIV-positive individual; care is required in choosing the regimen and in avoiding potentially serious interactions. Starting antiretroviral treatment in the first 2 months of antituberculosis treatment increases the risk of immune reconstitution syndrome.

Infection may also be caused by other mycobacteria e.g. *M. avium* complex in which case specialist advice on management is needed.

**Corticosteroids** In meningeal or pericardial tuberculosis, a corticosteroid should be started at the same time as antituberculosis therapy.

**Prevention of tuberculosis** Some individuals may develop tuberculosis owing to reactivation of previously latent disease. Chemoprophylaxis may be required in those who have evidence of latent tuberculosis and are receiving treatment with immunosuppressants (including cytotoxics and possibly long-term treatment with systemic corticosteroids). In these cases, chemoprophylaxis involves use of either isoniazid alone for 6 months or of isoniazid and rifampicin for 3 months, see Table 2, section 5.1; longer chemoprophylaxis is not recommended.

For prevention of tuberculosis in susceptible close contacts or those who have become tuberculin-positive, see Table 2, section 5.1. For advice on immunisation against tuberculosis, see section 14.4.
should be checked before treatment with these drugs. Those with pre-existing liver disease or alcohol dependence should have frequent checks particularly in the first 2 months. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. In view of the need to comply fully with antituberculous treatment on the one hand and to guard against serious liver damage on the other, patients and their carers should be informed carefully how to recognise signs of liver disorders and advised to discontinue treatment and seek immediate medical attention should symptoms of liver disease occur.

Renal function should be checked before treatment with antituberculous drugs and appropriate dosage adjustments made. Streptomycin or ethambutol should preferably be avoided in patients with renal impairment, but if used, the dose should be reduced and the plasma-drug concentration monitored.

Visual acuity should be tested before ethambutol is used (see below).

Major causes of treatment failure are incorrect prescribing by the physician and inadequate compliance by the patient. Monthly tablet counts and urine examination (rifampicin imparts an orange-red coloration) may be useful indicators of compliance with treatment. Avoid both excessive and inadequate dosage. Treatment should be supervised by a specialist physician.

Isoniazid is cheap and highly effective. Like rifampicin it should always be included in any antituberculous regimen unless there is a specific contra-indication. Its only common side-effect is peripheral neuropathy which is more likely to occur where there are pre-existing risk factors such as diabetes, alcohol dependence, chronic renal failure, pregnancy, malnutrition and HIV infection. In these circumstances pyridoxine 10 mg daily (or 20 mg daily if suitable product not available) (section 9.6.2) should be given prophylactically from the start of treatment. The risk of peripheral neuropathy may also be increased by high doses of isoniazid; pyridoxine should, therefore, be considered for those receiving Voractiv® (p. 395) 5 tablets daily. Other side-effects such as hepatitis (important: see Monitoring above) and psychosis are rare.

Rifampicin, a rifamycin, is a key component of any antituberculous regimen. Like isoniazid it should always be included unless there is a specific contra-indication. During the first two months (‘initial phase’) of rifampicin administration transient disturbance of liver function with elevated serum transaminases is common but generally does not require interruption of treatment. Occasionally more serious liver toxicity requires a change of treatment particularly in those with pre-existing liver disease (important: see Monitoring above).

On intermittent treatment six toxicity syndromes have been recognised—influenza-like, abdominal, and respiratory symptoms, shock, renal failure, and thrombocytopenic purpura—and can occur in 20 to 30% of patients.

Rifampicin induces hepatic enzymes which accelerate the metabolism of several drugs including oestrogens, corticosteroids, phenytoin, sulfonylureas, and anticoagulants; interactions: Appendix 1 (rifamycins). Important: the effectiveness of hormonal contraceptives is reduced and alternative family planning advice should be offered (section 7.3.1).

Rifabutin, another rifamycin, is indicated for prophylaxis against M. avium complex infections in patients with a low CD4 count; it is also licensed for the treatment of non-tuberculous mycobacterial disease and pulmonary tuberculosis. Important: as with rifampicin it induces hepatic enzymes and the effectiveness of hormonal contraceptives is reduced requiring alternative family planning methods.

Pyrazinamide is a bactericidal drug only active against intracellular dividing forms of Mycobacterium tuberculosis; it exerts its main effect only in the first two or three months. It is particularly useful in tuberculous meningitis because of good meningeal penetration. It is not active against M. bovis. Serious liver toxicity may occasionally occur (important: see Monitoring above).

Ethambutol is included in a treatment regimen if isoniazid resistance is suspected; it can be omitted if the risk of resistance is low.

Side-effects of ethambutol are largely confined to visual disturbances in the form of loss of acuity, colour blindness, and restriction of visual fields. These toxic effects are more common where excessive dosage is used or if the patient’s renal function is impaired. The earliest features of ocular toxicity are subjective and patients should be advised to discontinue therapy immediately if they develop deterioration in vision and promptly seek further advice. Early discontinuation of the drug is almost always followed by recovery of eyesight. Patients who cannot understand warnings about visual side-effects should, if possible, be given an alternative drug. In particular, ethambutol should be used with caution in children until they are at least 5 years old and capable of reporting symptomatic visual changes accurately.

Visual acuity should be tested by Snellen chart before treatment with ethambutol.

Streptomycin [unlicensed] is now rarely used in the UK except for resistant organisms. Plasma-drug concentration should be measured in patients with impaired renal function in whom streptomycin must be used with great care.

Drug-resistant tuberculosis should be treated by a specialist physician with experience in such cases, and where appropriate facilities for infection-control exist. Second-line drugs available for infections caused by resistant organisms, or when first-line drugs cause unacceptable side-effects, include amikacin, capreomycin, cycloserine, newer macrolides (e.g. azithromycin and clarithromycin), moxifloxacin and protonamide (prothionamide; no longer on UK market).

Hepatic impairment use with caution
Renal impairment reduce dose—consult product literature; nephrotoxic; ototoxic
Pregnancy manufacturer advises use only if potential benefit outweighs risk—teratogenic in animal studies
Cycloserine

**Indications** in combination with other drugs, tuberculosis resistant to first-line drugs

**Cautions** monitor haematological, renal, and hepatic function; interactions: Appendix 1 (cycloserine)

**Contra-indications** epilepsy, depression, severe anxiety, psychotic states, alcohol dependence

**Renal impairment** increase interval between doses if creatinine clearance less than 50 mL/minute and monitor blood-cycloserine concentration

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—crosses the placenta

**Breast-feeding** amount too small to be harmful

**Side-effects** mainly neurological, including headache, dizziness, vertigo, drowsiness, tremor, convulsions, confusion, psychosis, depression (discontinue or reduce dose); megaloblastic anaemia; changes in liver function tests; heart failure at high doses reported

**Dose**
- Initially 250 mg every 12 hours for 2 weeks increased according to blood concentration and response to max. 500 mg every 12 hours; CHILD 2–18 years see BNF for Children
- Note blood concentration monitoring required especially in renal impairment or if dose exceeds 500 mg daily or if signs of toxicity; blood concentration should not exceed 30 mg/litre

**Ethambutol Hydrochloride**

**Indications** tuberculosis, in combination with other drugs

**Cautions** monitor in notes above; also slow acetylator status (increased risk of side-effects); epilepsy; history of psychosis; alcohol dependence, malnutrition, diabetes mellitus, HIV infection (risk of peripheral neuritis); acute porphyria (section 9.8.2); interactions: Appendix 1 (isoniazid)

**Hepatic disorders** Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop

**Contra-indications** drug-induced liver disease

**Hepatic impairment** use with caution; monitor liver function regularly and particularly frequently in first 2 months; see also Hepatic Disorders above

**Renal impairment** risk of otoxicity and peripheral neuropathy; prophylactic pyridoxine recommended, see notes above

**Pregnancy** not known to be harmful; prophylactic pyridoxine recommended; see also p. 391

**Breast-feeding** amount too small to be harmful; see also p. 391

**Side-effects** optic neuritis, red/green colour blindness, peripheral neuritis, rarely rash, pruritus, urticaria, thrombocytopenia

**Dose**
- Note ‘Peak’ concentration (2–2.5 hours after dose) should be 2–6 mg/litre (7–22 micromol/litre), ‘trough’ (pre-dose) concentration should be less than 1 mg/litre (4 micromol/litre); see Renal Impairment above

**Isoniazid**

**Indications** tuberculosis, in combination with other drugs; prophylaxis—Table 2, section 5.1

**Cautions** see Monitoring in notes above; also slow acetylator status (increased risk of side-effects); epilepsy; history of psychosis; alcohol dependence, malnutrition, diabetes mellitus, HIV infection (risk of peripheral neuritis); acute porphyria (section 9.8.2); interactions: Appendix 1 (isoniazid)

**Contra-indications** optic neuritis, red/green colour blindness, peripheral neuritis, rarely rash, pruritus, urticaria, thrombocytopenia

**Dose**
- Note ‘Peak’ concentration (2–2.5 hours after dose) should be 2–6 mg/litre (7–22 micromol/litre), ‘trough’ (pre-dose) concentration should be less than 1 mg/litre (4 micromol/litre); see Renal Impairment above

**Ethambutol (Non-proprietary)**

**Tablets**, ethambutol hydrochloride 100 mg, net price 56-tab pack = £42.74. Label: 8

**BNF 68 5.1.9 Antituberculosis drugs 393**

**Cytochrome C Oxidase**

**Indications** in combination with other drugs; prophylaxis—Table 2, section 5.1

**Cautions** monitoring in notes above; also slow acetylator status (increased risk of side-effects); epilepsy; history of psychosis; alcohol dependence, malnutrition, diabetes mellitus, HIV infection (risk of peripheral neuritis); acute porphyria (section 9.8.2); interactions: Appendix 1 (isoniazid)

**Hepatic disorders** Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop

**Contra-indications** drug-induced liver disease

**Hepatic impairment** use with caution; monitor liver function regularly and particularly frequently in first 2 months; see also Hepatic Disorders above

**Renal impairment** risk of otoxicity and peripheral neuropathy; prophylactic pyridoxine recommended, see notes above

**Pregnancy** not known to be harmful; prophylactic pyridoxine recommended; see also p. 391

**Breast-feeding** amount too small to be harmful; see also p. 391

**Side-effects** optic neuritis, red/green colour blindness, peripheral neuritis, rarely rash, pruritus, urticaria, thrombocytopenia

**Dose**
- Note ‘Peak’ concentration (2–2.5 hours after dose) should be 2–6 mg/litre (7–22 micromol/litre), ‘trough’ (pre-dose) concentration should be less than 1 mg/litre (4 micromol/litre); see Renal Impairment above

**Isoniazid**

**Indications** tuberculosis, in combination with other drugs; prophylaxis—Table 2, section 5.1

**Cautions** see Monitoring in notes above; also slow acetylator status (increased risk of side-effects); epilepsy; history of psychosis; alcohol dependence, malnutrition, diabetes mellitus, HIV infection (risk of peripheral neuritis); acute porphyria (section 9.8.2); interactions: Appendix 1 (isoniazid)

**Contra-indications** optic neuritis, red/green colour blindness, peripheral neuritis, rarely rash, pruritus, urticaria, thrombocytopenia

**Dose**
- Note ‘Peak’ concentration (2–2.5 hours after dose) should be 2–6 mg/litre (7–22 micromol/litre), ‘trough’ (pre-dose) concentration should be less than 1 mg/litre (4 micromol/litre); see Renal Impairment above

**Ethambutol (Non-proprietary)**

**Tablets**, ethambutol hydrochloride 100 mg, net price 56-tab pack = £42.74. Label: 8
5.1.9 Antituberculosis drugs

**PYRAZINAMIDE**

**Indications** tuberculosis in combination with other drugs

**Cautions** see Monitoring in notes above; also diabetes; gout (avoid in acute attack); **interactions:** Appendix 1 (pyrazinamide)

**Hepatic disorders** Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop

**Hepatic impairment** monitor hepatic function—idiosyncratic hepatotoxicity more common; avoid in severe hepatic impairment; see also Hepatic Disorders above

**Renal impairment** monitor for gout; 25–30 mg/kg 3 times a week if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk; see also p. 391

**Breast-feeding** amount too small to be harmful; see also p. 391

**Side-effects** hepatotoxicity including fever, anorexia, hepatomegaly, splenomegaly, jaundice, liver failure; nausea, vomiting, flushing, dysuria, arthralgia, sideroblastic anaemia, thrombocytopenia, rash and occasionally photosensitivity

**Dose**
- See notes above

**Zinamide** (Genus) ® Tablets, scored, pyrazinamide 500 mg. net price 30-tab pack = £31.35. Label: 8

**RIFAMPICIN**

**Indications** see under Dose

**Cautions** see Monitoring in notes above; also liver function tests and blood counts in hepatic disorders, alcohol dependence, and on prolonged therapy, see also below; **important:** effectiveness of hormonal contraception is reduced and alternative family planning advice should be offered (see also section 7.3.1); discoulours soft contact lenses; see also notes above; **interactions:** Appendix 1 (rifampicins)

**Note** If treatment interrupted re-introduce with low dosage and increase gradually; discontinue permanently if serious side-effects develop

**Hepatic disorders** Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop

**Contra-indications** jaundice; rifamycin hypersensitivity; acute porphyria (section 9.8.2)

**Hepatic impairment** impaired elimination; monitor liver function; avoid or do not exceed 8 mg/kg daily; see also Cautions above

**Renal impairment** use with caution if dose above 600 mg daily

**Pregnancy** manufacturers advise very high doses teratogenic in animal studies in first trimester; risk of neonatal bleeding may be increased in third trimester; see also p. 391

**Breast-feeding** amount too small to be harmful; see also p. 391

**Side-effects** gastro-intestinal symptoms including anorexia, nausea, vomiting, diarrhoea (antibiotic-associated colitis reported); headache, drowsiness; those occurring mainly on intermittent therapy include influenza-like symptoms (with chills, fever, dizziness, bone pain), respiratory symptoms (including shortness of breath), collapse and shock, haemolytic anaemia, thrombocytopenic purpura, disseminated intravascular coagulation, and acute renal failure; alterations of liver function, jaundice, flushing, urticaria, and rashes; other side-effects reported include oedema, psychoses, adrenal insufficiency, muscular weakness and myopathy, exfoliative dermatitis, toxic epidermal necrolysis, Stevens-Johnson syndrome, pemphigoid reactions, leucopenia, eosinophilia, menstrual disturbances; urine, saliva, and other body secretions coloured orange-red; also reported hepatitis, influenza-like symptoms, chest pain, dyspnoea

**Dose**
- Prophylaxis of *Mycobacterium avium* complex infections in immunosuppressed patients with low CD4 count (see product literature), 300 mg daily as a single dose
- Treatment of non-tuberculous mycobacterial disease, in combination with other drugs, 450–600 mg daily as a single dose for up to 6 months after cultures negative
- Treatment of pulmonary tuberculosis, in combination with other drugs, 150–450 mg daily as a single dose for at least 6 months
- **CHILD** not recommended

**Mycobutin® (Pharmacia)** ® Capsules, red-brown, rifabutin 150 mg. Net price 30-cap pack = £90.38. Label: 8, 14, counselling, lenses, see under Rifampicin

**RIFABUTIN**

**Indications** see under Dose

**Cautions** see Monitoring in notes above; also liver function tests and blood counts in hepatic disorders, alcohol dependence, and on prolonged therapy, see also below; **important:** effectiveness of hormonal contraception is reduced and alternative family planning advice should be offered (see also section 7.3.1); discoulours soft contact lenses; see also notes above; **interactions:** Appendix 1 (rifampicins)

**Note** If treatment interrupted re-introduce with low dosage and increase gradually; discontinue permanently if serious side-effects develop

**Hepatic disorders** Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop

**Contra-indications** jaundice; rifamycin hypersensitivity; acute porphyria (section 9.8.2)

**Hepatic impairment** impaired elimination; monitor liver function; avoid or do not exceed 8 mg/kg daily; see also Cautions above

**Renal impairment** use with caution if dose above 600 mg daily

**Pregnancy** manufacturers advise very high doses teratogenic in animal studies in first trimester; risk of neonatal bleeding may be increased in third trimester; see also p. 391

**Breast-feeding** amount too small to be harmful; see also p. 391

**Side-effects** gastro-intestinal symptoms including anorexia, nausea, vomiting, diarrhoea (antibiotic-associated colitis reported); headache, drowsiness; those occurring mainly on intermittent therapy include influenza-like symptoms (with chills, fever, dizziness, bone pain), respiratory symptoms (including shortness of breath), collapse and shock, haemolytic anaemia, thrombocytopenic purpura, disseminated intravascular coagulation, and acute renal failure; alterations of liver function, jaundice, flushing, urticaria, and rashes; other side-effects reported include oedema, psychoses, adrenal insufficiency, muscular weakness and myopathy, exfoliative dermatitis, toxic epidermal necrolysis, Stevens-Johnson syndrome, pemphigoid reactions, leucopenia, eosinophilia, menstrual disturbances; urine, saliva, and other body secretions coloured orange-red; also reported hepatitis, influenza-like symptoms, chest pain, dyspnoea

**Dose**
- Brucellosis, legionnaires’ disease, endocarditis and serious staphylococcal infections, in combination with other drugs, by mouth or by intravenous infusion, 0.6–1.2 g daily (in 2–4 divided doses)
- Tuberculosis, in combination with other drugs, see notes above
**5.1.10 Antileprotic drugs**

Advice from a member of the Panel of Leprosy Opinion is essential for the treatment of leprosy (Hansen’s disease). Details can be obtained from the Hospital for Tropical Diseases, London (telephone (020) 3456 7890). The World Health Organization has made recommendations to overcome the problem of dapsone resistance and to prevent the emergence of resistance to other antileprotic drugs. Drugs recommended are dapsone, rifampicin (section 5.1.9), and clofazimine. Other drugs with significant activity against Mycobacterium leprae include ofloxacin, minocycline and clarithromycin, but none of these are as active as rifampicin; at present they should be reserved as second-line drugs for leprosy.

A three-drug regimen is recommended for **multibacillary leprosy** (lepromatous, borderline-lepromatous, and borderline leprosy) and a two-drug regimen for **pauicibacillary leprosy** (borderline-tuberculoid, tuberculoid, and indeterminate). The following regimens are widely used throughout the world (with minor local variations):

**Multibacillary leprosy (3-drug regimen)**

<table>
<thead>
<tr>
<th>Drug</th>
<th>Dosage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rifampicin</td>
<td>600 mg once-monthly, supervised (450 mg/adults weighing less than 35 kg)</td>
</tr>
<tr>
<td>Dapsone</td>
<td>100 mg daily, self-administered (50 mg daily or 1–2 mg/kg daily for adults weighing less than 35 kg)</td>
</tr>
<tr>
<td>Clofazimine</td>
<td>300 mg once-monthly, supervised, and 50 mg daily (or 100 mg on alternate days), self-administered</td>
</tr>
</tbody>
</table>

Multibacillary leprosy should be treated for at least 2 years. Treatment should be continued unchanged during both type I (reversal) or type II (erythema nodosum leprous) reactions. During reversal reactions neuritic pain or weakness can herald the rapid onset of perma-
Dapsone

Indications  leprosy, dermatitis herpetiformis; Pneumocystis jirovecii (Pneumocystis carinii) pneumonia (section 5.4.8)

Cautions  cardiac or pulmonary disease; anaemia (treat severe anaemia before starting); susceptibility to haemolysis including G6PD deficiency (section 9.1.5); avoid in acute porphyria (section 9.8.2); interactions: Appendix 1 (dapsone)

Blood disorders  On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop

Pregnancy  folic acid 5 mg daily should be given to mother throughout pregnancy; neonatal haemolysis and methaemoglobinemia reported in third trimester

Breast-feeding  haemolytic anaemia; although significant amount in milk, risk to infant very small unless infant is G6PD deficient

Side-effects  (dose-related and uncommon at doses used for leprosy), haemolysis, methaemoglobinemia, neuropathy, allergic dermatitis (rarely including toxic epidermal necrolysis and Stevens-Johnson syndrome), anorexia, nausea, vomiting, tachycardia, headache, insomnia, psychosis, hepatitis, agranulocytosis; dapsone syndrome (rash with fever and eosinophilia)—discontinue immediately (may progress to exfoliative dermatitis, hepatitis, hypoa-lbuminemia, psychosis and death)

Dose  • Leprosy, 1–2 mg/kg daily, see notes above • Dermatitis herpetiformis, see specialist literature

Dapsone (Non-proprietary) (PS)

Tablets, dapsone 50 mg, net price 28-tab pack = £46.69; 100 mg, 28-tab pack = £92.70 Label: 8

CLOFAZIMINE

Indications  leprosy

Cautions  may discolor soft contact lenses; avoid if persistent abdominal pain and diarrhoea

Hepatic impairment  use with caution

Renal impairment  use with caution

Pregnancy  use with caution

Breast-feeding  may alter colour of milk; skin discoloration of infant

Side-effects  nausea, vomiting (hospitalise if persistent), abdominal pain; headache, tiredness; brownish-black discoloration of lesions and skin including areas exposed to light; reversible hair discoloration; dry skin; red discoloration of faeces, urine and other body fluids; also rash, pruritus, photosensitivity, acne-like eruptions, anorexia, eosinophilic enteropathy, bowel obstruction, dry eyes, dimmed vision, macular and subepithelial corneal elevation; penetration of blood sugar, weight loss, splenic infarction, lymphadenopathy

Dose  • Leprosy, see notes above  • Lepromatous lepra reactions, dosage increased to 300 mg daily for max. of 3 months

Clofazimine (Non-proprietary) (PS)

Capsules, clofazimine 100 mg. Label: 8, 14, 21 Available on named-patient basis

Metronidazole and tinidazole

Metronidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa; indications include trichomonal vaginitis (section 5.4.3), bacterial vaginosis (notably Gardnerella vaginalis infections), and Entamoeba histolytica and Giardia lamblia infections (section 5.4.2). It is also used for surgical and gynaecological sepsis in which its activity against colonic anaerobes, especially Bacteroides fragilis, is important. Metronidazole by the rectal route is an effective alternative to the intravenous route when oral administration is not possible. Intravenous metronidazole is used for the treatment of established cases of tetanus; diazepam (section 10.2.2) and tetanus immunoglobulin (section 14.5.2) are also used.

Metronidazole by mouth is effective for the treatment of Clostridium difficile infection , see also section 1.5; it can be given by intravenous infusion if oral treatment is inappropriate.

Topical metronidazole (section 13.10.1.2) reduces the odour produced by anaerobic bacteria in fungating tumours; it is also used in the management of rosacea (section 13.6).

Tinidazole is similar to metronidazole but has a longer duration of action.

Oral infections  Metronidazole is an alternative to a penicillin for the treatment of many oral infections where the patient is allergic to penicillin or the infection is due to beta-lactamase-producing anaerobes (Table 1, section 5.1). It is the drug of first choice for the treatment of acute necrotising ulcerative gingivitis (Vincent’s infection) and pericoronitis; amoxicillin is a suitable alternative (section 5.1.1.3). For these purposes metronidazole in a dose of 200 mg 3 times daily for 3 days is sufficient, but the duration of treatment may need to be...
longer in pericoronitis. Tinidazole is licensed for the treatment of acute ulcerative gingivitis.

### METRONIDAZOLE

**Indications** anaerobic infections (including dental), see under Dose below; protozoal infections (section 5.4.2); *Helicobacter pylori* eradication (section 1.3); fistulating Crohn’s disease (section 1.5); skin (section 13.10.1.2)

**Cautions** disulfiram-like reaction with alcohol; clinical and laboratory monitoring advised if treatment exceeds 10 days; interactions: Appendix 1 (metronidazole)

**Hepatic impairment** in severe liver disease reduce total daily dose to one-third, and give once daily; use with caution in hepatic encephalopathy

**Pregnancy** manufacturer advises avoidance of high-dose regimens

**Breast-feeding** significant amount in milk; manufacturer advises avoid large single doses

**Side-effects** gastrointestinal disturbances (including nausea and vomiting), taste disturbances, furred tongue, oral mucositis, anorexia; very rarely hepatitis, jaundice, pancreatitis, drowsiness, dizziness, headache, ataxia, psychotic disorders, darkening of urine, optic neuropathy and leucopenia; also reported aseptic meningitis, peripheral neuropathy, transient epileptiform seizures, visual disturbances, rash, pruritus, and erythema multiforme; on prolonged or intensive therapy peripheral neuropathy, transient epiliditif seizures, and leucopenia; also reported aseptic meningitis, optic neuropathy

**Dose**
- Anaerobic infections (usually treated for 7 days and for 10–14 days in *Clostridium difficile* infection), by mouth, either 400 mg every 8 hours or 500 mg every 8 hours, CHILD 1–2 months 7.5 mg/kg every 12 hours, 2 months–12 years 7.5 mg/kg (max. 400 mg) every 8 hours; by rectum, 1 g every 8 hours for 3 days, then 1 g every 12 hours, CHILD every 8 hours for 3 days, then every 12 hours, 1 month–1 year 125 mg, 1–5 years 250 mg, 5–10 years 500 mg, over 10 years, adult dose; by intravenous infusion over 20 minutes, 500 mg every 8 hours; CHILD under 18 years see BNF for Children
- Leg ulcers and pressure sores, by mouth, 400 mg every 8 hours for 7 days
- Bacterial vaginosis, by mouth, 400–500 mg twice daily for 5–7 days or 2 g as a single dose
- Pelvic inflammatory disease (see also Table 1, section 5.1), by mouth, 400 mg twice daily for 14 days; CHILD 12–18 years see BNF for Children
- Acute ulcerative gingivitis, by mouth, 200–250 mg every 8 hours for 3 days; CHILD 1–3 years 50 mg every 8 hours for 3 days; 3–7 years 100 mg every 12 hours; 7–10 years 100 mg every 8 hours
- Acute oral infections, by mouth, 200 mg every 8 hours for 3–7 days (see also notes above); CHILD 1–3 years 50 mg every 8 hours for 3–7 days; 3–7 years 100 mg every 12 hours; 7–10 years 100 mg every 8 hours
- Surgical prophylaxis, by mouth, 400–500 mg 2 hours before surgery; up to 3 further doses of 400–500 mg may be given every 8 hours for high-risk procedures; CHILD 1 month–18 years see BNF for Children
- By rectum, 1 g 2 hours before surgery; up to 3 further doses of 1 g may be given every 8 hours for high-risk procedures; CHILD 5–18 years see BNF for Children
- By intravenous infusion (if rectal administration inappropriate), 500 mg up to 30 minutes before the procedure; up to 3 further doses of 500 mg may be given every 8 hours for high-risk procedures; CHILD under 18 years see BNF for Children

**Note** Tinidazole doses in BNF may differ from those in product literature

**Metronidazole** (Non-proprietary) Tablets, metronidazole 200 mg, net price 21-tab pack = £1.13; 400 mg, 21-tab pack = £1.21. Label: 4, 9, 21, 25, 27

Brands include Vagisyl

**Dental prescribing on NHS** Metronidazole Tablets may be prescribed

**Tablets**
- metronidazole 500 mg, net price 21-tab pack = £3.75. Label: 4, 9, 21, 25, 27
- Dental prescribing on NHS Metronidazole Tablets may be prescribed

**Suspension**
- metronidazole (as benzoate) 200 mg/5 mL. Net price 100 mL = £28.63. Label: 4, 9
- Brands include Norzol

**Flagyl** (Zentiva) Tablets, both f/c, ivory, metronidazole 200 mg, net price 21-tab pack = £4.49; 400 mg, 14-tab pack = £6.34. Label: 4, 9, 21, 25, 27

**Suppositories**
- metronidazole 500 mg, net price 10 = £15.18; 1 g, 10 = £23.06. Label: 4, 9

**Metrol®** (Sandoz) Tablets, both f/c, ivory, metronidazole 200 mg, net price 21-tab pack = £4.49; 400 mg, 14-tab pack = £6.34. Label: 4, 9, 21, 25, 27

**Susppositories**
- metronidazole 500 mg, net price 10 = £12.34; 1 g, 10 = £18.34. Label: 4, 9

### TINIDAZOLE

**Indications** anaerobic infections, see under Dose below; protozoal infections (section 5.4.2); *Helicobacter pylori* eradication (section 1.3)

**Cautions** see under Metronidazole; avoid in acute porphyria (section 9.8.2); interactions: Appendix 1 (tinidazole)

**Pregnancy** manufacturer advises avoid in first trimester

**Breast-feeding** present in milk—manufacturer advises avoid breast-feeding during and for 3 days after stopping treatment

**Side-effects** see under Metronidazole

**Dose**
- Anaerobic infections, 2 g initially, followed by 1 g daily or 500 mg twice daily, usually for 5–6 days
- Bacterial vaginosis and acute ulcerative gingivitis, a single 2-g dose
- Abdominal surgery prophylaxis, a single 2-g dose approximately 12 hours before surgery

**Fasigyn** (Pfizer) Tablets, f/c, tinidazole 500 mg. Net price 16-tab pack = £11.04. Label: 4, 9, 21, 25
Nalidixic acid and norfloxacin are effective in uncomplicated urinary-tract infections (section 5.1.13).

Ciprofloxacin is active against both Gram-positive and Gram-negative bacteria. It is particularly active against Gram-negative bacteria, including salmonella, shigella, campylobacter, neisseria, and pseudomonas. Ciprofloxacin has only moderate activity against Gram-positive bacteria such as Streptococcus pneumoniae and Enterococcus faecalis; it should not be used for pneumococcal pneumonia. It is active against chlamydia and some mycobacteria. Most anaerobic organisms are not susceptible. Ciprofloxacin can be used for respiratory tract infections (but not for pneumococcal pneumonia), urinary-tract infections (section 5.1.13), infections of the gastro-intestinal system (including typhoid fever), bone and joint infections, gonorrhoea and septicaemia caused by sensitive organisms.

Ofloxacin is used for urinary-tract infections (section 5.1.13), lower respiratory-tract infections, gonorrhoea, and non-gonococcal urethritis and cervicitis.

Levofloxacin is active against Gram-positive and Gram-negative organisms. It has greater activity against pneumococci than ciprofloxacin. Levofloxacin is licensed for the treatment of acute sinusitis, acute exacerbations of chronic bronchitis, and community-acquired pneumonia, but it should only be considered for these infections when first-line treatment cannot be used or is ineffective. Levofloxacin is also licensed for the treatment of urinary-tract infections (section 5.1.13).

Although ciprofloxacin, levofloxacin, moxifloxacin, and ofloxacin are licensed for skin and soft-tissue infections, many staphylococci are resistant to the quinolones and their use should be avoided in MRSA infections.

Moxifloxacin should be reserved for the treatment of sinusitis, community-acquired pneumonia, exacerbations of chronic bronchitis, mild to moderate pelvic inflammatory disease, or complicated skin and soft-tissue infections which have failed to respond to other antibacterials or for patients who cannot be treated with other antibacterials. It has been associated with QT interval prolongation and life-threatening hepatotoxicity. Moxifloxacin is active against Gram-positive and Gram-negative organisms. It has greater activity against Gram-positive organisms, including pneumococci, than ciprofloxacin. Moxifloxacin is not active against Pseudomonas aeruginosa or meticillin-resistant Staphylococcus aureus (MRSA).

**Anthrax** Inhalation or gastro-intestinal anthrax should be treated initially with either ciprofloxacin [not licensed for gastro-intestinal anthrax] or doxycycline [unlicensed indication] (section 5.1.3) combined with one or two other antibacterials (such as amoxicillin, benzylpenicillin, chloramphenicol, clarithromycin, clindamycin, imipenem with cilastatin, rifampicin [unlicensed indication], and vancomycin). When the condition improves and the sensitivity of the Bacillus anthracis strain is known, treatment may be switched to a single antibacterial. Treatment should continue for 60 days because germination may be delayed.

Cutaneous anthrax should be treated with either ciprofloxacin [unlicensed indication] or doxycycline [unlicensed indication] (section 5.1.3) for 7 days. Treatment may be switched to amoxicillin (section 5.1.1.3) if the infecting strain is susceptible. Treatment may need to be extended to 60 days if exposure is due to aerosol. A combination of antibacterials for 14 days is recommended for cutaneous anthrax with systemic features, extensive oedema, or lesions of the head or neck.

Ciprofloxacin or doxycycline may be given for post-exposure prophylaxis. If exposure is confirmed, antibacterial prophylaxis should continue for 60 days. Antibacterial prophylaxis may be switched to amoxicillin after 10–14 days if the strain of *B. anthracis* is susceptible. Vaccination against anthrax (section 14.4) may allow the duration of antibacterial prophylaxis to be shortened.

**Cautions** Quinolones should be used with caution in patients with a history of epilepsy or conditions that predispose to seizures, in G6PD deficiency (section 9.1.5), myasthenia gravis (risk of exacerbation), and in children or adolescents (arthropathy has developed in weight-bearing joints in young animals—see below). Exposure to excessive sunlight should be avoided (discontinue if photosensitivity occurs). Quinolones can prolong the QT interval. Moxifloxacin is contra-indicated in patients with risk factors for QT interval prolongation (e.g. electrolyte disturbances, acute myocardial infarction, heart failure with reduced left ventricular ejection fraction, bradycardia, congenital long QT syndrome, concomitant use with other drugs known to prolong the QT interval, history of symptomatic arrhythmias) and the other quinolones should be used with caution in these patients. The CSM has warned that quinolones may induce convulsions in patients with or without a history of convulsions; taking NSAIDs at the same time may also induce them. Other interactions: Appendix 1 (quinolones).

**Use in children** Quinolones cause arthropathy in the weight-bearing joints of immature animals and are therefore generally not recommended in children and growing adolescents. However, the significance of this effect in humans is uncertain and in some specific circumstances short-term use of either ciprofloxacin or nalidixic acid may be justified in children. For further details see BNF for Children.

**Tendon damage** Tendon damage (including rupture) has been reported rarely in patients receiving quinolones. Tendon rupture may occur within 48 hours of starting treatment; cases have also been reported several months after stopping a quinolone. Healthcare professionals are reminded that:

- quinolones are contra-indicated in patients with a history of tendon disorders related to quinolone use;
- patients over 60 years of age are more prone to tendon damage;
- the risk of tendon damage is increased by the concomitant use of corticosteroids;
- if tendinitis is suspected, the quinolone should be discontinued immediately.

**Contra-indications** Quinolone hypersensitivity. See also Cautions above.

**Pregnancy** Quinolones should be avoided in pregnancy because they have been shown to cause arthropathy in animal studies; safer alternatives are available; however, a single dose of ciprofloxacin may be used for the prevention of a secondary case of meningococcal meningitis

**Side-effects** Side-effects of the quinolones include nausea, vomiting, diarrhoea (rarely antibiotic-associated...
coliitis), headache, and dizziness. Less frequent side-effects include dyspepsia, abdominal pain, anorexia, sleep disturbances, asthenia, confusion, anxiety, depression, hallucinations, tremor, blood disorders (including eosinophilia, leucopenia, thrombocytopenia), arthralgia, myalgia, rash (very rarely Stevens-Johnson syndrome and toxic epidermal necrolysis), disturbances in vision and taste. Other side-effects reported rarely or very rarely include hepatic dysfunction (including jaundice and hepatitis), hypotension, vasculitis, dysphonia (more frequent with levofloxacin and moxifloxacin), convulsions, psychoses, symptoms of peripheral neuropathy (sometimes irreversible), renal failure, interstitial nephritis, tendon inflammation and damage (see also Tendon Damage above), photosensitivity, disturbances in hearing and smell. The drug should be discontinued if psychiatric, neurological or hypersensitivity reactions (including severe rash) occur.

**CIPROFLOXACIN**

**Indications** see notes above and under Dose; fistulating Crohn’s disease (section 1.5); eye infections (section 11.3.1)

**Cautions** see notes above; avoid excessive alkalinity of urine and ensure adequate fluid intake (risk of crystalluria); interactions: Appendix 1 (quinolones)

**Driving** May impair performance of skilled tasks (e.g. driving); effects enhanced by alcohol

**Contra-indications** see notes above

**Renal impairment** by mouth, 250–500 mg every 12 hours if eGFR 30–60 mL/minute/1.73 m² (every 24 hours if eGFR less than 30 mL/minute/1.73 m²); by intravenous infusion (200 mg over 30 minutes), 200–400 mg every 12 hours if eGFR 30–60 mL/minute/1.73 m² (every 24 hours if eGFR less than 30 mL/minute/1.73 m²)

**Pregnancy** see notes above

**Breast-feeding** amount too small to be harmful but manufacturer advises avoid

**Side-effects** see notes above; also flatulence, pain and phlebitis at injection site; rarely dysphagia, pancreatitis, chest pain, tachycardia, syncope, oedema, hot flushes, abnormal dreams, sweating, hyperglycaemia, hypoglycaemia, and erythema nodosum; very rarely movement disorders, tinnitus, intracranial hypertension, and tenosynovitis; also reported peripheral neuropathy and polyneuropathy

**Dose**

- **By mouth**, respiratory-tract infections, 500–750 mg twice daily (750 mg twice daily in pseudomonal lower respiratory-tract infection in cystic fibrosis)
- Urinary-tract infections, 250–750 mg twice daily (250 mg twice daily for 3 days usually adequate for acute uncomplicated cystitis in women)
- Acute or chronic prostatitis, 500 mg twice daily for 28 days
- Gonorrhoea (see also Table 1, section 5.1), 500 mg as a single dose
- Most other infections, 500 mg twice daily (increased to 750 mg twice daily in severe or deep-seated infection)
- Surgical prophylaxis [unlicensed], 750 mg 60 minutes before procedure
- Prophylaxis of meningococcal meningitis, Table 2, section 5.1
- **By intravenous infusion** over 60 minutes, 400 mg every 8–12 hours

- Anthrax (treatment and post-exposure prophylaxis, see notes above), by mouth, 500 mg twice daily
  - **By intravenous infusion** over 60 minutes, 400 mg every 12 hours
- **CHILD** under 18 years see BNF for Children

**Ciprofloxacin** (Non-proprietary) (MF)

**Tablets**, ciprofloxacin (as hydrochloride) 100 mg, net price 6-tab pack = £1.26; 250 mg, 10-tab pack = 84p, 20-tab pack = £1.48; 500 mg, 10-tab pack = 98p; 20-tab pack = £1.47; 750 mg, 10-tab pack = £8.90. Label: 7, 9, 25, counselling, driving

**Intravenous infusion**, ciprofloxacin (as lactate) 2 mg/mL, net price 50-mL bottle = £7.57, 100-mL bottle = £14.49, 200-mL bottle = £19.79

**Ciproxin®** (Bayer) (MF)

**Tablets**, all f/c, ciprofloxacin (as hydrochloride) 250 mg (scored), net price 10-tab pack = £6.59; 500 mg (scored), 10-tab pack = £12.49; 750 mg, 10-tab pack = £17.78. Label: 7, 9, 25, counselling, driving

**Suspension**, strawberry-flavoured, ciprofloxacin for reconstitution with diluent provided, 250 mg/5 mL, net price 100 mL = £19.80. Label: 7, 9, 25, counselling, driving

**Intravenous infusion**, ciprofloxacin (as lactate) 2 mg/mL, in sodium chloride 0.9%, net price 50-mL bottle = £7.61, 100-mL bottle = £15.01, 200-mL bottle = £22.85

**Electrolytes** Na⁺ 15.4 mmol/100-mL bottle

---

**LEVOFLOXACIN**

**Indications** see notes above and under Dose

**Cautions** see notes above; history of psychiatric illness; interactions: Appendix 1 (quinolones)

**Driving** May impair performance of skilled tasks (e.g. driving)

**Contra-indications** see notes above

**Renal impairment** usual initial dose then use half normal dose if eGFR 20–50 mL/minute/1.73 m²; consult product literature if eGFR less than 20 mL/minute/1.73 m²

**Pregnancy** see notes above

**Breast-feeding** manufacturer advises avoid

**Side-effects** see notes above; also flatulence, constipation, hyperhidrosis; rarely tachycardia, palpitation, abnormal dreams, tinnitus, hypoglycaemia; also reported potentially life-threatening hepatic failure, syncope, benign intracranial hypertension, pneumonitis, peripheral neuropathy, extrapyramidal symptoms, hyperglycaemia, rhombomylolysis, stomatitis; local reactions and transient hypotension reported with infusion

**Dose**

- **By mouth**, acute sinusitis, 500 mg once daily for 10–14 days
- Acute exacerbation of chronic bronchitis, 500 mg once daily for 7–10 days
- Community-acquired pneumonia, 500 mg once or twice daily for 7–14 days
- Urinary-tract infections, 500 mg once daily for 7–14 days (250 mg once daily for 3 days in uncomplicated infection)
- Chronic prostatitis, 500 mg once daily for 28 days
- Complicated skin and soft tissue infections, 500 mg once or twice daily for 7–14 days
- Inhalation anthrax (treatment and post-exposure prophylaxis, see notes above), by mouth, 500 mg twice daily
  - **By intravenous infusion** over 60 minutes, 400 mg every 12 hours
- **CHILD** under 18 years see BNF for Children

**Ciprofloxacin** (Non-proprietary) (MF)

**Tablets**, ciprofloxacin (as hydrochloride) 100 mg, net price 6-tab pack = £1.26; 250 mg, 10-tab pack = 84p, 20-tab pack = £1.48; 500 mg, 10-tab pack = 98p; 20-tab pack = £1.47; 750 mg, 10-tab pack = £8.90. Label: 7, 9, 25, counselling, driving

**Intravenous infusion**, ciprofloxacin (as lactate) 2 mg/mL, net price 50-mL bottle = £7.57, 100-mL bottle = £14.49, 200-mL bottle = £19.79

**Ciproxin®** (Bayer) (MF)

**Tablets**, all f/c, ciprofloxacin (as hydrochloride) 250 mg (scored), net price 10-tab pack = £6.59; 500 mg (scored), 10-tab pack = £12.49; 750 mg, 10-tab pack = £17.78. Label: 7, 9, 25, counselling, driving

**Suspension**, strawberry-flavoured, ciprofloxacin for reconstitution with diluent provided, 250 mg/5 mL, net price 100 mL = £19.80. Label: 7, 9, 25, counselling, driving

**Intravenous infusion**, ciprofloxacin (as lactate) 2 mg/mL, in sodium chloride 0.9%, net price 50-mL bottle = £7.61, 100-mL bottle = £15.01, 200-mL bottle = £22.85

**Electrolytes** Na⁺ 15.4 mmol/100-mL bottle
5 Infections

- **Levofloxacin (Non-proprietary) (BNF 68)**
  
  Tablets, yellow-red, 1/5, scored, levofloxacin 250 mg, net price 5-tab pack = £14.45; 500 mg, 5-tab pack = £22.85. Label: 6, 9, 25.

- **Tavanic**
  
  Tablets, red, 1/5, 100 mg, net price 5-tab pack = £10.79; 500 mg, 5-tab pack = £16.13. Label: 6, 9, 25.

- **Avelox® (Sanofi-Aventis) (BNF 58)**
  
  Tablets, red, 1/5, moxifloxacin (as hydrochloride) 400 mg, net price 5-tab pack = £12.43. Label: 6, 9.

### 400 5.1.12 Quinolones BNF 68

**Indications**

- Sinusitis, community-acquired pneumonia, exacerbations of chronic bronchitis, mild to moderate pelvic inflammatory disease, or complicated skin and soft-tissue infections which have failed to respond to other antibacterials or for patients who cannot be treated with other antibacterials.

**Dose**

- **By mouth**
  
  400 mg once daily

- **By intravenous infusion**
  
  500 mg once daily

**Note**

- Recommended duration of treatment is 7–14 days for community-acquired pneumonia, 5–10 days in exacerbations of chronic bronchitis, 7 days in sinusitis, 14 days in pelvic inflammatory disease, 7–21 days for complicated skin and soft-tissue infections.

**Contra-indications**

- Severe impairment

**Cautions**

- Contains Nalidixic Acid

- Use with caution; avoid if eGFR less than 20 mL/minute/1.73 m².

**Excipients**

- Include sucrose 450 mg/5 mL

### NALIDIXIC ACID

**Indications**

- Urinary-tract infections

**Dose**

- 900 mg every 6 hours for 7 days, reduced in chronic infections to 600 mg every 6 hours; CHILD 3 months–18 years see BNF for Children

**Side-effects**

- Very rarely haemolytic anaemia reported

**Contra-indications**

- Severe impairment

**Cautions**

- Contains Nalidixic Acid

- Use with caution; avoid if eGFR less than 20 mL/minute/1.73 m².

**Excipients**

- Include sucrose 450 mg/5 mL
Norfloxacin (Non-proprietary) Tablets, norfloxacin 400 mg, net price 6-tab pack = £5.40, 14-tab pack = £12.00. Label: 7, 9, 23, counselling, driving

**OFLOXACIN**

**Indications** see under Dose

**Cautions** see notes above; history of psychiatric illness; 

**Driving** May affect performance of skilled tasks (e.g. driving); effects enhanced by alcohol

**Contra-indications** see notes above

**Hepatic impairment** use with caution; elimination may be reduced in severe impairment

**Renal impairment** usual initial dose, then use half normal dose if eGFR 20–50 mL/minute/1.73 m²; 100 mg every 24 hours if eGFR less than 20 mL/minute/1.73 m²

**Pregnancy** see notes above

**Breast-feeding** amount probably too small to be harmful but manufacturer advises avoid

**Side-effects** see notes above; also cough, nasopharyngitis, eye irritation; rarely arrhythmias, bronchospasm, abnormal dreams, hot flushes, hyperhidrosis; very rarely neuropathy, extrapyramidal symptoms, tinnitus; also reported pneumonitis, changes in blood sugar, myopathy, rhabdomyolysis; on intravenous infusion, hypotension and local reactions (including thrombophlebitis)

**Dose**

- **By mouth**, urinary-tract infections, 200–400 mg daily preferably in the morning, increased if necessary in upper urinary-tract infections to 400 mg twice daily. Acute or chronic prostatitis, 200 mg twice daily for 28 days. Lower respiratory-tract infections, 400 mg daily preferably in the morning, increased if necessary to 400 mg twice daily. Skin and soft-tissue infections, 400 mg twice daily. Uncomplicated gonorrhoea, 400 mg as a single dose. Uncomplicated genital chlamydial infection, non-gonococcal urethritis, 400 mg daily in single or divided doses for 7 days. Pelvic inflammatory disease (see also section 5.1, table 1), 400 mg twice daily for 14 days.

- **By intravenous infusion** (over at least 30 minutes for each 200 mg), complicated urinary-tract infection, 200 mg daily. Lower respiratory-tract infection, 200 mg twice daily. Septicaemia, 200 mg twice daily. Skin and soft-tissue infections, 400 mg twice daily. Severe or complicated infections, dose may be increased to 400 mg twice daily.

**Olofaxin** (Non-proprietary) Tablets, ofloxacin 200 mg, net price 10-tab pack = £7.64; 400 mg, 5-tab pack = £12.67; 10-tab pack = £4.59. Label: 6, 9, 11, counselling, driving

**Tarivid** (Sanofi-Aventis) Tablets, E/C, scored, ofloxacin 200 mg, net price 10-tab pack = £7.53; 20-tab pack = £15.05; 400 mg (yellow), 5-tab pack = £7.52; 10-tab pack = £14.99. Label: 6, 9, 11, counselling, driving

**Intravenous infusion**, ofloxacin (as hydrochloride) 2 mg/mL, net price 100-mL bottle = £16.16 (hosp. only)

5.1.13 Urinary-tract infections

Urinary-tract infection is more common in women than in men; when it occurs in men there is frequently an underlying abnormality of the renal tract. Recurrent episodes of infection are an indication for radiological investigation especially in children in whom untreated pyelonephritis may lead to permanent kidney damage. *Escherichia coli* is the most common cause of urinary-tract infection. *Staphylococcus saprophyticus* is also common in sexually active young women. Less common causes include Proteus and Klebsiella spp. *Pseudomonas aeruginosa* infections usually occur in the hospital setting and may be associated with functional or anatomical abnormalities of the renal tract. *Staphylococcus epidermidis* and *Enterococcus faecalis* infection may complicate catheterisation or instrumentation.

A specimen of urine should be collected for culture and sensitivity testing before starting antibacterial therapy;

- in men;
- in pregnant women;
- in children under 3 years of age;
- in patients with suspected upper urinary-tract infection, complicated infection, or recurrent infection;
- if resistant organisms are suspected;
- if urine dipstick testing gives a single positive result for leucocyte esterase or nitrite;
- if clinical symptoms are not consistent with results of dipstick testing.

Treatment should not be delayed while waiting for results. The antibacterial chosen should reflect current local bacterial sensitivity to antibacterials.

Uncomplicated lower urinary-tract infections often respond to trimethoprim, nitrofurantoin, or amoxicillin given for 7 days (3 days may be adequate for infections in women; see also Table 1, section 5.1); those caused by fully sensitive bacteria respond to two 3-g doses of amoxicillin (section 5.1.1.3). Widespread bacterial resistance to ampicillin, amoxicillin, and trimethoprim has been reported. Alternatives for resistant organisms include co-amoxiclav (amoxicillin with clavulanic acid), an oral cephalosporin, nitrofurantoin, pivmecillinam, or a quinolone. Fosfomycin [unlicensed] can be used, on the advice of a microbiologist, for the treatment of uncomplicated lower urinary-tract infections caused by multiple-antibacterial resistant organisms when other antibacterials cannot be used; in adults, it is given as a single oral dose of 3 g.

Long-term low dose therapy may be required in selected patients to prevent recurrence of infection; indications include frequent relapses and significant kidney damage. Trimethoprim, nitrofurantoin and cefalexin have been recommended for long-term therapy.

*Methenamine* (hexamine) should not generally be used because it requires an acidic urine for its antimicrobial activity and is ineffective for upper urinary-tract infections; it may, however, have a role in the prophylaxis and treatment of chronic or recurrent uncomplicated lower urinary-tract infections.

*Acute pyelonephritis* can lead to septicemia and is treated initially by injection of a broad-spectrum antibacterial such as cefuroxime or a quinolone if the patient is severely ill; gentamicin can also be used.
Urinary-tract infections in children require prompt antibacterial treatment to minimise the risk of renal scarring. Uncomplicated ‘lower’ urinary-tract infections in children over 3 months of age can be treated with trimethoprim, nitrofurantoin, a first generation cephalosporin (e.g. cefalexin), or amoxicillin for 3 days; children should be reassessed if they continue to be unwell 24–48 hours after the initial assessment. Amoxicillin should only be used if the organism causing the infection is sensitive to it.

Acute pyelonephritis in children over 3 months of age can be treated with a first generation cephalosporin such as cefotaxime, or a broad-spectrum antibacterial such as cefotaxime or co-amoxiclav; gentamicin is an alternative.

Children Urinary-tract infections in children require prompt antibacterial treatment to minimise the risk of renal scarring. Uncomplicated ‘lower’ urinary-tract infections in children over 3 months of age can be treated with trimethoprim, nitrofurantoin, a first generation cephalosporin (e.g. cefalexin), or amoxicillin for 3 days; children should be reassessed if they continue to be unwell 24–48 hours after the initial assessment. Amoxicillin should only be used if the organism causing the infection is sensitive to it.

Acute pyelonephritis in children over 3 months of age can be treated with a first generation cephalosporin such as cefotaxime, or a broad-spectrum antibacterial such as cefotaxime or co-amoxiclav; gentamicin is an alternative.

Children under 3 months of age should be transferred to hospital and treated initially with intravenous antibacterial drugs such as ampicillin with gentamicin, or cefotaxime alone, until the infection responds; full doses of oral antibacterials are then given for a further period. Recurrent episodes of infection are an indication for imaging tests. Antibacterial prophylaxis with low doses of trimethoprim or nitrofurantoin may be considered for children with recurrent infection, significant urinary-tract anomalies, or significant kidney damage.

### Nitrofurantoin

**Indications** urinary-tract infections

**Cautions** anaemia; diabetes mellitus; electrolyte imbalance; vitamin B and folate deficiency; pulmonary disease; on long-term therapy, monitor liver function and monitor for pulmonary symptoms, especially in the elderly (discontinue if deterioration in lung function); susceptibility to peripheral neuropathy; false positive urinary glucose (if tested for reducing substances); urine may be coloured yellow or brown; **interactions:** Appendix 1 (nitrofurantoin)

**Contra-indications** infants less than 3 months old, G6PD deficiency (section 9.1.5); acute porphyria (section 9.8.2)

**Hepatic impairment** use with caution; cholestatic jaundice and chronic active hepatitis reported

**Renal impairment** avoid if eGFR less than 60 mL/minute/1.73 m²; risk of peripheral neuropathy; ineffective because of inadequate urine concentrations

**Pregnancy** avoid at term—may produce neonatal haemolysis

**Breast-feeding** avoid; only small amounts in milk but could be enough to produce haemolysis in G6PD-deficient infants (section 9.1.5)

**Side-effects** anorexia, nausea, vomiting, and diarrhoea; acute and chronic pulmonary reactions (pulmonary fibrosis reported; possible association with lupus erythematosus-like syndrome); peripheral neuropathy; also reported, hypersensitivity reactions (including angioedema, anaphylaxis, sialadenitis, urticaria, rash and pruritus); rarely, cholestatic jaundice, hepatitis, exfoliative dermatitis, erythema multiforme, pancreatitis, arthralgia, blood disorders (including agranulocytosis, thrombocytopenia, and aplastic anaemia), benign intracranial hypertension, and transient alopecia

**Dose**
- Acute uncomplicated infection, 50 mg every 6 hours with food for 7 days (3 days usually adequate in women); **CHILD** over 3 months, 750 micrograms/kg every 6 hours
- Severe chronic recurrent infection, 100 mg every 6 hours with food for 7 days (dose reduced or discontinued if severe nausea)
- Prophylaxis (but see Cautions), 50–100 mg at night; **CHILD** over 3 months, 1 mg/kg at night

**Nitrofurantoin (Non-proprietary)**

- **Tablets**, nitrofurantoin 50 mg, net price 28-tab pack = £24.35; 100 mg, 28-tab pack = £8.47. Label: 9, 14, 21
- **Oral suspension**, nitrofurantoin 25 mg/5 mL, net price 300 mL = £195.83. Label: 9, 14, 21
- **Note** Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription

**Modified release**

- **Macrobid® (AMCo)**

  - **Capsules**, m/r, blue/yellow, nitrofurantoin 100 mg (as nitrofurantoin macrocrystals and nitrofurantoin monohydrate), net price 14-cap pack = £9.50. Label: 9, 14, 21, 25
  - **Dose** uncomplicated urinary-tract infection, 1 capsule twice daily with food
  - Genito-urinary surgical prophylaxis, 1 capsule twice daily on day of procedure and for 3 days after

### Methenamine Hippurate

(Hexamine hippurate)

**Indications** prophylaxis and long-term treatment of chronic or recurrent lower urinary-tract infections

**Cautions** avoid concurrent administration with sulfonamides (risk of crystalluria) or urinary alkalising agents; **interactions:** Appendix 1 (methenamine)

**Contra-indications** severe dehydration, gout, metabolic acidosis

**Hepatic impairment** avoid

**Renal impairment** avoid if eGFR less than 10 mL/minute/1.73 m²—risk of hipppurate crystalluria

**Pregnancy** use with caution

**Breast-feeding** amount too small to be harmful

**Side-effects** gastro-intestinal disturbances, bladder irritation, rash
Dose
- 1 g every 12 hours (may be increased in patients with catherers to 1 g every 8 hours); CHILD 6–12 years 500 mg every 12 hours

Hiprex® (Meda) Tablets, scored, methenamine hippurate 1 g, net price 60-tab pack = £19.74. Label: 9

5.2 Antifungal drugs

5.2.1 Triazole antifungals
5.2.2 Imidazole antifungals
5.2.3 Polyene antifungals
5.2.4 Echinocandin antifungals
5.2.5 Other antifungals

Treatment of fungal infections

The systemic treatment of common fungal infections is outlined below; specialist treatment is required in most forms of systemic or disseminated fungal infections. For local treatment of fungal infections, see section 7.2.2 (genital), section 7.4.4 (bladder), section 11.3.2 (eye), section 12.1.1 (ear), section 12.3.2 (opharynx), and section 13.10.2 (skin).

Aspergillosis Aspergillosis most commonly affects the respiratory tract but in severely immunocompromised patients, invasive forms can affect the heart, brain, and skin. Voriconazole (section 5.2.1) is the treatment of choice for aspergillosis; liposomal amphotericin (section 5.2.3) is an alternative first-line treatment when voriconazole cannot be used. Caspofungin (section 5.2.4), itraconazole (section 5.2.1), or posaconazole (section 5.2.1) can be used in patients who are refractory to, or intolerant of voriconazole and liposomal amphotericin. Itraconazole is also used for the treatment of chronic pulmonary aspergillosis or as an adjunct in the treatment of allergic bronchopulmonary aspergillosis [unlicensed indication].

Candidiasis Many superficial candidal infections including infections of the skin (section 13.10.2) are treated locally; widespread or intractable infection requires systemic antifungal treatment. Vaginal candidiasis (section 7.2.2) may be treated with locally acting antifungals or with fluconazole (section 5.2.1) given by mouth; for resistant organisms, itraconazole (section 5.2.1) can be given by mouth.

Oropharyngeal candidiasis generally responds to topical therapy (section 12.3.2); fluconazole is given by mouth for unresponsive infections; it is effective and is reliably absorbed. Itraconazole may be used for infections that do not respond to fluconazole. Topical therapy may not be adequate in immunocompromised patients and an oral triazole antifungal is preferred.

For invasive or disseminated candidiasis, an echinocandin (section 5.2.4) can be used. Fluconazole (section 5.2.1) is an alternative for Candida albicans infection in clinically stable patients who have not received an azole antifungal recently. Amphotericin (section 5.2.3) is an alternative when an echinocandin or fluconazole cannot be used, however, amphotericin should be considered for the initial treatment of CNS candidiasis. Voriconazole (section 5.2.1) can be used for infections caused by fluconazole-resistant Candida spp. when oral therapy is required, or in patients intolerant of amphotericin or an echinocandin. In refractory cases, fluconosine (section 5.2.5) can be used with intravenous amphotericin.

Cryptococcosis Cryptococcosis is uncommon but infection in the immunocompromised, especially in HIV-positive patients, can be life-threatening; cryptococcal meningitis is the most common form of fungal meningitis. The treatment of choice in cryptococcal meningitis is amphotericin (section 5.2.3) by intravenous infusion and fluconosine (section 5.2.5) by intravenous infusion for 2 weeks, followed by fluconazole (section 5.2.1) by mouth for 8 weeks or until cultures are negative. In cryptococcosis, fluconazole is sometimes given alone as an alternative in HIV-positive patients with mild, localised infections or in those who cannot tolerate amphotericin. Following successful treatment, fluconazole can be used for prophylaxis against relapse until immunity recovers.

Histoplasmosis Histoplasmosis is rare in temperate climates; it can be life-threatening, particularly in HIV-infected persons. Itraconazole (section 5.2.1) can be used for the treatment of immunocompetent patients with indolent non-meningeal infection, including chronic pulmonary histoplasmosis. Amphotericin (section 5.2.3) by intravenous infusion is used for the initial treatment of fulminant or severe infections, followed by a course of itraconazole by mouth. Following successful treatment, itraconazole can be used for prophylaxis against relapse until immunity recovers.

Skin and nail infections Mild localised fungal infections of the skin (including tinea corporis, tinea cruris, and tinea pedis) respond to topical therapy (section 13.10.2). Systemic therapy is appropriate if topical therapy fails, if many areas are affected, or if the site of infection is difficult to treat such as in infections of the nails (onychomycosis) and of the scalp (tinea capitis). Oral imidazole or triazole antifungals (particularly itraconazole) and terbinafine are used more frequently than griseofulvin because they have a broader spectrum of activity and require a shorter duration of treatment.

Tinea capitis is treated systemically; additional topical application of an antifungal (section 13.10.2) may reduce transmission. Griseofulvin (section 5.2.5) is used for tinea capitis in adults and children; it is effective against infections caused by Trichophyton tonsurans and Microsporum spp. Terbinafine (section 5.2.5) is used for tinea capitis caused by T. tonsurans [unlicensed indication]. The role of terbinafine in the management of Microsporum infections is uncertain.

Pityriasis versicolor (section 13.10.2) may be treated with itraconazole (section 5.2.1) by mouth if topical therapy is ineffective; fluconazole (section 5.2.1) by mouth is an alternative. Oral terbinafine is not effective for pityriasis versicolor.

Antifungal treatment may not be necessary in asymptomatic patients with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. Terbinafine (section 5.2.5) and itraconazole (section 5.2.1) have largely replaced griseofulvin for the systemic treatment of onychomycosis, particularly of the toenail; terbinafine is considered to be the drug of choice. Itraconazole can be administered as intermittent ‘pulse’ therapy. For the role of topical antifungals in the treatment of onychomycosis, see section 13.10.2.

Immunocompromised patients Immunocompromised patients are at particular risk of fungal infections...
and may receive antifungal drugs prophylactically; oral triazole antifungals are the drugs of choice for prophylaxis. **Fluconazole** (section 5.2.1) is more reliably absorbed than **itraconazole** (section 5.2.1), but fluconazole is not effective against *Aspergillus* spp. Itraconazole is preferred in patients at risk of invasive aspergillosis. **Posaconazole** (section 5.2.1) can be used for prophylaxis in patients who are undergoing haematopoietic stem cell transplantation or receiving chemotherapy for acute myeloid leukaemia and myelodysplastic syndrome, if they are intolerant of fluconazole or itraconazole. **Micafungin** (section 5.2.4) can be used for prophylaxis of candidiasis in patients undergoing haematopoietic stem cell transplantation when fluconazole, itraconazole or posaconazole cannot be used.

**Amphotericin** (section 5.2.3) by intravenous infusion or **caspofungin** (section 5.2.4) is used for the empirical treatment of serious fungal infections; caspofungin is not effective against fungal infections of the CNS.

### 5.2.1 Triazole antifungals

For the role of triazole antifungal drugs in the prevention and systemic treatment of fungal infections, see p. 403. Fluconazole is very well absorbed after oral administration. It also achieves good penetration into the cerebrospinal fluid to treat fungal meningitis. Fluconazole is excreted largely unchanged in the urine and can be used to treat candiduria.

**Itraconazole** is active against a wide range of dermatophytes. Itraconazole capsules require an acid environment in the stomach for optimal absorption. Itraconazole has been associated with liver damage and should be avoided or used with caution in patients with liver disease; fluconazole is less frequently associated with hepatotoxicity.

**Posaconazole** is licensed for the treatment of invasive fungal infections unresponsive to conventional treatment. **Voriconazole** is a broad-spectrum antifungal drug which is licensed for use in life-threatening infections.

#### FLUCONAZOLE

**Indications** see under Dose  
**Cautions** concomitant use with hepatotoxic drugs; monitor liver function with high doses or extended courses—discontinue if signs or symptoms of hepatic disease; (risk of hepatic necrosis); sensitivity to QT interval prolongation; **Interactions**: Appendix 1 (antifungals, triazole)

**Contra-indications** acute porphyria (section 9.8.2)  
**Hepatic impairment** toxicity with related drugs  
**Renal impairment** usual initial dose then halve subsequent doses if eGFR less than 50 mL/minute/1.73 m²  
**Pregnancy** manufacturer advises avoid—multiple congenital abnormalities reported with long-term high doses  
**Breast-feeding** present in milk but amount probably too small to be harmful  
**Side-effects** nausea, abdominal discomfort, diarrhoea, flatulence, headache, rash (discontinue treatment or monitor closely if infection invasive or systemic); less frequently dyspepsia, vomiting, taste disturbance, hepatic disorders, hypersensitivity reactions, anaphylaxis, dizziness, seizures, alopecia, pruritus, toxic epidermal necrolysis, Stevens-Johnson syndrome (severe cutaneous reactions more likely in HIV-positive patients), hyperlipidaemia, leucopenia, thrombocytopenia, and hypokalaemia reported

**Dose**

- **Vaginal candidiasis** (see also Recurrent Vulvovaginal Candidiasis, section 7.2.2) and candidal balanitis, **ADULT** and **CHILD** over 16 years, by mouth, a single dose of 150 mg
- **Mucosal candidiasis** (except genital), by mouth, 50 mg daily (100 mg daily in unusually difficult infections) given for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14 days in atopic oral candidiasis associated with dentures; for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections); **CHILD** by mouth or by intravenous infusion, 3–6 mg/kg on first day then 3 mg/kg daily (every 72 hours in NEONATE up to 2 weeks old, every 48 hours in neonate 2–4 weeks old)
- **Tinea pedis**, corporis, cruris, pityriasis versicolor, and dermat candidiasis, by mouth, 50 mg daily for 2–4 weeks (for up to 6 weeks in tinea pedis); max. duration of treatment 6 weeks
- **Invasive candidal infections** (including candidaemia and disseminated candidiasis) and cryptococcal infections (including meningitis), by mouth or intravenous infusion, 400 mg on first day then 200–400 mg daily; max. 800 mg daily in severe infections (unlicensed dose); treatment continued according to response (at least 8 weeks for cryptococcal meningitis), **CHILD** 6–12 mg/kg daily (every 72 hours in NEONATE up to 2 weeks old, every 48 hours in NEONATE 2–4 weeks old); max. 800 mg daily [unlicensed dose]
- **Prevention of relapse of cryptococcal meningitis in HIV-infected patients after completion of primary therapy**, by mouth or by intravenous infusion, 200 mg daily
- **Prevention of fungal infections in immunocompromised patients**, by mouth or by intravenous infusion, 50–400 mg daily adjusted according to risk; 400 mg daily if high risk of systemic infections e.g. following bone-marrow transplantation; commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range; **CHILD** according to extent and duration of neutropenia, 3–12 mg/kg daily (every 72 hours in NEONATE up to 2 weeks old, every 48 hours in NEONATE 2–4 weeks old); max. 400 mg daily

**Fluconazole** (Non-proprietary) [Fluc]

1Capsules, fluconazole 50 mg, net price 7-cap pack = £1.00; 150 mg, single-capule pack = 94p; 200 mg, 7-cap pack = £8.06. Label: 9, (50 and 200 mg)

### Dental prescribing on NHS

**Fluconazole Capsules** 50 mg may be prescribed

**Intravenous infusion**, fluconazole 2 mg/mL, net price 25-mL bottle = £7.31; 100-mL bottle = £27.45; 50-mL infusion bag = £2.70; 100-mL infusion bag = £27.82

1. Capsules can be sold to the public for vaginal candidiasis and associated candidal balanitis in those aged 16–60 years, in a container or packaging containing not more than 150 mg and labelled to show a max. dose of 150 mg
Capsules can be sold to the public for vaginal candidiasis manufacturer advises use only in life-

Renal impairment risk of congestive heart failure; 

Hepatic impairment use only if potential benefit 

acute porphyria (section 9.8.2) 

Contra-indications 

Breast-feeding small amounts present in milk—may accumulate; manufacturer advises avoid

Side-effects 

nausea, vomiting, taste disturbances, abdominal pain, diarrhoea, hepatitis (see Hepato-
toxicity above), dyspnoea, headache, hypokalaemia, rash; less commonly dyspepsia, flatulence, constipa-
tion, oedema, dizziness, peripheral neuropathy (dis-
continue treatment), menstrual disorder, myalgia; rarely pancreatitis, heart failure (see Cautions above), 

hypertriglyceridaemia, erectile dysfunction, urinary frequency, leucopenia, visual disturbances, tinnitus, 
deafness, alopecia, photosensitivity, toxic epidermal 
necrolysis, Stevens-Johnson syndrome; also reported, 

blood pressure changes, confusion, drowsiness, tre-

mor, thrombocytopenia, renal impairment, arthralgia; with intravenous injection hyperglycaemia

\[ \text{Diflucan} \] **(Pfizer)**

Counselling Patients should be told how to recognise signs 

Hepatotoxicity Potentially life-threatening hepatotoxicity 

reported very rarely—discontinue if signs of hepatitis develop. Avoid or use with caution if history of 

hepatotoxicity with other drugs or in active liver disease. 

Counselling Itraconazole should be avoided in patients with 

ventricular dysfunction or a history of heart failure. Those at risk include: 

patients receiving treatment with negative inotropic 

agents, e.g. calcium channel blockers.

Heart failure Following reports of heart failure, caution is advised when prescribing itraconazole to patients at high risk 

of heart failure. Those at risk include: 

• patients receiving high doses and longer treatment 

courses; 

• older patients and those with cardiac disease; 

• patients with chronic lung disease (including chronic 

obstructive pulmonary disease) associated with pulm-

onary hypertension; 

• patients receiving treatment with negative inotropic 

drugs, e.g. calcium channel blockers.

Contra-indications acute porphyria (section 9.8.2) 

Hepatotoxicity use only if potential benefit 

overweighs risk of hepatotoxicity (see Hepatotoxicity 

above); dose reduction may be necessary

Renal impairment risk of congestive heart failure; 

bioavailability of oral formulations possibly reduced; 

use intravenous infusion with caution if eGFR 30– 

80 mL/minute/1.73 m²; avoid intravenous infusion if 

eGFR less than 30 mL/minute/1.73 m²

Pregnancy manufacturer advises use only in life-

threatening situations (toxicity at high doses in animal 

studies); ensure effective contraception during treat-

ment and until the next menstrual period following 

end of treatment

1. Capsules can be sold to the public for vaginal candidiasis and 
asociated candidal balanitis in those aged 16–60 
years, in a container or packaging containing not more 
than 150 mg and labelled to show a max dose of 150 mg

**ITRACONAZOLE**

**Indications** see under Dose

**Cautions** absorption reduced in HIV-infection and 

neutropenia (monitor plasma-itraconazole concen-

tration and increase dose if necessary); susceptibility 

to congestive heart failure (see also Heart Failure, 

below); **Interactions:** Appendix 1 (antifungals, tri-

azole)

**Hepatotoxicity** Potentially life-threatening hepatotoxicity 

reported very rarely—discontinue if signs of hepatitis develop. Avoid or use with caution if history of 

hepatotoxicity with other drugs or in active liver disease. 

Monitor liver function if treatment continues for longer than 

one month, if receiving other hepatotoxic drugs, or in hepatic impairment 

Counselling Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain or dark urine develop

**Heart failure** Following reports of heart failure, caution is advised when prescribing itraconazole to patients at high risk 

of heart failure. Those at risk include: 

• patients receiving high doses and longer treatment 

courses; 

• older patients and those with cardiac disease; 

• patients with chronic lung disease (including chronic 

obstructive pulmonary disease) associated with pulm-

onary hypertension; 

• patients receiving treatment with negative inotropic 

drugs, e.g. calcium channel blockers.

**Contra-indications** acute porphyria (section 9.8.2) 

**Hepatotoxicity** use only if potential benefit 

overweighs risk of hepatotoxicity (see Hepatotoxicity 

above); dose reduction may be necessary

**Renal impairment** risk of congestive heart failure; 

bioavailability of oral formulations possibly reduced; 

use intravenous infusion with caution if eGFR 30– 

80 mL/minute/1.73 m²; avoid intravenous infusion if 

eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** manufacturer advises use only in life-

threatening situations (toxicity at high doses in animal 

studies); ensure effective contraception during treat-

ment and until the next menstrual period following 

end of treatment

1. Capsules can be sold to the public for vaginal candidiasis and 
asociated candidal balanitis in those aged 16–60 
years, in a container or packaging containing not more 
than 150 mg and labelled to show a max dose of 150 mg

**Dose** 

• **By mouth**, oropharyngeal candidiasis, see under 

Sporanox® oral liquid below 

Vulvovaginal candidiasis (see also Recurrent Vulvo-

vaginal Candidiasis, section 7.2.2), 200 mg twice daily 

for 1 day 

Pityriasis versicolor, 200 mg once daily for 7 days 

Tinea corporis and tinea cruris, either 100 mg once 

daily for 15 days or 200 mg once daily for 7 days 

Tinea pedis and tinea manuum, either 100 mg once 

daily for 30 days or 200 mg twice daily for 7 days 

Onychomycosis, either 200 mg once daily for 3 

months or course (‘pulse’) of 200 mg twice daily for 7 

days, subsequent courses repeated after 21-day 

interval; fingernails 2 courses, toenails 3 courses 

Aspergillosis, 200 mg twice daily 

Histoplasmosis, 200 mg 3 times daily for 3 days, then 

200 mg once or twice daily 

Systemic candidiasis and cryptococcosis including 

cryptococcal meningitis where other antifungal drugs 

inappropriate or ineffective, 200 mg once daily 

(candidiasis 100–200 mg once daily) increased in 

invasive or disseminated disease and in cryptococcal 

meningitis to 200 mg twice daily 

Maintenance in HIV-infected patients to prevent 

relapse of underlying fungal infection and prophylaxis 

in neutropenia when standard therapy inappropriate, 

200 mg once daily, increased to 200 mg twice daily if 

low plasma-itraconazole concentration (see Cautions) 

Prophylaxis in patients with haematological malign-

ancy or undergoing bone-marrow transplant, see 

under Sporanox® oral liquid below

• **By intravenous infusion**, systemic aspergillosis, 

candidiasis and cryptococcosis including crypto-

coccal meningitis where other antifungal drugs inap-

propriate or ineffective, histoplasmosis, 200 mg every 

12 hours for 2 days, then 200 mg once daily for max. 

12 days 

• **Child** under 18 years see **BNF for Children** 

**Note** Itraconazole doses in BNF may differ from those in 

product literature 

**Itraconazole (Non-proprietary)**

**Capsules**, enclosing coated beads, itraconazole 

100 mg, net price 15-cap pack = £4.30. Label: 5, 9, 

21, 25, counselling, hepatotoxicity 

Sporanox® (lansenn) **(Teva)**

**Capsules**, blue/pink, enclosing coated beads, itra-

conazole 100 mg, net price 4-cap pack = £3.67; 15-

cap pack = £13.77; 28-cap pack (Sporanox®-Pulse) = 

£25.72; 60-cap pack = £55.10. Label: 5, 9, 21, 25, 

counselling, hepatotoxicity

5 Infections

BNF 68
Oral liquid, sugar-free, cherry-flavoured, itraconazole 10 mg/mL, net price 150 mL (with 10-mL measuring cup) = £58.34. Label: 9, 23, counselling, administration, hepatotoxicity

**Dose** oral or oesophageal candidiasis in HIV-positive or other immunocompromised patients, 20 mL (2 measuring cups) daily in 1–2 divided doses for 1 week (continue for another week if no response)

Oral or oesophageal candidiasis that has not responded to fluconazole, 10–20 mL (1–2 measuring cups) twice daily for 2 weeks (continue for another 2 weeks if no response; the higher dose should not be used for longer than 2 weeks if no signs of improvement)

Prophylaxis of deep fungal infections (when standard therapy is inappropriate) in patients with haematological malignancy or undergoing bone-marrow transplantation who are expected to become neutropenic, 5 mg/kg daily, in 2 divided doses; starting before transplantation or before chemotherapy (taking care to avoid interaction with cytotoxic drugs) and continued until neutrophil count recovers; CHILD and ELDERS safety and efficacy not established

**Counselling** Do not take with food; swish around mouth and swallow, do not rinse afterwards

**Concentrate for intravenous infusion**, itraconazole 10 mg/mL. For dilution before use. Net price 25-mL amp (with infusion bag and filter) = £70.71

**Excipients** include propylene glycol

### POSaconazole

**Indications** invasive aspergillosis (see notes above); fusariosis either unresponsive to, or in patients intolerant of, amphotericin; chromoblastomycosis and mycetoma either unresponsive to, or in patients intolerant of, itraconazole; coccidioidomycosis either unresponsive to, or in patients intolerant of, amphotericin, itraconazole, or fluconazole; see also contraindications below

**Cautions** cardiomyopathy, bradyarrhythmia, symptomatic arrhythmias, history of QT interval prolongation, concomitant use with other drugs known to cause QT-interval prolongation; monitor electrolytes (including potassium, magnesium, and calcium) before and during therapy, monitor liver function before and during therapy; body-weight under 60 kg—risk of side-effects increased; body-weight over 120 kg—risk of treatment failure possibly increased; **interactions:** Appendix 1 (antifungals, triazole)

**Contra-indications** acute porphyria (section 9.8.2)

**Hepatic impairment** monitor liver function; manufacturer advises caution

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk and recommends effective contraception during treatment; toxicity in animal studies

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies

**Side-effects** gastro-intestinal disturbances (including nausea, vomiting, abdominal pain, diarrhoea, constipation, dyspepsia, and flatulence); dizziness, headache, paraesthesia, drowsiness, fatigue, fever, anorexia; blood disorders (including anaemia, neutropenia, and thrombocytopenia); electrolyte disturbances; dry mouth; rash; pruritus; less commonly pancreatitis, hepatic disorders, gastro-oesophageal reflux, arrhythmias, bradyarrhythmia, tachycardia, palpitation, changes in blood pressure, oedema, vasculitis, cough, hiccups, convulsions, neuropathy, tremor, aphasia, insomnia, hyperglycaemia, menstrual disorders, renal failure, musculoskeletal pain, visual disturbances, mouth ulcers, and alopecia; rarely ileus, cardiac failure, myocardial infarction, stroke, thrombosis, syncope, pneumonitis, psychosis, depression, encephalopathy, adrenal insufficiency, breast pain, hearing impairment, and Stevens-Johnson syndrome

**Dose** see under preparations below

**Noxafil**® (MSD) Tablets, yellow, e/c, posaconazole 100 mg, net price 24-tab pack = £596.96, 96-tab pack = £2387.85. Label: 3, 9, 25

**Note** Tablets not licensed for oropharyngeal candidiasis

**Dose** **ADULT** over 18 years, 300 mg twice daily on first day, then 300 mg once daily

Prophylaxis of invasive fungal infections in patients undergoing bone-marrow transplantation or receiving chemotherapy for acute myeloid leukaemia and myelodysplastic syndrome who are expected to become neutropenic, and who are intolerant of fluconazole or itraconazole, **ADULT** over 18 years, 300 mg twice daily on first day, then 300 mg once daily, starting before transplantation or before chemotherapy and continued until neutrophil count recovers

**Suspension**, posaconazole 200 mg/5 mL, net price 105 mL (cherry-flavoured) = £491.20. Label: 3, 9, 21

**Dose** **ADULT** over 18 years, 400 mg twice daily with food or if food not tolerated, 200 mg 4 times daily

Oropharyngeal candidiasis (severe infection or in immunocompromised patients only), **ADULT** over 18 years, 200 mg with food on first day, then 100 mg once daily with food for 13 days

Prophylaxis of invasive fungal infections in patients undergoing bone-marrow transplantation or receiving chemotherapy for acute myeloid leukaemia and myelodysplastic syndrome who are expected to become neutropenic, and who are intolerant of fluconazole or itraconazole, **ADULT** over 18 years, 200 mg 3 times daily with food, starting before transplantation or before chemotherapy and continued until neutrophil count recovers

**Note** Where possible, **Noxafil**® tablets should be used in preference to the suspension because the tablets have a higher bioavailability; the suspension is not interchangeable with the tablets on a milligram-for-milligram basis

**Voriconazole**

**Indications** invasive aspergillosis; serious infections caused by **Scedosporium spp.**, **Fusarium spp.**, or invasive fluconazole-resistant **Candida** spp. (including **C. krusei**)

**Cautions** electrolyte disturbances, cardiomyopathy, bradyarrhythmia, symptomatic arrhythmias, history of QT interval prolongation, concomitant use with other drugs that prolong QT interval; patients at risk of pancreatitis; monitor renal function; **interactions:** Appendix 1 (antifungals, triazole)

**Hepatotoxicity** Hepatitis, cholestasis, and fulminant hepatic failure reported uncommonly; risk increased in patients with haematological malignancy. Monitor liver function before starting treatment, then at least weekly for 1 month, and then monthly during treatment. Consider treatment discontinuation if severe abnormalities in liver function tests. Patients should be told how to recognise signs of liver disorder, and advised to seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop

**Phototoxicity** Phototoxicity occurs uncommonly. Patients should be advised to avoid intense or prolonged exposure to direct sunlight, and to avoid use of sunbeds. In sunlight, patients should cover sun-exposed areas of skin and use a sunscreen with a high sun protection factor. Patients should seek medical attention if they experience sunburn or a severe skin reaction following exposure to light or sun. If phototoxicity occurs, consider treatment discontinuation; if
treatment is continued, monitor for pre-malignant skin lesions and squamous cell carcinoma, and discontinue treatment if they occur. Patients should be advised to keep the Alert Card with them at all times.

**Contra-indications**
- acute porphyria (section 9.8.2)

**Hepatic impairment**
- in mild to moderate hepatic impairment—manufacturer advises use only if potential benefit outweighs risks. See also Hepatoxicity above.

**Renal impairment**
- intravenous vehicle may accumulate if eGFR less than 50 mL/minute/1.73 m²—use intravenous infusion only if potential benefit outweighs risk, and monitor renal function; alternatively, use tablets or oral suspension (no dose adjustment required).

**Pregnancy**
- toxicity in animal studies—manufacturer advises avoid—potential benefit outweighs risk. See also Hepatotoxicity above.

**Breast-feeding**
- manufacturer advises avoid—no information available.

**Side-effects**
- nausea, vomiting, abdominal pain, diarrhoea, jaundice (see Hepatotoxicity above), oedema, hypotension, chest pain, respiratory distress syndrome, sinusitis, headache, dizziness, asthenia, anxiety, depression, confusion, agitation, hallucinations, paraesthesia, tremor, influenza-like symptoms, hypoglycaemia, haematuria, blood disorders (including anaemia, thrombocytopenia, leucopenia, pancytopenia), acute renal failure, hypokalaemia, visual disturbances (including altered perception, blurred vision, and photophobia), rash, pruritus, photosensitivity, alopecia, chelitis, injection-site reactions; less commonly: dyspepsia, duodenitis, cholecystitis, pancreatitis, hepatitis (see Hepatotoxicity above), constipation, arthralgia (including QT interval prolongation), syncope, hyponatraemia, raised serum cholesterol, hypersensitivity reactions (including flushing), ataxia, nystagmus, hypoesthesia, adrenocortical insufficiency, arthritis, blepharitis, optic neuritis, scleritis, glossitis, gingivitis, psoriasis, Stevens-Johnson syndrome; rarely: pseudomembranous colitis, taste disturbances (more common with oral suspension), convulsions, extrapyramidal effects, insomnia, tinnitus, hearing disturbances, hypertension, hypothyroidism, hyperthyroidism, discoid lupus erythematosus, toxic epidermal necrolysis, pseudoporphyria, retinal haemorrhage, optic atrophy; also reported on long-term treatment squamous cell carcinoma of the skin (particularly in presence of phototoxicity) and periostitis (particularly in transplant patients).

**Dose**
- By mouth, ADULT over 18 years, body-weight over 40 kg, 400 mg every 12 hours for 2 doses then 200 mg every 12 hours, increased if necessary to 300 mg every 12 hours; body-weight under 40 kg, 200 mg every 12 hours for 2 doses then 100 mg every 12 hours, increased if necessary to 150 mg every 12 hours; CHILD 2–18 years see BNF for Children.
- By intravenous infusion, 6 mg/kg every 12 hours for 2 doses, then 4 mg/kg every 12 hours (reduced to 3 mg/kg every 12 hours if not tolerated) for max. 6 months; CHILD 2–18 years see BNF for Children.

**Vfend®** (Pfizer) (TM)
- Tablets, 1/2c, voriconazole 50 mg, net price 28-tablet pack = £275.68; 200 mg, 28-tab pack = £1102.74. Label: 9, 11, 23, counselling, hepatotoxicity, phototoxicity.

**Intravenous infusion**
- powder for reconstitution, voriconazole, net price 200-mg vial = £77.14; 200-mg vial (with solvent) = £77.14.

**Excipients** include sulfobutylether beta cyclodextrin sodium (risk of accumulation in renal impairment).

**Electrolytes**
- Na⁺ 9.47 mmol/vial.

---

**5.2.2 Imidazole antifungals**

The imidazole antifungals include clotrimazole, econazole, ketoconazole, and toconazole. They are used for the local treatment of vaginal candidiasis (section 7.2.2) and for dermatophyte infections (section 13.10.2).

**CHMP advice**

**Ketoconazole (July 2013)**

The CHMP has recommended that the marketing authorisation for oral ketoconazole should be suspended. The CHMP concluded that the risk of hepatotoxicity associated with oral ketoconazole is greater than the benefit in treating fungal infections. Doctors should review patients who are being treated with oral ketoconazole for fungal infections, with a view to stopping treatment or choosing an alternative treatment. Patients with a prescription of oral ketoconazole for fungal infections should be referred back to their doctors.

Topical products containing ketoconazole are not affected by this advice.

**Miconazole** (section 12.3.2) can be used locally for oral infections; it is also effective in intestinal infections. Systemic absorption may follow use of miconazole oral gel and may result in significant drug interactions.

**5.2.3 Polyene antifungals**

The polyene antifungals include amphotericin and nystatin; neither drug is absorbed when given by mouth. Nystatin is used for oral, oropharyngeal, and perioral infections by local application in the mouth (section 12.3.2). Nystatin is also used for *Candida albicans* infection of the skin (section 13.10.2).

**Amphotericin** by intravenous infusion is used for the treatment of systemic fungal infections and is active against most fungi and yeasts. It is highly protein bound and penetrates poorly into body fluids and tissues. When given parenterally amphotericin is toxic and side-effects are common. Lipid formulations of amphotericin (*Abelcet®* and *AmBisome®*) are significantly less toxic and are recommended when the conventional formulation of amphotericin is contra-indicated because of toxicity, especially nephrotoxicity or when response to conventional amphotericin is inadequate; lipid formulations are more expensive. For the role of amphotericin in the systemic treatment of fungal infections, see p. 403.

**AMPHOTERICIN**

**(Amphotericin B)**

**Indications**
- See under Dose.

**Cautions**
- when given parenterally, toxicity common (close supervision necessary and test dose required).
required; see Anaphylaxis below); hepatic and renal function tests, blood counts, and plasma electrolyte (including plasma-potassium and magnesium concentration) monitoring required; corticosteroids (avoid except to control reactions); avoid rapid infusion (risk of arrhythmias); interactions: Appendix 1 (amphotericin)

**Anaphylaxis** Amphotericin can occur with any intravenous amphotericin product and a test dose is advisable before the first infusion, the patient should be carefully observed for at least 30 minutes after the test dose. Prophylactic antipyretics or hydrocortisone should only be used in patients who have previously experienced acute adverse reactions (in whom continued treatment with amphotericin is essential)

**Renal impairment** use only if no alternative, nephrotoxicity may be reduced with use of lipid formulation

**Pregnancy** not known to be harmful but manufacturers advise avoid unless potential benefit outweighs risk

**Breast-feeding** no information available

**Side-effects** nausea, vomiting, abdominal pain, diarrhoea, cardiovascular effects (including arrhythmias, blood pressure changes, chest pain), dyspnoea, headache, febrile reactions, electrolyte disturbances (including hypokalaemia and hyponatraemia), disturbances in renal function (including renal tubular acidosis), abnormal liver function (discontinue treatment), blood disorders (including anaemia, thrombocytopenia, rash; less commonly anaphylactic reactions (see Anaphylaxis, above), bronchospasm, neurological disorders (including convulsions, peripheral neuropathy, tremor, encephalopathy, hearing loss, diplopia); also reported anorexia, myalgia, arthralgia, toxic epidermal necrolysis, Stevens-Johnson syndrome

**Dose**

- **By intravenous infusion**, see preparations

  **Note** Different preparations of intravenous amphotericin vary in their pharmacodynamics, pharmacokinetics, dosage, and administration; these preparations should not be considered interchangeable. To avoid confusion, prescribers should specify the brand to be dispensed

**Fungizone** (Squibb) intravenous infusion, powder for reconstitution, amphotericin (as sodium deoxycholate complex), net price 50-mg vial = £3.88

**Electrolytes** Na⁺ 0.5 mmol/vial

**Dose** by intravenous infusion, systemic fungal infections, initial test dose of 1 mg over 20–30 minutes then 250 micrograms/kg daily, gradually increased over 2–4 days, if tolerated, to 1 mg/kg daily; max (severe infection) 1.5 mg/kg daily or on alternate days; **CHILD** under 18 years see **BNF for Children**

**Note** Prolonged treatment usually necessary; if interrupted for longer than 7 days recommence at 250 micrograms/kg and increase gradually

**Lipid formulations**

**Abelcet** (TEVA UK) intravenous infusion, amphotericin 5 mg/mL as lipid complex with L-α-dimyristoylphosphatidylcholine and L-α-dimyristoylphosphatidylglycerol, net price 20-mL vial = £77.50 ( hosp. only)

**Electrolytes** Na⁺ 1.2 mmol/vial

**Dose** by intravenous infusion, severe invasive candidiasis; severe systemic fungal infections in patients not responding to conventional amphotericin or to other antifungal drugs or where toxicity or renal impairment precludes conventional amphotericin, including invasive aspergillosis, cryptococcal meningitis and disseminated cryptococcosis in HIV patients, initial dose 1 mg over 15 minutes then 5 mg/kg once daily for at least 14 days; **CHILD** under 18 years see **BNF for Children**

**AmBisome** (Gilead) intravenous infusion, powder for reconstitution, amphotericin 50 mg encapsulated in liposomes, net price 50-mg vial = £96.69

**Electrolytes** Na⁺ < 0.5 mmol/vial

**Excipients** include sucrose 900 mg/vial

**Dose** by intravenous infusion, severe systemic or deep mycoses where toxicity (particularly nephrotoxicity) precludes use of conventional amphotericin; suspected or proven infection in febrile neutropenic patients unresponsive to broad-spectrum antibiotics; aspergillosis, initial test dose 1 mg over 10 minutes then 3 mg/kg once daily, max. 5 mg/kg once daily (unlicensed dose); **CHILD** under 18 years see **BNF for Children**

Visceral leishmaniasis, see section 5.4.5 and product literature

## 5.2.4 Echinocandin antifungals

The echinocandin antifungals include **anidulafungin**, **caspofungin** and **micafungin**. They are only active against *Aspergillus* spp. and *Candida* spp.; however, anidulafungin and micafungin are not used for the treatment of aspergillosis. Echinocandins are not effective against fungal infections of the CNS. For the role of echinocandin antifungals in the prevention and systemic treatment of fungal infections, see p. 403.

### ANIDULAFUNGIN

**Indications** invasive candidiasis (see notes above)

**Pregnancy** manufacturer advises avoid—no information available

**Breast-feeding** manufacturer advises avoid unless potential benefit outweighs risk—present in milk in animal studies

**Side-effects** diarrhoea, nausea, vomiting, flushing, convulsion, headache, coagulopathy, hypokalaemia, raised serum creatinine, rash, pruritus; less commonly abdominal pain, cholestasis, hypertension, hyperglycaemia, urticaria, injection-site pain; also reported, hypotension, dyspnoea, bronchospasm, hepatitis

**Dose**

- **By intravenous infusion**, **ADULT** over 18 years, 200 mg on first day then 100 mg once daily

**Ecalfa** (Pfizer) intravenous infusion, powder for reconstitution, anidulafungin, net price 100-mg vial = £299.99

### CASPOFUNGIN

**Indications** invasive aspergillosis (see notes above); invasive candidiasis (see notes above); empirical treatment of systemic fungal infections in patients with neutropenia

**Cautions** interactions: Appendix 1 (caspofungin)

**Hepatic impairment** 70 mg on first day then 35 mg once daily in moderate impairment; no information available for severe impairment

**Pregnancy** manufacturer advises avoid unless essential—toxicity in animal studies

**Breast-feeding** present in milk in animal studies—manufacturer advises avoid

**Side-effects** nausea, diarrhoea, vomiting; dyspnoea; headache; hypokalaemia; arthralgia; rash, pruritus, sweating, injection-site reactions; less commonly abdominal pain, dyspepsia, dry mouth, dysphagia, taste disturbances, anorexia, constipation, flatulence,
cholestasis, hepatic dysfunction, ascites, palpitation, arrhythmia, chest pain, heart failure, thrombopel- 
itis, flushing, hypotension, hypertension, broncho-
spasm, cough, dizziness, fatigue, paraesthesia, 
hypoaesthesia, sleep disturbances, tremor, anxiety, 
disorientation, hyperglycaemia, renal failure, hypo-
magnesaemia, hypocalcaemia, metabolic acidosis, 
anæmia, thrombocytopenia, leucopenia, myalgia, 
muscular weakness, blurred vision, and erythema 
multiforme; also reported, adult respiratory distress 
syndrome and anaphylaxis

**Dose**

- By intravenous infusion, 70 mg on first day then 
  50 mg once daily (70 mg once daily if body-weight 
  over 80 kg); **CHILD** under 18 years see BNF for Children

**Cancidas** (MSD) 

| Intravenous Infusion, powder for reconstitution, cas- 
pofungin (as acetate), net price 50-mg vial = 
£327.67; 70-mg vial = £416.78 |

**MICAFUNGIN**

| **Indications** see under Dose |
| **Cautions** monitor renal function; **interactions:** |
| Appendix 1 (micafungin) |
| Hepatotoxicity Potentially life-threatening hepatotoxicity reported. Monitor liver function—discontinue if significant and persistent abnormalities in liver function tests develop. Use with caution in hepatic impairment (avoid if severe) or if receiving other hepatotoxic drugs. Risk of hepatic side-effects greater in children under 1 year of age |
| **Hepatic impairment** use with caution in mild to moderate impairment; avoid in severe impairment; see also Hepatotoxicity above |
| **Renal impairment** use with caution; renal function may deteriorate |
| **Pregnancy** manufacturer advises avoid unless essential—toxicity in animal studies |
| **Breast-feeding** manufacturer advises use only if potential benefit outweighs risk—present in milk in animal studies |
| **Side-effects** nausea, vomiting, diarrhoea, abdominal pain; headache, fever, hypokalaemia, hypomagnesaemia, hypocalcaemia, leucopenia, anaemia, rash, phlebitis, less common dyspepsia, constipation, hepatomegaly, hepatitis and cholestasis (see also Hepatotoxicity above), taste disturbances, anorexia, tachycardia, palpitation, bradycardia, blood pressure changes, flushing, dyspnoea, sleep disturbances, anxiety, confusion, dizziness, tremor, pancytopenia, thrombocytopenia, eosinophilia, hypoponatraemia, hypophosphataemia, hyperkalaemia, hyperhidrosis, and pruritus; rarely haemolytic anaemia; also reported disseminated intravascular coagulation, renal failure (more frequent in children), Stevens-Johnson syndrome, toxic epidermal necrolysis |
| **Dose** By intravenous infusion, invasive candidiasis, **ADULT** body-weight over 40 kg, 100 mg once daily (increased to 200 mg daily if inadequate response) for at least 14 days; body-weight under 40 kg, 2 mg/kg once daily (increased to 4 mg/kg daily if inadequate response) for at least 14 days; **CHILD** under 18 years see BNF for Children |
| Oesophageal candidiasis, **ADULT** body-weight over 40 kg, 150 mg once daily; body-weight under 40 kg, 3 mg/kg once daily; **CHILD** 16–18 years see BNF for Children |

Prophylaxis of candidiasis in patients undergoing bone-marrow transplantation or who are expected to become neutropenic for over 10 days, **ADULT** body-weight over 40 kg, 50 mg once daily; body-weight under 40 kg, 1 mg/kg once daily; continue for at least 7 days after neutrophil count desirable range; **CHILD** under 18 years see BNF for Children

**Mycamine** (Astellas) 

Intravenous infusion, powder for reconstitution, micafungin (as sodium), net price 50-mg vial = £196.08; 100-mg vial = £341.00

**5.2.5 Other antifungals**

Flucytosine is used with amphotericin in a synergistic combination. Bone marrow depression can occur which limits its use, particularly in HIV-positive patients; weekly blood counts are necessary during prolonged therapy. Resistance to flucytosine can develop during therapy and sensitivity testing is essential before and during treatment. For the role of flucytosine in the treatment of systemic candidiasis and cryptococcal meningitis, see p. 403.

Griseofulvin is effective for widespread or intractable dermatophyte infections but has been superseded by newer antifungals, particularly for nail infections. It is the drug of choice for trichophyton infections in children. Duration of therapy is dependent on the site of the infection and may extend to a number of months. For the role of griseofulvin in the treatment of tinea capitis, see p. 403.

Terbinafine is the drug of choice for fungal nail infec-
tions and is also used for ringworm infections where oral treatment is considered appropriate (see p. 405).

**FLUCYTOSINE**

| **Indications** systemic yeast and fungal infections; adjunct to amphotericin in cryptococcal meningitis (see Cryptococcosis, p. 403), adjunct to amphotericin in severe systemic candidiasis and in other severe or long-standing infections |
| **Cautions** elderly; blood disorders; liver- and kidney-function tests and blood counts required (weekly in blood disorders); **interactions:** Appendix 1 (flucytosine) |
| **Renal impairment** liver- and kidney-function tests and blood counts required weekly; use 50 mg/kg every 12 hours if creatinine clearance 20–40 mL/minute; use 50 mg/kg every 24 hours if creatinine clearance 10–20 mL/minute; use initial dose of 50 mg/kg if creatinine clearance less than 10 mL/minute and then adjust dose according to plasma-flucytosine concentration |
| **Pregnancy** teratogenic in animal studies; manufacturer advises use only if potential benefit outweighs risk |
| **Breast-feeding** manufacturer advises avoid |
| **Side-effects** nausea, vomiting, diarrhoea, rashes; less frequently cardiotoxicity, confusion, hallucinations, convulsions, headache, sedation, vertigo, alterations in liver function tests (hepatitis and hepatic necrosis reported), and toxic epidermal necrolysis; blood dis-
orders including thrombocytopenia, leucopenia, and aplastic anaemia reported |

**Appendix 1 (flucytosine)**

**Flucytosine** is used with amphotericin in a synergistic combination. Bone marrow depression can occur which limits its use, particularly in HIV-positive patients; weekly blood counts are necessary during prolonged therapy. Resistance to flucytosine can develop during therapy and sensitivity testing is essential before and during treatment. For the role of flucytosine in the treatment of systemic candidiasis and cryptococcal meningitis, see p. 403.

Griseofulvin is effective for widespread or intractable dermatophyte infections but has been superseded by newer antifungals, particularly for nail infections. It is the drug of choice for trichophyton infections in children. Duration of therapy is dependent on the site of the infection and may extend to a number of months. For the role of griseofulvin in the treatment of tinea capitis, see p. 403.

Terbinafine is the drug of choice for fungal nail infec-
tions and is also used for ringworm infections where oral treatment is considered appropriate (see p. 405).
5.3 Antiviral drugs

Dose

- **By intravenous infusion** over 20–40 minutes, 200 mg/kg daily in 4 divided doses usually for not more than 7 days; extremely sensitive organisms, 100–150 mg/kg daily may be sufficient; **CHILD** under 18 years see **BNF for Children**.

Cryptococcal meningitis (adjunct to amphotericin, see Cryptococcus, p. 403) 100 mg/kg daily in 4 divided doses for 2 weeks [unlicensed duration]; **CHILD** under 18 years see **BNF for Children**.

Note: For plasma concentration monitoring, blood should be taken shortly before starting the next infusion; plasma concentration for optimum response 25–50 mg/litre (200–400 micromol/litre)—should not be allowed to exceed 80 mg/litre (620 micromol/litre).

**Ancotil** (Meda)®

- **Intravenous infusion**, flucytosine 10 mg/mL, net price 250-mL infusion bottle = £30.33 (hosp. only).

Note: Flucytosine tablets [unlicensed] may be available from ‘special-order’ manufacturers or specialist-importing companies, see p. 1104.

**GRISEOFULVIN**

- **Indications** dermatophyte infections of the skin, scalp, hair and nails where topical therapy has failed or is inappropriate.

- **Cautions** interactions: Appendix 1 (griseofulvin).

- **Driving** May impair performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

- **Contra-indications** severe liver disease; systemic lupus erythematosus (risk of exacerbation); acute porphyria (section 9.8.2).

- **Hepatic impairment** avoid in severe liver disease.

- **Pregnancy** avoid (fetotoxicity and teratogenicity in animals); effective contraception required during and for at least 1 month after administration to women (important: effectiveness of oral contraceptives may be reduced, additional contraceptive precautions e.g. barrier method, required); also men should avoid fathering a child during and for at least 6 months after administration.

- **Breast-feeding** avoid—no information available.

- **Side-effects** nausea, vomiting, diarrhoea; headache; also reported, abdominal pain, dyspepsia, hepatitis, hepatotoxicity, glossitis, taste disturbances, dizziness, fatigue, confusion, agitation, depression, impaired coordination and hearing, peripheral neuropathy, menstrual disturbances, renal failure, leucopenia, systemic lupus erythematosus, rash (including rarely erythema multiforme, toxic epidermal necrolysis), and photosensitivity.

- **Dose**
  - **By mouth**, 250 mg daily usually for 2–6 weeks in tinea pedis, 2–4 weeks in tinea cruris, 4 weeks in tinea corporis, 6 weeks–3 months in nail infections (occasionally longer in toenail infections); **CHILD** [unlicensed] usually for 4 weeks, tinea capitis, over 1 year, body-weight 10–20 kg, 62.5 mg once daily; body-weight 20–40 kg, 125 mg once daily; body-weight over 40 kg, 250 mg once daily.

**Terbinafine** (Non-proprietary)®

**Lamisil** (Novartis)®

5.3 Antiviral drugs

- **TERBINAFINE**

  - **Indications** dermatophyte infections of the nails, ringworm infections (including tinea pedis, cruris, and corporis) where oral therapy appropriate (due to site, severity or extent).

  - **Cautions** psoriasis (risk of exacerbation); autoimmune disease (risk of lupus-erythematosus-like effect); monitor hepatic function before treatment and then every 4–6 weeks during treatment — discontinue if abnormalities in liver function tests; **interactions**: Appendix 1 (terbinafine).

- **Hepatic impairment** manufacturer advises avoid—elimination reduced.

- **Renal impairment** use half normal dose if eGFR less than 50 mL/minute/1.73 m² and no suitable alternative available.

- **Pregnancy** manufacturer advises use only if potential benefit outweighs risk—no information available.

- **Breast-feeding** avoid—present in milk.

- **Side-effects** abdominal discomfort, anorexia, nausea, diarrhoea, dyspepsia, headache, arthralgia, myalgia, rash, urticaria; *less commonly* taste disturbance; *rarely* liver toxicity (including jaundice, cholestasis, and hepatitis)—discontinue treatment, dizziness, malaise, paraesthesia, hypoaesthesia; *very rarely* blood disorders (including neutropenia and thrombocytopenia), lupus erythematosus-like effect, photosensitivity, alopecia, serious skin reactions (including Stevens-Johnson syndrome and toxic epidermal necrolysis)—discontinue treatment if progressive skin rash; also reported, pancreatitis, vasculitis, influenza-like symptoms, rhabdomyolysis, disturbances in smell, hearing disturbances, exacerbation of psoriasis.

**GRISEOFULVIN**

- **Indications** dermatophyte infections of the skin, scalp, hair and nails where topical therapy has failed or is inappropriate.

- **Cautions** interactions: Appendix 1 (griseofulvin).

- **Driving** May impair performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

- **Contra-indications** severe liver disease; systemic lupus erythematosus (risk of exacerbation); acute porphyria (section 9.8.2).

- **Hepatic impairment** avoid in severe liver disease.

- **Pregnancy** avoid (fetotoxicity and teratogenicity in animals); effective contraception required during and for at least 1 month after administration to women (important: effectiveness of oral contraceptives may be reduced, additional contraceptive precautions e.g. barrier method, required); also men should avoid fathering a child during and for at least 6 months after administration.

- **Breast-feeding** avoid—no information available.

- **Side-effects** nausea, vomiting, diarrhoea; headache; also reported, abdominal pain, dyspepsia, hepatitis, hepatotoxicity, glossitis, taste disturbances, dizziness, fatigue, confusion, agitation, depression, impaired coordination and hearing, peripheral neuropathy, menstrual disturbances, renal failure, leucopenia, systemic lupus erythematosus, rash (including rarely erythema multiforme, toxic epidermal necrolysis), and photosensitivity.

- **Dose**
  - **By mouth**, 500 mg once daily or in divided doses; in severe infection dose may be doubled, reducing when response occurs; **CHILD** under 50 kg, 10 mg/kg once daily or in divided doses.
  - **Tinea capitis caused by Trichophyton tonsurans**, 1 g once daily or in divided doses; **CHILD** under 50 kg, 15–30 mg/kg once daily or in divided doses.

**Griseofulvin** (Non-proprietary)®

- **Tablets**, griseofulvin 125 mg, net price 100 = £35.39; 500 mg, 100= £90.41. Label: 9, 21, counselling, driving.

The majority of virus infections resolve spontaneously in immunocompetent subjects. A number of specific treatments for viral infections are available, particularly for the immunocompromised. This section includes notes on herpes simplex and varicella-zoster, human immunodeficiency virus, cytomegalovirus, respiratory syncytial virus, viral hepatitis and influenza.
5.3.1 HIV infection

There is no cure for infection caused by the human immunodeficiency virus (HIV) but a number of drugs slow or halt disease progression. Drugs for HIV infection (antiretrovirals) may be associated with serious side-effects. Although antiretrovirals increase life expectancy considerably and decrease the risk of complications associated with premature ageing, mortality and morbidity remain slightly higher than in uninfected individuals. Treatment should be undertaken only by those experienced in their use.

**Principles of treatment** Treatment aims to prevent the mortality and morbidity associated with chronic HIV infection whilst minimising drug toxicity. Although it should be started before the immune system is irreversibly damaged, the need for early drug treatment should be balanced against the risk of toxicity. Commitment to treatment and strict adherence over many years are required; the regimen chosen should take into account convenience and patient tolerance. The development of drug resistance is reduced by using a combination of drugs; such combinations should have synergistic or additive activity while ensuring that their toxicity is not additive. It is recommended that viral sensitivity to antiretroviral drugs is established before starting treatment or before switching drugs if the infection is not responding.

Treatment also reduces the risk of HIV transmission to sexual partners, but the risk is not eliminated completely, therefore, other methods to reduce transmission should continue to be recommended.

**Initiation of treatment** The optimum time for initiating antiretroviral treatment depends primarily on the CD4 cell count. The timing and choice of treatment should also take account of clinical symptoms, comorbidities, and the possible effect of antiretroviral drugs on factors such as the risk of cardiovascular events. Treatment includes a combination of drugs known as ‘highly active antiretroviral therapy’. Treatment of HIV-1 infection is initiated with 2 nucleoside reverse transcriptase inhibitors and either a non-nucleoside reverse transcriptase inhibitor, or a boosted protease inhibitor, or an integrase inhibitor; the regimens of choice contain tenofovir and emtricitabine with either efavirenz or ritonavir-boosted atazanavir, or ritonavir-boosted darunavir, or raltegravir. Alternative regimens contain abacavir and lamivudine with either ritonavir-boosted lopinavir, or ritonavir-boosted fosamprenavir, or nevirapine, or rilpivirine. Patients who require treatment for both HIV and chronic hepatitis B should be treated with antivirals active against both diseases (section 5.3.3.1).

**Switching therapy** Deterioration of the condition (including clinical and virological changes) may require a change in therapy. The choice of an alternative regimen depends on factors such as the response to previous treatment, tolerance and the possibility of cross-resistance.

**Pregnancy** Treatment of HIV infection in pregnancy aims to reduce the risk of toxicity to the fetus (although information on the teratogenic potential of most antiretroviral drugs is limited), to minimise the viral load and disease progression in the mother, and to prevent transmission of infection to the neonate. All treatment options require careful assessment by a specialist.

Combination antiretroviral therapy maximises the chance of preventing transmission and represents optimal therapy for the mother. However, it may be associated with a greater risk of preterm delivery. Pregnancies in HIV-positive women and babies born to them should be reported prospectively to the National Study of HIV in Pregnancy and Childhood at www.nshpc.ucl.ac.uk and to the Antiretroviral Pregnancy Registry at www.apregistry.com.

Mitochondrial dysfunction has been reported in infants exposed to nucleoside reverse transcriptase inhibitors in utero; the main effects include haematological, metabolic, and neurological disorders; all infants whose mothers received nucleoside reverse transcriptase inhibitors during pregnancy should be monitored for relevant signs or symptoms.

**Breast-feeding** Breast-feeding by HIV-positive mothers may cause HIV infection in the infant and should be avoided.

**Children** HIV disease in children has a different natural progression to adults. Children infected with HIV should be managed within a formal paediatric HIV clinical network by specialists with access to guidelines and information on antiretroviral drugs for children.

**Post-exposure prophylaxis** Prophylaxis with antiretroviral drugs [unlicensed indication] may be appropriate following exposure to HIV-contaminated material. Immediate expert advice should be sought in such cases; national guidelines on post-exposure prophylaxis for healthcare workers have been developed (by the Chief Medical Officer’s Expert Advisory Group on AIDS, www.gov.uk/dh) and local ones may also be available. Antiretrovirals for prophylaxis are chosen on the basis of efficacy and potential for toxicity. Prompt prophylaxis with antiretroviral drugs [unlicensed indication] is also appropriate following potential sexual exposure to HIV; recommendations have been developed by the British Association for Sexual Health and HIV, www.bashh.org.

**Drugs for HIV infection** Zidovudine, a nucleoside reverse transcriptase inhibitor (or ‘nucleoside analogue’), was the first anti-HIV drug to be introduced. Other nucleoside reverse transcriptase inhibitors include abacavir, didanosine, emtricitabine, lamivudine, stavudine, and tenofovir.

The protease inhibitors include atazanavir, darunavir, fosamprenavir (a pro-drug of amprenavir), indinavir, lopinavir, ritonavir, saquinavir, and tipranavir. Indinavir is rarely used in the treatment of HIV-infection because it is associated with nephrolithiasis. Ritonavir in low doses boosts the activity of atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, saquinavir, and tipranavir increasing the persistence of plasma concentrations of these drugs; at such a low dose, ritonavir has no intrinsic antiviral activity. A combination of lopinavir with low-dose ritonavir is available. The protease inhibitors are metabolised by cytochrome P450 enzyme systems and therefore have a significant potential for drug interactions. Protease inhibitors are associated with lipodystrophy and metabolic effects (see below).

The non-nucleoside reverse transcriptase inhibitors efavirenz, etravirine, nevirapine, and rilpivirine are used in the treatment of HIV-1 infection, but not against the subtype HIV-2, a subtype that is rare in the UK. Nevirapine is associated with a high incidence of rash (including...
Infections

Metabolic effects associated with antiretroviral treatment include dyslipidaemia, which is associated with antiretroviral treatment, particularly with protease inhibitors. Protease inhibitors and some nucleoside reverse transcriptase inhibitors are associated with insulin resistance and hyperglycaemia. Of the protease inhibitors, atazanavir and darunavir may be less likely to cause dyslipidaemia, while saquinavir and atazanavir may be less likely to impair glucose tolerance.

**Osteonecrosis** Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

**Nucleoside reverse transcriptase inhibitors**

**Cautions**

**Lactic acidosis** Life-threatening lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with nucleoside reverse transcriptase inhibitors. They should be used with caution in patients (particularly obese women) with hepatomegaly, hepatitis (especially hepatitis C treated with interferon alfa and ribavirin), liver-enzyme abnormalities and with other risk factors for liver disease and hepatic steatosis (including alcohol abuse). Treatment with the nucleoside reverse transcriptase inhibitor should be discontinued in case of symptomatic hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function. Stavudine, especially with didanosine, is associated with a higher risk of lactic acidosis and should be used only if alternative regimens are not suitable.

**Hepatic impairment** Nucleoside reverse transcriptase inhibitors should be used with caution in patients with chronic hepatitis B or C (greater risk of hepatic side-effects); see also Lactic acidosis above.

**Pregnancy** see p. 411

**Breast-feeding** see p. 411

**Side-effects** Side-effects of the nucleoside reverse transcriptase inhibitors include gastro-intestinal disturbances (such as nausea, vomiting, abdominal pain, flatulence and diarrhoea), anorexia, pancreatitis, liver damage (see also Lactic Acidosis, above), dyspnoea, cough, headache, insomnia, dizziness, fatigue, blood disorders (including anaemia, neutropenia, and thrombocytopenia), myalgia, arthralgia, rash, urticaria, and fever. See notes above for metabolic effects and lipodystrophy (Lipodystrophy Syndrome), and Osteonecrosis.

**ABACAVIR**

**Indications** HIV infection in combination with other antiretroviral drugs

**Cautions** see notes above: also test for HLA-B*5701 allele before treatment or if restarting treatment and HLA-B*5701 status not known—increased risk of hypersensitivity reaction in presence of HLA-B*5701 allele; HIV load greater than 100 000 copies/mL; patients at high risk of cardiovascular disease (especially if 10-year cardiovascular risk greater than 20%);

**interactions** Appendix 1 (abacavir)

**Hypersensitivity reactions** Life-threatening hypersensitivity reactions reported—characterised by fever or rash and possibly nausea, vomiting, diarrhoea, abdominal pain, dyspnoea, cough, laryngitis, malaise, headache, and

**Dyslipidaemia** is associated with antiretroviral treatment, particularly with protease inhibitors. Protease inhibitors and some nucleoside reverse transcriptase inhibitors are associated with insulin resistance and hyperglycaemia. Of the protease inhibitors, atazanavir and darunavir may be less likely to cause dyslipidaemia, while saquinavir and atazanavir may be less likely to impair glucose tolerance.

**Immune reconstitution syndrome** Improvement in immune function as a result of antiretroviral treatment may provoke a marked inflammatory reaction against residual opportunistic organisms; these reactions may occur within the first few weeks or months of initiating treatment. Autoimmune disorders (such as Graves’ disease) have also been reported many months after initiation of treatment.

**Lipodystrophy syndrome** Metabolic effects associated with antiretroviral treatment include fat redistribution, insulin resistance, and dyslipidaemia; collectively these have been termed lipodystrophy syndrome. The usual risk factors for cardiovascular disease should be taken into account before starting antiretroviral therapy and patients should be advised about lifestyle changes to reduce their cardiovascular risk. Plasma lipids and blood glucose should be measured before starting antiretroviral therapy, after 3–6 months of treatment, and then annually.

Fat redistribution (with loss of subcutaneous fat, increased abdominal fat, ‘buffalo hump’ and breast enlargement) is associated with regimens containing protease inhibitors and nucleoside reverse transcriptase inhibitors. Stavudine (especially in combination with didanosine), and to a lesser extent zidovudine, are associated with a higher risk of lipodystrophy and should be used only if alternative regimens are not suitable.
myalgia, less frequently mouth ulceration, oedema, hypotension, sore throat, acute respiratory distress syndrome, anaphylaxis, pancreatitis, arthritis, conjunctivitis, lymphadenopathy, lymphocytopenia and renal failure, rarely myositis; laboratory abnormalities may include raised liver function tests (see Lactic Acidosis p. 412) and creatine kinase; symptoms usually appear in the first 6 weeks, but may occur at any time; monitor for symptoms every 2 weeks for 2 months; discontinue immediately if any symptom of hypersensitivity develops and do not rechallenge (risk of more severe hypersensitivity reaction); discontinue if hypersensitivity cannot be ruled out, even when other diagnoses possible—if rechallenge necessary it must be carried out in hospital setting, if abacavir is stopped for any reason other than hypersensitivity, exclude hypersensitivity reaction as the cause and rechallenge only if medical assistance is readily available; care needed with concomitant use of drugs which cause skin toxicity

**Counselling** Patients should be told the importance of regular dosing (intermittent therapy may increase the risk of sensitisation), how to recognise signs of hypersensitivity, and advised to seek immediate medical attention if symptoms develop or before re-starting treatment; patients should be advised to keep Alert Card with them at all times

**Hepatic impairment** see notes above; also avoid in severe impairment

**Renal impairment** manufacturer advises avoid in end-stage renal disease; avoid *Kivexa*® or *Trizivir*® if eGFR less than 50 mL/minute/1.73 m² (consult product literature)

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** see p. 411

**Side-effects** see notes above; also hypersensitivity reactions (see above); very rarely Stevens-Johnson syndrome and toxic epidermal necrolysis; rash and gastro-intestinal disturbances more common in children

**Dose**
- 600 mg daily in 1–2 divided doses; **CHILD** 3 months–18 years see *BNF for Children*

**Ziagen**®(ViiV) Tablets, yellow, f/c, scored, abacavir (as sulfate) 300 mg, net price 60-tab pack = £177.60. Counselling, hypersensitivity reactions

**Oral solution** sugar-free, banana and strawberry flavoured, abacavir (as sulfate) 20 mg/mL, net price 240-mL = £47.36. Counselling, hypersensitivity reactions

**With lamivudine** For cautions, contra-indications, side-effects, and other prescribing information see under individual drugs

**Kivexa**®(ViiV) Tablets, orange, f/c, abacavir (as sulfate) 600 mg, lamivudine 300 mg, net price 30-tab pack = £299.41. Counselling, hypersensitivity reactions

**Dose** **ADULT** body-weight over 40 kg, 1 tablet once daily; **CHILD** 12–18 years see *BNF for Children*

**With lamivudine and zidovudine**

**Note** For patients stabilised (for 6–8 weeks) on the individual components in the same proportions. For cautions, contra-indications, side-effects, and other prescribing information see under individual drugs

**Trizivir**®(ViiV) Tablets, blue-green, f/c, abacavir (as sulfate) 300 mg, lamivudine 150 mg, zidovudine 300 mg, net price 60-tab pack = £432.70. Counselling, hypersensitivity reactions

**Dose** 1 tablet twice daily; **CHILD** under 18 years, body-weight over 30 kg see *BNF for Children*
LAMIVUDINE (3TC)

**Indications** see preparations below

**Cautions** see notes above; **Interactions:** Appendix 1 (lamivudine)

**Chronic hepatitis B** Recurrent hepatitis in patients with chronic hepatitis B may occur on discontinuation of lamivudine. When treating chronic hepatitis B with lamivudine, monitor liver function tests every 3 months, and viral markers of hepatitis B every 3–6 months, more frequently in patients with advanced liver disease or following transplantation (monitoring to continue for at least 1 year after discontinuation)

**Hepatic impairment** see notes above and Cautions above

**Renal impairment** reduce dose if eGFR less than 50 mL/minute/1.73 m²; consult product literature

**Pregnancy** see p. 411

**Breast-feeding** can be used with caution in women infected with chronic hepatitis B alone, providing that adequate measures are taken to prevent hepatitis B infection in infants; for women infected with HIV, see p. 411

**Side-effects** see notes above; also peripheral neuropathy, muscle disorders including rhabdomyolysis, nasal symptoms, alopecia

**Dose**
- See preparations below

---

**STAVUDINE (d4T)**

**Indications** HIV infection in combination with other antiretroviral drugs when no suitable alternative available and when prescribed for shortest period possible

**Cautions** see notes above; also history of peripheral neuropathy, excessive alcohol intake, concomitant use of isoniazid—risk of peripheral neuropathy (see under Side-effects); history of pancreatitis or concomitant use with other drugs associated with pancreatitis; **Interactions:** Appendix 1 (stavudine)

**Hepatic impairment** see notes above

**Renal impairment** risk of peripheral neuropathy; use half normal dose every 12 hours if eGFR 25–50 mL/minute/1.73 m²; use half normal dose every 24 hours if eGFR less than 25 mL/minute/1.73 m²

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** see p. 411

**Side-effects** see notes above; also peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops), abnormal dreams, cognitive dysfunction, drowsiness, depression, pruritus; less commonly anxiety, gynecomastia

**Dose**
- **ADULT** under 60 kg, 30 mg every 12 hours preferably at least 1 hour before food; 60 kg and over, 40 mg every 12 hours; **CHILD** 1 month–18 years see BNF for Children

---

**Epivir (ViiV)**

**Tablets,** I/c, lamivudine 150 mg (scored, white), net price 60-tab pack = £121.82; 300 mg (grey), 30-tab pack = £133.89

**Oral solution**, banana- and strawberry-flavoured, lamivudine 50 mg/5 mL, net price 240-mL pack = £33.16

**Excipients** include sacrose 1 g/5 mL

**Dose** HIV infection in combination with other antiretroviral drugs, 150 mg every 12 hours or 300 mg once daily; **CHILD** 1 month–18 years see BNF for Children

- **With abacavir** See under Abacavir
- **With zidovudine** See under Zidovudine
- **With abacavir and zidovudine** See under Abacavir

---

**Emtriva (Gilead)**

**Capsules,** white/blue, emtricitabine 200 mg, net price 30-cap pack = £163.50

**Dose** 240 mg once daily; **CHILD** body-weight over 33 kg see BNF for Children

**Oral solution**, orange, emtricitabine 10 mg/mL, net price 170-mL pack (candy-flavoured) = £46.50

**Electrolytes** Na⁺ 460 micromol/mL

**Dose** 240 mg once daily; **CHILD** 4 months–18 years see BNF for Children

- **Note** 240 mg oral solution = 200 mg capsule; where appropriate the capsule may be used instead of the oral solution

**Missed dose** If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time

- **With tenofovir** See under Tenofovir
- **With efavirenz and tenofovir** See under Tenofovir
- **With rilpivirine and tenofovir** See under Tenofovir
- **With cobicistat, elvitegravir, and tenofovir** See under Tenofovir

---

**Zefflix (ViiV)**

**Tablets,** brown, I/c, lamivudine 100 mg, net price 28-tab pack = £78.09

**Dose** chronic hepatitis B infection either with compensated liver disease (with evidence of viral replication and histology of active liver inflammation or fibrosis) when first-line treatments cannot be used, or (in combination with another antiviral drug without cross-resistance to lamivudine) with decompensated liver disease, 100 mg daily; **CHILD** [unlicensed indication] 2–11 years, 3 mg/kg once daily (max. 100 mg daily), 12–17 years, adult dose

**Note** Patients receiving lamivudine for concomitant HIV infection should continue to receive lamivudine in a dose appropriate for HIV infection
BNF 68

Zerit® (Bristol-Myers Squibb) ®

Capsules, stavudine 20 mg (brown), net price 56-cap pack = £139.46; 30 mg (light orange/dark orange), 56-cap pack = £146.25; 40 mg (dark orange), 56-cap pack = £150.66 (all hosp. only)

Oral solution, cherry-flavoured, stavudine for reconstitution with water, 1 mg/mL, net price 200 mL = £22.94

**TENOFOVIR DISOPROXIL**

**Indications**  
HIV infection in combination with other antiretroviral drugs; chronic hepatitis B infection with either compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) or decompensated liver disease

**Cautions** see notes above; also test renal function and serum phosphate before treatment, then every 4 weeks (more frequently if at increased risk of renal impairment) for 1 year and then every 3 months, interrupt treatment if renal function deteriorates or serum phosphate decreases; concomitant or recent use of nephrotoxic drugs; **interactions:** Appendix 1 (tenofovir)

**Chronic hepatitis B** When treating chronic hepatitis B with tenofovir, monitor liver function tests every 3 months and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation— recurrent hepatitis may occur on discontinuation)

**Hepatic impairment** see notes above and Cautions above; manufacturer of Atripla® advises caution in mild impairment; avoid Atripla® in moderate to severe impairment; manufacturer of Eviplera® advises caution in moderate impairment; avoid Eviplera® or Strivib® in severe impairment

**Renal impairment** monitor renal function—interrupt treatment if further deterioration.

Granules: 132 mg once daily if eGFR 30–50 mL/minute/1.73 m²; 66 mg once daily if eGFR 20–30 mL/minute/1.73 m²; 33 mg once daily if eGFR 10–20 mL/minute/1.73 m².

Tablets: 245 mg every 2 days if eGFR 30–50 mL/minute/1.73 m²; 245 mg every 3–4 days if eGFR 10–30 mL/minute/1.73 m². Avoid Atripla® if eGFR less than 50 mL/minute/1.73 m²; avoid Eviplera® if eGFR less than 50 mL/minute/1.73 m²; use normal dose of Truvada® every 2 days if eGFR 30–50 mL/minute/1.73 m²; avoid Truvada® if eGFR less than 30 mL/minute/1.73 m²; if eGFR less than 90 mL/minute/1.73 m², only initiate Strivid® if other treatments cannot be used (avoid initiating Strivid® if eGFR less than 70 mL/minute/1.73 m²); if eGFR less than 70 mL/minute/1.73 m², only continue Strivid® if potential benefit outweighs risk (discontinue Strivid® if eGFR less than 50 mL/minute/1.73 m²)

**Pregnancy** see p. 411

**Breast-feeding** see p. 411

**Side-effects** see notes above; also hypophosphataemia; rarely renal failure, proximal renal tubulopathy, nephrogenic diabetes insipidus; also reported reduced bone density

**Dose**

- **ADULT** over 18 years, 245 mg once daily; **CHILD** 2–18 years see BNF for Children

**Missed dose** If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time

5.3.1 HIV infection

Viread® (Gilead) ®

Tablets, f/c, blue, tenofovir disoproxil (as fumarate) 245 mg, net price 30-tab pack = £240.46. Label: 21

Granules, sugar-free, tenofovir disoproxil (as fumarate) 33 mg/g, net price 60 g (with 1-g scoop) = £54.50. Label: 21, counselling, administration

Note: 7.5 scoops of granules contains approx. 245 mg tenofovir disoproxil (as fumarate)

**Counselling** Mix 1 scoop of granules with 1 tablespoon of soft food (e.g. yoghurt, apple sauce) and take immediately without chewing. Do not mix granules with liquids

**With emtricitabine**  
For cautions, contra-indications, side-effects, and other prescribing information see under individual drugs

Truvada® (Gilead) ®

Tablets, blue, f/c, tenofovir disoproxil (as fumarate) 245 mg, emtricitabine 200 mg, net price 30-tab pack = £418.50. Label: 21, counselling, administration

**Counselling** Patients with swallowing difficulties may disperse tablet in half a glass of water, orange juice, or grape juice (but bitter taste)

**Dose** HIV infection in combination with other antiretroviral drugs, ADULT over 18 years, 1 tablet once daily

**Missed dose** If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time

**With efavirenz and emtricitabine**  
For cautions, contra-indications, side-effects, and other prescribing information see under individual drugs

Atripla® (Gilead) ®

Tablets, pink, f/c, efavirenz 600 mg, emtricitabine 200 mg, tenofovir disoproxil (as fumarate) 245 mg, net price 30-tab pack = £626.90. Label: 23, 25

**Dose** HIV infection stabilised on antiretroviral therapy for more than 3 months, ADULT over 18 years, 1 tablet once daily

**Missed dose** If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time

**With emtricitabine and rilpivirine**  
For cautions, contra-indications, side-effects, and other prescribing information see under individual drugs

Eviplera® (gilead) ®

Tablets, purple-pink, f/c, emtricitabine 200 mg, rilpivirine (as hydrochloride) 25 mg, tenofovir disoproxil (as fumarate) 245 mg, net price 30-tab pack = £618.77. Label: 21, 25, counselling, antacids

**Counselling** avoid antacids 2 hours before or 4 hours after counselling

**Dose** HIV infection in patients with plasma HIV-1 RNA concentration less than 100 000 copies/mL, ADULT over 18 years, 1 tablet once daily

**Missed dose** If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time

**With emtricitabine and rilpivirine**  
For cautions, contra-indications, side-effects, and other prescribing information see under individual drugs

Strivid® (Gilead) ®

Tablets, green, f/c, cobicistat 150 mg, emtricitabine 200 mg, tenofovir disoproxil (as fumarate) 245 mg, net price 30-tab pack = £1034.72. Label: 21, counselling, antacids

**Counselling** avoid antacids 4 hours before or 4 hours after taking Strivid®

**Cautions** see notes above and also Cautions under Emtricitabine and Tenofovir Disoproxil, also test urine
ZIDOVUDINE
(Azidothymidine, AZT)

Note: The abbreviation AZT which is sometimes used for zidovudine has also been used for another drug.

Indications: HIV infection in combination with other antiretroviral drugs; prevention of maternal-fetal HIV transmission (see notes above under Pregnancy and Breast-feeding).

Cautions: see notes above; also haematological toxicity, particularly with high dose and advanced disease—monitor full blood count after 4 weeks of treatment, then every 3 months; vitamin B₁₂ deficiency (increased risk of neutropenia); if anaemia or myelosuppression occur, reduce dose or interrupt treatment according to product literature, or consider other treatment; elderly; interactions: Appendix 1 (zidovudine).

Contra-indications: abnormally low neutrophil counts or haemoglobin concentration (consult product literature); neonates with hyperbilirubinaemia requiring treatment other than phototherapy, or with raised transaminase (consult product literature); acute porphyria (section 9.8.2).

Hepatic impairment: see notes above; also accumulation may occur.

Renal impairment: reduce oral dose to 300–400 mg daily in divided doses or intravenous dose to 1 mg/kg 3–4 times daily if eGFR is less than 10 mL/minute/1.73 m²; avoid Combivir® (or non-proprietary equivalents) if eGFR less than 50 mL/minute/1.73 m² (consult product literature).

Pregnancy: see p. 411

Breast-feeding: see p. 411

Side-effects: see notes above; also anaemia (may require transfusion), taste disturbance, chest pain, influenza-like symptoms, paraesthesia, neuropathy, convulsions, dizziness, drowsiness, anxiety, depression, loss of mental acuity, myopathy, myalgia, pancreatitis, urinary frequency, sweating, pruritus, pigmentations of nails, skin and oral mucosa.

Dose:
- By mouth, 250–300 mg twice daily; CHILD 1 month–18 years see BNF for Children.
- Prevention of maternal-fetal HIV transmission, seek specialist advice (combination therapy preferred).
- Patients temporarily unable to take zidovudine by mouth, by intravenous infusion over 1 hour, 0.8–1 mg/kg every 4 hours (approximating to 1.2–1.5 mg/kg every 4 hours by mouth) usually for not more than 2 weeks; CHILD 3 months–18 years see BNF for Children.

Zidovudine (Non-proprietary)
Capsules, zidovudine 100 mg, net price 60-cap pack = £50.17; 250 mg, 60-cap pack = £125.44

Retrovir® (ViiV)
Capsules, zidovudine 100 mg (white), net price 100-cap pack = £88.86; 250 mg (blue/white), 40-cap pack = £88.86

Oral solution: sugar-free, strawberry-flavoured, zidovudine 50 mg/5 mL, net price 200-mL pack with 10-mL oral syringe = £17.78

Injection, zidovudine 10 mg/mL. For dilution and use as an intravenous infusion. Net price 20-mL vial = £8.92

With lamivudine
For cautions, contra-indications, side-effects, and other prescribing information see under individual drugs.

Zidovudine and lamivudine (Non-proprietary)
Tablets, f/c, scored, zidovudine 300 mg, lamivudine 150 mg, net price 60-tab pack = £70.61
Dose: 1 tablet twice daily; CHILD body-weight over 14 kg see BNF for Children.

Combivir® (ViiV)
Tablets, f/c, scored, zidovudine 300 mg, lamivudine 150 mg, net price 60-tab pack = £255.10
Dose: 1 tablet twice daily; CHILD body-weight over 14 kg see BNF for Children.

Note: Tablets may be crushed and mixed with semi-solid food or liquid just before administration.

With abacavir and lamivudine
See under Abacavir.

Protease inhibitors

Cautions: Protease inhibitors are associated with hyperglycaemia and should be used with caution in diabetes (see Lipodystrophy Syndrome, p. 412). Caution is also needed in patients with haemophilia who may be at increased risk of bleeding.

Contra-indications: Protease inhibitors should not be given to patients with acute porphyria (but see section 9.8.2).

Hepatic impairment: Protease inhibitors should be used with caution in patients with chronic hepatitis B or C (increased risk of hepatic side-effects).

Pregnancy: See p. 411

Breast-feeding: See p. 411

Side-effects: Side-effects of the protease inhibitors include gastrointestinal disturbances (including diarrhoea, nausea, vomiting, abdominal pain, flatulence), anorexia, hepatic dysfunction, pancreatitis; blood disorders including anaemia, neutropenia, and thrombocytopenia; sleep disturbances, fatigue, headache, dizziness, paraesthesia, myalgia, myositis, rhabdomyolysis; taste disturbances; rash, pruritus, Stevens–Johnson syndrome, hypersensitivity reactions including anaphylaxis; see also notes above for lipodystrophy and metabolic effects (Lipodystrophy Syndrome), and Osteonecrosis.
ATAZANAVIR

**Indications**  HIV infection in combination with other antiretroviral drugs

**Cautions** see notes above; also concomitant use with drugs that prolong PR interval; cardiac conduction disorders; predisposition to QT interval prolongation (including electrolyte disturbances, concomitant use of drugs that prolong QT interval); **interactions:** Appendix 1 (atazanavir)

**Rash** Mild to moderate rash occurs commonly, usually within the first 3 weeks of therapy. Severe rash occurs less frequently and may be accompanied by systemic symptoms. Discontinue if severe rash develops

**Contra-indications** see notes above

**Hepatic impairment** see notes above; also manufacturer advises caution in mild impairment; avoid in moderate to severe impairment

**Pregnancy** see p. 411; monitor viral load and plasma-atazanavir concentration during third trimester; theoretical risk of hyperbilirubinaemia in neonate if used at term

**Breast-feeding** see p. 411

**Side-effects** see notes above; also AV block (in children); less commonly mouth ulcers, dry mouth, cholelithiasis, hypertension, syncope, chest pain, torsade de points, dyspnoea, peripheral neuropathy, abnormal dreams, amnesia, diarrohea, depression, anxiety, weight changes, increased appetite, gynaecomastia, nephrolithiasis, urinary frequency, haematuria, proteinuria, arthralgia, and alopecia; rarely cholecytitis, hepatosplenomegaly, oedema, palpitation, abnormal gait

**Dose**

- With low-dose ritonavir, 300 mg once daily; **CHILD** 6–18 years see BNF for Children

**Reyataz® (Bristol-Myers Squibb)**

- **Capsules**, atazanavir (as sulfate) 150 mg (dark blue/ light blue), net price 60-cap pack = £303.38, 200 mg (dark blue), 60-cap pack = £303.38; 300 mg (red/ blue), 30-cap pack = £303.38. Label: 5, 21

DARUNAVIR

**Indications**  HIV infection in combination with other antiretroviral drugs

**Cautions** see notes above; also sulfonamide sensitivity; monitor liver function before and during treatment; **interactions:** Appendix 1 (darunavir)

**Rash** Mild to moderate rash occurs commonly, usually within the first 4 weeks of therapy and resolves without stopping treatment. Severe skin rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis) occurs less frequently and may be accompanied by fever, malaise, arthralgia, myalgia, oral lesions, conjunctivitis, hepatitis, or eosinophilia; treatment should be stopped if severe rash develops

**Contra-indications** see notes above

**Hepatic impairment** see notes above; also manufacturer advises caution in mild to moderate impairment; avoid in severe impairment; no information available

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk; if required, use the twice daily dose regimen; see also p. 411

**Breast-feeding** see p. 411

**Side-effects** see notes above; also peripheral neuropathy; less commonly myocardial infarction, angina, QT interval prolongation, tachycardia, hypertension, flushing, peripheral oedema, dyspnoea, cough, anxiety, memory impairment, depression, abnormal dreams, increased appetite, weight changes, pyrexia, hypothyroidism, osteoporosis, gynaecomastia, erectile dysfunction, reduced libido, dysuria, polyuria, nephrolithiasis, renal failure, arthralgia, dry eyes, conjunctival hyperaemia, throat irritation, dry mouth, stomatitis, nail discoloration, acne, eczema, increased sweating, alopecia; rarely haematemesis, syncope, bradycardia, palpitation, confusion, convulsions, visual disturbances, rhinorrhea, seborrhoeic dermatitis

**Dose**

- With low-dose ritonavir, **ADULT** over 18 years previously treated with antiretroviral therapy, 600 mg twice daily or (if no resistance to darunavir, if plasma HIV-RNA concentration less than 100 000 copies/mL, and if CD4 cell count greater than 100 cells × 10^9/litre) 800 mg once daily; **CHILD** 3–18 years see BNF for Children

**Missed dose** If a dose is more than 6 hours late on the twice daily regimen (or more than 12 hours late on the once daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time

**Prezista® (Janssen)**

- **Tablets**, darunavir (as ethanolate) 75 mg (white), net price 480-tab pack = £446.70; 150 mg (white), 240-tab pack = £446.70; 400 mg (light orange), 60-tab pack = £297.80; 600 mg (orange), 60-tab pack = £446.70; 800 mg (red), 30-tab pack = £297.80. Label: 21

**Oral suspension**, sugar-free, strawberry-flavoured, darunavir (as ethanolate) 100 mg/mL, net price 200-mL = £248.17. Label: 21

**FOSAMPRENAVIR**

**Note** Fosamprenavir is a pro-drug of amprenavir

**Indications**  HIV infection in combination with other antiretroviral drugs

**Cautions** see notes above; **interactions:** Appendix 1 (fosamprenavir)

**Rash** May occur, usually in the second week of therapy; discontinue permanently if severe rash with systemic or allergic symptoms or, mucocutaneous involvement, if rash mild or moderate, may continue without interruption—usually resolves within 2 weeks and may respond to antihistamines

**Contra-indications** see notes above

**Hepatic impairment** see notes above; also manufacturer advises caution in mild impairment; reduce dose to 450 mg twice daily in moderate impairment; reduce dose to 300 mg twice daily in severe impairment

**Pregnancy** toxicity in animal studies; manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** see p. 411

**Side-effects** see notes above; also reported, rash including rarely Stevens-Johnson syndrome (see also Rash above)

**Dose**

- With low-dose ritonavir, 700 mg twice daily; **CHILD** 6–18 years see BNF for Children

**Note** 700 mg fosamprenavir is equivalent to approx. 600 mg amprenavir
**Hepatic impairment** see notes above; also avoid oral solution due to propylene glycol content; manufacturer advises avoid capsules and tablets in severe impairment

**Renal impairment** avoid oral solution due to propylene glycol content; use tablets with caution in severe impairment

**Pregnancy** avoid oral solution due to propylene glycol content; use tablets only if potential benefit outweighs risk (toxicity in animal studies); for tablets see also p. 411

**Breast-feeding** see p. 411

**Side-effects** see notes above; also colitis, weight changes, hypertension, anxiety, neuropathy, sexual dysfunction, amenorrhoea, menorrhagia, arthralgia, night sweats; less commonly gastrointestinal ulcer, rectal bleeding, dry mouth, stomatitis, myocardial infarction, AV block, cerebrovascular accident, deep vein thrombosis, abnormal dreams, convulsions, tremor, nephritis, haematuria, visual disturbances, tininitus, alopecia

**Dose**
- See preparations below

**Kaletra® (AbbVie)**

**Indications** HIV infection in combination with other antiretroviral drugs; low doses used to increase effect of some protease inhibitors

**Cautions** see notes above; concomitant use with drugs that prolong QT or PR interval; cardiac conduction disorders, structural heart disease; pancreatitis (see below); interactions: Appendix 1 (lopinavir, ritonavir)

**Pancreatitis** Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis is diagnosed

**Contra-indications** see notes above

**Ritonavir**

**Indications** HIV infection in combination with other antiretroviral drugs; low doses used to increase effect of some protease inhibitors

**Cautions** see notes above; concomitant use with drugs that prolong PR interval; cardiac conduction disorders, structural heart disease; pancreatitis (see below); interactions: Appendix 1 (lopinavir, ritonavir)

**Pancreatitis** Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis is diagnosed

**Contra-indications** see notes above

**Breast-feeding** see p. 411

**Side-effects** see notes above; also gastrointestinal haemorrhage, blood pressure changes, oedema, syncope, flushing, cough, pharyngitis, anxiety, confusion, seizures, peripheral neuropathy, fever, decreased blood thyroxine concentration, menorrhagia, renal impairment, arthralgia, blurred vision, mouth ulcers, acne; less commonly...
myocardial infarction, electrolyte disturbances; rarely toxic epidermal necrolysis

**Dose**
- Initially 300 mg every 12 hours for 3 days, increased in steps of 100 mg every 12 hours over not longer than 14 days to 600 mg every 12 hours; **CHILD 2–18 years see BNF for Children**
- Low-dose booster to increase effect of other protease inhibitors, 100–200 mg once or twice daily; **CHILD 2–18 years see BNF for Children**

Norvir® (AbbVie) (oral solution)
- Tablets, I/c, ritonavir 100 mg, net price 30-tab pack = £19.44. Label: 21, 25
- Oral solution, sugar-free, ritonavir 400 mg/5 mL, net price 5 × 90-mL packs (with measuring cup) = £403.20. Label: 21, counselling, administration
- Excipients include propylene glycol 26% (see Excipients, p. 2), alcohol 43%
- Counselling: Bitter taste of oral solution can be masked by mixing with chocolate milk; do not mix with water, measuring cup must be dry

**With lopinavir**

See under Lopinavir with Ritonavir

### SAQUINAVIR

**Indications** HIV infection in combination with other antiretroviral drugs

**Cautions** see notes above; monitor ECG before starting treatment and then on day 3 or 4 of treatment—discontinue if QT interval over 480 milliseconds, if QT interval more than 20 milliseconds above baseline, or if prolongation of PR interval; concomitant use of garlic (avoid garlic capsules—reduces plasma-saquinavir concentration); **interactions:** Appendix 1 (saquinavir)

**Counselling** Patients should be told how to recognise signs of arrhythmia and advised to seek medical attention if symptoms such as palpitation or syncope develop

**Contra-indications** see notes above; predisposition to cardiac arrhythmias (including congenital QT prolongation, bradycardia, history of symptomatic arrhythmias, heart failure with reduced left ventricular ejection fraction, electrolyte disturbances, concomitant use of drugs that prolong QT or PR interval); concomitant use of drugs that increase plasma-saquinavir concentration (avoid unless no alternative treatment available)

**Hepatic impairment** see notes above; also manufacturer advises caution in moderate impairment; avoid in severe impairment

**Renal impairment** use with caution if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** see p. 411

**Breast-feeding** see p. 411

**Side-effects** see notes above; also dyspnoea, anorexia, peripheral neuropathy, influenza-like symptoms, renal impairment and photosensitivities; rarely dehydration

**Dose**
- See preparations

Aptivus® (Boehringer Ingelheim) (oral solution)
- Capsules, pink, tipranavir 250 mg, net price 120–cap pack = £441.00. Label: 5, 21
- Excipients include ethanol 100 mg per capsule
- **Dose** with low-dose ritonavir, 500 mg twice daily; **CHILD 12–18 years see BNF for Children**
- Oral Solution, toffee-and mint-flavoured, tipranavir 100 mg/mL, net price 95–mL pack = £129.65. Label: 5, 21, counselling, crystallisation
- Excipients include vitamin E 78 mg/mL
- **Dose** with low-dose ritonavir, **CHILD 2–12 years see BNF for Children**

**Note** The bioavailability of Aptivus® oral solution is higher than that of the capsules; the oral solution is not interchangeable with the capsules on a milligram-for-milligram basis

**Counselling** Patients should be told to observe the oral solution for crystallisation; the bottle should be replaced if more than a thin layer of crystals form (doses should continue to be taken at the normal time until the bottle is replaced)

### Invirase® (Roche) (oral solution)
- **Tablets**, orange, I/c, saquinavir (as mesilate) 500 mg, net price 120-tab pack = £251.26. Label: 21, counselling, arrhythmias

### TIPRANAVIR

**Indications** HIV infection resistant to other protease inhibitors, in combination with other antiretroviral drugs in patients previously treated with antiretrovirals

**Cautions** see notes above; also patients at risk of increased bleeding from trauma, surgery or other pathological conditions; concomitant use of drugs that increase risk of bleeding; **interactions:** Appendix 1 (tipranavir)

**Hepatotoxicity** Potentially life-threatening hepatotoxicity reported; monitor liver function before treatment then every 2 weeks for 1 month, then every 3 months. Discontinue if signs or symptoms of hepatitis develop or if liver-function abnormality develops (consult product literature)

**Contra-indications** see notes above

**Hepatic impairment** see notes above; also manufacturer advises caution in mild impairment; avoid in moderate or severe impairment—no information available

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—*toxicity in animal studies*

**Breast-feeding** see p. 411

**Side-effects** see notes above; also dyspnoea, anorexia, peripheral neuropathy, influenza-like symptoms, renal impairment and photosensitivities; rarely dehydration

**Dose**
- See preparations

Efavirenz

**Indications** HIV infection in combination with other antiretroviral drugs

**Cautions** elderly; history of mental illness or seizures; monitor liver function if receiving other hepatotoxic drugs; **interactions:** Appendix 1 (efavirenz)

**Rash** Rash, usually in the first 2 weeks, is the most common side-effect; discontinue if severe rash with blistering.
desquamation, mucosal involvement or fever, if rash mild or moderate, may continue without interruption—usually resolves within 1 month.

Psychiatric disorders Patients or their carers should be advised to seek immediate medical attention if symptoms such as severe depression, psychosis or suicidal ideation occur.

Contra-indications acute porphyria (but see section 9.8.2)

Hepatic impairment in mild liver disease, monitor for dose related side-effects (e.g. CNS effects) and monitor liver function; avoid in moderate to severe impairment; greater risk of hepatic side-effects in chronic hepatitis B or C.

Renal impairment manufacturer advises caution in severe renal failure—no information available.

Pregnancy see p. 411; reports of neural tube defects following use of efavirenz, and anencephaly in animals.

Breast-feeding see p. 411

Side-effects rash including Stevens-Johnson syndrome (see Rash above), abdominal pain, diarrhoea, nausea, vomiting; anxiety, depression, sleep disturbances, abnormal dreams, dizziness, headache, fatigue, impaired concentration (administration at bedtime especially in first 2–4 weeks reduces CNS effects); pruritus; less commonly pancreatitis, hepatitis, flushing, psychosis, mania, suicidal ideation, amnesia, ataxia, tremor, convulsions, gynaecomastia, blurred vision, tinnitus; rarely hepatic failure, photosensitivity; also reported raised serum cholesterol (see Lipodystrophy Syndrome, p. 412); see also Osteonecrosis, p. 412.

Dose See preparations below.

Sustiva® (Bristol-Myers Squibb) (Ped)

Capsules, efavirenz 50 mg (yellow/white), net price 30-cap pack = £16.73; 100 mg (white), 30-cap pack = £33.41; 200 mg (yellow), 90-cap pack = £200.27. Label: 23.

Dose 600 mg once daily. CHILD 3–18 years see BNF for Children.

Tablets, f/c, yellow, efavirenz 600 mg, net price 30-tab pack = £200.27. Label: 23.

Dose 600 mg once daily. CHILD 3–18 years see BNF for Children.

Oral solution, sugar-free, strawberry and mint flavour, efavirenz 30 mg/mL, net price 180-mL pack = £53.84.

Dose 720 mg once daily. CHILD 3–18 years see BNF for Children.

Note The bioavailability of Sustiva® oral solution is lower than that of the capsules and tablets; the oral solution is not interchangeable with either capsules or tablets on a milligram-for-milligram basis.

With emtricitabine and tenofovir See under Tenofovir.

ETRAVIRINE

Indications in combination with other antiretroviral drugs (including a boosted protease inhibitor) for HIV infection resistant to other non-nucleoside reverse transcriptase inhibitors and protease inhibitors.

Cautions interactions: Appendix 1 (etravirine). Hypersensitivity reactions Rash, usually in the second week, is the most common side-effect and appears more frequently in women. Life-threatening hypersensitivity reactions reported usually during week 3–6 of treatment and characterised by rash, eosinophilia, and systemic symptoms (including fever, general malaise, myalgia, arthralgia, blistering, oral lesions, conjunctivitis, and hepatitis). Discontinue permanently if hypersensitivity reaction or severe rash develop. If rash mild or moderate (without signs of hypersensitivity reaction), may continue without interruption—usually resolves within 2 weeks.

Counselling Patients should be told how to recognise hypersensitivity reactions and advised to seek immediate medical attention if hypersensitivity reaction or severe rash develop.

Contra-indications acute porphyria (but see section 9.8.2).

Hepatic impairment manufacturer advises caution in moderate impairment; avoid in severe impairment—no information available; greater risk of hepatic side-effects in chronic hepatitis B or C.

Pregnancy see p. 411

Breast-feeding see p. 411

Side-effects rash (including Stevens-Johnson syndrome rarely and toxic epidermal necrolysis very rarely; see also Hypersensitivity Reactions above); gastro-oesophageal reflux, nausea, abdominal pain, flatulence, gastritis, myocardial infarction, hyper tension; peripheral neuropathy; diabetes, hyperlipidaemia (see also Lipodystrophy Syndrome, p. 412); renal failure, anaemia, less commonly pancreatitis, haematemesis, hepatitis, angina, bronchospasm, drowsiness, malaise, gynaecomastia, blurred vision, dry mouth, and sweating; also reported, haemorrhagic stroke and hypersensitivity reactions; see also Osteonecrosis, p. 412.

Dose

200 mg twice daily after food. CHILD 6–18 years see BNF for Children.

Missed dose If a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Intelence® (Janssen) (Ped)

Tablets, etravirine 100 mg, net price 120-tab pack = £301.27; 200 mg, 60-tab pack = £301.27. Label: 21, counselling, rash and hypersensitivity reactions.

Note Dispense in original container (contains desiccant). Patients with swallowing difficulties may disperse tablets in a glass of water just before administration.

NEVIRAPINE

Indications HIV infection in combination with other antiretroviral drugs.

Cautions chronic hepatitis B or C, high CD4 cell count, and women (all at greater risk of hepatic side-effects—if plasma HIV-1 RNA detectable, manufacturer advises avoid in women with CD4 cell count greater than 250 cells/mm³ or in men with CD4 cell count greater than 400 cells/mm³ unless potential benefit outweighs risk); interactions: Appendix 1 (nevirapine).

Hepatic disease Potentially life-threatening hepatotoxicity including fatal fulminant hepatitis reported usually in first 6 weeks; close monitoring required during first 18 weeks; monitor liver function before treatment then every 2 weeks for 2 months then after 1 month and then regularly. Discontinue permanently if abnormalities in liver function tests accompanied by hypersensitivity reaction (rash, fever, arthralgia, myalgia, lymphadenopathy, hepatitis, renal impairment, eosinophilia, granulocytopenia); suspend if severe abnormalities in liver function tests but no hypersensitivity reaction—discontinue permanently if
significant liver function abnormalities recur; monitor patient closely if mild to moderate abnormalities in liver function tests with no hypersensitivity reaction

Rash  Rash, usually in first 6 weeks, is most common side-effect; incidence reduced if introduced at low dose and dose increased after 14 days; monitor closely for skin reactions during first 18 weeks; discontinue permanently if severe rash or if rash accompanied by blistering, oral lesions, conjunctivitis, facial oedema, general malaise or hypersensitivity reactions; if rash mild or moderate may continue without interruption but dose should not be increased until rash resolves

Counselling  Patients should be told how to recognise hypersensitivity reactions and advised to discontinue treatment and seek immediate medical attention if severe skin reaction, hypersensitivity reactions, or symptoms of hepatitis develop

Contra-indications  acute porphyria (but see section 9.8.2); post-exposure prophylaxis

Hepatic impairment  manufacturer advises avoid modified-release preparation—no information available; use ‘immediate-release’ preparation with caution in moderate impairment and avoid in severe impairment; see also Hepatic Disease, above

Renal impairment  manufacturer advises avoid modified-release preparation—no information available

Pregnancy  see p. 411

Breast-feeding  see p. 411

Side-effects  rash including Stevens-Johnson syndrome and toxic epidermal necrolysis (see also Cautions above), nausea, vomiting, abdominal pain, diarrhoea, hepatitis (see also Hepatic Disease above), hypersensitivity reactions (may involve hepatic reactions and rash, see also Hepatic Disease above), headache, fatigue, fever, granulocytopenia; less commonly anaemia, myalgia, arthralgia; see also Osteonecrosis, p. 412

Dose  • 200 mg once daily of ‘immediate-release’ preparation for first 14 days then (if no rash present) 200 mg twice daily of ‘immediate-release’ preparation or 400 mg once daily of modified-release preparation; CHILD under 18 years see BNF for children

Note  Duration of once daily dose regimen of ‘immediate-release’ preparation should not exceed 28 days; if rash not resolved within 28 days, alternative treatment should be sought. If treatment interrupted for more than 7 days, restart using the once daily dose regimen of the ‘immediate-release’ preparation for the first 14 days as for new treatment

Missed dose  If a dose is more than 8 hours late with the ‘immediate-release’ preparation (or more than 12 hours late with the modified-release preparation), the missed dose should not be taken and the next dose should be taken at the usual time

Nevirapine  (Non-proprietary) Tablets, nevirapine 200 mg, net price 60 = £122.00. Counselling, hypersensitivity reactions

Viramune® (Boehringer Ingelheim) Tablets, nevirapine 200 mg, net price 14-tab pack = £39.67, 60-tab pack = £170.00. Counselling, hypersensitivity reactions

Suspension, nevirapine 50 mg/5 mL, net price 240-mL pack = £50.40. Counselling, hypersensitivity reactions

Prolonged-release tablets, m/r, yellow, nevirapine 400 mg, net price 30-tab pack = £170.00. Label: 25, counselling, hypersensitivity reactions

BNF 68

5.3.1 HIV infection 421

RILPIVIRINE

Indications  see preparations below

Cautions  concomitant use with drugs that prolong QT interval; interactions: Appendix 1 (rilpivirine)

Hepatic impairment  manufacturer advises caution in moderate impairment; avoid in severe impairment—no information available; greater risk of hepatic side-effects in chronic hepatitis B or C

Renal impairment  manufacturer advises caution in severe impairment

Pregnancy  manufacturer advises avoid unless essential—no information available

Breast-feeding  see p. 411

Side-effects  nausea, vomiting, abdominal pain, anaesthesia, dry mouth, raised serum amylase and lipase, hyperlipidaemia (see also Lipodystrophy Syndrome, p. 412), depression, abnormal dreams, sleep disturbances, headache, dizziness, malaise, rash; see also Osteonecrosis, p. 412

Dose  • See preparations below

Edurant® (Janssen) Tablets, f/c, rilpivirine (as hydrochloride) 25 mg, net price 30-tab pack = £200.27. Label: 21, 25, counselling, antacids

Counselling  Avoid antacids 2 hours before or 4 hours after taking rilpivirine

Dose  HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy and if plasma HIV-1 RNA concentration less than 100 000 copies/mL, ADULT over 18 years, 25 mg once daily

Missed dose  If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time

With emtricitabine and tenofovir

See under Tenofovir

Other antiretrovirals

DOLUGTEGRAVIR

Indications  HIV infection in combination with other antiretroviral drugs

Cautions  avoid concomitant use with etravirine, unless used in combination with atazanavir, darunavir, or lopinavir; interactions: Appendix 1 (dolutegravir)

Hypersensitivity reactions  Hypersensitivity reactions (including severe rash, or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, oral lesions, conjunctivitis, angioedema, eosinophilia, or raised liver enzymes) reported uncommonly. Discontinue immediately if any sign or symptoms of hypersensitivity reactions develop

Hepatic impairment  manufacturer advises caution in severe impairment—no information available

Pregnancy  manufacturer advises use only if potential benefit outweighs risk

Breast-feeding  see p. 411

Side-effects  diarrhoea, nausea, vomiting, abdominal pain, flatulence, headache, dizziness, insomnia, abnormal dreams, fatigue, rash, pruritus, raised creatine kinase; less commonly hepatitis, hypersensitivity reactions (see Cautions); see also Osteonecrosis, p. 412
Dose
- 50 mg once daily; if resistance to other inhibitors of HIV integrase suspected, 50 mg twice daily with food;
  CHILD 12–18 years see BNF for Children

Note
50 mg twice daily with concomitant efavirenz, nevirapine, tipranavir, or ritonavir, however, avoid concomitant use with these drugs if resistance to other inhibitors of HIV integrase suspected

Missed dose
If a dose is more than 20 hours late on the once daily regimen (or more than 8 hours late on the twice daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time

Tivicay® (GSK) ®
Tablets, yellow, f/c, dolutegravir (as sodium salt)
50 mg, net price 30-tab pack = £498.75. Counselling, antacids

Cautions
- interactions: Appendix 1 (enfuvirtide)
  Hypersensitivity reactions
Hypersensitivity reactions including rash, fever, nausea, vomiting, chills, rigors, low blood pressure, respiratory distress, glomerulonephritis, and raised liver enzymes reported; discontinue immediately if any signs or symptoms of systemic hypersensitivity develop and do not rechallenge

Counselling
Patients should be told how to recognise signs of hypersensitivity, and advised to discontinue treatment and seek immediate medical attention if symptoms develop

Hepatic impairment
Manufacturer advises caution—no information available; chronic hepatitis B or C (possibly greater risk of hepatic side-effects)

Pregnancy
Manufacturer advises use only if potential benefit outweighs risk

Breast-feeding
see p. 411

Side-effects
- injection-site reactions; pancreatitis, gastro-oesophageal reflux disease, anorexia, weight loss; hypertriglyceridaemia; peripheral neuropathy, asthenia, tremor, anxiety, nightmares, irritability, impaired concentration, vertigo; pneumonia, sinusitis, influenza-like illness; diabetes mellitus; haematuria; renal calculi, lymphadenopathy; myalgia; conjunctivitis; dry skin, acne, erythema, skin papilloma; less commonly hypersensitivity reactions (see Cautions); see also Osteonecrosis, p. 412

Breast-feeding
see p. 411

Raltegravir

Indications
HIV infection in combination with other antiretroviral drugs

Cautions
- risk factors for myopathy or rhabdomyolysis; chronic hepatitis B or C (greater risk of hepatic side-effects); psychiatric illness (may exacerbate underlying illness including depression); interactions: Appendix 1 (raltegravir)
  Rash
Rash occurs commonly. Discontinue if severe rash or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, mouth ulceration, conjunctivitis, angioedema, hepatitis, or eosinophilia

Hepatic impairment
Manufacturer advises caution in severe impairment—no information available

Breast-feeding
see p. 411

Side-effects
diarrhoea, nausea, vomiting, dyspepsia, abdominal pain, flatulence, hypertriglyceridaemia, dizziness, headache, depression, insomnia, abnormal dreams, hyperactivity, asthenia, rash (including less commonly Stevens-Johnson syndrome, rash with eosinophilia and systemic symptoms; see also Rash above), less commonly gastritis, hepatitis, pancreatitis, dry mouth, taste disturbances, pain on swallowing, peptic ulcer, constipation, rectal bleeding, lipodyrophy (see Lipodyrophy Syndrome, p. 412), palpitation, ventricular extrasystoles, bradycardia, hypertension, flushing, chest pain, oedema, dysphonia, epistaxis, nasal congestion, drowsiness, anxiety, appetite changes, confusion, impaired memory and attention, suicidal ideation, pyrexia, chills, carpal tunnel syndrome, tremor, peripheral neuropathy, erectile dysfunction, gynaecomastia, menopausal symptoms, osteopenia, renal failure, nocturia, polydipsia, anaemia, thrombocytopenia, neutropenia, arthralgia, myalgia, rhabdomyolysis, visual disturbances, tinnitus, gingivitis, glossitis, acne, pruritus, hyperhidrosis, dry skin, skin papilloma, alopecia; see also Osteonecrosis, p. 412

Dose
- 400 mg twice daily; CHILD 2–18 years see BNF for Children

Isentress® (MSD) ®
Tablets, pink, f/c, raltegravir (as potassium salt)
400 mg, net price 60-tab pack = £232.79. Label: 25
5.3.2 Herpesvirus infections

5.3.2.1 Herpes simplex and varicella–zoster infection

The two most important herpesvirus pathogens are herpes simplex virus (herpesvirus hominis) and varicella–zoster virus.

**Herpes simplex infections** Herpes infection of the mouth and lips and in the eye is generally associated with herpes simplex virus serotype 1 (HSV-1); other areas of the skin may also be infected, especially in immunodeficiency. Genital infection is most often associated with HSV-2 and also HSV-1. Treatment of herpes simplex infection should start as early as possible and usually within 5 days of the appearance of the infection. In individuals with good immune function, mild infection of the eye (ocular herpes, section 11.3.3) and of the lips (herpes labialis or cold sores, section 13.10.3) is treated with a topical antiviral drug. Primary herpetic gingivostomatitis is managed by changes to diet and with analgesics (section 12.3.2). Severe infection, neonatal herpes infection or infection in immunocompromised individuals requires treatment with a systemic antiviral drug. Primary or recurrent genital herpes simplex infection is treated with an antiviral drug given by mouth. Persistence of a lesion or recurrence in an immunocompromised patient may signal the development of resistance. Specialist advice should be sought for systemic treatment of herpes simplex infection in pregnancy.

**Varicella-zoster infections** Regardless of immune function and the use of any immunoglobulins, neonates with chickenpox should be treated with a parenteral antiviral to reduce the risk of severe disease. Chickenpox in otherwise healthy children between 1 month and 12 years is usually mild and antiviral treatment is not usually required.

Chickenpox is more severe in adolescents and adults than in children; antiviral treatment started within 24 hours of the onset of rash may reduce the duration and severity of symptoms in otherwise healthy adults and adolescents. Antiviral treatment is generally recommended in immunocompromised patients and those at special risk (e.g. because of severe cardiovascular or respiratory disease or chronic skin disorder); in such cases, an antiviral is given for 10 days with at least 7 days of parenteral treatment.

Pregnant women who develop severe chickenpox may be at risk of complications, especially varicella pneumonia. Specialist advice should be sought for the treatment of chickenpox during pregnancy.

Those who have been exposed to chickenpox and are at special risk of complications may require prophylaxis with varicella-zoster immunoglobulin (see under Disease Specific Immunoglobulins, section 14.5.2).

In herpes zoster (shingles) systemic antiviral treatment can reduce the severity and duration of pain, reduce complications, and reduce viral shedding. Treatment with the antiviral should be started within 72 hours of the onset of rash and is usually continued for 7–10 days.

Immunocompromised patients at high risk of disseminated or severe infection should be treated with a parenteral antiviral drug.

Chronic pain which persists after the rash has healed (postherpetic neuralgia) requires specific management (section 4.7.3).

**Choice** Aciclovir is active against herpesviruses but does not eradicate them. Uses of aciclovir include systemic treatment of varicella–zoster and the systemic and topical treatment of herpes simplex infections of the skin (section 13.10.3) and mucous membranes (section 7.2.2). It is used by mouth for severe herpetic stomatitis (see also p. 776). Aciclovir eye ointment (section 11.3.3) is used for herpes simplex infections of the eye; it is combined with systemic treatment for ophthalmic zoster.

Famciclovir, a prodrug of penciclovir, is similar to aciclovir and is licensed for use in herpes zoster and genital herpes. Penciclovir itself is used as a cream for herpes simplex labialis (section 13.10.3).

Valaciclovir is an ester of aciclovir, licensed for herpes zoster and herpes simplex infections of the skin and mucous membranes (including genital herpes); it is also licensed for preventing cytomegalovirus disease following solid organ transplantation. Famciclovir or valaciclovir are suitable alternatives to aciclovir for oral lesions associated with herpes zoster. Valaciclovir once daily may reduce the risk of transmitting genital herpes to heterosexual partners—specialist advice should be sought.

Foscarnet (section 5.3.2.2) is used for mucocutaneous herpes simplex virus infection unresponsive to aciclovir in immunocompromised patients; it is toxic and can cause renal impairment.

Inosine pranobex has been used by mouth for herpes simplex infections; its effectiveness remains unproven.

---

**ACICLOVIR** (Acyclovir)

**Indications** herpes simplex and varicella–zoster (see also under Dose)

**Cautions** maintain adequate hydration (especially with infusion or high doses, or during renal impairment); elderly (risk of neurological reactions); interaction: Appendix 1 (aciclovir)

**Renal impairment** see Cautions above; also risk of neurological reactions increased; use normal intravenous dose every 12 hours if eGFR 25–50 mL/minute/1.73 m² (every 24 hours if eGFR 10–25 mL/minute/1.73 m²); consult product literature for intravenous dose if eGFR less than 10 mL/minute/1.73 m²; for herpes zoster, use normal oral dose every 8 hours if eGFR 10–25 mL/minute/1.73 m² (every 12 hours if eGFR less than 10 mL/minute/1.73 m²); for herpes simplex, use normal oral dose every 12 hours if eGFR less than 10 mL/minute/1.73 m²

**Pregnancy** not known to be harmful—manufacturers advise use only when potential benefit outweighs risk

**Breast-feeding** significant amount in milk after systemic administration—not known to be harmful but manufacturer advises caution

**Side-effects** nausea, vomiting, abdominal pain, diarrhoea, headache, fatigue, rash, urticaria, pruritus, photosensitivity; very rarely hepatitis, jaundice, dyspnoea, neurological reactions (including dizziness, confusion, hallucinations, convulsions, ataxia, dysar-
5.3.2 Herpesvirus infections

**By mouth**

- **Herpes simplex**
  - **Prophylaxis** in the immunocompromised or HIV-positive patients: treatment of recurrent infection, 800 mg 3 times daily for 2 days or 200 mg 5 times daily for 5 days or 400 mg 3 times daily for 3–5 days (400 mg 3 times daily for 5–10 days in immunocompromised or HIV-positive patients)
  - **First episode**
    - Genital herpes simplex: treatment of first episode, 200 mg 5 times daily or 400 mg 3 times daily usually for 5 days, longer if new lesions appear during treatment or if healing is incomplete (400 mg 5 times daily for 7–10 days in immunocompromised or HIV-positive patients); treatment of recurrent infection, 800 mg 3 times daily for 2 days or 200 mg 5 times daily for 5 days or 400 mg 3 times daily for 3–5 days (400 mg 3 times daily for 5–10 days in immunocompromised or HIV-positive patients)
  - **Varicella and herpes zoster**
    - Treatment, 800 mg 5 times daily for 7 days (for herpes zoster in immunocompromised continue for 2 days after crusting of lesions); **CHILD 1 month–2 years**, half adult dose, over 2 years, adult dose
    - Varicella and herpes zoster, treatment, 800 mg 5 times daily for 7 days (for herpes zoster in immunocompromised continue for 2 days after crusting of lesions); **CHILD 1 month–2 years**, half adult dose, over 2 years, adult dose

- **Herpes simplex, prophylaxis in the immunocompromised**, 200–400 mg 4 times daily; **CHILD 1 month–2 years**, half adult dose, over 2 years, adult dose

- **Varicella**
  - Treatment of first episode, 200 mg 5 times daily or 400 mg 3 times daily usually for 5 days, longer if new lesions appear during treatment or if healing is incomplete (400 mg 5 times daily for 7–10 days in immunocompromised or HIV-positive patients); treatment of recurrent infection, 800 mg 3 times daily for 2 days or 200 mg 5 times daily for 5 days or 400 mg 3 times daily for 3–5 days (400 mg 3 times daily for 5–10 days in immunocompromised or HIV-positive patients)

- **Shingles**
  - Varicella and herpes zoster, treatment, 800 mg 5 times daily for 5 days (for herpes zoster in immunocompromised continue for 2 days after crusting of lesions); **CHILD 1 month–2 years**, 200 mg 5 times daily, usually for 5 days

- **Varicella and herpes zoster, treatment of first episode**
  - Genital herpes simplex, treatment of first episode, 200 mg 5 times daily or 400 mg 3 times daily usually for 5 days, longer if new lesions appear during treatment or if healing is incomplete (400 mg 5 times daily for 7–10 days in immunocompromised or HIV-positive patients); treatment of recurrent infection, 800 mg 3 times daily for 2 days or 200 mg 5 times daily for 5 days or 400 mg 3 times daily for 3–5 days (400 mg 3 times daily for 5–10 days in immunocompromised or HIV-positive patients)
  - **First episode**
    - Genital herpes simplex: treatment of first episode, 200 mg 5 times daily or 400 mg 3 times daily usually for 5 days, longer if new lesions appear during treatment or if healing is incomplete (400 mg 5 times daily for 7–10 days in immunocompromised or HIV-positive patients); treatment of recurrent infection, 800 mg 3 times daily for 2 days or 200 mg 5 times daily for 5 days or 400 mg 3 times daily for 3–5 days (400 mg 3 times daily for 5–10 days in immunocompromised or HIV-positive patients)

- **Varicella and herpes zoster, treatment, 800 mg 5 times daily for 5 days (for herpes zoster in immunocompromised or HIV-positive patients)**

- **Herpes simplex, prophylaxis in the immunocompromised, 200–400 mg 4 times daily**
  - **CHILD 1 month–2 years**, half adult dose, over 2 years, adult dose

- **Varicella and herpes zoster, treatment, 800 mg 5 times daily for 7 days**
  - For herpes zoster in immunocompromised continue for 2 days after crusting of lesions; **CHILD 1 month–2 years**, 200 mg 5 times daily, usually for 5 days

- **Varicella and herpes zoster, treatment of first episode, 200 mg 5 times daily or 400 mg 3 times daily usually for 5 days**
  - Longed if new lesions appear during treatment or if healing is incomplete (400 mg 5 times daily for 7–10 days in immunocompromised or HIV-positive patients); treatment of recurrent infection, 800 mg 3 times daily for 2 days or 200 mg 5 times daily for 5 days or 400 mg 3 times daily for 3–5 days (400 mg 3 times daily for 5–10 days in immunocompromised or HIV-positive patients)

- **Varicella and herpes zoster, treatment, 800 mg 5 times daily for 750 mg 1–2 times daily for 7 days**
  - In immunocompromised, 500 mg 3 times daily for 10 days, continue for 2 days after crusting of lesions

- **Herpes simplex, prophylaxis in the immunocompromised, 5 mg/kg every 8 hours**
  - Note: To avoid excessive dosage in obese patients, parenteral dose should be calculated on the basis of ideal weight for height
  - **CHILD under 18 years**, see **BNF for Children**

- **Herpes zoster, treatment, 500 mg 3 times daily for 7 days**
  - Or 750 mg 1–2 times daily for 7 days (in immunocompromised, 500 mg 3 times daily for 10 days, continue for 2 days after crusting of lesions)

- **Herpesvirus infections**
  - **By intravenous infusion**
    - Aciclovir doses in BNF may differ from those in product literature
  - **Famciclovir** (GSK)
    - **Indications** see under Dose
    - **Cautions** interactions: Appendix 1 (famciclovir)
    - **Hepatic impairment** usual dose in well compensated liver disease (information not available on decomposition)
    - **Renal impairment** reduce dose; consult product literature
    - **Pregnancy** manufacturers advise avoid unless potential benefit outweighs risk
    - **Breast-feeding** no information available—present in milk in animal studies
    - **Side-effects** nausea, vomiting, abdominal pain, diarrhoea; headache, fatigue; sweating, pruritus; rarely confusion; very rarely jaundice, dizziness, drowsiness, hallucinations, thrombocytopenia, rash (including Stevens-Johnson syndrome); also reported, constipation and fever
  - **Dose**
    - **Herpes zoster**, treatment, 500 mg 3 times daily for 7 days or 750 mg 1–2 times daily for 7 days (in immunocompromised, 500 mg 3 times daily for 10 days, continue for 2 days after crusting of lesions)

**Aciclovir** (Non-proprietary) (Par)

- **Tablets**, aciclovir 200 mg, net price 25-tab pack = £1.66; 400 mg, 56-tab pack = £4.30; 800 mg, 35-tab pack = £4.30. Label: 9
- **Dental prescribing on NHS** Aciclovir Tablets 200 mg or 800 mg may be prescribed
- **Dispersible tablets**, aciclovir 200 mg, net price 25-tab pack = £2.17; 400 mg, 56-tab pack = £9.91; 800 mg, 35-tab pack = £9.29. Label: 9
- **Suspension**, aciclovir 200 mg/5 mL, net price 125 mL = £35.82; 400 mg/5 mL, 100 mL = £39.54. Label: 9
- **Note** Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription
- **Dental prescribing on NHS** Aciclovir Oral Suspension 200 mg/5 mL may be prescribed
- **Intravenous infusion, powder for reconstitution, aciclovir** (as sodium salt), net price 250-mg vial = £9.13; 500-mg vial = £20.22
- **Electrolytes** Na⁺ 1.1 mmol/250-mg vial
  - **Intravenous infusion, aciclovir** (as sodium salt), 25 mg/mL, net price 10-mL (250-mg) vial = £10.18; 20-mL (500-mg) vial = £19.61; 40-mL (1-g) vial = £40.44
  - **Electrolytes** Na⁺ 1.16 mmol/250-mg vial
- **Zovirax** (GSK) (Par)
  - **Tablets**, all dispersible, f/c, aciclovir 200 mg, net price 25-tab pack = £2.85; 600 mg (scored, Shingles Treatment Pack), 35-tab pack = £10.50. Label: 9
  - **Suspension**, both off-white, sugar-free, aciclovir 200 mg/5 mL (banana-flavoured), net price 125 mL = £29.56; 400 mg/5 mL (Double Strength Suspension, orange-flavoured) 100 mL = £33.02. Label: 9
  - **Intravenous infusion, powder for reconstitution, aciclovir** (as sodium salt), net price 250-mg vial = £3.34; 500-mg vial = £3.40
  - **Electrolytes** Na⁺ 1.1 mmol/250-mg vial

**FAMCICLOVIR**

- **Note** Famiclovir is a pro-drug of penciclovir
● Genital herpes, treatment of first episode, 250 mg 3 times daily for 5 days, longer if new lesions appear during treatment or if healing incomplete (500 mg twice daily for 10 days in immunocompromised or HIV-positive patients); treatment of recurrent infection, 125 mg twice daily for 5 days or 1 g twice daily for 1 day (500 mg twice daily for 5–10 days in immunocompromised or HIV-positive patients)

● Genital herpes, suppression, 250 mg twice daily (500 mg twice daily in immunocompromised or HIV-positive patients); therapy interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

● Non-genital herpes simplex, treatment in the immunocompromised, 500 mg twice daily for 7 days

● CHILD not recommended

Note  Famciclovir doses in BNF may differ from those in product literature

Famiclovir (Non-proprietary) (Pat)
Tablets, famciclovir 125 mg, net price 10-tab pack = £31.60; 250 mg, 15-tab pack = £103.75, 21-tab pack = £145.25, 56-tab pack = £387.33; 500 mg, 14-tab pack = £179.00, 30-tab pack = £399.34, 56-tab pack = £831.46; 750 mg, 7-tab pack = £134.88. Label: 9

Famvir® (Novartis) (Pat)
Tablets, all f/c, famciclovir 125 mg, net price 10-tab pack = £44.54; 250 mg, 15-tab pack = £133.62, 21-tab pack = £187.04; 56-tab pack = £498.80; 500 mg, 14-tab pack = £249.43, 30-tab pack = £534.34, 56-tab pack = £997.75. Label: 9

5.3.2 Herpesvirus infections

Cautions  see under Aciclovir

Hepatic impairment  manufacturer advises caution with high doses used for herpes labialis and prevention of cytomegalovirus disease—no information available

Renal impairment  maintain adequate hydration; for herpes zoster, 1 g every 12 hours if eGFR 30–50 mL/minute/1.73 m² (1 g every 24 hours if eGFR 10–30 mL/minute/1.73 m², 500 mg every 24 hours if eGFR less than 10 mL/minute/1.73 m²); for treatment of herpes simplex, 500 mg (1 g in immunocompromised or HIV-positive patients) every 24 hours if eGFR less than 30 mL/minute/1.73 m²; for treatment of herpes labialis, if eGFR 30–50 mL/minute/1.73 m², initially 1 g, then 1 g 12 hours after initial dose (if eGFR 10–30 mL/minute/1.73 m², 500 mg every 24 hours if eGFR less than 30 mL/minute/1.73 m²); for reduction of genital herpes transmission, 250 mg every 24 hours if eGFR less than 15 mL/minute/1.73 m²; reduce dose according to eGFR for cytomegalovirus prophylaxis following solid organ transplantation (consult product literature)

Pregnancy  see under Aciclovir

Breast-feeding  see under Aciclovir

Side-effects  see under Aciclovir but neurological reactions more frequent with high doses

Dose  

● Herpes zoster, 1 g 3 times daily for 7 days (in immunocompromised continue for 2 days after crusting of lesions); CHILD 12–18 years see BNF for Children

● Herpes simplex, treatment of first episode, 500 mg twice daily for 5 days, longer if new lesions appear during treatment or if healing incomplete (1 g twice daily for 10 days in immunocompromised or HIV-positive patients); treatment of recurrent infection, 500 mg twice daily for 3–5 days (1 g twice daily for 5–10 days in immunocompromised or HIV-positive patients); CHILD 12–18 years see BNF for Children

● Herpes labialis, treatment, ADULT and CHILD over 12 years, initially 2 g, then 2 g 12 hours after initial dose

● Herpes simplex, suppression, 500 mg daily in 1–2 divided doses (in immunocompromised or HIV-positive patients, 500 mg twice daily); therapy interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences; CHILD 12–18 years see BNF for Children

● Reduction of transmission of genital herpes, seek specialist advice, 500 mg once daily to be taken by the infected partner

● Prevention of cytomegalovirus disease following solid organ transplantation (preferably starting within 72 hours of transplantation), 2 g 4 times daily usually for 90 days; CHILD 12–18 years see BNF for Children

Valaciclovir (Non-proprietary) (Pat)
Tablets, valaciclovir 500 mg, net price 10-tab pack = £3.83, 42 tab-pack = £8.50. Label: 9

Valtrex® (GSK) (Pat)
Tablets, f/c, valaciclovir (as hydrochloride) 250 mg, net price 60-tab pack = £123.28; 500 mg, 10-tab pack = £20.59, 42-tab pack = £86.30. Label: 9

Valaciclovir is a pro-drug of aciclovir

Indications  treatment of herpes zoster; treatment of initial and suppression of recurrent herpes simplex infections of skin and mucous membranes including initial and recurrent genital herpes; reduction of transmission of genital herpes; prevention of cytomegalovirus disease following solid organ transplantation when valganciclovir or ganciclovir cannot be used

Valaciclovir (Non-proprietary) (Pat)
Tablets, valaciclovir 500 mg, net price 10-tab pack = £3.83, 42 tab-pack = £8.50. Label: 9
**Cytomegalovirus infection**

Ganciclovir is related to aciclovir but is more active against cytomegalovirus (CMV); it is also much more toxic than aciclovir and should therefore be prescribed only when the potential benefit outweighs the risks. Ganciclovir is administered by intravenous infusion for the initial treatment of CMV infection. Ganciclovir causes profound myelosuppression when given with zidovudine; the two should not normally be given together particularly during initial ganciclovir therapy. The likelihood of ganciclovir resistance increases in patients with a high viral load or in those who receive the drug over a long duration; cross-resistance to cidofovir is common.

Valaciclovir (see p. 425) is licensed for prevention of cytomegalovirus disease following renal transplantation.

Valganciclovir is an ester of ganciclovir which is licensed for the initial treatment and maintenance treatment of CMV retinitis in AIDS patients. Valganciclovir is also licensed for preventing CMV disease following solid organ transplantation from a cytomegalovirus-positive donor.

Foscarnet is active against cytomegalovirus; it is toxic and can cause renal impairment.

Cidofovir is given in combination with probenecid for CMV retinitis in AIDS patients when ganciclovir and foscarnet are contra-indicated. Cidofovir is nephrotoxic.

For local treatment of CMV retinitis, see section 11.3.3.

**Cidofovir**

**Indications** cytomegalovirus retinitis in AIDS patients for whom other drugs are inappropriate

**Cautions** monitor renal function (serum creatinine and urinary protein) and neutrophil count within 24 hours before each dose; co-treatment with probenecid and prior hydration with intravenous fluids necessary to minimise potential nephrotoxicity (see below); diabetes mellitus (increased risk of ocal hypotony); **interactions:** Appendix 1 (cidofovir)

**Nephrotoxicity** Do not initiate treatment in renal impairment (assess creatinine clearance and proteinuria—consult product literature); discontinue treatment and give intravenous fluids if renal function deteriorates—consult product literature

**Ocular disorders** Regular ophthalmological examinations recommended; iritis and uveitis have been reported which may respond to a topical corticosteroid with or without a cycloplegic drug—discontinue cidofovir if no response to topical corticosteroid or if condition worsens, or if iritis or uveitis recur after successful treatment

**Contra-indications** concomitant administration of potentially nephrotoxic drugs (discontinue potentially nephrotoxic drugs at least 7 days before starting cidofovir)

**Renal impairment** avoid if creatinine clearance less than 55 mL/minute; nephrotoxic

**Pregnancy** avoid (toxicity in animal studies; effective contraception required during and for at least 3 months after treatment)

**Breast-feeding** avoid—no information available

**Side-effects** nephrotoxicity (see Cautions above); nausea, vomiting, diarrhoea; dysphagia; headache, fever, asthenia; neutropenia; decreased intra-ocular pressure, iritis, uveitis (see Cautions above); alopecia, rash; less commonly Fanconi syndrome; also reported, hearing impairment and pancreatitis

**Dose**

- Initial (induction) treatment, **ADULT** over 18 years, by **intravenous infusion** over 1 hour, 5 mg/kg once weekly for 2 weeks (give probenecid and intravenous fluids with each dose, see below)
- Maintenance treatment, beginning 2 weeks after completion of induction, **ADULT** over 18 years, by **intravenous infusion** over 1 hour, 5 mg/kg once every 2 weeks (give probenecid and intravenous fluids with each dose, see below)

**Probenecid co-treatment** By mouth (preferably after food), probenecid 2 g 3 hours before cidofovir infusion followed by probenecid 1 g at 2 hours and 1 g at 8 hours after the end of cidofovir infusion (total probenecid 4 g); for cautions, contra-indications and side-effects of probenecid see section 10.1.4

**Prior hydration** Sodium chloride 0.9%, by **intravenous infusion**, 1 litre over 1 hour immediately before cidofovir infusion (if tolerated an additional 1 litre may be given over 1–3 hours, starting at the same time as the cidofovir infusion or immediately afterwards)

**Vistide** (Gilead) 30 mL

**Intravenous infusion**, cidofovir 75 mg/mL; net price 5-mL vial = £653.22

**Caution in handling** Cidofovir is toxic and personnel should be adequately protected during handling and administration; if solution comes into contact with skin or mucosa, wash off immediately with water

**Ganciclovir**

**Indications** life-threatening or sight-threatening cytomegalovirus infections in immunocompromised patients only; prevention of cytomegalovirus disease during immunosuppressive therapy following organ transplantation; local treatment of CMV retinitis (section 11.3.3)

**Cautions** close monitoring of full blood count (severe deterioration may require correction and possibly treatment interruption); history of cytopenia; potential carcinogen and teratogen; radiotherapy; ensure adequate hydration during intravenous administration; vesicant—infuse into vein with adequate flow preferably using plastic cannula; children (possible risk of long-term carcinogenic or reproductive toxicity); **interactions:** Appendix 1 (ganciclovir)

**Contra-indications** hypersensitivity to ganciclovir, ganciclovir, aciclovir, or valaciclovir; abnormally low haemoglobin, neutrophil, or platelet counts (consult product literature)

**Renal impairment** reduce dose if eGFR less than 70 mL/minute/1.73 m²; consult product literature

**Pregnancy** avoid—teratogenic risk; ensure effective contraception during treatment and barrier contraception for men during and for at least 90 days after treatment

**Breast-feeding** avoid—no information available

**Side-effects** diarrhoea, nausea, vomiting, dyspepsia, abdominal pain, constipation, flatulence, dysphagia, taste disturbance, hepatic dysfunction; dysphagia, chest pain, cough; headache, insomnia, convulsions, dizziness, peripheral neuropathy, depression, anxiety, confusion, abnormal thinking, fatigue, weight loss, anorexia; infection, pyrexia, night sweats; anaemia, leucopenia, thrombocytopenia, pancytopenia, renal impairment; myalgia, arthralgia; macular oedema, retinal detachment, vitreous floaters, eye pain; ear pain; dermatitis, pruritus; injection-site reactions; less commonly mouth ulcers, pancreatitis, arrhythmias,
hypotension, anaphylactic reactions, psychosis, tremor, male infertility, haematuria, disturbances in hearing and vision, and alopecia

**Dose**

- By intravenous infusion, initially (induction) 5 mg/kg every 12 hours for 14–21 days for treatment or for 7–14 days for prevention; maintenance (for patients at risk of relapse of retinitis) 6 mg/kg daily on 5 days per week or 5 mg/kg daily until adequate recovery of immunity; if retinitis progresses initial induction treatment may be repeated; **CHILD** under 18 years, see BNF for Children

**Cyomeve**<sup>(Roche)</sup>®

**Intravenous infusion**, powder for reconstitution, ganciclovir (as sodium salt). Net price 500-mg vial = £29.77

**Electrolytes** Na<sup>+</sup> 2 mmol/500-mg vial

**Caution in handling** Ganciclovir is toxic and personnel should be adequately protected during handling and administration; if solution comes into contact with skin or mucosa, wash off immediately with soap and water

**Renal impairment** reduce dose; consult product literature

**Pregnancy** manufacturer advises avoid

**Breast-feeding** see under Ganciclovir

**Contra-indications** see under Ganciclovir

**Dose**

- **CMV retinitis, induction**, **ADULT** over 18 years, 900 mg twice daily for 21 days then 900 mg once daily; induction regimen may be repeated if retinitis progresses
- **Prevention of cytomegalovirus disease following solid organ transplantation from a cytomegalovirus-positive donor**

**Note** Foscarnet doses in BNF may differ from those in product literature

**Foscavir**<sup>(Roche)</sup>®

**Intravenous infusion**, foscarnet sodium hexahydrate 24 mg/mL, net price 250-mL bottle = £119.85

**Electrolytes** Na<sup>+</sup> 0.24 mmol/mL

**Caution in handling** Foscarnet is a potential teratogen; use protective clothing; avoid skin or mucosal contact; wash off immediately with soap and water

**Renal impairment** reduce dose; consult product literature

**Pregnancy** see under Ganciclovir

**Breast-feeding** see under Ganciclovir

**Side-effects** see under Ganciclovir

**Dose**

- **CMV retinitis, induction**
  - **CHILD** under 18 years, see section 14.5.1 (passive immunisation), section 14.5.2 (passive immunisation against hepatitis A), and section 14.4 (active immunisation), section 14.5.1 (passive immunisation against hepatitis A, and section 14.5.2 (passive immunisation against hepatitis B).

**Note** Oral ganciclovir 900 mg twice daily is equivalent to intravenous ganciclovir 5 mg/kg twice daily

**Valcyte**<sup>(Roche)</sup>®

**Tablets**, pink, 1/f, valganciclovir (as hydrochloride) 450 mg, net price 60-tab pack = £1081.66. Label: 21

**Oral solution**, tutti-frutti flavoured, valganciclovir (as hydrochloride) 250 mg/5 mL when reconstituted with water, net price 100 mL = £230.32. Label: 21

**Caution in handling** Valganciclovir is a potential teratogen and carcinogen and caution is advised when handling the powder, reconstituted solution, or broken tablets; if these come into contact with skin or mucosa, wash off immediately with water; avoid inhalation of powder

**Indications** cytomegalovirus disease [licensed for cytomegalovirus retinitis in AIDS patients only]; mucocutaneous herpetic simplex virus infections unresponsive to aciclovir in immunocompromised patients

**Cautions** monitor electrolytes, particularly calcium and magnesium; monitor serum creatinine every second day during induction and every week during maintenance; ensure adequate hydration; avoid rapid infusion; men should avoid fathering a child during and for 6 months after treatment; **interactions**: Appendix 1 (foscarnet)
### 5.3.3.1 Chronic hepatitis B

**Peginterferon alfa** (section 8.2.4) is an option for the initial treatment of chronic hepatitis B and may be preferable to **interferon alfa**. The use of peginterferon alfa and interferon alfa is limited by a response rate of 30–40% and relapse is frequent. Treatment should be discontinued if no improvement occurs after 4 months. The manufacturer of peginterferon alfa-2a and interferon alfa contraindicate use in decompensated liver disease, but low doses can be used with great caution in these patients. Although interferon alfa is contra-indicated in patients receiving immunosuppressant treatment (or who have received it recently), cautious use of peginterferon alfa-2a may be justified in some cases.

**Entecavir or tenofovir disoproxil** (see p. 415) are options for the initial treatment of chronic hepatitis B. If the response is inadequate after 6–9 months of treatment, a change in treatment should be considered. Other drugs that are licensed for the treatment of chronic hepatitis B include **adefovir dipivoxil**, **lamivudine** (see p. 414), or **telbivudine** (but see NICE guidance below).

Entecavir alone, tenofovir disoproxil alone, or a combination of lamivudine with either adefovir dipivoxil or tenofovir disoproxil can be used in patients with decompensated liver disease.

If drug-resistant hepatitis B virus emerges during treatment, another antiviral drug to which the virus is sensitive should be added. Hepatitis B viruses with reduced susceptibility to lamivudine have emerged following extended therapy. Adefovir or tenofovir can be given with lamivudine in lamivudine-resistant chronic hepatitis B; telbivudine or entecavir should not be used because cross-resistance can occur.

If there is no toxicity or loss in efficacy, treatment with adefovir, entecavir, lamivudine, telbivudine, or tenofovir is usually continued until 6 months after adequate seroconversion has occurred. Treatment is usually continued long-term in patients with decompensated liver disease.

Tenofovir, or a combination of tenofovir with either emtricitabine or lamivudine may be used with other antiretrovirals, as part of ‘highly active antiretroviral therapy’ (section 5.3.1) in patients who require treatment for both HIV and chronic hepatitis B. If patients infected with both HIV and chronic hepatitis B only require treatment for chronic hepatitis B, they should receive antivirals that are not active against HIV, such as peginterferon alfa or adefovir. Treatment may be continued long-term, even if adequate seroconversion occurs. Management of these patients should be coordinated between HIV and hepatology specialists.

---

**NICE guidance**

**Entecavir for chronic hepatitis B (August 2008)**

Entecavir is an option for the treatment of chronic hepatitis B.

www.nice.org.uk/TA153

---

**NICE guidance**

**Tenofovir disoproxil for the treatment of chronic hepatitis B (July 2009)**

Tenofovir is an option for the treatment of chronic hepatitis B.

www.nice.org.uk/TA173

---

**ADEFOVIR DIPIVOXIL**

**Indications** chronic hepatitis B infection with either compensated liver disease with evidence of viral replication, and histologically documented active liver inflammation and fibrosis, when other treatment not appropriate or decompensated liver disease in combination with another antiviral for chronic hepatitis B that has no cross-resistance to adefovir

**Cautions** monitor liver function tests every 3 months, and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation); monitor renal function before treatment then every 3 months, more frequently in renal impairment or in patients receiving nephrotoxic drugs; elderly; discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis

**Renal impairment** 10 mg every 48 hours if eGFR 30–50 mL/minute/1.73 m²; 10 mg every 72 hours if eGFR 10–30 mL/minute/1.73 m²; no information available if eGFR less than 10 mL/minute/1.73 m²; see also Cautions above

**Pregnancy** toxicity in animal studies—manufacturer advises use only if potential benefit outweighs risk; effective contraception required during treatment

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** nausea, vomiting, dyspepsia, abdominal pain, flatulence, diarrhoea, asthenia, headache; renal failure; hypophosphataemia; rash and pruritus; also reported pancreatitis

**Dose**

- **ADULT** over 18 years, 10 mg once daily

**Hepsera®** (Gilead)

Tablets, adefovir dipivoxil 10 mg, net price 30-tab pack = £296.73

---

**ENTECAVIR**

**Indications** chronic hepatitis B infection either with compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) or decompensated liver disease

**Cautions** monitor liver function tests every 3 months, and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation); monitor renal function before treatment then every 3 months, more frequently in renal impairment or in patients receiving nephrotoxic drugs; elderly; discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis
year after discontinuation—recurrent hepatitis may occur on discontinuation); HIV infection—risk of HIV resistance in patients not receiving ‘highly active antiretroviral therapy’; lamivudine-resistant chronic hepatitis B—risk of entecavir resistance; discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis.

Renal impairment reduce dose if eGFR less than 50 mL/minute/1.73 m²; consult product literature

Pregnancy toxicity in animal studies—manufacturer advises use only if potential benefit outweighs risk; effective contraception required during treatment

Breast-feeding manufacturer advises avoid—present in milk in animal studies

Side-effects nausea, vomiting, dyspepsia, diarrhoea, raised serum amylase and lipase, headache, fatigue, dizziness, sleep disturbances; less commonly: thrombocytopenia, rash, alopecia

Dose
- Compensated liver disease not previously treated with nucleoside analogues, ADULT over 18 years, 500 micrograms once daily
- Compensated liver disease with lamivudine-resistant chronic hepatitis B (but see notes above), ADULT over 18 years, 1 mg once daily; consider other treatment if inadequate response after 6 months
  
  Counselling To be taken at least 2 hours before or 2 hours after food

- Decompensated liver disease, ADULT over 18 years, 1 mg once daily
  
  Counselling To be taken at least 2 hours before or 2 hours after food

Baraclude® (Bristol-Myers Squibb) Tablets, f/c, entecavir (as monohydrate) 500 micrograms (white), net price 30-tab pack = £363.26; 1 mg (pink), 30-tab pack = £363.26. Counselling, administration

Oral solution, entecavir (as monohydrate) 50 micrograms/mL, net price 210-mL pack (orange-flavoured) = £423.80. Counselling, administration

5.3.3.2 Chronic hepatitis C

Before starting treatment, the genotype of the infecting hepatitis C virus should be determined and the viral load measured as this may affect the choice and duration of treatment. A combination of ribavirin (see p. 433) and peginterferon alfa (section 8.2.4) is used for the treatment of chronic hepatitis C (see NICE guidance, below). The combination of ribavirin and interferon alfa is less effective than the combination of peginterferon alfa and ribavirin. Peginterferon alfa alone should be used if ribavirin is contra-indicated or not tolerated. Ribavirin monotherapy is ineffective.

NICE guidance Peginterferon alfa and ribavirin for mild chronic hepatitis C (August 2006 and September 2010) The combination of peginterferon alfa and ribavirin can be used for treating mild chronic hepatitis C in patients over 18 years. Alternatively, treatment can be delayed until the disease has reached a moderate stage (‘watchful waiting’). Peginterferon alfa alone can be used if ribavirin is contra-indicated or not tolerated.

www.nice.org.uk/TA200

NICE guidance Peginterferon alfa, interferon alfa, and ribavirin for moderate to severe chronic hepatitis C (January 2004 and September 2010) The combination of peginterferon alfa and ribavirin should be used for treating moderate to severe chronic hepatitis C in patients aged over 18 years:

- not previously treated with interferon alfa or peginterferon alfa,
- treated previously with interferon alfa alone or in combination with ribavirin,
- whose condition did not respond to peginterferon alfa alone or to a combination of peginterferon alfa and ribavirin, or responded but subsequently relapsed,
- co-infected with HIV.

Peginterferon alfa alone should be used if ribavirin is contra-indicated or not tolerated. Interferon alfa for either monotherapy or combined therapy should be used only if neutropenia and thrombocytopenia are a particular risk. Patients receiving interferon alfa may be switched to peginterferon alfa.

www.nice.org.uk/TA200
Boceprevir and telaprevir are protease inhibitors that inhibit the replication of hepatitis C virus genotype 1, but they are less effective against other genotypes of the virus. Monotherapy is not recommended because there is a high likelihood of resistance developing. Either boceprevir or telaprevir is licensed for use in combination with ribavirin and peginterferon alfa for the treatment of chronic hepatitis C infection of genotype 1 in patients with compensated liver disease; these combinations are more effective than dual therapy with ribavirin and peginterferon alfa. However, triple therapy is associated with a higher incidence and greater severity of anaemia than dual therapy. Neutropenia seems to be more frequent during treatment with regimens containing boceprevir than with those containing telaprevir. Rash is a particular concern with telaprevir, and to a lesser extent with boceprevir.

**NICE guidance**

**Boceprevir for chronic hepatitis C infection of genotype 1 (April 2012)**

Boceprevir in combination with ribavirin and peginterferon alfa is an option for the treatment of chronic hepatitis C infection of genotype 1 in adults with compensated liver disease:
- who have not been treated previously;
- in whom previous treatment (e.g. with peginterferon alfa in combination with ribavirin) has failed.

www.nice.org.uk/TA253

**Telaprevir for chronic hepatitis C infection of genotype 1 (April 2012)**

Telaprevir in combination with ribavirin and peginterferon alfa is an option for the treatment of chronic hepatitis C infection of genotype 1 in adults with compensated liver disease:
- who have not been treated previously;
- in whom previous treatment (e.g. with peginterferon alfa in combination with ribavirin) has failed.

www.nice.org.uk/TA252

Sofosbuvir is a pro-drug of a nucleoside inhibitor that is effective against hepatitis C virus polymerase NS5B. It is licensed for use in combination with ribavirin, with or without peginterferon alfa, for the treatment of chronic hepatitis C infection of genotypes 1, 2, 3, 4, 5, or 6 in patients with compensated liver disease. Sofosbuvir monotherapy is not recommended because it is less effective than combination therapy.

**SOFOSBUVIR**

**Indications** in combination with ribavirin, with or without peginterferon alfa, for chronic hepatitis C infection of genotypes 1, 2, 3, 4, 5, or 6, only use sofosbuvir with ribavirin in those with intolerance or contra-indications to peginterferon alfa who require urgent treatment; **Cautions** in chronic hepatitis C of genotype 1, 4, 5, or 6, only use sofosbuvir with ribavirin in those with intolerance or contra-indications to peginterferon alfa who require urgent treatment; **Interactions:** Appendix 1 (sofosbuvir) **Renal impairment** safety and efficacy not established if eGFR less than 30 mL/minute/1.73m²—accumulation may occur **Pregnancy** manufacturer advises avoid; see also under Ribavirin **Breast-feeding** manufacturer advises avoid—metabolites present in milk in animal studies **Side-effects** in combination with ribavirin (with or without peginterferon alfa), anaemia, nausea, constipation, abdominal discomfort, gastro-oesophageal reflux, flatulence, diarrhoea, constipation, haemorrhoids, dry mouth, disturbances in taste and smell, mouth ulcers, stomatitis, tooth disorder, palpitiation, blood pressure changes, syncope, peripheral oedema, hypertriglyceridaemia, cough, dyspnoea, dizziness, headache, decreased appetite, weight loss, anxiety, depression, insomnia, agitation, amnesia, asthenia, hypoaesthesia, paraesthesia, tremor, influenza-like symptoms, hyperglycaemia, hypothyroidism, changes in libido, erectile dysfunction, polyuria, leucocenia, thrombocytopenia, pancytopenia, arthropathy, myalgia, muscle spasms, hyperuricaemia, visual disturbances, dry eyes, tinnitus, alopecia, rash (also reported Stevens-Johnson syndrome, rash with eosinophilia and systemic symptoms), pruritus, hyperhidrosis, psoriasis; less commonly gingivitis, tongue discoloration, hyper-salivation, dysphagia, pancreatitis, colitis, hyperbiliary-ubinaemia, arthrythmias, venous thromboembolism, flushing, pallor, dysphonia, hyperaesthesia, homicidal and suicidal ideation, hyperthyroidism, amenorrhoea, menorrhagia, dysuria, hypokalaemia, hypercalcaemia, gout, retinal ischaemia, retinopathy, conjunctival haemorrhage, eye pain, increased lacrima-tion, photophobia, hearing impairment, photosensitivity, skin ulceration; rarely cholecystitis, acute myocardial infarction, coronary artery disease, pericarditis, pleural fibrosis, respiratory failure, bipolar disorder, hallucinations, encephalopathy, thyroid neoplasms, aspermia, sarcoidosis

**Dose**
- In combination with ribavirin and peginterferon alfa, **ADULT** over 18 years, 800 mg 3 times daily (for duration of treatment consult product literature)
- **Missed dose** If a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time

**VICTRELIS® (MSD)** ▼ ▼ ▼

Capsules, brown-yellow/white, boceprevir 200 mg, net price 336-cap pack = £2800.00. Label: 21
In combination with ribavirin and peginterferon alfa, also vomiting, diarrhoea, dry mouth, chest pain, decreased appetite, weight loss, anxiety, agitation, dizziness, migraine, memory impairment, neutropenia, blurred vision

**Dose**

- In combination with Copegus® with or without peginterferon alfa, ADULT over 18 years, 400 mg once daily (for duration of treatment consult product literature)

**Missed dose** If a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time

**Sovaldi® (Gilead)**

- Tablets, yellow, f/c, sofosbuvir 400 mg, net price 28-tab pack = £11660.98 Label: 21, 25

**Note** Dispense in original container (contains desiccant)

**TELAPREVIN**

**Indications** in combination with ribavirin and peginterferon alfa for chronic hepatitis C infection of genotype 1 in patients with compensated liver disease

**Cautions** monitor full blood count, platelets, electrolytes, serum creatinine, uric acid, and liver and thyroid function tests before starting treatment and then on weeks 2, 4, 8, and 12 of treatment, then as indicated clinically: electrolyte disturbances; prolongation of QT interval, bradycardia, heart failure with reduced left ventricular ejection fraction, concomitant use with other drugs known to prolong QT interval; congenital or family history of QT interval prolongation, family history of sudden death; effectiveness of hormonal contraceptives reduced during treatment and for 2 months after stopping telaprevir—effective non-hormonal methods of contraception necessary during this time (see also Cautions under Ribavirin).

**interactions:** Appendix 1 (telaprevir)

- **Rash** Rash occurs very commonly. If rash mild or moderate, may continue without interruption, but monitor for deterioration. If moderate rash deteriorates, consider permanent discontinuation of telaprevir; if rash does not improve within 7 days of discontinuation, suspend ribavirin. If severe rash or if rash accompanied by blistersing or mucosal ulceration, discontinue telaprevir permanently; if rash does not improve within 7 days of discontinuation, consider discontinuation of ribavirin and peginterferon alfa. If serious rash, or if severe rash deteriorates, or if rash accompanied by systemic symptoms, discontinue telaprevir, ribavirin, and peginterferon alfa permanently.

**Counselling** Patients should be told to seek immediate medical attention if a rash develops or if an existing rash worsens

**Hepatic impairment** manufacturer advises avoid in moderate to severe impairment

**Pregnancy** manufacturer advises avoid; see Cautions above and also see under Ribavirin

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies

**Side-effects** in combination with ribavirin and peginterferon alfa, rash (including eczema and rarely Stevens-Johnson syndrome and toxic epidermal necrolysis; see also Rash above), pruritus, anaemia, nausea, vomiting, diarrhoea, haemorrhoids, anal fissure, hyperbilirubinaemia, taste disturbances, syncope, peripheral oedema, hypothryoidism, hypokalaemia, thrombocytopenia, lymphopenia, hyperuricemia; less commonly proctitis, gout, retinopathy, urticaria

**Dose**

- In combination with ribavirin and peginterferon alfa, ADULT over 18 years, 1.125 g every 12 hours or 750 mg every 8 hours (for duration of treatment consult product literature)

**Missed dose** If a dose is more than 6 hours late with the 12 hourly regimen (or more than 4 hours late with the 8 hourly regimen), the missed dose should not be taken and the next dose should be taken at the normal time

**Incivo® (Janssen)**

- Tablets, yellow, f/c, telaprevir 375 mg, net price 42-tab pack = £1866.50. Label: 21, counselling, rash

**Note** Dispense in original container (contains desiccant)

**TELAPREVIN**

**Indications** in combination with ribavirin and peginterferon alfa for chronic hepatitis C infection of genotype 1 in patients with compensated liver disease

**Cautions** monitor full blood count, platelets, electrolytes, serum creatinine, uric acid, and liver and thyroid function tests before starting treatment and then on weeks 2, 4, 8, and 12 of treatment, then as indicated clinically: electrolyte disturbances; prolongation of QT interval, bradycardia, heart failure with reduced left ventricular ejection fraction, concomitant use with other drugs known to prolong QT interval; congenital or family history of QT interval prolongation, family history of sudden death; effectiveness of hormonal contraceptives reduced during treatment and for 2 months after stopping telaprevir—effective non-hormonal methods of contraception necessary during this time (see also Cautions under Ribavirin).

**interactions:** Appendix 1 (telaprevir)

- **Rash** Rash occurs very commonly. If rash mild or moderate, may continue without interruption, but monitor for deterioration. If moderate rash deteriorates, consider permanent discontinuation of telaprevir; if rash does not improve within 7 days of discontinuation, suspend ribavirin. If severe rash or if rash accompanied by blistersing or mucosal ulceration, discontinue telaprevir permanently; if rash does not improve within 7 days of discontinuation, consider discontinuation of ribavirin and peginterferon alfa. If serious rash, or if severe rash deteriorates, or if rash accompanied by systemic symptoms, discontinue telaprevir, ribavirin, and peginterferon alfa permanently.

**Counselling** Patients should be told to seek immediate medical attention if a rash develops or if an existing rash worsens

**Hepatic impairment** manufacturer advises avoid in moderate to severe impairment

**Pregnancy** manufacturer advises avoid; see Cautions above and also see under Ribavirin

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies

**Side-effects** in combination with ribavirin and peginterferon alfa, rash (including eczema and rarely Stevens-Johnson syndrome and toxic epidermal necrolysis; see also Rash above), pruritus, anaemia, nausea, vomiting, diarrhoea, haemorrhoids, anal fissure, hyperbilirubinaemia, taste disturbances, syncope, peripheral oedema, hypothryoidism, hypokalaemia, thrombocytopenia, lymphopenia, hyperuricemia; less commonly proctitis, gout, retinopathy, urticaria

**Dose**

- In combination with ribavirin and peginterferon alfa, ADULT over 18 years, 1.125 g every 12 hours or 750 mg every 8 hours (for duration of treatment consult product literature)

**Missed dose** If a dose is more than 6 hours late with the 12 hourly regimen (or more than 4 hours late with the 8 hourly regimen), the missed dose should not be taken and the next dose should be taken at the normal time

**Incivo® (Janssen)**

- Tablets, yellow, f/c, telaprevir 375 mg, net price 42-tab pack = £1866.50. Label: 21, counselling, rash

**Note** Dispense in original container (contains desiccant)

**TELAPREVIN**

**Indications** in combination with ribavirin and peginterferon alfa for chronic hepatitis C infection of genotype 1 in patients with compensated liver disease

**Cautions** monitor full blood count, platelets, electrolytes, serum creatinine, uric acid, and liver and thyroid function tests before starting treatment and then on weeks 2, 4, 8, and 12 of treatment, then as indicated clinically: electrolyte disturbances; prolongation of QT interval, bradycardia, heart failure with reduced left ventricular ejection fraction, concomitant use with other drugs known to prolong QT interval; congenital or family history of QT interval prolongation, family history of sudden death; effectiveness of hormonal contraceptives reduced during treatment and for 2 months after stopping telaprevir—effective non-hormonal methods of contraception necessary during this time (see also Cautions under Ribavirin).

**interactions:** Appendix 1 (telaprevir)

- **Rash** Rash occurs very commonly. If rash mild or moderate, may continue without interruption, but monitor for deterioration. If moderate rash deteriorates, consider permanent discontinuation of telaprevir; if rash does not improve within 7 days of discontinuation, suspend ribavirin. If severe rash or if rash accompanied by blistersing or mucosal ulceration, discontinue telaprevir permanently; if rash does not improve within 7 days of discontinuation, consider discontinuation of ribavirin and peginterferon alfa. If serious rash, or if severe rash deteriorates, or if rash accompanied by systemic symptoms, discontinue telaprevir, ribavirin, and peginterferon alfa permanently.

**Counselling** Patients should be told to seek immediate medical attention if a rash develops or if an existing rash worsens

**Hepatic impairment** manufacturer advises avoid in moderate to severe impairment

**Pregnancy** manufacturer advises avoid; see Cautions above and also see under Ribavirin

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies

**Side-effects** in combination with ribavirin and peginterferon alfa, rash (including eczema and rarely Stevens-Johnson syndrome and toxic epidermal necrolysis; see also Rash above), pruritus, anaemia, nausea, vomiting, diarrhoea, haemorrhoids, anal fissure, hyperbilirubinaemia, taste disturbances, syncope, peripheral oedema, hypothryoidism, hypokalaemia, thrombocytopenia, lymphopenia, hyperuricemia; less commonly proctitis, gout, retinopathy, urticaria

**Dose**

- In combination with ribavirin and peginterferon alfa, ADULT over 18 years, 1.125 g every 12 hours or 750 mg every 8 hours (for duration of treatment consult product literature)

**Missed dose** If a dose is more than 6 hours late with the 12 hourly regimen (or more than 4 hours late with the 8 hourly regimen), the missed dose should not be taken and the next dose should be taken at the normal time

**Incivo® (Janssen)**

- Tablets, yellow, f/c, telaprevir 375 mg, net price 42-tab pack = £1866.50. Label: 21, counselling, rash

**Note** Dispense in original container (contains desiccant)
Oseltamivir in children under 1 year of age
Data on the use of oseltamivir in children under 1 year of age is limited. Furthermore, oseltamivir may be ineffective in neonates because they may not be able to metabolise oseltamivir to its active form. However, oseltamivir can be used (under specialist supervision) for the treatment or post-exposure prophylaxis of influenza in children under 1 year of age. The Department of Health has advised (May 2009) that during a pandemic, treatment with oseltamivir can be overseen by healthcare professionals experienced in assessing children.

Pregnancy and breast-feeding
Although safety data are limited, either oseltamivir or zanamivir can be used in women who are pregnant or breast-feeding when the potential benefit outweighs the risk (e.g. during a pandemic). Oseltamivir is the preferred drug in women who are breast-feeding.

NICE guidance
Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008)
The drugs described here are not a substitute for vaccination, which remains the most effective way of preventing illness from influenza.

- Amantadine is not recommended for prophylaxis of influenza.
- Oseltamivir or zanamivir are not recommended for seasonal prophylaxis against influenza.
- When influenza is circulating in the community, either oseltamivir or zanamivir is recommended (in accordance with UK licensing) for the treatment of influenza in at-risk patients who are not effectively protected by influenza vaccine, and who have been in close contact with someone suffering from influenza-like illness in the same household or residential setting. Oseltamivir should be given within 48 hours of exposure to influenza while zanamivir should be given within 36 hours of exposure to influenza.
- During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, either oseltamivir or zanamivir may be used for post-exposure prophylaxis in at-risk patients (regardless of influenza vaccination) living in long-term residential or nursing homes.

At risk patients include those aged over 65 years or those who have one or more of the following conditions:
- chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological disease;
- immunosuppression;
- diabetes mellitus.

This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.

www.nice.org.uk/TA158
Pregnancy use only if potential benefit outweighs risk (e.g. during a pandemic); see also p. 432

Breast-feeding amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic); see also p. 432

Side-effects nausea, vomiting, abdominal pain, dyspepsia, headache; less commonly arthralgias, convulsions and altered consciousness (usually in children and adolescents), eczema, rash; rarely hepatitis, gastrointestinal bleeding, neuropsychiatric disorders (usually in children and adolescents), thrombocytopenia, visual disturbances, Stevens-Johnson syndrome, toxic epidermal necrolysis

Dose
- Prevention of influenza, ADULT and CHILD over 13 years, 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic; NEONATE (see notes above), 2 mg/kg once daily for 10 days for post-exposure prophylaxis; CHILD 1–3 months (see notes above), 2.5 mg/kg once daily for 10 days for post-exposure prophylaxis; 3 months–1 year (see notes above), 3 mg/kg once daily for 10 days for post-exposure prophylaxis; 1–13 years, body-weight 10–15 kg, 30 mg once daily for 10 days for post-exposure prophylaxis (for up to 6 weeks during an epidemic); body-weight 15–23 kg, 45 mg once daily for 10 days for post-exposure prophylaxis (for up to 6 weeks during an epidemic); body-weight 23–40 kg, 60 mg once daily for 10 days for post-exposure prophylaxis (for up to 6 weeks during an epidemic); body-weight over 40 kg, adult dose
- Treatment of influenza, ADULT and CHILD over 13 years, 75 mg every 12 hours for 5 days; NEONATE (see notes above), 2 mg/kg every 12 hours for 5 days; CHILD 1–3 months (see notes above), 2.5 mg/kg every 12 hours for 5 days; 3 months–1 year (see notes above), 3 mg/kg every 12 hours for 5 days; 1–13 years, body-weight 10–15 kg, 30 mg every 12 hours for 5 days, body-weight 15–23 kg, 45 mg every 12 hours for 5 days, body-weight 23–40 kg, 60 mg every 12 hours for 5 days, body-weight over 40 kg, adult dose

Note Not licensed for use in children under 1 year of age unless there is a pandemic

Tamiflu® (Roche) Capsules, oseltamivir (as phosphate) 30 mg (yellow), net price 10-cap pack = £7.71; 45 mg (grey), 10-cap pack = £15.41; 75 mg (grey-yellow), 10-cap pack = £15.41. Label: 9

Note If suspension not available, capsules can be opened and the contents mixed with a small amount of sweetened food, such as sugar water or chocolate syrup, just before administration

Oral suspension, sugar-free, tutti-frutti-flavoured, oseltamivir (as phosphate) for reconstitution with water, 30 mg/5 mL, net price 65 mL = £10.27. Label: 9

Excipients include sorbitol 900 mg/5 mL

Note Solutions prepared by ‘special order’ manufacturers may be a different concentration

ZANAMIVIR

Indications see notes above

Cautions asthma and chronic pulmonary disease (risk of bronchospasm—short-acting bronchodilator

Ribavirin inhibits a wide range of DNA and RNA viruses. It is licensed for administration by inhalation for the treatment of severe bronchiolitis caused by the respiratory syncytial virus (RSV) in infants, especially when they have other serious diseases. However, there is no evidence that ribavirin produces clinically relevant benefit in RSV bronchiolitis. Ribavirin is given by mouth with peginterferon alfa or interferon alfa for the treatment of chronic hepatitis C infection (see section 5.3.3.2, p. 429). Ribavirin is also effective in Lassa fever [unlicensed indication].

Palivizumab is a monoclonal antibody licensed for preventing serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease; it should be prescribed under specialist supervision and on the basis of the likelihood of hospitalisation.

Palivizumab is recommended for:
- children under 9 months of age who require long-term ventilation;

5.3.5 Respiratory syncytial virus

should be available; avoid in severe asthma unless close monitoring possible and appropriate facilities available to treat bronchospasm; uncontrolled chronic illness; other inhaled drugs should be administered before zanamivir

Pregnancy use only if potential benefit outweighs risk (e.g. during a pandemic); see also p. 432

Breast-feeding amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic); see also p. 432

Side-effects rash; less commonly bronchospasm, dyspnoea, angioedema, urticaria; rarely Stevens-Johnson syndrome, toxic epidermal necrolysis; also reported neuropsychiatric disorders (especially in children and adolescents)

Dose
- By inhalation of powder, post-exposure prophylaxis of influenza, ADULT and CHILD over 5 years, 10 mg once daily for 10 days
- Prevention of influenza during an epidemic, ADULT and CHILD over 5 years, 10 mg once daily for up to 28 days
- Treatment of influenza, ADULT and CHILD over 5 years, 10 mg twice daily for 5 days (for up to 10 days if resistance to oseltamivir suspected [unlicensed duration])

Relenza® (GSK) Dry powder for inhalation disks containing 4 blisters of zanamivir 5 mg/blisters, net price 5 disks with Diskhaler® device = £16.36

for the treatment and prophylaxis of influenza as indicated in the notes above and NICE guidance, endorse prescription ‘SLS’

1 For details of the preterm age groups included in the recommendations, see Immunisation against Infectious Disease (2006), available at www.gov.uk/dh
Infections

5.3.5 Respiratory syncytial virus

- children 1–2 years of age who require long-term ventilation and have an additional co-morbidity (including cardiac disease or pulmonary hypertension).

**PALIVIZUMAB**

**Indications** see notes above

**Contraindications** moderate to severe acute infection or febrile illness; thrombocytopenia; serum-palivizumab concentration may be reduced after cardiac surgery; hypersensitivity to humanised monoclonal antibodies

**Side-effects** fever, injection-site reactions, nervousness; less commonly diarrhoea, vomiting, constipation, haemorrhage, rhinitis, cough, wheeze, pain, drowsiness, asthma, hyperkinesia, leucopenia, and rash; also reported, apnoea, hypersensitivity reactions (including anaphylaxis), convulsions and thrombocytopenia

**Dose**

- By intramuscular injection (preferably in anterolateral thigh), 15 mg/kg once a month during season of RSV risk (child undergoing cardiac bypass surgery, 15 mg/kg as soon as stable after surgery, then once a month during season of risk); injection volume over 1 mL should be divided between more than one site

**Synagis** (AbbVie) 15 mg/kg, reconstituted, palivizumab, net price 50-mg vial = £306.34; 100-mg vial = £563.64

**RIBAVIRIN** (Tribibvirin)

**Indications** severe respiratory syncytial virus bronchiolitis in infants and children; in combination with peginterferon alfa or interferon alfa for chronic hepatitis C in patients without liver decompensation (see also section 5.3.3.2)

**Cautions** Specific cautions for inhaled treatment Maintain standard supportive respiratory and fluid management therapy; monitor electrolytes closely; monitor equipment for precipitation; pregnant women (and those planning pregnancy) should avoid exposure to aerosol

Specific cautions for oral treatment Exclude pregnancy before treatment; effective contraception essential during treatment and for 4 months after treatment in women and for 7 months after treatment in men; routine monthly pregnancy tests recommended; condoms must be used if partner of male patient is pregnant (ribavirin excreted in semen); cardiac disease (assessment including ECG recommended before and during treatment—discontinue if deterioration); gout, determine full blood count, platelets, electrolytes, serum creatinine, liver function tests and uric acid before starting treatment and then on weeks 2 and 4 of treatment, then as indicated clinically—adjust dose if adverse reactions or laboratory abnormalities develop (consult product literature); eye examination recommended before treatment, eye examination also recommended during treatment if pre-existing ophthalmological disorder or if decrease in vision reported—discontinue treatment if ophthalmological disorder deteriorates or if new ophthalmological disorder develops; patients with a transplant—risk of rejection; test thyroid function before treatment and then every 3 months in children, risk of growth retardation in children, the reversibility of which is uncertain—if possible, consider starting treatment after pubertal growth spurt

**Interactions:** Appendix 1 (ribavirin)

**Contra-indications** Specific contra-indications for oral treatment Severe cardiac disease, including unstable or uncontrolled cardiac disease in previous 6 months; haemoglobinopathies; severe debilitating medical conditions; autoimmune disease (including autoimmune hepatitis), uncontrolled severe psychiatric condition; history of severe psychiatric condition in children

**Hepatic impairment** no dosage adjustment required; use oral ribavirin with caution in severe hepatic dysfunction or uncompensated cirrhosis

**Renal impairment** plasma-ribavirin concentration increased; avoid oral ribavirin unless essential if eGFR less than 50 mL/minute/1.73 m²—monitor haemoglobin concentration closely

**Pregnancy** avoid; teratogenicity in animal studies; see also Cautions above

**Breast-feeding** avoid—no information available

**Side-effects** Specific side-effects for inhaled treatment Worsening respiration, bacterial pneumonia, and pneumothorax reported, rarely non-specific anaemia and haemolyisis

Specific side-effects for oral treatment Haemolytic anaemia (anaemia may be improved by epoetin); also (in combination with peginterferon alfa or interferon alfa) nausea, vomiting, dyspepsia, abdominal pain, flatulence, constipation, diarrhoea, colitis, chest pain, palpititation, tachycardia, peripheral oedema, changes in blood pressure, syncope, flushing, cough, dyspnoea, headache, dizziness, asthenia, impaired concentration and memory, sleep disturbances, abnormal dreams, anxiety, depression, suicidal ideation (more frequent in children), psychoses, dysphagia, weight loss, dysphonia, paraesthesia, hypoaesthesia, ataxia, hyperpnoea, influenza-like symptoms, thyroid disorders, hyperglycaemia, menstrual disturbances, breast pain, prostatitis, sexual dysfunction, micturition disorders, leucopenia, thrombocytopenia, lymphadenopathy, dehydration, hypocalcaemia, myalgia, arthralgia, hyperuricaemia, visual disturbances, eye pain, dry eyes, hearing impairment, tinnitus, earache, dry mouth, taste disturbances, mouth ulcers, stomatitis, glossitis, tooth disorder, gingivitis, alopecia, pruritus, dry skin, rash (including very rarely Stevens-Johnson syndrome and toxic epidermal necrolysis), increased sweating, psoriasis, photosensitivity, and acne; less commonly pancreatitis, gastro-intestinal bleeding, and hypertriglyceridaemia; rarely peptic ulcer, arthrihnias, cardiomyopathy, myocardial infarction, pericarditis, stroke, interstitial pneumonitis, pulmonary embolism, seizures, renal failure, vasculitis, rheumatoid arthritis, systemic lupus erythematosus, sarcoidosis, optic neuropathy, and retinal haemorrhage; very rarely aplastic anaemia and peripheral icchaemia, in children also growth retardation (including decrease in height and weight), palor, tachypnoea, hyperkinesia, virilism, and skin discoloration

**Dose**

- See preparations below

**Copegus** (Roche) 200 mg, net price 42-tab pack = £92.50, 112-tab pack = £246.65, 168-tab pack = £369.98, 400 mg (red-brown), 56-tab pack = £246.65. Label: 21

Dose chronic hepatitis C (in combination with interferon alfa or peginterferon alfa), ADULT over 18 years, body-weight under 75 kg, 400 mg in the morning and 600 mg in the evening; body-weight 75 kg and over, 600 mg twice daily

**Note** Patients with chronic hepatitis C genotype 2 or 3 (not previously treated), or patients infected with HIV and hepatitis C require a lower dose of Copegus (in combination with peginterferon alfa), usual dose 400 mg twice daily

**Rebetol** (MSD) 200 mg, net price 84-cap pack = £160.69, 140-cap pack = £267.81, 168-cap pack = £321.38. Label: 21

Dose chronic hepatitis C (in combination with interferon alfa or peginterferon alfa), ADULT over 18 years, body-weight under 65 kg, 400 mg twice daily, body-weight 65–
81 kg, 400 mg in the morning and 600 mg in the evening; body-weight 81–105 kg, 600 mg twice daily; body-weight over 105 kg, 800 mg in the morning and 800 mg in the evening. CHILD 3–18 years see BNF for Children

Virazole® (Meda) For inhalation, ribavirin 6 g for reconstitution with 300 mL water for injections. Net price 3 x 6-g vials £349.00

Dose: bronchiolitis, by aerosol inhalation or nebulisation (via small particle aerosol generator) of solution containing 20 mg/mL for 12–18 hours for at least 3 days; max. 7 days

5.4.1 Antimalarials

Recommendations on the prophylaxis and treatment of malaria reflect guidelines agreed by UK malaria specialists. The centres listed above should be consulted for advice on special problems.

Treatment of malaria

If the infective species is not known, or if the infection is mixed, initial treatment should be as for falciparum malaria with quinine, Malarone® (proguanil with atovaquone), or Riamet® (artemether with lumefantrine). Falciparum malaria can progress rapidly in unprotected individuals and antimalarial treatment should be considered in those with features of severe malaria and possible exposure, even if the initial blood tests for the organism are negative.

Falciparum malaria (treatment)

Falciparum malaria (malignant malaria) is caused by Plasmodium falciparum. In most parts of the world P. falciparum is now resistant to chloroquine which should not therefore be given for treatment.

Quinine. Malarone® (proguanil with atovaquone), or Riamet® (artemether with lumefantrine) can be given by mouth if the patient can swallow and retain tablets and there are no serious manifestations (e.g. impaired consciousness); quinine should be given by intravenous infusion (see below) if the patient is seriously ill or unable to take tablets. Mefloquine is now rarely used for treatment because of concerns about resistance.

Oral. The adult dosage regimen for quinine by mouth is:

600 mg (of quinine salt) every 8 hours for 5–7 days together with or followed by either doxycycline 200 mg once daily for 7 days or clindamycin 450 mg every 8 hours for 7 days [unlicensed indication].

If the parasite is likely to be sensitive, pyrimethamine 75 mg with sulfadoxine 1.5 g as a single dose [unlicensed] may be given (instead of either clindamycin or doxycycline) together with, or after, a course of quinine.

Alternatively, Malarone® or Riamet® may be given instead of quinine. It is not necessary to give doxycycline, clindamycin or pyrimethamine with sulfadoxine after Malarone® or Riamet® treatment.

The adult dose of Malarone® by mouth is:

4 (‘standard’) tablets once daily for 3 days.

The dose of Riamet® by mouth for adult with body-weight over 35 kg is:

4 tablets initially, followed by 5 further doses of 4 tablets each given at 8, 24, 36, 48, and 60 hours (total 24 tablets over 60 hours).

Parenteral. If the patient is seriously ill or unable to take tablets, or if more than 2% of red blood cell are parasitized, quinine should be given by intravenous infusion [unlicensed]. The adult dosage regimen for quinine by infusion is:

loading dose of 20 mg/kg (up to maximum 1.4 g) of quinine sulfate infused over 4 hours then 8 hours after the start of the loading dose, maintenance dose of 10 mg/kg (up to maximum 700 mg) of quinine salt infused over 4 hours every 8 hours (until patient can swallow tablets to complete the 7-day

1. Valid for quinine hydrochloride, dihydrochloride, and sulfate; not valid for quinine bisulfate which contains a correspondingly smaller amount of quinine.

2. In intensive care units the loading dose can alternatively be given as quinine salt 1 mg/kg infused over 4 minutes followed immediately by 10 mg/kg over 4 hours then (after 8 hours) maintenance dose as described.

3. Important: the loading dose of 20 mg/kg should not be used if the patient has received quinine or mefloquine during the previous 12 hours.

4. Maintenance dose should be reduced to 5–7 mg/kg of quinine salt in patients with severe renal impairment, severe hepatic impairment, or if parenteral treatment is required for more than 48 hours.
course together or followed by either doxycycline or clindamycin as above). Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intravenous artesunate may be available for 'named-patient' use.

**Children**

Oral. Quinine is well tolerated by children although the salts are bitter. The dosage regimen for quinine by mouth for children is:

- 10 mg/kg (of quinine salt); max. 600 mg every 8 hours for 7 days together or followed by Clindamycin 7–13 mg/kg (max. 450 mg) every 8 hours for 7 days [unlicensed indication]
- or 60 hours (total 12 tablets over 60 hours); body-weight 31–40 kg, 2 ‘standard’ tablets once daily for 3 days
- or if the parasite is likely to be sensitive, pyrimethamine with sulfadoxine as a single dose [unlicensed]; up to 4 years and body-weight over 5 kg, pyrimethamine 12.5 mg with sulfadoxine 250 mg; 5–6 years, pyrimethamine 25 mg with sulfadoxine 500 mg; 7–9 years, pyrimethamine 37.5 mg with sulfadoxine 750 mg; 10–14 years, pyrimethamine 50 mg with sulfadoxine 1 g; 14–18 years, pyrimethamine 75 mg with sulfadoxine 1.5 g

Alternatively, Malarone® or Riamet® may be given instead of quinine; it is not necessary to give clindamycin, doxycycline, or pyrimethamine with sulfadoxine after Malarone® or Riamet® treatment. The dose regimen for Malarone® or Riamet® by mouth for children over 40 kg is the same as for adults (see above); the dose regimen for Malarone® for smaller children is reduced as follows:

- body-weight 5–9 kg, 2 ‘paediatric’ tablets once daily for 3 days; body-weight 9–11 kg, 3 ‘paediatric’ tablets once daily for 3 days; body-weight 11–21 kg, 1 ‘standard’ tablet once daily for 3 days; body-weight 21–31 kg, 2 ‘standard’ tablets once daily for 3 days; body-weight 31–40 kg, 3 ‘standard’ tablets once daily for 3 days.

The dose regimen of Riamet® by mouth for children over 12 years and body-weight over 35 kg is the same as for adults (see above). The dose regimen for Riamet® for children under 12 years is as follows:

- body-weight 5–15 kg 1 tablet initially, followed by 5 further doses of 1 tablet each given at 8, 24, 36, 48, and 60 hours (total 6 tablets over 60 hours); body-weight 15–25 kg 2 tablets initially, followed by 5 further doses of 2 tablets each given at 8, 24, 36, 48, and 60 hours (total 12 tablets over 60 hours); body-weight 25–35 kg 3 tablets initially, followed by 5 further doses of 3 tablets each given at 8, 24, 36, 48, and 60 hours (total 18 tablets over 60 hours)

Parenteral. The dose regimen for quinine by intravenous infusion for children is calculated on a mg/kg basis as for adults (see above).

**Pregnancy**

Falciparum malaria is particularly dangerous in pregnancy, especially in the last trimester. The adult treatment doses of oral and intravenous quinine given above (including the loading dose) can safely be given to pregnant women. Clindamycin 450 mg every 8 hours for 7 days [unlicensed indication] should be given with or after quinine. Doxycycline should be avoided in pregnancy (affects teeth and skeletal development); pyrimethamine with sulfadoxine, Malarone®, and Riamet® are also best avoided until more information is available. Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intravenous artesunate may be available for ‘named-patient’ use.

**Non-falciparum malaria (treatment)**

Non-falciparum malaria is usually caused by Plasmodium vivax and less commonly by P. ovale and P. malariae. P. knowlesi is also present in the Asia-Pacific region. Chloroquine is the drug of choice for the treatment of non-falciparum malaria (but chloroquine-resistant P. vivax has been reported in the Indonesian archipelago, the Malay Peninsula, including Myanmar, and eastward to Southern Vietnam).

The adult dosage regimen for chloroquine by mouth is:

- initial dose of 620 mg of base then 1 single dose of 310 mg of base after 6 to 8 hours then 1 single dose of 310 mg of base daily for 2 days (approximate total cumulative dose of 25 mg/kg of base)

Chloroquine alone is adequate for P. malariae and P. knowlesi infections but in the case of P. vivax and P. ovale, a radical cure (to destroy parasites in the liver and thus prevent relapses) is required. This is achieved with primaquine [unlicensed] given after chloroquine; in P. vivax infection primaquine is given in an adult dosage of 30 mg daily for 14 days and for P. ovale infection it is given in an adult dosage of 15 mg daily for 14 days.

**Children**

The dosage regimen of chloroquine for non-falciparum malaria in children is:

- initial dose of 10 mg/kg of base (max. 620 mg) then 1 single dose of 5 mg/kg of base (max. 310 mg) after 6–8 hours then 1 single dose of 5 mg/kg of base (max. 310 mg) daily for 2 days

For a radical cure, primaquine [unlicensed] is then given to children over 6 months of age; specialist advice should be sought for children under 6 months of age. In P. vivax infection primaquine is given in a dose of 500 micrograms/kg (max. 30 mg) daily for 14 days, and for P. ovale infection it is given in a dose of 250 micrograms/kg (max. 15 mg) daily for 14 days.

**Parenteral**

If the patient is unable to take oral therapy, quinine can be given by intravenous infusion [unlicensed].

1. Valid for quinine hydrochloride, dihydrochlortizide, and sulfate; not valid for quinine bisulfate which contains a correspondingly smaller amount of quinine.

2. For the treatment of chloroquine-resistant non-falciparum malaria, Malarone® [unlicensed indication], quinine, or Riamet® [unlicensed indication] can be used; as with chloroquine, primaquine should be given for radical cure.

3. Before starting primaquine, blood should be tested for glucose-6-phosphate dehydrogenase (G6PD) activity since the drug can cause haemolysis in G6PD-deficient patients. Specialist advice should be obtained in G6PD deficiency; in mild G6PD deficiency primaquine in a dose for adults of 45 mg once a week (children 750 micrograms/kg once a week; max. 45 mg once a week) for 8 weeks, has been found useful and without undue harmful effects.
Prophylaxis against malaria

The recommendations on prophylaxis reflect guidelines agreed by UK malaria specialists; the advice is aimed at residents of the UK who travel to endemic areas. The choice of drug for a particular individual should take into account:

- risk of exposure to malaria;
- extent of drug resistance;
- efficacy of the recommended drugs;
- side-effects of the drugs;
- patient-related factors (e.g. age, pregnancy, renal or hepatic impairment, compliance with prophylactic regimen).

Protection against bites

Prophylaxis is not absolute, and breakthrough infection can occur with any of the drugs recommended. Personal protection against being bitten is very important. Mosquito nets impregnated with permethrin provide the most effective barrier protection against insects; mats and vapourised insecticides are also useful. Diethyltoluamide (DEET) 20–50% in lotions, sprays, or roll-on formulations is safe and effective when applied to the skin of adults and children over 2 months of age. It can also be used during pregnancy and breast-feeding. The duration of protection varies according to the concentration of DEET and is longest for DEET 50%. When sunscreen is also required, DEET should be applied after the sunscreen. Long sleeves and trousers worn after dusk also provide protection against bites.

Length of prophylaxis

In order to determine tolerance and to establish habit, prophylaxis should generally be started one week (2–3 weeks in the case of mefloquine) before travel into an endemic area; Malarone® or doxycycline prophylaxis should be started 1–2 days before travel. Prophylaxis should be continued for 4 weeks after leaving (except for Malarone® prophylaxis which should be stopped 1 week after leaving).

In those requiring long-term prophylaxis, chloroquine and proguanil may be used for periods of over 5 years. Mefloquine is licensed for up to 1 year (although, if it is tolerated in the short term, there is no evidence of harm when it is used for up to 3 years). Doxycycline can be used for up to 2 years. Malarone® can be used for up to 1 year. Prophylaxis with mefloquine, doxycycline, or Malarone® may be considered for longer durations if it is justified by the risk of exposure to malaria. Specialist advice should be sought for long-term prophylaxis.

Return from malarial region

It is important to be aware that any illness which occurs within 1 year and especially within 3 months of return might be malaria even if all recommended precautions against malaria were taken. Travellers should be warned of this and told that if they develop any illness particularly within 3 months of their return they should go immediately to a doctor and specifically mention their exposure to malaria.

Children

Prophylactic doses are based on guidelines agreed by UK malaria experts and may differ from advice in product literature. Weight is a better guide than age. If in doubt telephone centres listed on p. 435.

Epilepsy

Both chloroquine and mefloquine are unsuitable for malaria prophylaxis in individuals with a history of epilepsy. In areas without chloroquine resistance proguanil 200 mg daily alone is recommended; in areas with chloroquine resistance, doxycycline or Malarone® may be considered; the metabolism of doxycycline may be influenced by antiepileptics (see interactions: Appendix 1 (tetracyclines)).

Asplenia

Asplenic individuals (or those with severe splenic dysfunction) are at particular risk of severe malaria. If travel to malarious areas is unavoidable, rigorous precautions are required against contracting the disease.

Renal impairment

Avoidance (or dosage reduction) of proguanil is recommended since it is excreted by the kidneys. Malarone® should not be used for prophylaxis in patients with estimated glomerular filtration rate less than 30 mL/minute/1.73 m². Chloroquine is only partially excreted by the kidneys and reduction of the dose for prophylaxis is not required except in severe impairment. Mefloquine is considered to be appropriate to use in renal impairment and does not require dosage reduction. Doxycycline is also considered to be appropriate.

Pregnancy

Travel to malarious areas should be avoided during pregnancy; if travel is unavoidable, effective prophylaxis must be used. Chloroquine and proguanil can be given in the usual doses during pregnancy, but these drugs are not appropriate for most areas because their effectiveness has declined, particularly in Sub-Saharan Africa; in the case of proguanil, folic acid 5 mg daily should be given for at least the first trimester. The centres listed on p. 435 should be consulted for advice on prophylaxis in chloroquine-resistant areas. Although the manufacturer advises that mefloquine should not be used during pregnancy, particularly in the first trimester, unless the potential benefit outweighs the risk, studies of mefloquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas. Doxycycline is contra-indicated during pregnancy (see section 5.1.3); however, it can be used for malaria prophylaxis if other regimes are unsuitable, and if the entire course of doxycycline can be completed before 15 weeks’ gestation [unlicensed]. Malarone® should be avoided during pregnancy, however, it can be considered during the second and third trimesters if there is no suitable alternative.

Breast-feeding

Prophylaxis is required in breast-fed infants; although antimalarials are present in milk, the amounts are too variable to give reliable protection.

Anticoagulants

Travellers taking warfarin should begin chemoprophylaxis 2–3 weeks before departure. The INR should be stable before departure. It should be...
measured before starting chemoprophylaxis, 7 days after starting, and after completing the course. For prolonged stays, the INR should be checked at regular intervals.

Specific recommendations
Where a journey requires two regimens, the regimen for the higher risk area should be used for the whole journey. Those travelling to remote or little-visited areas may require expert advice.

Important
Settled immigrants (or long-term visitors) to the UK may be unaware that any immunity they may have acquired while living in malarious areas is lost rapidly after migration to the UK, or that any non-malarious areas where they lived previously may now be malarious.

Standby treatment

Travellers visiting remote, malarious areas for prolonged periods should carry standby treatment if they are likely to be more than 24 hours away from medical care. Self-medication should be avoided if medical help is accessible.

In order to avoid excessive self-medication, the traveller should be provided with written instructions that urgent medical attention should be sought if fever (38°C or more) develops 7 days (or more) after arriving in a malarious area and that self-treatment is indicated if medical help is not available within 24 hours of fever onset.

In view of the continuing emergence of resistant strains and of the different regimens required for different areas expert advice should be sought on the best treatment course for an individual traveller. A drug used for chemoprophylaxis should not be considered for standby treatment for the same traveller.

Artemether with lumefantrine

Artemether with lumefantrine is licensed for the treatment of acute uncomplicated falciparum malaria.

**ARTEMETHER WITH LUMEFANTRINE**

**Indications** treatment of acute uncomplicated falciparum malaria; treatment of non-falciparum malaria [unlicensed indication]

**Cautions** electrolyte disturbances, concomitant use with other drugs known to cause QT-interval prolongation; monitor patients unable to take food (greater risk of recrudescence); avoid in acute porphyria (section 9.8.2); interactions: Appendix 1 (artemether with lumefantrine)

**Driving** Dizziness may affect performance of skilled tasks (e.g. driving)

**Contra-indications** history of arrhythmias, of clinically relevant bradycardia, and of congestive heart failure accompanied by reduced left ventricular ejection fraction; family history of sudden death or of congenital QT interval prolongation

**Hepatic impairment** manufacturer advises caution in severe impairment

**Renal impairment** manufacturer advises caution in severe impairment—monitor ECG and plasma potassium concentration

**Pregnancy** toxicity in animal studies with artemether; manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises avoid breast-feeding for at least 1 week after last dose; present in milk in animal studies

**Side-effects** abdominal pain, anorexia, diarrhoea, vomiting, nausea; palpitation, prolonged QT interval; cough; headache, dizziness, sleep disturbances, asthenia, paraesthesia; arthralgia, myalgia; pruritus, rash; less commonly ataxia, hypoaesthesia, and clonus

**Dose**

- Treatment of malaria, see p. 435

**Riamet®** (Novartis)

**Tablets**, yellow, artemether 20 mg, lumefantrine 120 mg, net price 24-tab pack = £22.50. Label: 21, counselling, driving

**Note** Tablets may be crushed just before administration

Chloroquine

Chloroquine is used for the prophylaxis of malaria in areas of the world where the risk of chloroquine-resistant
5 Infections

Malarone treatment should be with quinine, nor is it recommended if the infective species is resistant, nor is it recommended if the infective species is resistant. It is still recommended for the treatment of non-falciparum malaria (for details, see p. 436).

**CHLOROQUINE**

**Indications** chemoprophylaxis and treatment of malaria, rheumatoid arthritis and lupus erythematosus (section 10.1.3)

**Cautions** may exacerbate psoriasis; neurological disorders (avoid for prophylaxis if history of epilepsy, see notes above); may aggravate myasthenia gravis; severe gastro-intestinal disorders; G6PD deficiency (see section 9.1.5); ophthalmic examination and long-term therapy, see under Chloroquine, section 10.1.3; avoid concurrent therapy with hepatotoxic drugs—other interactions: Appendix 1 (chloroquine and hydroxychloroquine)

**Hepatic impairment** use with caution in moderate to severe impairment

**Renal impairment** manufacturers advise caution; see also Prophylaxis Against Malaria, p. 437

**Pregnancy** benefit of prophylaxis and treatment in malaria outweighs risk; see also Non-falciparum Malaria (treatment), p. 437 and Prophylaxis Against Malaria, p. 437

**Breast-feeding** amount in milk probably too small to be harmful; see also Prophylaxis Against Malaria, p. 437

**Side-effects** gastro-intestinal disturbances, headache, skin reactions (rashes, pruritus); also hypotension, convulsions, extrapyramidal symptoms, visual disturbances, depigmentation or loss of hair; rarely bone-marrow suppression, hypersensitivity reactions such as urticaria and angioedema; other side-effects (not usually associated with malaria prophylaxis or treatment), see under Chloroquine, section 10.1.3; very toxic in overdosage—immediate advice from poisons centres essential (see also p. 39)

**Dose**

**Note** Doses expressed as chloroquine base

- Prophylaxis of malaria, started 1 week before entering endemic area and continued for 4 weeks after leaving (see notes above), 310 mg once weekly; CHILD up to 6 years body-weight under 4.5 kg, 25 mg once weekly; 6 weeks–6 months body-weight 4.5–8 kg, 50 mg once weekly; 6 months–1 year body-weight 8–11 kg, 75 mg once weekly; 1–3 years body-weight 11–15 kg, 100 mg once weekly; 3–4 years body-weight 15–16.5 kg, 125 mg once weekly; 4–8 years body-weight 16.5–25 kg, 150 mg once weekly (or 155 mg once weekly if tablets used); 8–13 years body-weight 25–45 kg, 225 mg once weekly (or 222.5 mg once weekly if tablets used) over 15 years body-weight over 45 kg, adult dose.

**Counselling** Warn travellers about importance of avoiding mosquito bites, importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return. For details, see notes above

- Treatment of non-falciparum malaria, see p. 436

**Note** Chloroquine doses in BNF may differ from those in product literature

- Paludrine® (Alliance)

- Malarivon®

- Avloclor® (Alliance)

**MEFLOQUINE**

**Indications** chemoprophylaxis of malaria, treatment of malaria, see notes above

**Cautions** cardiac conduction disorders; epilepsy (avoid for prophylaxis); traumatic brain injury; not recommended in infants under 3 months (5 kg); interactions: Appendix 1 (mefloquine)

**Neuropsychiatric reactions** Mefloquine is associated with potentially serious neuropsychiatric reactions. Abnormal dreams, insomnia, anxiety, and depression occur commonly. Psychosis, suicidal ideation, and suicide have also been reported. Psychiatric symptoms such as nightmares, acute anxiety, depression, restlessness, or confusion should be regarded as potentially prodomal for a more serious event. If neuropsychiatric symptoms occur, patients should be advised to discontinue mefloquine and to seek immediate medical attention so that mefloquine can be replaced with an alternative antimalarial. Adverse reactions may occur and persist up to several months after discontinuation because mefloquine has a long half-life. Mefloquine is contraindicated for malaria prophylaxis in those with a history of psychiatric disorders or convulsions.

**Driving** Dizziness or a disturbed sense of balance may affect performance of skilled tasks (e.g. driving); effects may occur and persist up to several months after stopping mefloquine.

**Contra-indications** hypersensitivity to quinine; history of blackwater fever; avoid for standby treatment if history of convulsions; avoid for prophylaxis if 1. Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria. Drugs for malaria prophylaxis not import prescribable on the NHS; health authorities may investigate circumstances under which anti-malarials are prescribed
history of psychiatric disorders (including depression) or convulsions

**Hepatic impairment** elimination may be prolonged; avoid in severe impairment

**Renal impairment** manufacturer advises caution

**Pregnancy** manufacturer advises adequate contraception during prophylaxis and for 3 months after stopping (teratogenicity in *animal* studies), but see also p. 437

**Breast-feeding** present in milk but risk to infant minimal; see also p. 437

**Side-effects** nausea, vomiting, abdominal pain, diarrhoea, headache, dizziness, visual disturbances, pruritus; see also Neuropsychiatric Reactions above; also reported anorexia, dyspepsia, hepatic failure, hypotension, hypertension, flushing, chest pain, bradycardia, tachycardia, palpitation, arrhythmias, syncope, oedema, dyspnoea, pneumonitis, drowsiness, sensory and motor neuropathies, tremor, ataxia, panic attacks, confusion, amnesia, seizures, encephalopathy, speech disturbances, malaise, fever, blood disorders (including leucopenia, leucocytosis, thrombocytopenia), muscle weakness, myalgia, arthralgia, cataract, optic neuropathy, vestibular disorders, rash (including Stevens-Johnson syndrome), alopecia, hyperidrosis

**Dose**
- Prophylaxis of malaria, started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving (see notes above), **ADULT** and **CHILD** body-weight over 45 kg, 250 mg once weekly; body-weight 5–16 kg, 62.5 mg once weekly; body-weight 16–25 kg, 125 mg once weekly; body-weight 25–45 kg, 187.5 mg once weekly
- Treatment of malaria, see notes above

**Counselling** Inform travellers about adverse reactions of medicines that increase plasma-piperaquine concentration, in children who are vomiting, in females, or in the elderly; consider obtaining ECG in all patients before third dose and 4–6 hours after third dose; if QTc interval more than 500 milliseconds, discontinue treatment and monitor ECG for a further 24–48 hours; see also p. 437

**Contra-indications** risk factors for QT interval prolongation (e.g. electrolyte disturbances, acute myocardial infarction, severe hypertension, left ventricular hypertrophy, heart failure with reduced left ventricular ejection fraction, bradycardia, congenital long QT syndrome, family history of sudden death, concomitant use with other drugs known to prolong the QT interval, history of symptomatic arrhythmias)

**Hepatic impairment** no information available in moderate to severe impairment—manufacturer advises monitor ECG and plasma-potassium concentration

**Renal impairment** no information available in moderate to severe impairment—manufacturer advises monitor ECG and plasma-potassium concentration

**Pregnancy** teratogenic in *animal* studies—manufacturer advises use only if other antimalarials cannot be used

**Breast-feeding** manufacturer advises avoid—present in milk in *animal* studies

**Side-effects** QT interval prolonged, tachycardia, hypotension, hypertension, flushing, chest pain, bradycardia, palpitation, arrhythmias, syncope, oedema, dyspnoea, pneumonitis, drowsiness, sensory and motor neuropathies, tremor, ataxia, panic attacks, confusion, amnesia, seizures, encephalopathy, speech disturbances, malaise, fever, blood disorders (including leucopenia, leucocytosis, thrombocytopenia), muscle weakness, myalgia, arthralgia, cataract, optic neuropathy, vestibular disorders, rash (including Stevens-Johnson syndrome), alopecia, hyperidrosis

**Dose**
- See preparations

**Eurartesim**� (Sigma-Tau)�
  - **Tablets**, f/c, scored, piperaquine phosphate 320 mg, artemisin 40 mg, net price 12-tab pack = £40.00.
  - **Counselling**, administration
  - **Counselling** Tablets to be taken at least 3 hours before and at least 3 hours after food. Tablets may be crushed and mixed with water immediately before administration
  - **Dose** Treatment of uncomplicated falciparum malaria, **ADULT** and **CHILD** over 6 months, body-weight 7–13 kg, ½ tablet once daily for 3 days; body-weight 13–24 kg, 1 tablet once daily for 3 days; body-weight 24–36 kg, 2 tablets once daily for 3 days; body-weight 36–75 kg, 3 tablets once daily for 3 days; body-weight 75–100 kg, 4 tablets once daily for 3 days
  - **Note** Max. 2 courses in 12 months; second course given at least 2 months after first course

**Piperaquine with artemanol**

Piperaquine with artemanol is not recommended for the first-line treatment of acute uncomplicated falciparum malaria because there is limited experience of its use in travellers who usually reside in areas where malaria is not endemic. Piperaquine has a long half-life.

**PIPERAQUINE PHOSPHATE WITH ARTEMINOL**

(Piperaquine tetraphosphate with dihydroartemisinin)

**Indications** see notes above

**Cautions** obtain ECG as soon as possible after starting treatment then continue monitoring in those taking medicines that increase plasma-piperaquine concentration, in children who are vomiting, in females, or in the elderly; consider obtaining ECG in all patients before third dose and 4–6 hours after third dose; if QTc interval more than 500 milliseconds, discontinue treatment and monitor ECG for a further 24–48 hours; see also p. 437

**Interactions** Appendix 1 (piperaquine with artemol)

**Contra-indications** risk factors for QT interval prolongation (e.g. electrolyte disturbances, acute myocardial infarction, severe hypertension, left ventricular hypertrophy, heart failure with reduced left ventricular ejection fraction, bradycardia, congenital long QT syndrome, family history of sudden death, concomitant use with other drugs known to prolong the QT interval, history of symptomatic arrhythmias)

**Hepatic impairment** no information available in moderate to severe impairment—manufacturer advises monitor ECG and plasma-potassium concentration

**Renal impairment** no information available in moderate to severe impairment—manufacturer advises monitor ECG and plasma-potassium concentration

**Pregnancy** teratogenic in *animal* studies—manufacturer advises use only if other antimalarials cannot be used

**Breast-feeding** manufacturer advises avoid—present in milk in *animal* studies

**Side-effects** QT interval prolonged, tachycardia, hypotension, hypertension, flushing, chest pain, bradycardia, palpitation, arrhythmias, syncope, oedema, dyspnoea, pneumonitis, drowsiness, sensory and motor neuropathies, tremor, ataxia, panic attacks, confusion, amnesia, seizures, encephalopathy, speech disturbances, malaise, fever, blood disorders (including leucopenia, leucocytosis, thrombocytopenia), muscle weakness, myalgia, arthralgia, cataract, optic neuropathy, vestibular disorders, rash (including Stevens-Johnson syndrome), alopecia, hyperidrosis

**Dose**
- See preparations

**Eurartesim**� (Sigma-Tau)�
  - **Tablets**, f/c, scored, piperaquine phosphate 320 mg, artemisin 40 mg, net price 12-tab pack = £40.00.
  - **Counselling**, administration
  - **Counselling** Tablets to be taken at least 3 hours before and at least 3 hours after food. Tablets may be crushed and mixed with water immediately before administration
  - **Dose** Treatment of uncomplicated falciparum malaria, **ADULT** and **CHILD** over 6 months, body-weight 7–13 kg, ½ tablet once daily for 3 days; body-weight 13–24 kg, 1 tablet once daily for 3 days; body-weight 24–36 kg, 2 tablets once daily for 3 days; body-weight 36–75 kg, 3 tablets once daily for 3 days; body-weight 75–100 kg, 4 tablets once daily for 3 days
  - **Note** Max. 2 courses in 12 months; second course given at least 2 months after first course

**Primaquine**

Primaquine is used to eliminate the liver stages of *Plasmodium vivax* or *P. ovale* following chloroquine treatment (for details, see p. 436).

**PRIMAQUINE**

**Indications** adjunct in the treatment of *Plasmodium vivax* and *P. ovale* malaria (eradication of liver stages)

**Cautions** G6PD deficiency (test blood, see under Non-falciparum Malaria (treatment), p. 436); systemic diseases associated with granulocytopenia (e.g.,
Proguanil

Proguanil is used (usually with chloroquine, but occasionally alone) for the prophylaxis of malaria. For details, see specific recommendations by country. (For details, see specific recommendations by country, p. 438).

Proguanil used alone is not suitable for the treatment of malaria; however, Malarone® (a combination of atovaquone with proguanil) is licensed for the treatment of acute uncomplicated falciparum malaria. Malarone® is also used for the prophylaxis of falciparum malaria in areas of widespread mefloquine or chloroquine resistance. Malarone® is also used as an alternative to mefloquine or doxycycline. Malarone® is particularly suitable for short trips to highly chloroquine-resistant areas because it needs to be taken only for 7 days after leaving an endemic area.

**PROGUANIL HYDROCHLORIDE**

**Indications**

Chemoprophylaxis of malaria

**Cautions**

Interactions: See under Chloroquine

**Renal impairment**

Avoid for malaria prophylaxis (and if possible for malaria treatment) if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy**

Manufacturer advises avoid unless essential; see also p. 437

**Breast-feeding**

Use only if no suitable alternative available; see also p. 437

**Side-effects**

Abdominal pain, nausea, vomiting, diarrhoea; cough; headache, dizziness, insomnia, abnormal dreams, depression, anorexia, fever; rash, pruritus; less frequently stomatitis, palpitation, anxiety, blood disorders, hyponatraemia, and hair loss; also reported, hepatitis, cholestasis, tachycardia, hallucinations, seizures, vasculitis, mouth ulcers, photosensitivity, and Stevens-Johnson syndrome

**Dose**

See preparations

**Counselling**

Warn travellers about importance of avoiding mosquito bites. Importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return. For details, see notes above

1. Paludrine® (Alliance)

   Tablets, scored, proguanil hydrochloride 100 mg. Net price 98-tab pack = £8.65. Label: 21, counselling, prophylaxis, see above

   **Note**

   Tablet may be crushed and mixed with food such as milk, jam, or honey just before administration

2. Malarone® (GSK)®

   Tablets (‘standard’), pink, f/c, proguanil hydrochloride 100 mg, atovaquone 250 mg. Net price 12-tab pack = £25.21. Label: 21, counselling, prophylaxis, see above

   **Dose**

   Prophylaxis of malaria, started 1 week before entering endemic area and continued for 4 weeks after leaving (see notes above). 200 mg once daily; INFANT up to 12 weeks body-weight under 6 kg, 25 mg once daily; 12 weeks–1 year body-weight 6–10 kg, 50 mg once daily; CHILD 1–4 years body-weight 10–16 kg, 75 mg once daily; 4–8 years body-weight 16–25 kg, 100 mg once daily; 8–13 years, body-weight 25–45 kg, 150 mg once daily; over 13 years body-weight over 45 kg, adult dose.

   **Counselling**

   Warn travellers about importance of avoiding mosquito bites, importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return. For details, see notes above

   1. Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria. Drugs for malaria prophylaxis not prescribable on the NHS. Health authorities may investigate circumstances under which antimalarials are prescribed

   2. Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials prescribed

   **Note**

   Proguanil doses in BNf may differ from those in product literature
1. Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials prescribed for prophylaxis (severe side-effects on long-term use); interactions: Appendix 1 (pyrimethamine, sulfonamides)

Contra-indications see under Pyrimethamine and under Co-trimoxazole (section 5.1.8); sulfonamide allergy

Pregnancy possible teratogenic risk in first trimester (pyrimethamine a folate antagonist); in third trimester—risk of neonatal haemolysis and methaemoglobinemia; fear of increased risk of kernicterus in neonates appears to be unfounded; see also p. 436

Breast-feeding small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants (due to sulfadoxine)

Side-effects see under Pyrimethamine and under Co-trimoxazole (section 5.1.8); pulmonary infiltrates (e.g. eosinophilic or allergic alveolitis) reported—discontinue if cough or shortness of breath

Dose
- Treatment of falciparum malaria, see p. 435
- Prophylaxis, not recommended by UK malaria experts

Pyrimethamine with sulfadoxine (Non-proprietary) (GSK)

Tablets, scored, pyrimethamine 25 mg, sulfadoxine 500 mg, net price 3-tab pack = 74p

Note Also known as Fansidar®

Available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104

Quinine

Quinine is not suitable for the prophylaxis of malaria. Quinine is used for the treatment of falciparum malaria or if the infective species is not known or if the infection is mixed (for details see p. 435).

Quinine

Indications falciparum malaria; nocturnal leg cramps, see section 10.2.2

Cautions cardiac disease (including atrial fibrillation, conduction defects, heart block), elderly—monitor ECG during parenteral treatment; monitor blood glucose and electrolyte concentration during parenteral treatment; G6PD deficiency (see section 9.1.5); interactions: Appendix 1 (quinine)

Contra-indications haemoglobinuria, myasthenia gravis, optic neuritis, tinnitus

Hepatic impairment for treatment of malaria in severe impairment, reduce parenteral maintenance dose to 5–7 mg/kg of quinine salt

Renal impairment for treatment of malaria in severe impairment, reduce parenteral maintenance dose to 5–7 mg/kg of quinine salt

Pregnancy high doses are teratogenic in first trimester, but in malaria benefit of treatment outweighs risk; see also p. 436

Breast-feeding present in milk but not known to be harmful

Side-effects cinchonism, including tinnitus, hearing impairment, vertigo, headache, nausea, vomiting, abdominal pain, diarrhoea, visual disturbances (including temporary blindness); agitation, confusion; cardiovascular effects (see Cautions); dyspnoea; hypersensitivity reactions including angioedema, rashes, hot and flushed skin; hypoglycaemia (espe-

**DOXYCYCLINE**

**Indications** prophylaxis of malaria; adjunct to quinine in treatment of *Plasmodium falciparum* malaria; see also section 5.1.3

**Cautions** section 5.1.3

**Contra-indications** section 5.1.3

**Hepatic impairment** section 5.1.3

**Renal impairment** section 5.1.3

**Pregnancy** section 5.1.11

**Breast-feeding** section 5.1.11

**Side-effects** section 5.1.11

**Dose**

- Prophylaxis of malaria, started 1–2 days before entering endemic area and continued for 4 weeks after leaving (see notes above), **ADULT** and **CHILD** over 12 years, 100 mg once daily
- Treatment of falciparum malaria, see p. 435

**Preparations** Section 5.1.3

**5.4.2 Amoebicides**

Metronidazole is the drug of choice for *acute invasive amoebic dysentery* since it is very effective against vegetative forms of *Entamoeba histolytica* in ulcers; it is given in an adult dose of 800 mg three times daily for 5 days.

Tinidazole is also effective. Metronidazole and tinidazole are also active against amoebae which may have migrated to the liver. Treatment with metronidazole (or tinidazole) is followed by a 10-day course of diloxanide furoate.

Diloxanide furoate is the drug of choice for asymptomatic patients with *E. histolytica* cysts in the faeces; metronidazole and tinidazole are relatively ineffective.

Diloxanide furoate is relatively free from toxic effects and the usual course is of 10 days, given alone for chronic infections or following metronidazole or tinidazole treatment.

For *amoebic abscess* of the liver **metronidazole** is effective; tinidazole is an alternative. Aspiration of the abscess is indicated where it is suspected that it may rupture or where there is no improvement after 72 hours of metronidazole; the aspiration may need to be repeated. Aspiration aids penetration of metronidazole and, for abscesses with more than 100 mL of pus, if carried out in conjunction with drug therapy, may reduce the period of disability.

Diloxanide furoate is not effective against hepatic amoebiasis, but a 10-day course should be given at the completion of metronidazole or tinidazole treatment to destroy any amoebae in the gut.

**DILOXANIDE FURUATE**

**Indications** see notes above; chronic amoebiasis and as adjunct to metronidazole or tinidazole in acute amoebiasis

**Pregnancy** manufacturer advises avoid—no information available

**Breast-feeding** manufacturer advises avoid

**Side-effects** flatulence, vomiting, urticaria, pruritus

**Dose**

- 500 mg every 8 hours for 10 days; **CHILD** body-weight over 25 kg, 20 mg/kg daily in 3 divided doses for 10 days; body-weight under 25 kg, see **BNF for Children**

**Preparations** diloxanide furoate 500 mg, net price 30-tab pack = £93.50. Label: 9

**METRONIDAZOLE**

**Indications** see under Dose below; anaerobic infections, section 5.1.11

**Cautions** section 5.1.11

**Hepatic impairment** section 5.1.11

**Pregnancy** section 5.1.11

**Breast-feeding** section 5.1.11

**Side-effects** section 5.1.11

**Dose**

- By mouth, invasive intestinal amoebiasis, extra-intestinal amoebiasis (including liver abscess), 800 mg every 8 hours for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection); **CHILD** 1–3 years 200 mg every 8 hours; 3–7 years 200 mg every 6 hours; 7–10 years 400 mg every 8 hours
- Urogenital trichomoniasis, 200 mg every 8 hours for 7 days or 400–500 mg every 12 hours for 5–7 days, or 2 g as a single dose; **CHILD** 1–3 years 50 mg every 8 hours for 7 days; 3–7 years 100 mg every 12 hours; 7–10 years 100 mg every 8 hours
- Giardiasis, 2 g daily for 3 days or 400 mg 3 times daily for 5 days or 500 mg twice daily for 7–10 days; **CHILD** 1–3 years 500 mg daily for 3 days; 3–7 years 600–800 mg daily; 7–10 years 1 g daily

**Preparations** Section 5.1.11
TINIDAZOLE

Indications  see under Dose below; anaerobic infections, section 5.1.11
Cautions  section 5.1.11
Pregnancy  section 5.1.11
Breast-feeding  section 5.1.11
Side-effects  section 5.1.11

Dose
- Intestinal amoebiasis, 2 g daily for 2–3 days; CHILD 50–60 mg/kg daily for 3 days
- Amoebic involvement of liver, 1.5–2 g daily for 3–6 days; CHILD 50–60 mg/kg daily for 5 days
- Urogenital trichomoniasis and giardiasis, single 2 g dose; CHILD single dose of 50–75 mg/kg (repeated once if necessary)

Preparations  Section 5.1.11

5.4.3 Trichomonacides

Metronidazole (section 5.4.2) is the treatment of choice for Trichomonas vaginalis infection. Contact tracing is recommended and sexual contacts should be treated simultaneously. If metronidazole is ineffective, tinidazole (section 5.4.2) may be tried.

5.4.4 Antigiardial drugs

Metronidazole (section 5.4.2) is the treatment of choice for Giardia lamblia infections. Alternative treatments are tinidazole (section 5.4.2) or mepacrine hydrochloride.

MEPACRINE HYDROCHLORIDE

Indications  giardiasis; discoid lupus erythematosus
(Antimalarias, section 10.1.3)
Caution  hepatic impairment, elderly, history of psychosis; avoid in psoriasis; interactions: Appendix 1 (mepacrine)

Side-effects  gastro-intestinal disturbances; dizziness, headache; with large doses nausea, vomiting and occasionally transient acute toxic psychosis and CNS stimulation; on prolonged treatment yellow discoloration of skin and urine, chronic dermatoses (including severe exfoliative dermatitis), hepatitis, aplastic anaemia; also reported blue/black discoloration of palate and nails and cornel deposits with visual disturbances

Dose
- Giardiasis [unlicensed], 100 mg every 8 hours for 5–7 days

Mepacrine Hydrochloride

Tablets, mepacrine hydrochloride 100 mg. Label: 4, 9, 14, 21
Available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104

5.4.5 Leishmaniacides

Cutaneous leishmaniasis frequently heals spontaneously but if skin lesions are extensive or unsightly, treatment is indicated, as it is in visceral leishmaniasis (kala-azar). Leishmaniasis should be treated under specialist supervision.

SODIUM STIBOGLUCONATE

Indications  leishmaniasis
Caution  intravenous injections must be given slowly over 5 minutes (to reduce risk of local thrombosis) and stopped if coughing or substernal pain; mucocutaneous disease (see below); treat intercurrent infection (e.g. pneumonia); monitor ECG before and during treatment; heart disease (withdraw if conduction disturbances occur); predisposition to QT interval prolongation (including concomitant use with drugs that prolong QT interval); interactions: Appendix 1 (sodium stibogluconate)

Mucocutaneous disease  Successful treatment of mucocutaneous leishmaniasis may induce severe inflammation around the lesions (may be life-threatening if pharyngeal or tracheal involvement)—may require corticosteroid

Hepatic impairment  use with caution
Renal impairment  avoid in significant impairment
Pregnancy  manufacturer advises use only if potential benefit outweighs risk
Breast-feeding  amount probably too small to be harmful

Side-effects  anorexia, nausea, vomiting, abdominal pain, diarrhoea; ECG changes; coughing (see Caution); headache, lethargy, arthralgia, myalgia; rarely jaundice, flushing, bleeding from nose or gum, subternal pain (see Caution), vertigo, fever, sweating, and rash; also reported pancreatitis and anaphylaxis; pain and thrombosis on intravenous administration, intramuscular injection also painful

Dose
- See notes above

Pentostam® (GSK) injection 50 mg/mL. Net price 100-mL bottle = £66.43
Note  Injection should be filtered immediately before administration using a filter of 5 microns or less
5.4.6 Trypanocides

The prophylaxis and treatment of trypanosomiasis is difficult and differs according to the strain of organism. Expert advice should therefore be obtained.

5.4.7 Drugs for toxoplasmosis

Most infections caused by *Toxoplasma gondii* are self-limiting, and treatment is not necessary. Exceptions are patients with eye involvement (toxoplasma chorioretinitis), and those who are immunosuppressed. Toxoplasmic encephalitis is a common complication of AIDS. The treatment of choice is a combination of pyrimethamine and sulfadiazine, given for several weeks (expert advice essential). Pyrimethamine is a folate antagonist, and adverse reactions to this combination are relatively common (folinic acid supplements and weekly blood counts needed). Alternative regimens use combinations of pyrimethamine with clindamycin or clari-thromycin or azithromycin. Long-term secondary prophylaxis is required after treatment of toxoplasmosis in immunocompromised patients; prophylaxis should continue until immunity recovers.

If toxoplasmosis is acquired in pregnancy, transplacental infection may lead to severe disease in the fetus. Spiramycin [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104) may reduce the risk of transmission of maternal infection to the fetus.

5.4.8 Drugs for pneumocystis pneumonia

Pneumonia caused by *Pneumocystis jirovecii* (Pneumocystis carinii) occurs in immunosuppressed patients; it is a common cause of pneumonia in AIDS. Pneumocystis pneumonia should generally be treated by those experienced in its management. Blood gas measurement is used to assess disease severity.

Treatment

**Mild to moderate disease**  Co-trimoxazole (section 5.1.8) in high dosage is the drug of choice for the treatment of mild to moderate pneumocystis pneumonia.

Atovaquone is licensed for the treatment of mild to moderate pneumocystis infection in patients who cannot tolerate co-trimoxazole. A combination of dapsone 100 mg daily (section 5.1.10) with trimethoprim 5 mg/kg every 6–8 hours (section 5.1.8) is given by mouth for the treatment of mild to moderate disease [unlicensed indication].

A combination of clindamycin 600 mg by mouth every 8 hours (section 5.1.6) and primaquine 30 mg daily by mouth (section 5.4.1) is used in the treatment of mild to moderate disease [unlicensed indication]; this combination is associated with considerable toxicity.

**Severe disease**  Co-trimoxazole (section 5.1.8) in high dosage, given by mouth or by intravenous infusion, is the drug of choice for the treatment of severe pneumocystis pneumonia. Pentamidine isetionate given by intravenous infusion is an alternative for patients who cannot tolerate co-trimoxazole, or who have not responded to it. Pentamidine isetionate is a potentially toxic drug that can cause severe hypotension during or immediately after infusion.

Corticosteroid treatment can be lifesaving in those with severe pneumocystis pneumonia (see Adjunctive Therapy below).

**Adjunctive therapy**  In moderate to severe infections associated with HIV infection, prednisolone 50–80 mg daily is given by mouth for 5 days (alternatively, hydrocortisone may be given parenterally); the dose is then reduced to complete 21 days of treatment. Corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards. The corticosteroid should be withdrawn before anti-pneumocystis treatment is complete.

**Prophylaxis**

Prophylaxis against pneumocystis pneumonia should be given to all patients with a history of the infection. Prophylaxis against pneumocystis pneumonia should also be considered for severely immunocompromised patients. Prophylaxis should continue until immunity recovers sufficiently. It should not be discontinued if the patient has oral candidiasis, continues to lose weight, or is receiving cytotoxic therapy or long-term immunosuppressant therapy.

**Co-trimoxazole** by mouth is the drug of choice for prophylaxis against pneumocystis pneumonia. It is given in a dose of 960 mg daily or 960 mg on alternate days (3 times a week); the dose may be reduced to co-trimoxazole 480 mg daily to improve tolerance. Inhaled pentamidine isetionate is better tolerated than parenteral pentamidine. Intermittent inhalation of pentamidine isetionate is used for prophylaxis against pneumocystis pneumonia in patients unable to tolerate co-trimoxazole. It is effective but patients may be prone to extrapulmonary infection. Alternatively, dapsone 100 mg daily (section 5.1.10) can be used. Atovaquone 750 mg twice daily has also been used for prophylaxis [unlicensed indication].

**ATOVAQUONE**

**Indications**  treatment of mild to moderate *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia in patients intolerant of co-trimoxazole

**Cautions**  initial diarrhoea and difficulty in taking with food may reduce absorption (and require alternative therapy); other causes of pulmonary disease should be sought and treated; elderly; **interactions**: Appendix 1 (atovaquone)

**Hepatic impairment**  manufacturer advises caution—monitor more closely

**Renal impairment**  manufacturer advises caution—monitor more closely

**Pregnancy**  manufacturer advises avoid unless potential benefit outweighs risk—no information available

**Breast-feeding**  manufacturer advises avoid

**Side-effects**  nausea, diarrhoea, vomiting; headache, insomnia; fever, anaemia, neutropenia, hyponatraemia; rash, pruritus; also reported, Stevens-Johnson syndrome
5.5 Anthelmintics

5.5.1 Drugs for threadworms

**PENTAMIDINE ISETIONATE**

**Indications** see under Dose (should only be given by specialists)

**Cautions** risk of severe hypotension following administration (monitor blood pressure before starting treatment, during administration, and at regular intervals, until treatment concluded; patient should be lying down when receiving drug parenterally); hypokalaemia, hypomagnesaemia, coronary heart disease, bradycardia, history of ventricular arrhythmias, concomitant use with other drugs which prolong QT-interval; hypertension or hypotension; hyperglycaemia or hypoglycaemia; leucopenia, thrombocytopenia, or anaemia; carry out laboratory monitoring according to product literature; care required to protect personnel during handling and administration; interactions: Appendix 1 (pentamidine isetionate)

**Hepatic impairment** manufacturer advises caution

**Renal impairment** reduce intravenous dose for pneumocystis pneumonia if creatinine clearance less than 10 mL/minute: in life-threatening infection, use 4 mg/kg once daily for 7–10 days, then 4 mg/kg on alternate days to complete course of at least 14 doses; in less severe infection, use 4 mg/kg on alternate days for at least 14 doses

**Pregnancy** manufacturer advises avoid unless essential

**Breast-feeding** manufacturer advises avoid unless essential—no information available

**Side-effects** severe reactions, sometimes fatal, due to hypotension, hypoglycaemia, pancreatitis, and arrhythmias; also leucopenia, thrombocytopenia, acute renal failure, hypocalcaemia; also reported: azotaemia, abnormal liver-function tests, anaemia, hyperkalaemia, nausea and vomiting, dizziness, syncope, flushing, hyperglycaemia, rash, and taste disturbances; Stevens-Johnson syndrome reported; on inhalation, bronchoconstriction (may be prevented by prior use of bronchodilators), cough, and shortness of breath; discomfort, pain, induration, abscess formation, and muscle necrosis at injection site

**Dose**

- Treatment of *Pneumocystis jiroveci* (*Pneumocystis carinii*) pneumonia, by intravenous infusion, 4 mg/kg once daily for at least 14 days
- Prophylaxis of *Pneumocystis jiroveci* (*Pneumocystis carinii*) pneumonia, by inhalation of nebulised solution (using suitable equipment—consult product literature), 300 mg every 4 weeks or 150 mg every 2 weeks [unlicensed for primary prevention]
- Visceral leishmaniasis (kala-azar, section 5.4.5), by deep intramuscular injection, 3–4 mg/kg on alternate days to max. total of 10 injections; course may be repeated if necessary

**Note** Pentacarinat® Injection (dissolved in water for injection) may be used for nebulisation

---

**5.5 Anthelmintics**

- Cutaneous leishmaniasis, by deep intramuscular injection, 3–4 mg/kg once or twice weekly until condition resolves (but see also section 5.4.5)
- Trypanosomiasis, by deep intramuscular injection or intravenous infusion, 4 mg/kg daily or on alternate days to total of 7–10 injections

Note Direct intravenous injection should be avoided whenever possible and never given rapidly; intramuscular injections should be deep and preferably given into the buttock

**Pentacarinat®** (Sanofi-Aventis) 

Injection, powder for reconstitution, pentamidine isetionate, net price 300-mg vial = £31.77

**Caution in handling** Pentamidine isetionate is toxic and personnel should be adequately protected during handling and administration—consult product literature

**Advice on prophylaxis and treatment of helminth infections is available from:**

- Birmingham (0121) 424 0357
- Scottish Centre for Infection and Environmental Health (registered users of Travax only) (0141) 300 1100 (weekdays 12–5 p.m. only)
- Liverpool (0151) 705 3100
- London 0845 155 5000 (treatment)

**5.5.1 Drugs for threadworms** (*pinworms, Enterobius vermicularis*)

Anthelmintics are effective in threadworm infections, but their use needs to be combined with hygienic measures to break the cycle of auto-infection. All members of the family require treatment.

Adult threadworms do not live for longer than 6 weeks and for development of fresh worms, ova must be swallowed and exposed to the action of digestive juices in the upper intestinal tract. Direct multiplication of worms does not take place in the large bowel. Adult female worms lay ova on the perianal skin which causes pruritus; scratching the area then leads to ova being transmitted on fingers to the mouth, often via food eaten with unwashed hands. Washing hands and scrubbing nails before each meal and after each visit to the toilet is essential. A bath taken immediately after rising will remove ova laid during the night.

**Mebendazole** is the drug of choice for treating threadworm infection in patients of all ages over 2 years. It is given as a single dose; as reinfection is very common, a second dose may be given after 2 weeks.
**5.5.2 Ascaricides**

**MEBENDAZOLE**

**Indications**
threadworm, roundworm, whipworm, and hookworm infections

**Cautions** interactions: Appendix 1 (mebendazole)

Note: “The package insert in the Vermox® pack includes the statement that it is not suitable for women known to be pregnant or children under 2 years

**Pregnancy**
manufacturer advises toxicity in animal studies

**Breast-feeding**
amount too small to be harmful but manufacturer advises avoid

**Side-effects**
abdominal pain; less commonly diarrhoea, flatulence; rarely hepatitis, convulsions, dizziness, neutropenia, urticaria, alopecia, rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis)

**Dose**
- Threadworms, **ADULT** and **CHILD** over 2 years, 100 mg as a single dose; if reinfection occurs second dose may be needed after 2 weeks; **CHILD** under 2 years, see BNF for Children
- Whipworms, **ADULT** and **CHILD** over 2 years, 100 mg twice daily for 3 days; **CHILD** under 2 years, see BNF for Children
- Roundworms—section 5.5.2
- Hookworms—section 5.5.4

1 Mebendazole (Non-proprietary)  
Tablets, chewable, mebendazole 100 mg

Vermox® (Janssen)  
Tablets, orange, scored, chewable, mebendazole 100 mg. Net price 6-tab pack = £1.36

Oral suspension, mebendazole 100 mg/5 mL (banana-flavoured). Net price 30 mL = £1.59

**5.5.3 Drugs for tapeworm infections**

**Taenicides**

Nicosamide [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104) is the most widely used drug for tapeworm infections and side-effects are limited to occasional gastro-intestinal upset, lightheadedness, and pruritus; it is not effective against larval worms. Fears of develop-1op ing cysticercosis in *Taenia solium* infections have proved unfounded. All the same, an antiemetic can be given before treatment and a laxative can be given 2 hours after nicosamide.

Praziquantel [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104) is as effective as nicosamide and is given as a single dose of 5–10 mg/kg after a light breakfast (a single dose of 25 mg/kg for *Hymenolepis nana*).

**Hydatid disease**

Cysts caused by *Echinococcus granulosus* grow slowly and asymptomatic patients do not always require treatment. Surgical treatment remains the method of choice in many situations. Albendazole [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104) is used in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases. Alveolar echinococcosis due to *E. multilocularis* is usually fatal if untreated. Surgical removal with albendazole cover is the treatment of choice, but where effective surgery is impossible, repeated cycles of albendazole (for a year or more) may help. Careful monitoring of liver function is particularly important during drug treatment.

**5.5.4 Drugs for hookworms** (ankylostomiasis, necatoriasis)

Hookworms live in the upper small intestine and draw blood from the point of their attachment to their host. An iron-deficiency anaemia may occur and, if present, effective treatment of the infection requires not only expulsion of the worms but treatment of the anaemia.

Mebendazole (section 5.5.1) has a useful broad-spectrum activity, and is effective against hookworms; the usual dose is 100 mg twice daily for 3 days. Albendazole [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104) given as a single dose of 400 mg, is an alternative.

**5.5.5 Schistosomicides** (bilharziasis)

Adult *Schistosoma haematobium* worms live in the genito-urinary veins and adult *S. mansoni* in those of the colon and mesentery. *S. japonicum* is more widely distributed in veins of the alimentary tract and portal system.

Praziquantel [unlicensed] is available from Merck Serono (Cysticide®) and is effective against all human schistosomes. The dose is 20 mg/kg followed after 4–6 hours by one further dose of 20 mg/kg (20 mg/kg given 3 times on one day for *S. japonicum* infections). No serious adverse effects have been reported. Of all the available schistosomicides, it has the most attractive combination of effectiveness, broad-spectrum activity, and low toxicity.

Hycanthone, lucanthone, niridazole, oxamniquine, and sodium stibocaptate have now been superseded.

**5.5.6 Filaricides**

Diethylcarbamazine [unlicensed] (available from ‘special-order’ manufacturers or specialist importing com-
panies, see p. 1104) is effective against microfilariae and adults of *Loa loa*, *Wuchereria bancrofti*, and *Brugia malayi*. To minimise reactions treatment is commenced with a dose of diethylcarbamazine citrate 1 mg/kg on the first day and increased gradually over 3 days to 6 mg/kg daily in divided doses (up to 9 mg/kg daily in divided doses for *Loa loa*); this dosage is maintained for a further period. Close medical supervision is necessary particularly in the early phase of treatment.

In heavy infections there may be a febrile reaction, and in heavy *Loa loa* infection there is a small risk of encephalopathy. In such cases specialist advice should be sought, and treatment must be given under careful in-patient supervision and stopped at the first sign of cerebral involvement.

*Ivermectin* [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104) is very effective in onchocerciasis and it is now the drug of choice. A single dose of 150 micrograms/kg by mouth produces a prolonged reduction in microfilarial levels. Retreatment at intervals of 6 to 12 months depending on symptoms must be given until the adult worms die out. Reactions are usually slight and most commonly take the form of temporary aggravation of itching and rash. Diethylcarbamazine or suramin should no longer be used for onchocerciasis because of their toxicity.

5.5.7 Drugs for cutaneous larva migrans

*Creeping eruption*

Dog and cat hookworm larvae may enter human skin where they produce slowly extending itching tracks usually on the foot. Single tracks can be treated with topical *tiabendazole* (no commercial preparation available). Multiple infections respond to *ivermectin*, *albendazole* or *tiabendazole* (thiabendazole) by mouth [all unlicensed] and available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104).

5.5.8 Drugs for strongyloidiasis

Adult *Strongyloides stercoralis* live in the gut and produce larvae which penetrate the gut wall and invade the tissues, setting up a cycle of auto-infection. *Ivermectin* [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104) in a dose of 200 micrograms/kg daily for 2 days is the treatment of choice for chronic *Strongyloides* infection. *Albendazole* [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104) is an alternative given in a dose of 400 mg twice daily for 3 days, repeated after 3 weeks if necessary.
Diabetes mellitus occurs because of a lack of insulin or resistance to its action. It is diagnosed by measuring fasting or random blood-glucose concentration (and occasionally by oral glucose tolerance test). Although there are many subtypes, the two principal classes of diabetes are type 1 diabetes and type 2 diabetes.

Type 1 diabetes, (formerly referred to as insulin-dependent diabetes mellitus (IDDM)), occurs as a result of a deficiency of insulin following autoimmune destruction of pancreatic beta cells. Patients with type 1 diabetes require administration of insulin.

Type 2 diabetes, (formerly referred to as non-insulin-dependent diabetes (NIDDM)), is due to reduced secretion of insulin or to peripheral resistance to the action of insulin or to a combination of both. Although patients may be controlled on diet alone, many also require oral antidiabetic drugs or insulin (or both) to maintain satisfactory control. In overweight individuals, type 2 diabetes may be prevented by losing weight and increasing physical activity; use of the anti-obesity drug orlistat (section 4.5.1) may be considered in obese patients.

**Treatment of diabetes** Treatment of all forms of diabetes should be aimed at alleviating symptoms and minimising the risk of long-term complications (see below); tight control of diabetes is essential.

Diabetes is a strong risk factor for cardiovascular disease (section 2.12). Other risk factors for cardiovascular
disease such as smoking (section 4.10.2), hypertension (section 2.5), obesity (section 4.5), and hyperlipidaemia (section 2.12) should be addressed. Cardiovascular risk in patients with diabetes can be further reduced by the use of an ACE inhibitor (section 2.5.5.1), low-dose aspirin (section 2.9) and a lipid-regulating drug (section 2.12).

Prevention of diabetic complications Optimal glycaemic control in both type 1 diabetes and type 2 diabetes reduces, in the long term, the risk of microvascular complications including retinopathy, development of proteinuria and to some extent neuropathy. However, a temporary deterioration in established diabetic retinopathy may occur when normalising blood-glucose concentration. For reference to the use of an ACE inhibitor or an angiotensin-II receptor antagonist in the management of diabetic nephropathy, see section 6.1.5.

A measure of the total glycosylated (or glycated) haemoglobin (HbA₁c) or a specific fraction (HbA₁c) provides a good indication of glycaemic control over the previous 2–3 months. Overall it is ideal to aim for an HbA₁c (glycosylated haemoglobin) concentration of 48–59 mmol/mol or less (reference range 20–42 mmol/mol) but this cannot always be achieved and for those using insulin there is a significantly increased risk of disabling hypoglycaemia; in those at risk of arterial disease, the aim should be to maintain the HbA₁c concentration at 48 mmol/mol or less. HbA₁c should be measured every 3–6 months.

### Measurement of HbA₁c

HbA₁c values are expressed in mmol of glycosylated haemoglobin per mol of haemoglobin (mmol/mol), a standardised unit specific for HbA₁c created by the International Federation of Clinical Chemistry and Laboratory Medicine (IFCC). HbA₁c values were previously aligned to the assay used in the Diabetes Control and Complications Trial (DCCT) and expressed as a percentage.

<table>

Laboratory measurement of serum-fructosamine concentration is technically simpler and cheaper than the measurement of HbA₁c, and can be used to assess control over short periods of time, particularly when HbA₁c monitoring is invalid (e.g. disturbed erythrocyte turnover or abnormal haemoglobin type). Tight control of blood pressure in hypertensive patients with type 2 diabetes reduces mortality and protects visual acuity (by reducing considerably the risks of maculopathy and retinal photocoagulation) (see also section 2.5).

### Driving

Drivers with diabetes may be required to notify the Driver and Vehicle Licensing Agency (DVLA) of their condition depending on their treatment, the type of licence, and whether they have diabetic complications. Detailed guidance on eligibility to drive, and precautions required, is available from the DVLA (www.gov.uk/government/publications/at-a-glance).

Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems. Drivers treated with insulin should normally check their blood-glucose concentration before driving and, on long journeys, at 2-hour intervals as specified by DVLA guidance; depending on the type of licence, monitoring may also be necessary for drivers taking oral antidiabetic drugs which carry a risk of hypoglycaemia (e.g. sulfonylureas, nateglinide, repaglinide). Drivers treated with insulin should ensure that a supply of sugar is always available in the vehicle and they should avoid driving if their meal is delayed. If hypoglycaemia occurs, or warning signs develop, the driver should:

- stop the vehicle in a safe place;
- switch off the ignition and move from the driver’s seat;
- eat or drink a suitable source of sugar;
- wait until 45 minutes after blood glucose has returned to normal, before continuing journey.

### Insulins

#### 6.1.1 Insulins

##### 6.1.1.1 Short-acting insulins

##### 6.1.1.2 Intermediate- and long-acting insulins

##### 6.1.1.3 Hypodermic equipment

Insulin plays a key role in the regulation of carbohydrate, fat, and protein metabolism. It is a polypeptide hormone of complex structure. There are differences in the amino-acid sequence of animal insulins, human insulins and the human insulin analogues. Insulin may be extracted from pork pancreas and purified by crystallisation; it may also be extracted from beef pancreas, but beef insulins are now rarely used. Human sequence insulin may be produced semisynthetically by enzymatic modification of porcine insulin (emp) or biosynthetically by recombinant DNA technology using bacteria (crb, prb) or yeast (pyr).

All insulin preparations are to a greater or lesser extent immunogenic in man but immunological resistance to insulin action is uncommon. Preparations of human sequence insulin should theoretically be less immunogenic, but no real advantage has been shown in trials. Insulin is inactivated by gastro-intestinal enzymes, and must therefore be given by injection; the subcutaneous route is ideal in most circumstances. Insulin is usually injected into the upper arms, thighs, buttocks, or abdomen; absorption from a limb site may be increased if the limb is used in strenuous exercise after the injection. Generally subcutaneous insulin injections cause few problems; lipodystrophy may occur but can be minimised by using different injection sites in rotation. Local allergic reactions are rare.
Insulin is needed by all patients with ketoacidosis, and it is likely to be needed by most patients with:

- rapid onset of symptoms;
- substantial loss of weight;
- weakness;
- ketonuria;
- a first-degree relative who has type 1 diabetes.

Insulin is required by almost all children with diabetes. It is also needed for type 2 diabetes when other methods have failed to achieve good control, and temporarily in the presence of intercurrent illness or peri-operatively. Pregnant women with type 2 diabetes may be treated with insulin when diet alone fails. For advice on use of oral antidiabetic drugs in the management of diabetes in pregnancy, see section 6.1.2.

Management of diabetes with insulin The aim of treatment is to achieve the best possible control of blood-glucose concentration without making the patient obsessional and to avoid disabling hypoglycaemia; close co-operation is needed between the patient and the medical team because good control reduces the risk of complications.

Insulin preparations can be divided into 3 types:

- those of short duration which have a relatively rapid onset of action, namely soluble insulin and the rapid-acting insulin analogues, insulin aspart, insulin glulisine, and insulin lispro (section 6.1.1.1);
- those with an intermediate action, e.g. isophane insulin (section 6.1.1.2); and
- those whose action is slower in onset and lasts for long periods, e.g. protamine zinc insulin, insulin detemir, and insulin glargine (section 6.1.1.2).

The duration of action of a particular type of insulin varies considerably from one patient to another, and needs to be assessed individually.

Mixtures of insulin preparations may be required and appropriate combinations have to be determined for the individual patient. Treatment should be started with a short-acting insulin (e.g. soluble insulin) or a rapid-acting insulin analogue (e.g. insulin aspart) given before meals with intermediate-acting or long-acting insulin once or twice daily. Alternatively, for those who have difficulty with, or prefer not to use, multiple injection regimens, a mixture of premixed short-acting insulin or rapid acting insulin analogue with an intermediate-acting or long-acting insulin (most commonly in a proportion of 30% soluble insulin and 70% isophane insulin) can be given once or twice daily. The dose of short-acting or rapid-acting insulin (or the proportion of the short-acting soluble insulin component in premixed insulin) can be increased in those with excessive post-prandial hyperglycaemia. The dose of insulin is increased gradually according to the patient’s individual requirements, taking care to avoid troublesome hypoglycaemic reactions.

Insulin requirements may be increased by infection, stress, accidental or surgical trauma, and during puberty. Requirements may be decreased in those with certain endocrine disorders (e.g. Addison’s disease, hypopituitarism), or in coeliac disease.

Examples of recommended insulin regimens

- Multiple injection regimen: short-acting insulin or rapid-acting insulin analogue, before meals With intermediate-acting or long-acting insulin, once or twice daily;
- Short-acting insulin or rapid-acting insulin analogue mixed with intermediate-acting or long-acting insulin, once or twice daily (before meals);
- Intermediate-acting or long-acting insulin, once or twice daily With or without short-acting insulin or rapid-acting insulin before meals;
- Continuous subcutaneous insulin infusion (see below).

Hepatic impairment Insulin requirements may be decreased in patients with hepatic impairment.

Renal impairment Insulin requirements may decrease in patients with renal impairment and therefore dose reduction may be necessary. The compensatory response to hypoglycaemia is impaired in renal impairment.

Pregnancy and breast-feeding During pregnancy and breast-feeding, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician. The dose of insulin generally needs to be increased in the second and third trimesters of pregnancy. The short-acting insulin analogues, insulin aspart and insulin lispro, are not known to be harmful, and may be used during pregnancy and lactation. Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin is recommended where longer-acting insulins are needed; insulin detemir may also be considered.

Insulin administration Insulin is generally given by subcutaneous injection; the injection site should be rotated to prevent lipodystrophy. Injection devices (‘pens’) (section 6.1.1.3), which hold the insulin in a cartridge and meter the required dose, are convenient to use. Insulin syringes (for use with needles) are required for insulins not available in cartridge form.

For intensive insulin regimens multiple subcutaneous injections (3 or more times daily) are usually recommended.

Short-acting injectable insulins (soluble insulin, insulin aspart, insulin glulisine, and insulin lispro) can also be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens (see also NICE guidance, below). Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team.
BNF 68

6.1.1 Insulins 457

Endocrine system

Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008)

Continuous subcutaneous insulin infusion is recommended as an option in adults and children over 12 years with type 1 diabetes:

- who suffer repeated or unpredictable hypoglycaemia, whilst attempting to achieve optimal glycaemic control with multiple-injection regimens;
- whose glycaemic control remains inadequate (HbA1c > 8.5% [69 mmol/mol]) despite optimised multiple-injection regimens including the use of long-acting insulin analogues where appropriate).

Continuous subcutaneous insulin infusion is also recommended as an option for children under 12 years with type 1 diabetes for whom multiple-injection regimens are considered impractical or inappropriate. Children on insulin pumps should undergo a trial of multiple-injection therapy between the ages of 12 and 18 years.

www.nice.org.uk/TA151

Some patients have reported loss of hypoglycaemia warning after transfer to human insulin. Clinical studies do not confirm that human insulin decreases hypoglycaemia awareness. If a patient believes that human insulin is responsible for the loss of warning it is reasonable to revert to animal insulin and essential to educate the patient about avoiding hypoglycaemia. Great care should be taken to specify whether a human or an animal preparation is required.

Few patients are now treated with beef insulins; when undertaking conversion from beef to human insulin, the total dose should be reduced by about 10% with careful monitoring for the first few days. When changing between pork and human-sequence insulins, a dose change is not usually needed, but careful monitoring is still advised.

Diabetes and surgery

Perioperative control of blood-glucose concentrations in patients with type 1 diabetes is achieved via an adjustable, continuous, intravenous infusion of insulin. Detailed local protocols should be available to all healthcare professionals involved in the treatment of these patients; in general, the following steps should be followed:

- Give an injection of the patient’s usual insulin on the night before the operation;
- Early on the day of the operation, start an intravenous infusion of glucose containing potassium chloride (provided that the patient is not hyperkalaemic) and infuse at a constant rate appropriate to the patient’s fluid requirements (usually 125 mL per hour); make up a solution of soluble insulin in sodium chloride 0.9% and infuse intravenously using a syringe pump piggy-backed to the intravenous infusion. Glucose and potassium infusions, and insulin infusions should be made up according to locally agreed protocols;
- The rate of the insulin infusion should be adjusted according to blood-glucose concentration (frequent monitoring necessary) in line with locally agreed protocols. Other factors affecting the rate of infusion include the patient’s volume depletion, cardiac function, and age.

Protocols should include specific instructions on how to manage resistant cases (such as patients who are in shock or severely ill or those receiving corticosteroids or sympathomimetics) and those with hypoglycaemia.

If a syringe pump is not available, soluble insulin should be added to the intravenous infusion of glucose and potassium chloride (provided the patient is not hyperkalaemic), and the infusion run at the rate appropriate to the patient’s fluid requirements (usually 125 mL per hour) with the insulin dose adjusted according to blood-glucose concentration in line with locally agreed protocols.

Once the patient starts to eat and drink, give subcutaneous insulin before breakfast and stop intravenous insulin 30 minutes later; the dose may need to be 10–20% more than usual if the patient is still in bed or unwell. If the patient was not previously receiving insulin, an appropriate initial dose is 30–40 units daily in four divided doses using soluble insulin before meals and intermediate-acting insulin at bedtime and the dose adjusted from day to day. Patients with hyperglycaemia often relapse after conversion back to subcutaneous insulin calling for one of the following approaches:
Endocrine system

- additional doses of soluble insulin at any of the four injection times (before meals or bedtime) or
- temporary addition of intravenous insulin infusion (while continuing the subcutaneous regimen) until blood-glucose concentration is satisfactory or
- complete reversion to the intravenous regimen (especially if the patient is unwell).

**Insulin Passport** Insulin Passports and patient information booklets should be offered to patients receiving insulin. The Insulin Passport provides a record of the patient’s current insulin preparations and contains a section for emergency information. The patient information booklet provides advice on the safe use of insulin. They are available for purchase from:

3M Security Print and Systems Limited
Gorse Street, Chadderton
Oldham
OL9 9QH
Tel: 0845 610 1112

GP practices can obtain supplies through their Local Area Team stores.

NHS Trusts can order supplies from www.nhsforms.co.uk or by emailing nhsforms@mmm.com.

Further information is available at www.npsa.nhs.uk.

### 6.1.1 Insulins

#### 6.1.1.1 Short-acting insulins

**Soluble insulin** is a short-acting form of insulin. For maintenance regimens it is usual to inject it 15 to 30 minutes before meals.

Soluble insulin is the most appropriate form of insulin for use in diabetic emergencies e.g. diabetic ketoacidosis (section 6.1.3) and at the time of surgery. It can be administered intravenously and can be used as a temporary addition of intravenous insulin infusion (see Insulin Glulisine and at the time of surgery). Soluble insulin can be administered intravenously and can be used as a rapid-acting form of insulin in diabetic emergencies and at the time of surgery.

**Insulin Passports** Insulin Passports and patient information booklets should be offered to patients receiving insulin. The Insulin Passport provides a record of the patient’s current insulin preparations and contains a section for emergency information. The patient information booklet provides advice on the safe use of insulin. They are available for purchase from:

3M Security Print and Systems Limited
Gorse Street, Chadderton
Oldham
OL9 9QH
Tel: 0845 610 1112

GP practices can obtain supplies through their Local Area Team stores.

NHS Trusts can order supplies from www.nhsforms.co.uk or by emailing nhsforms@mmm.com.

Further information is available at www.npsa.nhs.uk.

**INSULIN**

**Insulin Injection; Neutral Insulin; Soluble Insulin**

A sterile solution of insulin (i.e. bovine or porcine) or human insulin; pH 6.6–8.0

**Indications** diabetes mellitus; diabetic ketoacidosis (section 6.1.3)

**Cautions** section 6.1.1; **interactions**: Appendix 1 (antidiabetics)

**Hepatic impairment** section 6.1.1

**Renal impairment** section 6.1.1

**Pregnancy** section 6.1.1

**Breast-feeding** section 6.1.1

**Side-effects** see notes above; transient oedema; local reactions and fat hypertrophy at injection site; rarely hypersensitivity reactions including urticaria, rash; overdose causes hypoglycaemia

**Dose**

- By subcutaneous, intramuscular or intravenous injection or intravenous infusion, according to requirements

- Highly purified animal

  **Counselling** Show container to patient and confirm that patient is expecting the version dispensed

- **Hypurin® Bovine Neutral** (Wockhardt) **(Humulin®)**

  **Injection**, soluble insulin (bovine, highly purified) 100 units/mL. Net price 10-mL vial = £27.72; cartridges (for Autopen® Classic) 5 × 3 mL = £41.58

- **Hypurin® Porcine Neutral** (Wockhardt) **(Humulin®)**

  **Injection**, soluble insulin (porcine, highly purified) 100 units/mL. Net price 10-mL vial = £25.20; cartridges (for Autopen® Classic) 5 × 3 mL = £37.80

- **Human sequence**

  **Counselling** Show container to patient and confirm that patient is expecting the version dispensed

- **Actrapid® (Novo Nordisk)** **(Humulin®)**

  **Injection**, soluble insulin (human, pyr) 100 units/mL. Net price 10-mL vial = £7.48

  **Note** Not recommended for use in subcutaneous insulin infusion pumps—may precipitate in catheter or needle

- **Humulin S® (Lilly)** **(Humulin®)**

  **Injection**, soluble insulin (human, prb) 100 units/mL. Net price 10-mL vial = £15.68; 5 × 3-mL cartridge (for most Autopen® Classic or HumaPen®) = £19.08

- **Insuman® Rapid** (Sanofi-Aventis) **(Humulin®)**

  **Injection**, soluble insulin (human, crb) 100 units/mL. Net price 5 × 3-mL cartridge (for ClikSTAR® and Autopen® 24) = £17.50

  **Note** Not recommended for use in subcutaneous insulin infusion pumps

- **Mixed preparations**

  See Biphasic Isophane Insulin (section 6.1.1.2)

### 6.1.1.2 Insulin analogues

**INSULIN ASPART** (Recombinant human insulin analogue)

**Indications** diabetes mellitus

**Cautions** section 6.1.1; **interactions**: Appendix 1 (antidiabetics)

**Renal impairment** section 6.1.1

**Pregnancy** section 6.1.1

**Breast-feeding** section 6.1.1

**INSULIN ASPART**

**Recombinant human insulin analogue**

A sterile solution of insulin (i.e. bovine or porcine) or human insulin; pH 6.6–8.0

**Indications** diabetes mellitus

**Cautions** section 6.1.1; **interactions**: Appendix 1 (antidiabetics)

**Hepatic impairment** section 6.1.1

**Renal impairment** section 6.1.1

**Pregnancy** section 6.1.1

**Breast-feeding** section 6.1.1

**Counselling** Show container to patient and confirm that patient is expecting the version dispensed

**Actrapid® (Novo Nordisk)** **(Humulin®)**

**Injection**, soluble insulin (bovine, highly purified) 100 units/mL. Net price 10-mL vial = £27.72; cartridges (for Autopen® Classic) 5 × 3 mL = £41.58

**Hypurin® Bovine Neutral** (Wockhardt) **(Humulin®)**

**Injection**, soluble insulin (bovine, highly purified) 100 units/mL. Net price 10-mL vial = £27.72; cartridges (for Autopen® Classic) 5 × 3 mL = £41.58

**Hypurin® Porcine Neutral** (Wockhardt) **(Humulin®)**

**Injection**, soluble insulin (porcine, highly purified) 100 units/mL. Net price 10-mL vial = £25.20; cartridges (for Autopen® Classic) 5 × 3 mL = £37.80

**Human sequence**

**Counselling** Show container to patient and confirm that patient is expecting the version dispensed

**Actrapid® (Novo Nordisk)** **(Humulin®)**

**Injection**, soluble insulin (human, pyr) 100 units/mL. Net price 10-mL vial = £7.48

**Note** Not recommended for use in subcutaneous insulin infusion pumps—may precipitate in catheter or needle

**Humulin S® (Lilly)** **(Humulin®)**

**Injection**, soluble insulin (human, prb) 100 units/mL. Net price 10-mL vial = £15.68; 5 × 3-mL cartridge (for most Autopen® Classic or HumaPen®) = £19.08

**Insuman® Rapid** (Sanofi-Aventis) **(Humulin®)**

**Injection**, soluble insulin (human, crb) 100 units/mL. Net price 5 × 3-mL cartridge (for ClikSTAR® and Autopen® 24) = £17.50

**Note** Not recommended for use in subcutaneous insulin infusion pumps

**Mixed preparations**

See Biphasic Isophane Insulin (section 6.1.1.2)
**Side-effects** see under Insulin

**Dose**
- By subcutaneous injection, **ADULT** and **CHILD** over 2 years, immediately before meals or when necessary shortly after meals, according to requirements
- By subcutaneous infusion, or intravenous injection, or intravenous infusion, **ADULT** and **CHILD** over 2 years, according to requirements

**NovoRapid** (Novo Nordisk) **Subcutaneous injection**, insulin aspart (recombinant human insulin analogue) 100 units/mL, net price 10-mL vial = £14.08; Penfill® cartridge (for NovoPen® devices) 5 × 3-mL = £28.31; 5 × 3-mL FlexPen™ prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £30.60; 5 × 3-mL FlexTouch® prefilled disposable injection devices (range 1–80 units, allowing 1-unit dosage adjustment) = £32.13

**Counselling** Show container to patient and confirm that patient is expecting the version dispensed

---

**INSULIN GLULISINE**
(Recombinant human insulin analogue)

**Indications** diabetes mellitus

**Cautions** section 6.1.1; interactions: Appendix 1 (antidiabetics)

**Hepatic impairment** section 6.1.1

**Renal impairment** section 6.1.1

**Pregnancy** section 6.1.1

**Breast-feeding** section 6.1.1

**Side-effects** see under Insulin

**Dose**
- By subcutaneous injection, **ADULT** and **CHILD** over 6 years, immediately before meals or when necessary shortly after meals, according to requirements
- By subcutaneous infusion or intravenous infusion **ADULT** and **CHILD** over 6 years, according to requirements

**Apida®** (Sanofi-Aventis) **Subcutaneous injection**, insulin glulisine (recombinant human insulin analogue) 100 units/mL, net price 10-mL vial = £16.00; 5 × 3-mL cartridge (for Classic or HumaPen®) = £28.31; 5 × 3-mL Humalog® KwikPen prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £29.46

**Counselling** Show container to patient and confirm that patient is expecting the version dispensed

---

**INSULIN LISPRO**
(Recombinant human insulin analogue)

**Indications** diabetes mellitus

**Cautions** section 6.1.1; children (use only if benefit likely compared to soluble insulin); interactions: Appendix 1 (antidiabetics)

**Hepatic impairment** section 6.1.1

**Renal impairment** section 6.1.1

**Pregnancy** section 6.1.1

**Breast-feeding** section 6.1.1

**Side-effects** see under Insulin

**Dose**
- By subcutaneous injection shortly before meals or when necessary shortly after meals, according to requirements
- By subcutaneous infusion, or intravenous injection, or intravenous infusion, according to requirements

**Humalog®** (Lilly) **Injection**, insulin lispro (recombinant human insulin analogue) 100 units/mL, net price 10-mL vial = £16.61; 5 × 3-mL cartridge (for Autopen® Classic or HumaPen®) = £28.31; 5 × 3-mL Humalog® KwikPen prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £29.46

**Counselling** Show container to patient and confirm that patient is expecting the version dispensed

---

**6.1.1.2 Intermediate- and long-acting insulins**

When given by subcutaneous injection, intermediate- and long-acting insulins have an onset of action of approximately 1–2 hours, a maximal effect at 4–12 hours, and a duration of 16–42 hours. Some are given twice daily in conjunction with short-acting (soluble) insulin, and others are given once daily, particularly in elderly patients. Soluble insulin can be mixed with intermediate- and long-acting insulins (except insulin detemir, insulin glargine, and insulin degludec) in the syringe, essentially retaining the properties of the two components, although there may be some blunting of the initial effect of the soluble insulin component (especially on mixing with protamine zinc insulin, see below).

**Isophane insulin** is a suspension of insulin with protamine; it is of particular value for initiation of twice-daily insulin regimens. Patients usually mix isophane with soluble insulin but ready-mixed preparations may be appropriate (biphasic isophane insulin, biphasic insulin aspart, or biphasic insulin lispro).

**Insulin zinc suspension** (30% amorphous, 70% crystalline) has a more prolonged duration of action.

**Protamine zinc insulin** is usually given once daily with short-acting (soluble) insulin. It has the drawback of binding with the soluble insulin when mixed in the same syringe and is now rarely used.

**Insulin glargine** and **insulin detemir** are both long-acting human insulin analogues with a prolonged duration of action; insulin glargine is given once daily and insulin detemir is given once or twice daily. NICE (December 2002) has recommended that insulin glargine should be available as an option for patients with type 1 diabetes.

NICE (May 2009) has recommended that, if insulin is required in patients with type 2 diabetes, insulin detemir or insulin glargine may be considered for those:
- who require assistance with injecting insulin or
- whose lifestyle is significantly restricted by recurrent symptomatic hypoglycaemia or
- who would otherwise need twice-daily basal insulin injections in combination with oral antidiabetic drugs or
- who cannot use the device needed to inject isophane insulin.
Insulin detemir is also licensed as add-on therapy in patients receiving treatment with liraglutide.

**INSULIN DEGLUDEC**
(Recombinant human insulin analogue—long acting)

**Indications** diabetes mellitus

**Cautions** section 6.1.1; **interactions**: Appendix 1 (antidiabetics)

**Hepatic impairment** section 6.1.1

**Renal impairment** section 6.1.1

**Pregnancy** section 6.1.1

**Breast-feeding** section 6.1.1

**Side-effects** see under Insulin (section 6.1.1.1)

**Dose**
- By subcutaneous injection, **ADULT** over 18 years, according to requirements

**Tresiba** (Novo Nordisk)®
Injection, insulin degludec (recombinant human insulin analogue) 100 units/mL, net price 5 x 3-mL *Penfill*® cartridges (for *Novo Nordisk*® devices) = £72.00; 100 units/mL, 5 x 3-mL *FlexTouch*® prefilled disposable injection devices (range 1–80 units, allowing 1-unit dosage adjustment) = £72.00; 200 units/mL, 3 x 3-mL *FlexTouch*® prefilled disposable injection devices (range 2–160 units, allowing 2-unit dosage adjustment) = £86.40

**Counselling** Show container to patient and confirm that patient is expecting the version dispensed

**INSULIN DETERMIR**
(Recombinant human insulin analogue—long acting)

**Indications** diabetes mellitus

**Cautions** section 6.1.1.1; **interactions**: Appendix 1 (antidiabetics)

**Hepatic impairment** section 6.1.1

**Renal impairment** section 6.1.1

**Pregnancy** section 6.1.1

**Breast-feeding** section 6.1.1

**Side-effects** see under Insulin (section 6.1.1.1)

**Dose**
- By subcutaneous injection, **ADULT** and **CHILD** over 2 years, according to requirements

**Levemir** (Novo Nordisk)®
Injection, insulin detemir (recombinant human insulin analogue) 100 units/mL, net price 5 x 3-mL cartridge (for *NovoPen*® devices) = £42.00; 5 x 3-mL *FlexPen*® prefilled disposable injection device (range 1–60 units, allowing 1-unit dosage adjustment) = £42.00; 5 x 3-mL *Levemir InnoLet*® prefilled disposable injection devices (range 1–50 units, allowing 1-unit dosage adjustment) = £44.85

**Counselling** Show container to patient and confirm that patient is expecting the version dispensed

**INSULIN GLARGINE**
(Recombinant human insulin analogue—long acting)

**Indications** diabetes mellitus

**Cautions** section 6.1.1; **interactions**: Appendix 1 (antidiabetics)

**Hepatic impairment** section 6.1.1

**Renal impairment** section 6.1.1

**Pregnancy** section 6.1.1

**Breast-feeding** section 6.1.1

**Side-effects** see under Insulin (section 6.1.1.1)

**Dose**
- By subcutaneous injection, **ADULT** and **CHILD** over 2 years, according to requirements

**Lantus** (Sanofi-Aventis)®
Injection, insulin glargine (recombinant human insulin analogue) 100 units/mL, net price 10-mL vial = £30.68; 5 x 3-mL cartridge (for *ClikSTAR*® and *Autopen*® 24) = £41.50; 5 x 3-mL Lantus® *SoloStar*® prefilled disposable injection devices (range 1–80 units, allowing 1-unit dosage adjustment) = £41.50

**Note** The Scottish Medicines Consortium (p. 4) has advised (March 2013) that insulin glargine is accepted for restricted use within NHS Scotland for the treatment of type 1 diabetes:
- in those who are at risk of or experience unacceptable frequency or severity of nocturnal hypoglycaemia on attempting to achieve better hypoglycaemic control during treatment with other insulins
- as a once daily insulin therapy for patients who require a carer to administer their insulin.

**Counselling** Show container to patient and confirm that patient is expecting the version dispensed

**INSULIN ZINC SUSPENSION**
(Insulin Suspension (Mixed)—long acting)

A sterile neutral suspension of bovine and/or porcine insulin or of human insulin in the form of a complex obtained by the addition of a suitable zinc salt; consists of rhombohedral crystals (10–40 microns) and of particles of no uniform shape (not exceeding 2 microns)

**Indications** diabetes mellitus

**Cautions** section 6.1.1; **interactions**: Appendix 1 (antidiabetics)

**Hepatic impairment** section 6.1.1

**Renal impairment** section 6.1.1

**Pregnancy** section 6.1.1

**Breast-feeding** section 6.1.1

**Side-effects** see under Insulin (section 6.1.1.1)

**Dose**
- By subcutaneous injection, according to requirements

**Highly purified animal**

**Hypurin**® Bovine Lente (Wockhardt)®
Injection, insulin zinc suspension (bovine, highly purified) 100 units/mL. Net price 10-mL vial = £27.72

**Counselling** Show container to patient and confirm that patient is expecting the version dispensed
BIPHASIC INSULIN ASPART

(Intermediate-acting insulin)

**Indications** diabetes mellitus

**Cautions** see section 6.1.1; interactions: Appendix 1 (antidiabetics)

**Hepatic impairment** section 6.1.1

**Renal impairment** section 6.1.1

**Pregnancy** section 6.1.1

**Breast-feeding** section 6.1.1

**Side-effects** see under Insulin (section 6.1.1.1); protamine may cause allergic reactions

**Dose**
- By subcutaneous injection, according to requirements

**BIPHASIC INSULIN LYSPRO**

(Intermediate-acting insulin)

**Indications** diabetes mellitus

**Cautions** see section 6.1.1.1 and Insulin Lispro; interactions: Appendix 1 (antidiabetics)

**Hepatic impairment** section 6.1.1

**Renal impairment** section 6.1.1

**Renal impairment** section 6.1.1
Endocrine system

6.1.1 Insulins

Pregnancy  section 6.1.1
Breast-feeding  section 6.1.1

Side-effects  see under Insulin (section 6.1.1.1); protamine may cause allergic reactions

Dose

● By subcutaneous injection, up to 15 minutes before or soon after a meal, according to requirements

Humalog® Mix25 (Lilly)  \[\text{Humalog}^\text{®} \text{Mix25} \]

Injection, biphasic insulin lispro (recombinant human insulin analogue), 25% insulin lispro, 75% insulin lispro protamine, 100 units/mL, net price 10-mL vial = £16.61; 5 × 3-mL cartridge (for Autopen® Classic or HumaPen®) = £29.46; 5 × 3-mL Humalog® Mix25 KwikPen prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £30.98

Counselling  Show container to patient and confirm that patient is expecting the version dispensed; the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries)

Humalog® Mix50 (Lilly)  \[\text{Humalog}^\text{®} \text{Mix50} \]

Injection, biphasic insulin lispro (recombinant human insulin analogue), 50% insulin lispro, 50% insulin lispro protamine, 100 units/mL, net price 5 × 3-mL cartridge (for Autopen® Classic or HumaPen®) = £29.46; 5 × 3-mL Humalog® Mix50 KwikPen prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £30.98

Counselling  Show container to patient and confirm that patient is expecting the version dispensed; the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries)

Human sequence  Counselling  Show container to patient and confirm that patient is expecting the version dispensed; the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries)

Humulin M3® (Lilly)  \[\text{Humulin}^\text{®} \text{M3} \]

Injection, biphasic isophane insulin (human, prb), 30% soluble, 70% isophane, 100 units/mL, net price 10-mL vial = £15.68; 5 × 3-mL cartridge (for most Autopen® Classic or HumaPen®) = £19.08; 5 × 3-mL Humulin M3 KwikPen® prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £21.70

Insuman® Comb 15 (Sanofi-Aventis)  \[\text{Insuman}^\text{®} \text{Comb 15} \]

Injection, biphasic isophane insulin (human, crb), 15% soluble, 85% isophane, 100 units/mL, net price 5 × 3-mL cartridge (for ClikSTAR® and Autopen® 24) = £17.50

Insuman® Comb 25 (Sanofi-Aventis)  \[\text{Insuman}^\text{®} \text{Comb 25} \]

Injection, biphasic isophane insulin (human, crb), 25% soluble, 75% isophane, 100 units/mL, net price 5 × 3-mL vial = £5.61; 5 × 3-mL cartridge (for ClikSTAR® and Autopen® 24) = £17.50; 5 × 3-mL Insu- man® Comb 25 SoloStar® prefilled disposable injection devices (range 1–80 units, allowing 1-unit dosage adjustment) = £19.80

Insuman® Comb 50 (Sanofi-Aventis)  \[\text{Insuman}^\text{®} \text{Comb 50} \]

Injection, biphasic isophane insulin (human, crb), 50% soluble, 50% isophane, 100 units/mL, net price 5 × 3-mL cartridge (for ClikSTAR® and Autopen® 24) = £17.50

6.1.1.3 Hypodermic equipment

Patients should be advised on the safe disposal of lancets, single-use syringes, and needles. Suitable arrangements for the safe disposal of contaminated waste must be made before these products are prescribed for patients who are carriers of infectious diseases.

Injection devices

Autopen® (Owen Mumford)  \[\text{Autopen}^\text{®} \]

Injection device, Autopen® 24 (for use with Sanofi-Aventis 3-mL insulin cartridges), allowing 1-unit dosage adjustment, max. 21 units (single-unit version) or 2-unit dosage adjustment, max. 42 units (2-unit version), net price (both) = £16.47; Autopen® Classic (for use with Lilly and Wockhardt 3-mL insulin cartridges), allowing 1-unit dosage adjustment, max. 21 units (single-unit version) or 2-unit dosage adjustment, max. 42 units (2-unit version), net price (all) = £16.72

ClikSTAR® (Sanofi-Aventis)  \[\text{ClikSTAR}^\text{®} \]

Injection device, for use with Lantus®, Apidra®, and Insumin® 3-mL insulin cartridges; allowing 1-unit dose adjustment, max. 80 units, net price = £25.00

HumaPen® Luxura (Lilly)  \[\text{HumaPen}^\text{®} \text{Luxura} \]

Injection device, for use with Humulin® and Humalog® 3-mL cartridges; allowing 1-unit dosage adjustment, max. 60 units, net price = £26.82

HumaPen® Luxura HD (Lilly)  \[\text{HumaPen}^\text{®} \text{Luxura HD} \]

Injection device, for use with Humulin® and Humalog® 3-mL cartridges; allowing 0.5-unit dosage adjustment, max. 30 units, net price = £26.82

BIPHASIC ISOPHANE INSULIN

(Biphasic Isophane Insulin Injection—intermediate acting)

A sterile buffered suspension of either porcine or human insulin complexed with protamine sulfate (or another suitable protamine) in a solution of insulin of the same species

Indications  diabetes mellitus

Cautions  section 6.1.1.1; interactions: Appendix 1 (antidiabetics)

Hepatic impairment  section 6.1.1

Renal impairment  section 6.1.1

Pregnancy  section 6.1.1

Breast-feeding  section 6.1.1

Side-effects  see under Insulin (section 6.1.1.1); protamine may cause allergic reactions

Dose

● By subcutaneous injection, according to requirements

Highly purified animal

Counselling  Show container to patient and confirm that patient is expecting the version dispensed; the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries)

Hypurin® Porcine 30/70 Mix (Wockhardt)  \[\text{Hypurin}^\text{®} \text{Porcine 30/70 Mix} \]

Injection, biphasic isophane insulin (porcine, highly purified), 30% soluble, 70% isophane, 100 units/mL, net price 10-mL vial = £25.20; cartridges (for Autopen® Classic) 5 × 3 mL = £37.80

BNF 68
HumaPen® Memoir (Lilly)  
Injection device, for use with Humalog® 3-mL cartridges; allowing 1-unit dosage adjustment. Max. 60 units, net price = £26.82

Injex (Injex UK)  
Needle-free insulin delivery device, for use with any 10-mL vial of insulin, allowing 1-unit dosage adjustment. Max. 30 units, net price starter set (Injex® device, reset box, transporter, 9 × 10-mL vial adaptors, 165 ampoules) = £149.36; 4-month refill pack (6 × 10-mL vial adaptors, 100 ampoules) = £24.47; ampoule pack (50 ampoules) = £12.28; vial adaptor pack (20 × 10-mL vial adaptors) = £12.23

Insulet  
Needle-free insulin delivery device, for use with any 10-mL vial or 3-mL cartridge of insulin, allowing 1-unit dosage adjustment. Max. 40 units, net price starter set (InsuLefa® device, nozzle cap, nozzle and piston, 1 × 10-mL adaptor, 1 × 3-mL adaptor, 1 cartridge cap removal key) = £143.60; nozzle pack (15 nozzles) = £28.40; cartridge adaptor pack (15 adaptors) = £21.70, vial adaptor pack (15 adaptors) = £21.70

NovoPen® 4 (Novo Nordisk)  
Injection device, for use with Penfill® 3-mL insulin cartridges; allowing 1-unit dosage adjustment. Max. 60 units, net price = £26.86

Lancets, needles, syringes, and accessories  
Lancets, needles, syringes, and accessories are listed under Hypoglycaemic Equipment in Part IIA of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 3 of the Scottish Drug Tariff).

The Drug Tariffs can be accessed online at:  
National Health Service Drug Tariff for England and Wales: www.ppa.org.uk/ppa/edt_intro.htm

### 6.1.2 Antidiabetic drugs

#### 6.1.2.1 Sulfonylureas

Oral antidiabetic drugs are used for the treatment of type 2 diabetes mellitus. They should be prescribed only if the patient fails to respond adequately to at least 3 months’ restriction of energy and carbohydrate intake and an increase in physical activity. They should be used to augment the effect of diet and exercise, and not to replace them.

For patients not adequately controlled by diet and oral hypoglycaemic drugs, insulin may be added to the treatment regimen or substituted for oral therapy. When insulin is added to oral therapy, it is generally given at bedtime as isophane or long-acting insulin, and when insulin replaces an oral regimen it may be given as twice-daily injections of a biphasic insulin (or isophane insulin mixed with soluble insulin), or a multiple injection regimen. Weight gain and hypoglycaemia may be complications of insulin therapy but weight gain may be reduced if the insulin is given in combination with metformin.

#### 6.1.2.2 Biguanides

#### 6.1.2.3 Other antidiabetic drugs

Exenatide, lixisenatide, and lixisenatide, given by subcutaneous injection, are also available for the treatment of type 2 diabetes, see section 6.1.2.3.

### Pregnancy and breast-feeding

During pregnancy, women with pre-existing diabetes can be treated with metformin [unlicensed use], either alone or in combination with insulin (section 6.1.1). Metformin can be continued, or glibenclamide resumed, during breast-feeding for those with pre-existing diabetes. Women with gestational diabetes may be treated, with or without concomitant insulin (section 6.1.1), with glibenclamide from 11 weeks gestation (after organogenesis) [unlicensed use] or with metformin [unlicensed use]. Women with gestational diabetes should discontinue hypoglycaemic treatment after giving birth. Other oral hypoglycaemic drugs, exenatide, lixisenatide, and lixisenatide are contra-indicated in pregnancy.

#### 6.1.2.1 Sulfonylureas

The sulfonylureas act mainly by augmenting insulin secretion and consequently are effective only when some residual pancreatic beta-cell activity is present; during long-term administration they also have an extrapancreatic action. All may cause hypoglycaemia but this is uncommon and usually indicates excessive dosage. Sulfonylurea-induced hypoglycaemia may persist for many hours and must always be treated in hospital.

Sulfonylureas are considered for patients who are not overweight, or in whom metformin is contra-indicated or not tolerated. Several sulfonylureas are available and choice is determined by side-effects and the duration of action as well as the patient’s age and renal function. Glibenclamide, a long-acting sulfonylurea, is associated with a greater risk of hypoglycaemia; for this reason it should be avoided in the elderly, and short-acting alternatives, such as gliconezide or tolbutamide, should be used instead.

When the combination of strict diet and sulfonylurea treatment fails, other options include:

- combining with metformin (section 6.1.2.2);
- combining with pioglitazone, but see section 6.1.2.3;
- combining with alogliptin, linagliptin, saxagliptin, sitagliptin, or vildagliptin (section 6.1.2.3);
- combining with canagliflozin or dapagliflozin (section 6.1.2.3);
- combining with exenatide, lixisenatide, or lixisenatide (section 6.1.2.3);
- combining with acarbose (section 6.1.2.3), which may have a small beneficial effect, but flatulence can be a problem;
- combining with bedtime isophane insulin (section 6.1.1) but weight gain and hypoglycaemia can occur.

The risk of hypoglycaemia associated with sulfonylureas (see notes above) should be discussed with the patient, especially when concomitant glucose-lowering drugs are prescribed.

Insulin therapy should be instituted temporarily during intercurrent illness (such as myocardial infarction, coma, infection, and trauma). Sulfonylureas should be
omitted on the morning of surgery; insulin is required because of the ensuing hyperglycaemia in these circumstances.

**Cautions** Sulfonylureas can encourage weight gain and should be prescribed only if poor control and symptoms persist despite adequate attempts at dieting; metformin (section 6.1.2.2) is considered the drug of choice in obese patients. Caution is needed in the elderly and in patients with G6PD deficiency (section 9.1.5).

**Contra-indications** Sulfonylureas should be avoided where possible in acute porphyria (section 9.8.2) but glipizide and glimepiride are thought to be safe. Sulfonylureas are contra-indicated in the presence of ketaocidosis.

**Hepatic impairment** Sulfonylureas should be avoided or a reduced dose should be used in severe hepatic impairment, because there is an increased risk of hypoglycaemia. Jaundice may occur.

**Renal impairment** Sulfonylureas should be used with care in those with mild to moderate renal impairment, because of the hazard of hypoglycaemia; they should be avoided where possible in severe renal impairment. Glipizide should also be avoided if the patient has both renal and hepatic impairment. If necessary, the short-acting drug tolbutamide can be used in renal impairment, as can gliclazide which is principally metabolised in the liver, but careful monitoring of blood-glucose concentration is essential; care is required to use the lowest dose that adequately controls blood glucose.

**Pregnancy** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia; however, glibenclamide can be used during the second and third trimesters of pregnancy in women with gestational diabetes, see section 6.1.2.

**Breast-feeding** The use of sulfonylureas (except glibenclamide [unlicensed use], see section 6.1.2) in breast-feeding should be avoided because there is a theoretical possibility of hypoglycaemia in the infant.

**Side-effects** Side-effects of sulfonylureas are generally mild and infrequent and include gastro-intestinal disturbances such as nausea, vomiting, diarrhoea, and constipation. Hypotension has been reported with glimepiride and glipizide.

Sulfonylureas can occasionally cause a disturbance in liver function, which may rarely lead to cholestatic jaundice, hepatitis, and hepatic failure. Hypersensitivity reactions can occur, usually in the first 6–8 weeks of therapy. They consist mainly of allergic skin reactions which progress rarely to erythema multiforme and exfoliative dermatitis, fever, and jaundice; photosensitivity has rarely been reported with glipizide. Blood disorders are also rare but may include leucopenia, thrombocytopenia, agranulocytosis, pancytopenia, haemolytic anaemia, and aplastic anaemia.

---

**Glibenclamide**

**Indications** type 2 diabetes mellitus

**Cautions** see notes above; **interactions:** Appendix 1 (antidiabetics)

**Contra-indications** see notes above

**Hepatic Impairment** see notes above

**Renal Impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

**Dose**

- Initially 5 mg daily with or immediately after breakfast, dose adjusted according to response (ELDERLY avoid, see notes above); max. 15 mg daily

**Glibenclamide (Non-proprietary)**

- **Tablets**, glibenclamide 2.5 mg, net price 28-tab pack = £18.50; 5 mg, 28-tab pack = £9.7p

---

**Gliclazide**

**Indications** type 2 diabetes mellitus

**Cautions** see notes above; **interactions:** Appendix 1 (antidiabetics)

**Contra-indications** see notes above

**Hepatic Impairment** see notes above

**Renal Impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

**Dose**

- Initially, 40–80 mg daily, adjusted according to response; up to 160 mg as a single dose, with breakfast; higher doses divided; max. 240 mg daily

**Gliclazide (Non-proprietary)**

- **Tablets**, gliclazide 40 mg, net price 28-tab pack = £3.36; 80 mg, 28-tab pack = £1.04, 60-tab pack = £2.23

**Diamicron® (Servier)**

- **Tablets**, scored, gliclazide 80 mg, net price 60-tab pack = £4.38

**Modified release**

**Gliclazide (Non-proprietary)**

- **Tablets**, m/r, gliclazide 30 mg, net price 28-tab pack = £2.06, 56-tab pack = £4.10. Label: 25

**Brands include** Dodiacis® MR, Viole® XL

**Dose** ADULT over 18 years, initially 30 mg daily with breakfast, adjusted according to response every 4 weeks (after 2 weeks if no decrease in blood glucose); max. 120 mg daily

**Note** Gliclazide modified release 30 mg may be considered to be approximately equivalent in therapeutic effect to standard formulation gliclazide 80 mg

**Diamicron® MR (Servier)**

- **Tablets**, m/r, gliclazide 30 mg, net price 28-tab pack = £2.81, 56-tab pack = £5.62. Label: 25

**Dose** ADULT initially 30 mg daily with breakfast, adjusted according to response every 4 weeks (after 2 weeks if no decrease in blood glucose); max. 120 mg daily

**Note** Diamicron® MR 30 mg may be considered to be approximately equivalent in therapeutic effect to standard formulation Diamicron® 80 mg

Tolbutamide

Dose
- Initially 1 mg daily, adjusted according to response in 1-mg steps at 1–2 week intervals; usual max. 4 mg daily (exceptionally, up to 6 mg daily may be used); taken shortly before or with first main meal

Glibizide

Dose
- Initially 2.5–5 mg daily shortly before breakfast or lunch, adjusted according to response; max. 20 mg daily; up to 15 mg may be given as a single dose; higher doses divided

Minodiab

Dose
- 0.5–1.5 g (max. 2 g) daily in divided doses with or immediately after meals or as a single dose with or immediately after breakfast

Metformin

Indications
- type 2 diabetes mellitus

Cautions
- see notes above; interactions: Appendix 1 (antidiabetics)

Contra-indications

- see notes above

Contra-indications
- see notes above

Cautions
- see notes above;

Appendix 1 (antidiabetics)

Type 2 diabetes mellitus

Interactions
- combining with a sulfonylurea (section 6.1.2.1);
- combining with pioglitazone (section 6.1.2.3);
- combining with repaglinide or nateglinide (section 6.1.2.3);
- combining with alogliptin, linagliptin, saxagliptin, sitagliptin, or vildagliptin (section 6.1.2.3);
- combining with canagliflozin or dapagliflozin (section 6.1.2.3);
- combining with exenatide, liraglutide, or lixisenatide (section 6.1.2.3);
- combining with acarbose (section 6.1.2.3), which may have a small beneficial effect, but flatulence can be a problem;
- combining with insulin (section 6.1.1) but weight gain and hypoglycaemia can be problems (weight gain minimised if insulin given at night).

Insulin treatment is almost always required in medical and surgical emergencies; insulin should also be substituted before elective surgery (omit metformin on the morning of surgery and give insulin if required).

Hypoglycaemia does not usually occur with metformin; other advantages are the lower incidence of weight gain and lower plasma-insulin concentration. It does not exert a hypoglycaemic action in non-diabetic subjects unless given in overdose.

Gastro-intestinal side-effects are initially common with metformin, and may persist in some patients, particularly when very high doses such as 3 g daily are given. Very rarely, metformin can provoke lactic acidosis. It is most likely to occur in patients with renal impairment, see Lactic Acidosis below.

Metformin is used for the symptomatic management of polycystic ovary syndrome [unlicensed indication]; however, treatment should be initiated by a specialist. Metformin improves insulin sensitivity, may aid weight reduction, helps to normalise menstrual cycle (increasing the rate of spontaneous ovulation), and may improve hirsutism.
1. NICE clinical guideline 87 (May 2009): Type 2 diabetes: The management of type 2 diabetes

year in patients with additional risk factors for renal impairment, or if deterioration suspected; interactions: Appendix 1 (antidiabetics)

Lactic acidosis Use with caution in renal impairment—increased risk of lactic acidosis; avoid in significant renal impairment. NICE recommends that the dose should be reviewed if eGFR less than 45 mL/minute/1.73 m² and to avoid if eGFR less than 30 mL/minute/1.73 m². Withdraw or interrupt treatment in those at risk of tissue hypoxia or sudden deterioration in renal function, such as those with dehydration, severe infection, shock, sepsis, acute heart failure, respiratory failure or hepatic impairment, or those who have recently had a myocardial infarction

Contra-indications ketoacidosis, see also Lactic Acidosis above; use of general anaesthesia (suspend metformin on the morning of surgery and restart when renal function returns to baseline)

Iodine-containing X-ray contrast media Intravascular administration of iodinated contrast agents can cause renal failure, which can increase the risk of lactic acidosis with metformin—see Lactic Acidosis above. Suspend metformin prior to the test; restart no earlier than 48 hours after the test if renal function has returned to baseline

Hepatic impairment withdraw if tissue hypoxia likely

Renal impairment see under Cautions

Pregnancy used in pregnancy for both pre-existing and gestational diabetes—see also p. 463

Breast-feeding may be used during breast-feeding—see p. 463

Side-effects anorexia, nausea, vomiting, diarrhoea (usually transient), abdominal pain, taste disturbance, rarely lactic acidosis (withdraw treatment), decreased vitamin-B₁₂ absorption, erythema, pruritus and urticaria; hepatitis also reported

Dose

• Diabetes mellitus, ADULT and CHILD over 10 years initially 500 mg with breakfast for at least 1 week then 500 mg with breakfast and evening meal for at least 1 week then 500 mg with breakfast, lunch and evening meal: usual max. 2 g daily in divided doses

• Polycystic ovary syndrome [unlicensed], initially 500 mg with breakfast for 1 week, then 500 mg with breakfast and evening meal for 1 week, then 1.5–1.7 g daily in 2–3 divided doses

Note Metformin doses in the BNF may differ from those in the product literature

Metformin (Non-proprietary) Tablets, coated, metformin hydrochloride 500 mg, net price 28-tab-pack = £2.66, 56-tab-pack = £5.32. Label: 21, 25

Brands include Bolamyn® SR, Glucents® SR, Metabese® SR

Dose initially 500 mg once daily, increased every 10–15 days, max. 2 g once daily with evening meal, if control not achieved, use 1 g twice daily with meals, and if control still not achieved change to standard-release tablets

Note Patients taking up to 2 g daily of the standard-release metformin may start with the same daily dose of metformin modified release, not suitable if dose of standard-release tablets more than 2 g daily

Glucophage® SR (Merck Serono) Tablets, m/r, metformin hydrochloride 500 mg, net price 28-tab-pack = £2.66, 56-tab-pack = £5.32; 750 mg, 28-tab-pack = £3.20, 56-tab-pack = £6.40; 1 g, 28-tab-pack = £4.26, 56-tab-pack = £8.52. Label: 21, 25

Dose initially 500 mg once daily, increased every 10–15 days, max. 2 g once daily with evening meal, if control not achieved, use 1 g twice daily with meals, and if control still not achieved change to standard-release tablets

Note Patients taking up to 2 g daily of the standard-release metformin may start with the same daily dose of Glucophage® SR; not suitable if dose of standard-release tablets more than 2 g daily

The Scottish Medicines Consortium (p. 4) has advised (September 2009) that Glucophage® SR is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in adult patients who are intolerant of standard-release metformin, and in whom the prolonged-release tablet allows the use of a dose of metformin not previously tolerated, or in patients for whom a once daily preparation offers a clinically significant benefit.

With alogliptin Section 6.1.2.3

With dapagliflozin Section 6.1.2.3

With linagliptin Section 6.1.2.3

With pioglitazone Section 6.1.2.3

With saxagliptin Section 6.1.2.3

With sitagliptin Section 6.1.2.3

With vildagliptin Section 6.1.2.3

6.1.2.3 Other antidiabetic drugs

Acarbose, an inhibitor of intestinal alpha glucosidases, delays the digestion and absorption of starch and sucrose; it has a small but significant effect in lowering blood glucose. Use of acarbose is usually reserved for when other oral hypoglycaemics are not tolerated or are contra-indicated. Postprandial hyperglycaemia in type 1 diabetes can be reduced by acarbose, but it has been little used for this purpose. Flatulence deters some from using acarbose although this side-effect tends to decrease with time.

Nateglinide and repaglinide stimulate insulin secretion. Both drugs have a rapid onset of action and
short duration of activity, and should be administered shortly before each main meal. Repaglinide may be given as monotherapy for patients who are not overweight or for those in whom metformin is contra-indicated or not tolerated, or it may be given in combination with metformin. Nateglinide is licensed only for use with metformin.

The thiazolidinedione, pioglitazone, reduces peripheral insulin resistance, leading to a reduction of blood-glucose concentration. Pioglitazone can be used alone or in combination with metformin or with a sulfonylurea (if metformin inappropriate), or with both; the combination of pioglitazone plus metformin is preferred to pioglitazone plus sulfonylurea, particularly for obese patients. Inadequate response to a combination of metformin and sulfonylurea may indicate failing insulin release; the introduction of pioglitazone has a limited role in these circumstances and the initiation of insulin is often more appropriate. Pioglitazone is also licensed in combination with insulin, in patients who have not achieved adequate glycaemic control with insulin alone, when metformin is inappropriate. Blood-glucose control may deteriorate temporarily when pioglitazone is substituted for an oral antidiabetic drug that is being used in combination with another. Long-term benefits of pioglitazone have not yet been demonstrated. NICE (May 2009) has recommended that, when glycaemic control is inadequate with existing treatment, pioglitazone can be added to:

- a sulfonylurea, if metformin is contra-indicated or not tolerated;
- metformin, if risks of hypoglycaemia with sulfonylurea are unacceptable or a sulfonylurea is contra-indicated or not tolerated;
- a combination of metformin and a sulfonylurea, if insulin is unacceptable because of lifestyle or other personal issues, or because the patient is obese.

NICE has recommended that treatment with pioglitazone is continued only if HbA1c concentration is reduced by at least 0.5 percentage points within 6 months of starting treatment.

The Scottish Medicines Consortium (p. 4) accepts use of pioglitazone (February 2007) with metformin and a sulfonylurea, for patients (especially if overweight) whose glycaemic control is inadequate despite the use of 2 oral hypoglycaemic drugs and who are unable or unwilling to take insulin; treatment should be initiated and monitored by an experienced diabetes physician.

Pioglitazone: risk of bladder cancer (July 2011)

The European Medicines Agency has advised that there is a small increased risk of bladder cancer associated with pioglitazone use. However, in patients who respond adequately to treatment, the benefits of pioglitazone continue to outweigh the risks. Pioglitazone should not be used in patients with active bladder cancer or a past history of bladder cancer, or in those who have uninvestigated macroscopic haematuria. Pioglitazone should be used with caution in elderly patients as the risk of bladder cancer increases with age.

Before initiating treatment with pioglitazone, patients should be assessed for risk factors of bladder cancer (including age, smoking status, exposure to certain occupational or chemotherapy agents, or previous radiation therapy to the pelvic region) and any macroscopic haematuria should be investigated. The safety and efficacy of pioglitazone should be reviewed after 3–6 months and pioglitazone should be stopped in patients who do not respond adequately to treatment.

Patients already receiving treatment with pioglitazone should be assessed for risk factors of bladder cancer and treatment should be reviewed after 3–6 months, as above.

Patients should be advised to report promptly any haematuria, dysuria, or urinary urgency during treatment.

Alogliptin, linagliptin, saxagliptin, sitagliptin, and vildagliptin inhibit dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion. Linagliptin is licensed for use in type 2 diabetes as monotherapy (if metformin inappropriate), or in combination with metformin (when treatment with metformin alone fails to achieve adequate glycaemic control), or both metformin and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control). Linagliptin may also be used in combination with insulin (with or without metformin) when a stable dose of insulin has not provided adequate glycaemic control. Saxagliptin and vildagliptin are licensed for use in type 2 diabetes as monotherapy (if metformin inappropriate), or in combination with metformin or a sulfonylurea (if metformin inappropriate), or pioglitazone (when treatment with either metformin or a sulfonylurea or pioglitazone fails to achieve adequate glycaemic control), and also in combination with both metformin and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control). Saxagliptin and vildagliptin are licensed for use in combination with both metformin and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control). The combination of either saxagliptin or vildagliptin, and insulin (with or without metformin) is also licensed for use when a stable dose of insulin has not provided adequate glycaemic control. Sitagliptin is licensed for use in type 2 diabetes as monotherapy (if metformin inappropriate), or in combination with metformin or a sulfonylurea (if metformin inappropriate), or pioglitazone (when treatment with either metformin or a sulfonylurea or pioglitazone fails to achieve adequate glycaemic control), and also in combination with both metformin and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control). Sitagliptin is also licensed for use in combination with both metformin and pioglitazone when dual therapy with these drugs

MHRA/CHM advice

Pioglitazone cardiovascular safety (December 2007 and January 2011)

Incidence of heart failure is increased when pioglitazone is combined with insulin especially in patients with predisposing factors e.g. previous myocardial infarction. Patients who take pioglitazone should be closely monitored for signs of heart failure; treatment should be discontinued if any deterioration in cardiac status occurs. Pioglitazone should not be used in patients with heart failure or a history of heart failure.
fails to achieve adequate glycaemic control, and may also be used in combination with insulin (with or without metformin) when a stable dose of insulin has not provided adequate glycaemic control. Alogliptin is licensed for use in type 2 diabetes as dual therapy in combination with either metformin, pioglitazone, a sulfonylurea, or insulin (when treatment with these drugs alone fails to achieve adequate glycaemic control); it is also licensed for use as triple therapy in combination with metformin and either pioglitazone or insulin.

NICE (May 2009) has recommended that, when glycaemic control is inadequate with existing treatment:

- sitagliptin or vildagliptin (instead of a sulfonylurea) can be added to metformin, if there is a significant risk of hypoglycaemia or if a sulfonylurea is contra-indicated or not tolerated;
- sitagliptin or vildagliptin can be added to a sulfonylurea, if metformin is contra-indicated or not tolerated;
- sitagliptin can be added to both metformin and a sulfonylurea, if insulin is unacceptable because of lifestyle or other personal issues, or because the patient is obese.

NICE has recommended that treatment with sitagliptin or vildagliptin is continued only if HbA1c concentration is reduced by at least 0.5 percentage points within 6 months of starting treatment. The Scottish Medicines Consortium (p. 4) has advised that vildagliptin (Galvus®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus as monotherapy when treatment with metformin or a sulfonylurea is inappropriate (November 2013), and in combination with metformin when addition of a sulfonylurea is inappropriate (March 2008), and in combination with a sulfonylurea if metformin is inappropriate (September 2009), and also as triple therapy in combination with metformin and a sulfonylurea, as an alternative to existing dipeptidyl peptidase-4 inhibitors, when treatment with metformin and a sulfonylurea is inadequate (November 2013).

The Scottish Medicines Consortium (p. 4) has advised that linagliptin (Trajenta®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus as monotherapy when both metformin and a sulfonylurea are inappropriate (January 2013), and in combination with metformin when addition of a sulfonylurea is inappropriate (December 2011), and also in combination with both a sulfonylurea and metformin when dual therapy is ineffective (January 2013).

The Scottish Medicines Consortium (p. 4) has advised that saxagliptin (Onglyza®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus as triple therapy in combination with metformin and a sulfonylurea, as an alternative to existing dipeptidyl peptidase-4 inhibitors, when treatment with metformin and a sulfonylurea is inadequate (November 2013).

Exenatide, liraglutide, and lixisenatide bind to, and activate, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppress glucagon secretion, and slow gastric emptying. Treatment with exenatide, liraglutide, and lixisenatide is associated with the prevention of weight gain and possible promotion of weight loss which can be beneficial in overweight patients. They are given by subcutaneous injection for the treatment of type 2 diabetes mellitus. Exenatide is licensed in combination with metformin or a sulfonylurea, or both, or with pioglitazone, or with both metformin and pioglitazone, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination; standard-release exenatide is also licensed in combination with basal insulin alone or with metformin or pioglitazone (or both).

NICE (May 2009) has recommended that, when glycaemic control is inadequate with metformin and sulfonylurea treatment, the addition of standard-release exenatide may be considered if the patient has:

- a body mass index of 35 kg/m² or over and is of European descent (with appropriate adjustment for other ethnic groups) and weight-related psychological or medical problems or
- a body mass index less than 35 kg/m², and insulin would be unacceptable for occupational reasons or weight loss would benefit other significant obesity-related comorbidities.

NICE has recommended that treatment with standard-release exenatide is continued only if HbA1c concentration is reduced by at least 1 percentage point and a weight loss of at least 3% is achieved within 6 months of starting treatment.

The Scottish Medicines Consortium (p. 4) has advised (June 2007) that standard-release exenatide (Byetta®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with metformin or sulfonylurea (or both), as an alternative to treatment with insulin in patients where treatment with metformin or sulfonylurea (or both) at maximally tolerated doses has been inadequate, and treatment with insulin would be the next option.

The Scottish Medicines Consortium (p. 4) has also advised (February 2011) that standard-release exenatide (Byetta®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with metformin and pioglitazone as a third-line pre-insulin treatment option.
NICE guidance

**Exenatide modified-release for the treatment of type 2 diabetes mellitus (February 2012)**

Modified-release exenatide in triple therapy regimens (in combination with metformin and a sulphonylurea, or metformin and a thiazolidinedione) is recommended for the treatment of type 2 diabetes, only when glycaemic control is inadequate and the patient has:

- A body mass index (BMI) $\geq 35\text{ kg/m}^2$ (in those of European descent, with appropriate adjustment for other ethnic groups) and weight-related psychological or medical problems, or
- A BMI $< 35\text{ kg/m}^2$, and insulin would be unacceptable for occupational reasons, or weight loss would benefit other significant obesity-related comorbidities.

Treatment with modified-release exenatide in a triple therapy regimen should be continued only if HbA$_1c$ concentration is reduced by at least 1 percentage point and a weight loss of at least 3% is achieved within 6 months of starting treatment.

Modified-release exenatide in dual therapy regimens (in combination with metformin or a sulphonylurea) is recommended only if:

- Treatment with metformin or a sulphonylurea is contra-indicated or not tolerated, and
- Treatment with thiazolidinediones and dipeptidylpeptidase-4 inhibitors is contra-indicated or not tolerated.

Modified-release exenatide in a dual therapy regimen should be continued only if HbA$_1c$ concentration is reduced by at least 1 percentage point within 6 months of starting treatment.

www.nice.org.uk/TA248

---

NICE guidance

**Liraglutide for the treatment of type 2 diabetes mellitus (October 2010)**

Liraglutide in triple therapy regimens (in combination with metformin and a sulphonylurea, or metformin and a thiazolidinedione) is recommended for the treatment of type 2 diabetes, only when glycaemic control is inadequate, and the patient has:

- A body mass index of 35 kg/m$^2$ or over and is of European descent (with appropriate adjustment for other ethnic groups) and weight-related psychological or medical problems, or
- A body mass index of less than 35 kg/m$^2$, and insulin would be unacceptable for occupational reasons or weight loss would benefit other significant obesity-related comorbidities.

Liraglutide in dual therapy regimens (in combination with metformin or a sulphonylurea) is recommended only if:

- Treatment with metformin or a sulphonylurea is contra-indicated or not tolerated, and
- Treatment with thiazolidinediones and dipeptidylpeptidase-4 inhibitors is contra-indicated or not tolerated.

Liraglutide, in combination with metformin or a sulphonylurea should be continued only if HbA$_1c$ concentration is reduced by at least 1 percentage point within 6 months of starting treatment.

Liraglutide 1.8 mg daily is not recommended. www.nice.org.uk/TA203

---

The Scottish Medicines Consortium (p. 4) has advised (December 2011) that modified-release exenatide (Bydureon®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes as a third-line treatment option.

Liraglutide is licensed for the treatment of type 2 diabetes mellitus in combination with metformin or a sulphonylurea, or both, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination. Liraglutide is also licensed for use in combination with both metformin and pioglitazone when dual therapy with these drugs fails to achieve adequate glycaemic control.

Lixisenatide is licensed for the treatment of type 2 diabetes mellitus in combination with oral antidiabetic drugs (e.g. metformin, pioglitazone, or a sulphonylurea) or basal insulin, or both, when adequate glycaemic control has not been achieved with these drugs; lixisenatide should not be used in combination with both basal insulin and a sulphonylurea because of an increased risk of hypoglycaemia.

The Scottish Medicines Consortium (p. 4) has advised (August 2013) that lixisenatide (Lyxumia®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with oral antidiabetic drugs or basal insulin (or both), when adequate glycaemic control has not been achieved with these drugs; use is restricted to patients in whom a GLP-1 agonist is appropriate, as an alternative to an existing GLP-1 agonist (exenatide or liraglutide).

Canagliflozin and dapagliflozin reversibly inhibit sodium-glucose co-transporter 2 (SGLT2) in the renal proximal convoluted tubule to reduce glucose reabsorption and increase urinary glucose excretion. Canagliflozin and dapagliflozin are licensed for use in type 2 diabetes as monotherapy (if metformin inappropriate), or in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control). Dapagliflozin is not recommended in combination with pioglitazone.
NICE guidance
Dapagliflozin in combination therapy for treating type 2 diabetes (June 2013)
Dapagliflozin in a dual therapy regimen in combination with metformin is recommended for the treatment of type 2 diabetes, only if glycaemic control is inadequate, and the patient has a significant risk of hypoglycaemia or if a sulfonylurea is contra-indicated or not tolerated.
Dapagliflozin in combination with insulin (alone or with other antidiabetic drugs) is an option for the treatment of type 2 diabetes.
Dapagliflozin in combination with metformin and a sulfonylurea as triple therapy is not recommended for the treatment of type 2 diabetes except as part of a clinical trial.
Patients currently receiving dapagliflozin in a dual or triple therapy regimen that is not recommended according to the above criteria should have the option to continue treatment until then and their clinician consider it appropriate to stop.
www.nice.org.uk/TA288

ACARBOSE

Indications diabetes mellitus inadequately controlled by diet or by diet with oral antidiabetic drugs
Cautions monitor liver function; may enhance hypoglycaemic effects of insulin and sulfonylureas (hypoglycaemic episodes may be treated with oral glucose but not with sucrose); interactions: Appendix 1 (antidiabetics)
Contra-indications inflammatory bowel disease, predisposition to partial intestinal obstruction; hernia, previous abdominal surgery
Hepatic impairment avoid
Renal impairment avoid if eGFR less than 25 mL/minute/1.73 m²
Pregnancy avoid
Breast-feeding avoid
Side-effects flatulence, soft stools, diarrhoea (may need to reduce dose or withdraw), abdominal distention and pain; rarely, nausea, abnormal liver function tests and skin reactions; very rarely, ileus, oedema, jaundice, and hepatitis
Note Antacids unlikely to be beneficial for treating side-effects
Dose
ADULT over 18 years, initially 50 mg daily increased to 50 mg 3 times daily, then increased if necessary after 6–8 weeks to 100 mg 3 times daily; max. 200 mg 3 times daily.
Counselling Tablets should be chewed with first mouthful of food or swallowed whole with a little liquid immediately before food. To counteract possible hypoglycaemia, patients receiving insulin or a sulfonylurea as well as acarbose need to carry glucose (not sucrose—acarbose interferes with sucrose absorption)

Glucobay® (Bayer) £1.61
Tablets, acarbose 50mg, net price 90-tab pack = £7.35; 100 mg (scored), 90-tab pack = £13.50. Counselling, administration

ALOGLIPTIN

Indications see notes above
Cautions determine renal function before treatment and periodically thereafter; history of pancreatitis; discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain); not recommended in moderate to severe heart failure (limited experience); interactions: Appendix 1 (antidiabetics)
Contra-indications history of serious hypersensitivity to dipeptidylpeptidase-4 inhibitors; ketoacidosis
Hepatic impairment manufacturer advises avoid in severe impairment—no information available
Renal impairment reduce dose to 12.5 mg once daily if eGFR 30–50 mL/minute/1.73 m²; reduce dose to 6.25 mg once daily if eGFR less than 30 mL/minute/1.73 m² and use with caution
Pregnancy manufacturer advises avoid—no information available
Breast-feeding avoid—present in milk in animal studies
Side-effects abdominal pain, gastro-oesophageal reflux, nasopharyngitis, upper respiratory-tract infection, headache, pruritus, rash; also reported pancreatitis, hepatic impairment, angioedema, urticaria, Stevens-Johnson syndrome
Dose
ADULT over 18 years, 25 mg once daily
Note Dose of concomitant sulfonylurea or insulin may need to be reduced; caution with use in combination with both metformin and pioglitazone—risk of hypoglycaemia (dose of metformin or pioglitazone may need to be reduced)
Vipidia® (Takeda) £2.50
Tablets, f/c, alogliptin (as benzoate) 6.25 mg (pink), net price 28-tab pack = £26.60; 12.5 mg (yellow), 28-tab pack = £26.60; 25 mg (red), 28-tab pack = £26.60
With metformin
For prescribing information on metformin, see section 6.1.2.2
Vipdomet® (Takeda) £1.76
Tablets, f/c, yellow, alogliptin (as benzoate) 12.5 mg, metformin hydrochloride 1 g, net price 56-tab pack = £26.60. Label: 21
Dose type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either pioglitazone or insulin, ADULT over 18 years, 1 tablet twice daily (based on patient’s current metformin dose)
Note Dose of concomitant insulin may need to be reduced; caution with use in combination with pioglitazone—risk of hypoglycaemia (dose of pioglitazone may need to be reduced)

CANAGLIFLOZIN

Indications see notes above
Cautions determine renal function before treatment and at least annually thereafter, and before initiation of concomitant drugs that reduce renal function and periodically thereafter; elderly or cardiovascular disease (risk of hypotension); history of hypotension;
**BNF 68**

6.1.2 Antidiabetic drugs

**Forxiga** *(Bristol-Myers Squibb, AstraZeneca)*  
Tablets, yellow, f/c, dapagliflozin (as propanediol monohydrate) 5 mg, net price 28-tab pack = £36.59; 10 mg, 28-tab pack = £36.59

With metformin  
For prescribing information on metformin, see section 6.1.2.2

**Xigduo** *(Bristol-Myers Squibb, AstraZeneca)*  
Xigduo® 5 mg/850 mg tablets, f/c, brown, dapagliflozin (as propanediol monohydrate) 5 mg, metformin hydrochloride 850 mg, net price 56 tab-pack = £36.59. Label: 21

**EXENATIDE**

Indications see notes above

Cautions  
elderly; pancreatitis (see below); may cause weight loss greater than 1.5 kg weekly; interactions: Appendix 1 (antidiabetics)

Pancreatitis  
Severe pancreatitis (sometimes fatal), including haemorrhagic or necrotising pancreatitis, has been reported rarely. Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek prompt medical attention if symptoms such as abdominal pain, nausea, and vomiting develop. Discontinue permanently if pancreatitis is diagnosed

Contra-indications  
ketoacidosis; severe gastro-intestinal disease

Renal impairment

Dose  
- **Adult** over 18 years, starting 5 micrograms twice daily within 1 hour before a meal. Some oral

**DAPAGLIFLOZIN**

Indications  
see notes above

Cautions  
determine renal function before treatment and at least annually thereafter; hypotension; electrolyte disturbances; cardiovascular disease or elderly (risk of hypotension); raised haematocrit; interactions: Appendix 1 (antidiabetics)

Volulture depletion  
Correct hypovolaemia before starting treatment. Consider interrupting treatment if volume depletion occurs

Contra-indications  
ketoacidosis

Hepatic impairment  
initial dose 5 mg daily in severe impairment, increased according to response; in combination with metformin (Xigduo®), avoid

Renal impairment  
avoid if eGFR less than 30 mL/minute/1.73 m² (ineffective)

Pregnancy  
avoid—toxicity in animal studies

Breast-feeding  
avoid—no information available

Side-effects  
gastro-intestinal disturbances including nausea, vomiting, diarrhoea, dyspepsia, abdominal pain and distension, gastro-oesophageal reflux disease, decreased appetite, weight loss, headache, dizziness, agitation, asthenia, hypoglycaemia, increased sweating, injection-site reactions, antibody formation; less commonly pancreatitis (see Cautions above); rarely alopecia; very rarely anaphylactic reactions; also reported constipation, flatulence, eructation, dehydration, taste disturbance, renal impairment, drowsiness, rash, pruritus, urticaria, and angioedema

Dose  
- **Adult** over 18 years, initially 5 micrograms twice daily within 1 hour before 2 main meals (at least 6 hours apart), increased if necessary after at least 1 month to max. 10 micrograms twice daily

Counselling  
If a dose is missed, continue with the next scheduled dose—do not administer after a meal. Some oral
medications should be taken at least 1 hour before or 4 hours after exenatide injection—consult product literature for details

**Note** Dose of concomitant sulfonylurea may need to be reduced

**Byetta**® (Bristol-Myers Squibb) ▼ ![BNF]

- **Injection**, exenatide 250 micrograms/mL, net price 5 microgram/dose prefilled pen (60 doses) = £68.24, 10 microgram/dose prefilled pen (60 doses) = £68.24. Label: 10, counselling, administration

- **Modified release**

- **Bydureon**® (Bristol-Myers Squibb) ▼ ![BNF]

  - **Injection**, m/r, powder for reconstitution, exenatide, net price 2-mg vial (with solvent) = £18.34. Label: 10, counselling, administration

  - **Dose** by subcutaneous injection, **ADULT** over 18 years, 2 mg once weekly

  - **Counselling** Patients changing from standard-release exenatide formulation may experience initial transient increase in blood glucose. Some oral medications should be taken at least 1 hour before or 4 hours after exenatide injection—consult product literature for details

  - **Note** Dose of concomitant sulfonylurea may need to be reduced

  - **Important Effect of Bydureon**® may persist for 10 weeks after discontinuation

**LINagliptin**

**Indications** see notes above

**Cautions** discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain); **interactions**: Appendix 1 (antidiabetics)

**Pregnancy** avoid—no information available

**Breast-feeding** avoid—present in milk in animal studies

**Side-effects** less commonly cough, nasopharyngitis; **also reported** pancreatitis

**Dose**

- **ADULT** over 18 years, 5 mg once daily

  - **Note** Dose of concomitant sulfonylurea or insulin may need to be reduced

  - **Trajenta**® (Boehringer Ingelheim) ▼ ![BNF]

    - **Tablets**, light red, f/c, linagliptin 5 mg, net price 28-tab pack = £33.26

- **With metformin**

  - For prescribing information on metformin, see section 6.1.2.2

  - **Jentadueto**® (Boehringer Ingelheim) ▼ ![BNF]

    - **Jentadueto**® 2.5 mg/850 mg tablets, f/c, light orange, linagliptin 2.5 mg, metformin hydrochloride 850 mg, net price 56-tab pack = £33.26. Label: 21

    - **Jentadueto**® 2.5 mg/1 g tablets, f/c, light pink, linagliptin 2.5 mg, metformin hydrochloride 1 g, net price 56-tab pack = £33.26. Label: 21

  - **Dose** type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either a sulfonylurea or insulin, **ADULT** over 18 years, 1 Jentadueto® tablet twice daily (based on patient’s current metformin dose)

  - **Note** Dose of concomitant sulfonylurea or insulin may need to be reduced

**LIRaglutide**

**Indications** see notes above

**Cautions** discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain); **interactions**: Appendix 1 (antidiabetics)

**Contra-indications** ketoadisis; inflammatory bowel disease; diabetic gastroparesis

**Hepatic impairment** avoid—limited experience

**Renal impairment** avoid if eGFR less than 60 mL/minute/1.73 m²—limited experience

**Pregnancy** avoid—toxicity in animal studies

**Breast-feeding** avoid—no information available

**Side-effects** gastro-intestinal disturbances including nausea, vomiting, constipation, diarrhoea, dyspepsia, abdominal pain and distension, flatulence, gastritis, gastro-oesophageal reflux disease, decreased appetite; headache, dizziness, fatigue, fever, bronchitis, nasopharyngitis; hypoglycaemia; injection site reactions; **also reported** acute pancreatitis, thyroid neoplasm, goitre, increased blood calcitonin, angioedema

**Dose**

- **By subcutaneous injection, ADULT** over 18 years, initially 0.6 mg once daily, increased after at least 1 week to 1.2 mg once daily, further increased if necessary after an interval of at least 1 week to max. 1.8 mg once daily

  - **Note** Dose of concomitant sulfonylurea may need to be reduced

  - **Victoza**® (Novo Nordisk) ▼ ![BNF]

    - **Injection**, liraglutide 6 mg/mL, net price 2 × 3-mL prefilled pens = £78.48, 3 × 3-mL prefilled pens = £117.72. Counselling, administration

**Lixisenatide**

**Indications** see notes above

**Cautions** discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain); **interactions**: Appendix 1 (antidiabetics)

**Contra-indications** ketoadisis; severe gastro-intestinal disease

**Renal impairment** use with caution if eGFR 30–50 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m²—no information available

**Pregnancy** avoid—toxicity in animal studies; women of child-bearing age should use effective contraception

**Breast-feeding** avoid—no information available

**Side-effects** nausea, vomiting, diarrhoea, dyspepsia, palpitation, headache, dizziness, drowsiness, hypoglycaemia, injection-site reactions; **less commonly** tachycardia, urticaria

**Dose**

- **By subcutaneous injection, ADULT** over 18 years, initially 10 micrograms once daily within 1 hour before the first meal of the day or the evening meal for 14 days, increased to 20 micrograms once daily thereafter

  - **Counselling** If a dose is missed, inject within 1 hour before the next meal. Some oral medications should be taken at least 1 hour before or 4 hours after lixisenatide injection—consult product literature for details

  - **Note** Dose of concomitant sulfonylurea or insulin may need to be reduced

  - **Lyxumia**® (Sanoft-Aventis) ▼ ![BNF]

    - **Injection**, 0.5 micrograms/mL, net price 10 micrograms/dose prefilled pen (14 doses) = £27.07; 100 micrograms/mL, 20 micrograms/dose prefilled pen (14 doses) × 2 = £54.14; treatment initiation pack, 10 micrograms/dose prefilled pen and 20 micrograms/dose prefilled pen = £54.14. Label: 10, counselling, administration
NATEGLINIDE

Indications type 2 diabetes mellitus in combination with metformin (section 6.1.2.2) when metformin alone inadequate

Cautions substitute insulin during intercurrent illness (such as myocardial infarction, coma, infection, and trauma) and during surgery (omit nateglinide on morning of surgery and recommence when eating and drinking normally); elderly, debilitated and malnourished patients; interactions: Appendix 1 (antidiabetics)

Contra-indications ketoacidosis

Hepatic impairment caution in moderate hepatic impairment; avoid in severe impairment—no information available

Pregnancy avoid—toxicity in animal studies

Breast-feeding avoid—present in milk in animal studies

Side-effects hypoglycaemia; hypersensitivity reactions including pruritus, rashes and urticaria

Dose

ADULT over 18 years, initially 60 mg 3 times daily within 30 minutes before main meals, adjusted according to response up to max. 180 mg 3 times daily

Starlix® (Novartis) Tablets, f/c, nateglinide 60 mg (pink), net price 84-tab pack = £22.71; 120 mg (yellow), 84-tab pack = £25.88; 180 mg (red), 84-tab pack = £25.88

PIOGLITAZONE

Indications type 2 diabetes mellitus (alone or combined with metformin or a sulfonylurea, or with both, or with insulin—see also notes above)

Cautions monitor liver function (see below); cardiovascular disease or in combination with insulin (risk of heart failure—see MHRA/CHM advice p. 467); substitute insulin during peri-operative period (omit pioglitazone on morning of surgery and recommence when eating and drinking normally); increased risk of bone fractures, particularly in women; avoid in acute porphyria (but see section 9.8.2); risk factors for bladder cancer (see Risk of Bladder Cancer, p. 467); elderly (increased risk of heart failure, fractures, and bladder cancer); interactions: Appendix 1 (antidiabetics)

Liver toxicity Rare reports of liver dysfunction; monitor liver function before treatment, and periodically thereafter; advise patients to seek immediate medical attention if symptoms such as nausea, vomiting, abdominal pain, fatigue and dark urine develop; discontinue if jaundice occurs

Contra-indications history of heart failure; uninvestigated macroscopic haematuria, previous or active bladder cancer

Hepatic impairment avoid; see also Cautions above

Pregnancy avoid—toxicity in animal studies

Breast-feeding avoid—present in milk in animal studies

Side-effects abdominal pain, diarrhoea, constipation, nausea, vomiting; rarely hypoglycaemia, hypersensitivity reactions including pruritus, rashes, vasculitis, urticaria, and visual disturbances

Dose

ADULT over 18 years, initially 500 micrograms within 30 minutes before main meals (1 mg if transferring from another oral hypoglycaemic), adjusted according to response at intervals of 1–2 weeks; up to 4 mg may be given as a single dose, max. 16 mg daily; ELDERLY over 75 years, not recommended

Repaglinide (Non-proprietary) Tablets, repaglinide 500 micrograms, net price 30-tab pack = £2.67; 90-tab pack = £8.70; 1 mg, 30-tab pack = £2.82; 90-tab pack = £9.08; 2 mg, 90-tab pack = £5.74

Prandin® (Takeda) Tablets, prandinide 500 micrograms, net price 30-tab pack = £3.92; 90-tab pack = £11.76; 1 mg (yellow), 30-tab pack = £3.92, 90-tab pack = £11.76; 2 mg (peach), 90-tab pack = £11.76

Formerly marketed as NovoNorm®
6.1.2 Antidiabetic drugs

**BFSN**

**SAXAGLIPTIN**

**Indications** see notes above

**Cautions** elderly; determine renal function before treatment and periodically thereafter; discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain); **interactions:** Appendix 1 (antidiabetics)

**Contra-indications** history of serious hypersensitivity to dipeptidylpeptidase-4 inhibitors

**Hepatic impairment** use with caution in moderate impairment; avoid in severe impairment

**Renal impairment** reduce dose to 2.5 mg once daily in moderate to severe impairment; use with caution in severe impairment

**Pregnancy** avoid unless essential—toxicity in animal studies

**Breast-feeding** avoid—present in milk in animal studies

**Side-effects** vomiting, dyspepsia, gastritis; peripheral oedema; headache, dizziness, fatigue; upper respiratory tract infection, urinary tract infection, gastrointestinal enteritis, sinusitis, nasopharyngitis; hypoglycaemia, myalgia; less commonly dyslipidaemia, hypertriglyceridaemia, pancreatitis, erectile dysfunction, arthralgia, hypersensitivity reactions (including anaphylaxis); also reported rash

**Dose**

- **ADULT** over 18 years, 5 mg once daily

  **Note** Dose of concomitant sulfonylurea or insulin may need to be reduced

- **Onglyza® (Bristol-Myers Squibb)** (MSD) Tablets, f/c, saxagliptin (as hydrochloride) 2.5 mg (yellow), net price 28-tab pack = £31.60; 5 mg (pink), net price 28-tab pack = £31.60

**With metformin**

For prescribing information on metformin, see section 6.1.2.2

- **Komboglyze® (Bristol-Myers Squibb, AstraZeneca)** (MSD) Tablets, f/c, brown, saxagliptin (as hydrochloride) 2.5 mg, metformin hydrochloride 850 mg, net price 56-tab pack = £31.60. Label: 21

  **Komboglyze® 2.5 mg/850 mg tablets, f/c, brown, saxagliptin (as hydrochloride) 2.5 mg, metformin hydrochloride 850 mg, net price 56-tab pack = £31.60. Label: 21**

- **Komboglyze® 2.5 mg/1 g tablets, f/c, yellow, saxagliptin (as hydrochloride) 2.5 mg, metformin hydrochloride 1 g, net price 56-tab pack = £31.60. Label: 21**

  **Dose** type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either a sulfonylurea or pioglitazone or insulin, **ADULT** over 18 years, 1 tablet twice daily (based on patient’s current metformin dose)

**Note** Dose of concomitant sulfonylurea or insulin may need to be reduced

The Scottish Medicines Consortium (p. 4) has advised (May 2013) that Komboglyze® is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in patients unable to achieve adequate glycaemic control with metformin alone and when the addition of a sulfonylurea is inappropriate

**VILDAGLIPTIN**

**Indications** see notes above

**Cautions** monitor liver function (see below); manufacturer advises avoid in severe heart failure—no information available; discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain); **interactions:** Appendix 1 (antidiabetics)

**Liver toxicity** rare reports of liver dysfunction; monitor liver function before treatment and every 3 months for first year and periodically thereafter; advise patients to seek prompt medical attention if symptoms such as nausea, vomiting, abdominal pain, fatigue, and dark urine develop; discontinue if jaundice or other signs of liver dysfunction occur

**Contra-indications** ketoacidosis

**Hepatic impairment** avoid; see also Cautions above

**Renal impairment** reduce dose to 50 mg once daily if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** avoid—toxicity in animal studies

**Breast-feeding** avoid—present in milk in animal studies
Side-effects  
nausea, peripheral oedema, headache, 
tremor, asthenia, dizziness; less commonly constipation, 
hypoglycaemia, arthralgia; rarely hepatic dysfunction (see also Liver Toxicity above); very rarely nasopharyngitis, upper respiratory tract infection; also reported pancreatitis, exfoliative and bullous skin reactions

Dose

- **ADULT** over 18 years, monotherapy, 50 mg twice daily
- **ADULT** over 18 years, dual therapy in combination with metformin or pioglitazone, 50 mg twice daily; dual therapy in combination with a sulfonylurea, 50 mg daily in the morning
- **ADULT** over 18 years, triple therapy in combination with metformin and a sulfonylurea, 50 mg twice daily
- **ADULT** over 18 years, in combination with insulin (with or without metformin), 50 mg twice daily

**Note**  
Dose of concomitant sulfonylurea or insulin may need to be reduced

Galvus® (Novartis) 
Tablets, pale yellow, vildagliptin 50 mg, net price 56-tab pack = £31.76

**With metformin**

For prescribing information on metformin, see section 6.1.2.2

Eucreas® (Novartis) 

- **Eucreas® 50 mg/850 mg tablets**, f/c, yellow, vildagliptin 50 mg, metformin hydrochloride 850 mg, net price 60-tab pack = £33.98. Label: 21
- **Eucreas® 50 mg/1 g tablets**, f/c, dark yellow, vildagliptin 50 mg, metformin hydrochloride 1 g, net price 60-tab pack = £33.98. Label: 21

**Dose**  
type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either a sulfonylurea or insulin, **ADULT** over 18 years, 1 **Eucreas** ® tablet twice daily (based on patient’s current metformin dose)

**Note**  
Dose of concomitant sulfonylurea or insulin may need to be reduced

The **Scottish Medicines Consortium** (p. 4) has advised (June 2008) that **Eucreas®** is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in patients unable to achieve adequate glycaemic control with metformin alone or those already treated with vildagliptin and metformin as separate tablets

### 6.1.3 Diabetic ketoacidosis

The management of diabetic ketoacidosis involves the replacement of fluid and electrolytes and the administration of insulin. Guidelines for the Management of Diabetic Ketoacidosis in Adults, published by the Joint British Diabetes Societies Inpatient Care Group, should be followed.

- To restore circulating volume if systolic blood pressure is below 90 mmHg (adjusted for age, sex, and medication as appropriate), give 500 mL sodium chloride 0.9% by intravenous infusion over 10–15 minutes; repeat if blood pressure remains below 90 mmHg and seek senior medical advice.
- When blood pressure is over 90 mmHg, sodium chloride 0.9% should be given by intravenous infusion at a rate that replaces deficit and provides maintenance; see guideline for suggested regimen.

- Include potassium chloride in the fluids unless anuria is suspected; adjust according to plasma-potassium concentration (measure at 60 minutes, 2 hours, and 2 hourly thereafter; measure hourly if outside the normal range).

- Start an intravenous insulin infusion: soluble insulin should be diluted (and mixed thoroughly) with sodium chloride 0.9% intravenous infusion to a concentration of 1 unit/mL; infuse at a fixed rate of 0.1 units/kg/hour.

- Established subcutaneous therapy with long-acting insulin analogues (insulin detemir or insulin glargine) should be continued during treatment of diabetic ketoacidosis.

- Monitor blood-ketone and blood-glucose concentrations hourly and adjust the insulin infusion rate accordingly. Blood-ketone concentration should fall by at least 0.5 mmol/litre/hour and blood-glucose concentration should fall by at least 3 mmol/litre/hour.

- Once blood-glucose concentration falls below 14 mmol/litre, glucose 10% should be given by intravenous infusion (into a large vein through a large-gauge needle) at a rate of 125 mL/hour, in addition to the sodium chloride 0.9% infusion.

- Continue insulin infusion until blood-ketone concentration is below 0.3 mmol/litre, blood pH is above 7.3 and the patient is able to eat and drink; ideally give subcutaneous fast-acting insulin and a meal, and stop the insulin infusion 1 hour later.

For the management of diabetic ketoacidosis in children under 18 years, see **BNF for Children**.

The management of hyperosmolar hyperglycaemic state or hyperosmolar hyperglycaemic nonketotic coma is similar to that of diabetic ketoacidosis, although lower rates of insulin infusion are usually necessary and slower rehydration may be required.

### 6.1.4 Treatment of hypoglycaemia

Initially glucose 10–20 g is given by mouth either in liquid form or as granulated sugar or sugar lumps. Approximately 10 g of glucose is available from non-diet versions of Lucozade® Energy Original 55 mL, Coca-Cola® 100 mL, Ribena® Blackcurrant 19 mL (to be diluted), 2 teaspoons of sugar, and also from 3 sugar lumps. If necessary this may be repeated in 10–15 minutes. After initial treatment, a snack providing sustained availability of carbohydrate (e.g. a sandwich, fruit, milk, or biscuits) or the next meal, if it is due, can prevent blood-glucose concentration from falling again.

Hypoglycaemia which causes unconsciousness is an emergency. Glucagon, a polypeptide hormone produced by the alpha cells of the islets of Langerhans, increases plasma-glucose concentration by mobilising glycogen stored in the liver. In hypoglycaemia, if sugar cannot be given by mouth, glucagon can be given by injection. Carbohydrates should be given as soon as possible to restore liver glycogen; glucagon is not appropriate for chronic hypoglycaemia. Glucagon may be injected into the deltoid or subcutaneous areas of the anterior or posterior thigh. The patient should be instructed in the self-administration of glucagon in the event of hypoglycaemia. If the patient is unconscious, it may be necessary to administer glucagon intramuscularly or intravenously. Glucagon should be stored under refrigeration.

2. Proprietary products of quick-acting carbohydrate (e.g. GlucoGel®, Dextrogel®, GSF-Syrup®, Rupalose® gel) are available on prescription for the patient to keep to hand in case of hypoglycaemia.
be issued to close relatives of insulin-treated patients for emergency use in hypoglycaemic attacks. It is often advisable to prescribe on an ‘if necessary’ basis to hospitalised insulin-treated patients, so that it may be given rapidly by the nurses during an hypoglycaemic emergency. If not effective in 10 minutes intravenous glucose should be given.

Alternatively, 50 mL of glucose intravenous infusion 20% (section 9.2.2) may be given intravenously into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs. Glucose intravenous infusion 10% may also be used but larger volumes are needed. Glucose intravenous infusion 50% is not recommended because of the higher risk of extravasation injury and because administration is difficult. Close monitoring is necessary in the case of an overdose with a long-acting insulin because further administration of glucose may be required. Patients whose hypoglycaemia is caused by an oral antidiabetic drug should be transferred to hospital because the hypoglycaemic effects of these drugs may persist for many hours.

For advice on the emergency management of hypoglycaemia in dental practice, see p. 29.

### GLUCAGON

**Indications** see notes above and under Dose

**Cautions** see notes above, insulinoma, glucagonoma; ineffective in chronic hypoglycaemia, starvation, and adrenal insufficiency.

**Contra-indications** pheochromocytoma

**Side-effects** nausea, vomiting, abdominal pain, hypokalaemia, hypotension, rarely hypersensitivity reactions

**Dose**

- Insulin-induced hypoglycaemia, by subcutaneous or intramuscular injection, **ADULT** and **CHILD** over 8 years (or body-weight over 25 kg), 1 mg; **CHILD** under 8 years (or body-weight under 25 kg), 500 micrograms; if no response within 10 minutes intravenous glucose must be given
- Diagnostic aid, consult product literature
- Beta-blocker poisoning, see p. 39

**Note** 1 unit of glucagon = 1 mg of glucagon

**Glucagon Hypokit** (Novo Nordisk)

**Injection, powder for reconstitution, glucagon (rys)** as hydrochloride with lactose, net price 1-mg vial with prefilled syringe containing water for injection = £11.52

### Chronic hypoglycaemia

Diazoxide, administered by mouth, is useful in the management of patients with chronic hypoglycaemia from excess endogenous insulin secretion, either from an islet cell tumour or islet cell hyperplasia. It has no place in the management of acute hypoglycaemia.

### DIAZOXIDE

**Indications** chronic intractable hypoglycaemia

**Cautions** impaired cardiac or cerebral circulation; heart failure; aortic coarctation; aortic stenosis; arteriogenous shunt; monitor blood pressure; hyper-

1. **BNF**: restriction does not apply where administration is for saving life in emergency

uricaemia; during prolonged use monitor white cell and platelet count; **interactions**: Appendix 1 (diazoxide)

**Renal impairment** dose reduction may be required

**Pregnancy** use only if essential; alopecia and hypertrichosis reported in neonates with prolonged use; may inhibit uterine activity during labour

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** nausea, vomiting, abdominal pain, diarrhoea, constipation, ileus, pancreatitis, anorexia (prolonged use), taste disturbance, bleeding, heart failure, hypotension, pulmonary hypertension, dyspnoea, extrapyramidal effects, headache, dizziness, galactorrhoea, hyperglycaemia, decreased libido, leucopenia, thrombocytopenia, anaemia, eosinophilia, hyperosmolar non-ketotic coma, raised serum creatinine and uric acid, reversible nephritic syndrome, sodium and fluid retention, uricaemia (prolonged use), musculoskeletal pain, visual disturbances, transient cataracts, lacrimation, tinnitus, hypertrichosis, pruritus, dermatitis, lichenoid eruption

**Dose**

- By mouth, **ADULT**, initially 5 mg/kg daily in 2–3 divided doses, then adjusted according to response; usual maintenance dose 3–6 mg/kg daily in 2–3 divided doses; **CHILD** 1 month–18 years see **BNF for Children**

**Eudemine** (PharmaSafer)

**Tablets, diazoxide 50 mg. Net price 100 = £46.45**

### 6.1.5 Treatment of diabetic nephropathy and neuropathy

#### Diabetic nephropathy

Regular review of diabetic patients should include an annual test for urinary protein (using Albustix®) and serum creatinine measurement. If the urinary protein test is negative, the urine should be tested for microalbuminuria (the earliest sign of nephropathy). If reagent strip tests (MicroTest II® or Microbumintest®) are used and prove positive, the result should be confirmed by laboratory analysis of a urine sample. Provided there are no contra-indications, all diabetic patients with nephropathy causing proteinuria or with established microalbuminuria (at least 3 positive tests) should be treated with an ACE inhibitor (section 2.5.5.1) or an angiotensin-II receptor antagonist (section 2.5.5.2) even if the blood pressure is normal; in any case, to minimise the risk of renal deterioration, blood pressure should be carefully controlled (section 2.5).

ACE inhibitors can potentiate the hypoglycaemic effect of insulin and oral antidiabetic drugs; this effect is more likely during the first weeks of combined treatment and in patients with renal impairment.

For the treatment of hypertension in diabetes, see section 2.5.

#### Diabetic neuropathy

Optimal diabetic control is beneficial for the management of painful neuropathy in patients with type 1 diabetes (see also section 4.7.3). Paracetamol (p. 276) or a non-steroidal anti-inflammatory drug such as ibuprofen (p. 708) may relieve mild to moderate pain.
Duloxetine (p. 259) is effective for the treatment of painful diabetic neuropathy; amitriptyline (p. 250) [unlicensed use] can be used if duloxetine is ineffective or unsuitable. Nortriptyline (p. 252) [unlicensed] may be better tolerated than amitriptyline. If treatment with amitriptyline or duloxetine is inadequate, treatment with pregabalin (p. 304) should be tried. Combination therapy of duloxetine or amitriptyline with pregabalin can be used if monotherapy at the maximum tolerated dose does not control symptoms.

Neuropathic pain may respond to opioid analgesics. There is evidence of efficacy for tramadol (p. 290), morphine (p. 286), and oxycodone (p. 287); however, treatment with morphine or oxycodone should be initiated only under specialist supervision. Tramadol can be prescribed while the patient is waiting for assessment by a specialist if other treatments have been unsuccessful.

Gabapentin (p. 303) and carbamazepine (p. 300) are sometimes used for the treatment of neuropathic pain. Capsaicin cream 0.075% (p. 738) is licensed for painful diabetic neuropathy and may have some effect, but it does not control symptoms. Propranolol (p. 74); side-effects are common. For the management of hyperhidrosis, see section 13.12.

In autonomic neuropathy diabetic diarrhoea can often be managed by 2 or 3 doses of tetracycline 250 mg [unlicensed use] (p. 375). Otherwise codeine (p. 59) is the best drug, but other antidiarrhoeal preparations can be tried. Erythromycin (especially when given intravenously) may be beneficial for gastroparesis [unlicensed use] (p. 375). Otherwise tetracycline [unlicensed use] can be prescribed while the patient is waiting for assessment by a specialist if other treatments have been unsuccessful.

In autonomic neuropathy diabetic diarrhoea can often be managed by 2 or 3 doses of tetracycline 250 mg [unlicensed use] (p. 375). Otherwise codeine (p. 59) is the best drug, but other antidiarrhoeal preparations can be tried. Erythromycin (especially when given intravenously) may be beneficial for gastroparesis [unlicensed use] but this needs confirmation.

In neuropathic postural hypotension increased salt intake and the use of the mineralocorticoid fludrocortisone 100–400 micrograms daily [unlicensed use] (p. 483) may help by increasing plasma volume, but uncomfortable oedema is a common side-effect. Fludrocortisone can also be combined with flurbiprofen (p. 708) and ephedrine hydrochloride (p. 189) [both unlicensed]. Middrin [unlicensed], an alpha agonist, may also be useful in postural hypotension.

Gustatory sweating can be treated with an antimuscarinic such as propantheline bromide (p. 49); side-effects are common. For the management of hyperhidrosis, see section 7.4.5.

### Blood monitoring

Blood glucose monitoring using a meter gives a direct measure of the glucose concentration at the time of the test and can detect hypoglycaemia as well as hyperglycaemia. Patients should be properly trained in the use of blood glucose monitoring systems and to take appropriate action on the results obtained. Inadequate understanding of the normal fluctuations in blood glucose can lead to confusion and inappropriate action.

Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen.

Self-monitoring of blood-glucose concentration is appropriate for patients with type 2 diabetes:

- who are treated with insulin;
- who are treated with oral hypoglycaemic drugs e.g. sulfonylureas, to provide information on hypoglycaemia;
- to monitor changes in blood-glucose concentration resulting from changes in lifestyle or medication, and during intercurrent illness;
- to ensure safe blood-glucose concentration during activities, including driving.

</table>

Note: In the UK blood-glucose concentration is expressed in mmol/litre and Diabetes UK advises that these units should be used for self-monitoring of blood glucose. In other European countries units of mg/100 mL (or mg/dL) are commonly used. It is advisable to check that the meter is pre-set in the correct units.

If the patient is unwell and diabetic ketoacidosis is suspected, blood ketones should be measured according to local guidelines (section 6.1.3). Patients and their carers should be trained in the use of blood ketone monitoring systems and to take appropriate action on the results obtained, including when to seek medical attention.

Urinalysis
Reagent strips are available for measuring for glucose in the urine. Tests for ketones by patients are rarely
required unless they become unwell—see also Blood
Monitoring, p. 477.
Microalbuminuria can be detected with Micral-Test
® (Roche Diagnostics) but this should be followed by confirmation in
the laboratory, since false positive results are common.

**Glucose**

Diabur-Test 5000® (Roche Diagnostics)
Reagent strips, for detection of glucose in urine. Net
price 50-strip pack = £2.87

Diastix® (Bayer Diabetes Care)
Reagent strips, for detection of glucose in urine. Net
price 50-strip pack = £2.78

Medi-Test® Glucose (BHR)
Reagent strips, for detection of glucose in urine. Net
price 50-strip pack = £2.33

Mission® Glucose (Spirit)
Reagent strips, for detection of glucose in urine. Net
price 50-strip pack = £2.29

**Ketones**

Ketostix® (Bayer Diabetes Care)
Reagent strips, for detection of ketones in urine. Net
price 50-strip pack = £3.03

Mission® Ketone (Spirit)
Reagent strips, for detection of ketones in urine. Net
price 50-strip pack = £2.50

**Protein**

Albustix® (Siemens)
Reagent strips, for detection of protein in urine. Net
price 50-strip pack = £4.10

Medi-Test® Protein 2 (BHR)
Reagent strips, for detection of protein in urine. Net
price 50-strip pack = £3.27

**Other reagent strips available for urinalysis include:**

- Combur-3 Test® (glucose and protein—Roche Diagnostics)
- Clinitek Microalbumin® (albumin and creatinine—Siemens)
- Ketodiasis® (glucose and ketones—Bayer Diagnostics)
- Medi-Test Combi 2® (glucose and protein—BHR)
- Micral-Test II® (albumin—Roche Diagnostics)
- Microalbustix® (albumin and creatinine—Siemens)
- Uristix® (glucose and protein—Siemens)

**Oral glucose tolerance test**

The oral glucose tolerance test is used mainly for
diagnosis of impaired glucose tolerance; it is not recom-
ended or necessary for routine diagnostic use when
severe symptoms of hyperglycaemia are present. In
patients who have less severe symptoms and blood
sugar levels that do not establish or exclude diabetes
(e.g. impaired fasting glycaemia), an oral glucose tol-
erance test may be required. It is also used to establish
the presence of gestational diabetes. The oral glucose tol-
erance test generally involves giving anhydrous glucose

75 g (equivalent to Glucose BP 82.5 g) by mouth to the
fasting patient, and measuring blood-glucose concen-
trations at intervals.

The appropriate amount of glucose should be given with
200–300 mL fluid. Anhydrous glucose 75 g may alter-
atively be given as 113 mL Polycal® with extra fluid to
administer a total volume of 200–300 mL, or as Rapi-
lose® OGTT oral solution.

**6.2 Thyroid and antithyroid drugs**

**6.2.1 Thyroid hormones**

Thyroid hormones are used in hypothyroidism (myx-
odema), and also in diffuse non-toxic goitre, Hashimo-
to’s thyroiditis (lymphadenoid goitre), and thyroid carci-
noma. Neonatal hypothyroidism requires prompt
treatment for normal development. Levothyroxine
sodium (thyroxine sodium) is the treatment of choice
for maintenance therapy.

In infants and children with congenital hypothyroidism
and juvenile myxodema, the dose of levothyroxine
should be titrated according to clinical response, growth
assessment, and measurements of plasma thyroxine
and thyroid-stimulating hormone. See BNF for Children
(section 6.2.1) for suitable dosage regimens.

Liothyronine sodium has a similar action to levothy-
oxine but is more rapidly metabolised and has a more
rapid effect; 20–25 micrograms is equivalent to
100 micrograms of levothyroxine. Its effects develop
after a few hours and disappear within 24 to 48 hours
of discontinuing treatment. It may be used in severe
hypothyroid states when a rapid response is desired.

Liothyronine by intravenous injection is the treatment of
choice in hypothyroid coma. Adjunctive therapy includes
intravenous fluids, hydrocortisone, and treatment of
infection; assisted ventilation is often required.

**LEVOTHYROXINE SODIUM**

(Thyroxine sodium)

**Indications** hypothyroidism; see also notes above

**Cautions** panhypopituitarism or predisposition to
adrenal insufficiency (initiate corticosteroid therapy
before starting levothyroxine), elderly, cardiovascular
disorders (including hypertension, myocardial insuf-
Bilation or myocardial infarction, see Initial Dosage
below), long-standing hypothyroidism, diabetes insi-
pidus, diabetes mellitus (dose of antidiabetic drugs
including insulin may need to be increased); inter-
actions: Appendix 1 (thyroid hormones)

**Initial dosage** Baseline ECG is valuable because changes
induced by hypothyroidism can be confused with ischaemia.
If metabolism increases too rapidly (causing diarrhoea,
nerveousness, rapid pulse, insomnia, tremors and sometimes
anginal pain where there is latent myocardial ischaemia),
reduce dose or withhold for 1–2 days and start again at a
lower dose

**Contra-indications** thyrotoxicosis

**Pregnancy** levothyroxine may cross the placenta;
excessive or insufficient maternal thyroid hormones
can be detrimental to fetus; levothyroxine require-
ment may increase during pregnancy; assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of levothyroxine)

Breast-feeding amount too small to affect tests for neonatal hypothyroidism

Side-effects usually at excessive dosage (see Initial Dosage above) include diarrhoea, vomiting, anginal pain, arrhythmias, palpitation, tachycardia, tremor, restlessness, excitability, insomnia; headache, flushing, sweating, fever, heat intolerance, weight-loss, muscle cramp, and muscular weakness; transient hair loss in children; hypersensitivity reactions including rash, pruritus and oedema also reported

Dose

• ADULT over 18 years, initially 50–100 micrograms once daily, preferably taken at least 30 minutes before breakfast, caffeine-containing liquids (e.g. coffee, tea), or other medication, adjusted in steps of 25–50 micrograms every 3–4 weeks according to response (usual maintenance dose 100–200 micrograms once daily); in cardiac disease, severe hypothyroidism, and patients over 50 years, initially 25 micrograms once daily, adjusted in steps of 25 micrograms every 4 weeks according to response (usual maintenance dose 50–200 micrograms once daily); CHILD under 18 years see BNF for Children (section 6.2.1)

• Congenital hypothyroidism and juvenile myxoedema, see BNF for Children (section 6.2.1)

Levothyroxine (Non-proprietary) Tablets, levothyroxine sodium 25 micrograms, net price 28-tab pack = £2.58; 50 micrograms, 28-tab pack = £1.76; 100 micrograms, 28-tab pack = £1.76. Brands include Eltroxin®

Oral solution, levothyroxine sodium 25 micrograms/5 mL, net price 100 mL = £52.83; 50 micrograms/5 mL, 100 mL = £58.80; 100 micrograms/5 mL, 100 mL = £84.72

LIOTHYRONINE SODIUM

(L-Tri-iodothyronine sodium)

Indications see notes above

Cautions see under Levothyroxine Sodium; interactions: Appendix 1 (thyroid hormones)

Contra-indications see under Levothyroxine Sodium

Pregnancy does not cross the placenta in significant amounts; excessive or insufficient maternal thyroid hormones can be detrimental to fetus; levothyroxine requirement may increase during pregnancy; assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of liothyronine)

Breast-feeding amount too small to affect tests for neonatal hypothyroidism

Side-effects see under Levothyroxine Sodium

Dose

• By mouth, initially 10–20 micrograms daily gradually increased to 60 micrograms daily in 2–3 divided doses; ELDERLY smaller initial doses; CHILD, adult dose reduced in proportion to body-weight

• By slow intravenous injection, hypothyroid coma, 5–20 micrograms repeated every 12 hours or as often as every 4 hours if necessary; alternatively initially

50 micrograms then 25 micrograms every 8 hours reducing to 25 micrograms twice daily

Liothyronine sodium (Non-proprietary) Tablets, scored, liothyronine sodium 20 micrograms, net price 28-tab pack = £102.30

Important Patients switched to a different brand should be monitored (particularly if pregnant or if heart disease present) as brands without a UK licence may not be bioequivalent and dose adjustment may be necessary; pregnant women or those with heart disease should undergo an early review of thyroid status, and other patients should have thyroid function assessed if experiencing a significant change in symptoms. If liothyronine is continued long-term, thyroid function tests should be repeated 1–2 months after any change of brand.

Injection, powder for reconstitution, liothyronine sodium, net price 20-microgram vial = £22.50

6.2.2 Antithyroid drugs

Antithyroid drugs are used for hyperthyroidism either to prepare patients for thyroidectomy or for long-term management. In the UK carbimazole is the most commonly used drug. Propylthiouracil should be reserved for patients who are intolerant of carbimazole or for those who experience sensitivity reactions to carbimazole (sensitivity is not necessarily displayed to both drugs), and for whom other treatments are inappropriate. Both drugs act primarily by interfering with the synthesis of thyroid hormones.

Neutropenia and agranulocytosis

Doctors are reminded of the importance of recognising bone marrow suppression induced by carbimazole and the need to stop treatment promptly.

1. Patient should be asked to report symptoms and signs suggestive of infection, especially sore throat.

2. A white blood cell count should be performed if there is any clinical evidence of infection.

3. Carbimazole should be stopped promptly if there is clinical or laboratory evidence of neutropenia.

Carbimazole is given in a dose of 15 to 40 mg daily; higher doses should be prescribed under specialist supervision only. This dose is continued until the patient becomes euthyroid, usually after 4 to 6 weeks and the dose is then gradually reduced to a maintenance dose of 5 to 15 mg. Therapy is usually given for 12 to 18 months. Treatment in children should be undertaken by a specialist, see BNF for Children. Rashes and pruritus are common but they can be treated with antihistamines without discontinuing therapy; alternatively propylthiouracil can be substituted. All patients should be advised to report any sore throat immediately because of the rare complication of agranulocytosis (see Neutropenia and Agranulocytosis, above).

Propylthiouracil is given in a dose of 200 to 400 mg daily in divided doses in adults and this dose is maintained until the patient becomes euthyroid; the dose may then be gradually reduced to a maintenance dose of 50 to 150 mg daily in divided doses.

Over-treatment with antithyroid drugs can result in the rapid development of hypothyroidism and should be avoided particularly during pregnancy because it can cause fetal goitre.
A combination of carbimazole, 40 to 60 mg daily with levothyroxine, 50 to 150 micrograms daily, may be used in a blocking-replacement regimen; therapy is usually given for 18 months. The blocking-replacement regimen is not suitable during pregnancy.

Iodine has been used as an adjunct to antithyroid drugs for 10 to 14 days before partial thyroidectomy; however, there is little evidence of a beneficial effect. Iodine should not be used for long-term treatment because its antithyroid action tends to diminish.

Radioactive sodium iodide (¹³¹I) solution is used increasingly for the treatment of thyrotoxicosis at all ages, particularly where medical therapy or compliance is a problem, in patients with cardiac disease, and in patients who relapse after thyroidectomy.

Propranolol is useful for rapid relief of thyrotoxic symptoms and may be used in conjunction with antithyroid drugs or as an adjunct to radioactive iodine. Beta-blockers are also useful in neonatal thyrotoxicosis and in supraventricular arrhythmias due to hyperthyroidism. Propranolol has been used in conjunction with iodine to prepare mildly thyrotoxic patients for surgery but it is preferable to make the patient euthyroid with carbimazole. Laboratory tests of thyroid function are not altered by beta-blockers. Most experience in treating thyrotoxicosis has been gained with propranolol but nadolol is also used. For doses and preparations of beta-blockers see section 2.4.

Thyrotoxic crisis (‘thyroid storm’) requires emergency treatment with intravenous administration of fluids, propranolol (5 mg) and hydrocortisone (100 mg every 6 hours, as sodium succinate), as well as oral iodine solution and carbimazole or propylthiouracil which may need to be administered by nasogastric tube.

Pregnancy Radioactive iodine therapy is contra-indicated during pregnancy. Propylthiouracil and carbimazole can be given but the blocking-replacement regimen (see above) is not suitable. Rarely, carbimazole has been associated with congenital defects, including aplasia cutis of the neonate, therefore propylthiouracil remains the drug of choice during the first trimester of pregnancy. In the second trimester, consider switching to carbimazole because of the potential risk of hepatotoxicity with propylthiouracil. Both propylthiouracil and carbimazole cross the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves’ disease tend to fall during pregnancy).

Breast-feeding Carbimazole and propylthiouracil are present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used.

### CARBIMAZOLE

**Indications** hyperthyroidism

**Contra-indications** severe blood disorders

**Hepatic impairment** use with caution in mild to moderate impairment; avoid in severe impairment

**Pregnancy** neonatal goitre and hypothyroidism; has been associated with congenital defects including aplasia cutis of the neonate; see also notes above

**Breast-feeding** amount in milk may be sufficient to affect neonatal thyroid function therefore lowest effective dose should be used; see also notes above

**Side-effects** nausea, mild gastro-intestinal disturbances, taste disturbance, headache, fever, malaise, rash, pruritus, arthralgia; rarely myopathy, alopecia, bone marrow suppression (including pancytopenia and agranulocytosis, see Neutropenia and Agranulocytosis above), and jaundice

Counselling Warn patient to tell doctor immediately if sore throat, mouth ulcers, bruising, fever, malaise, or non-specific illness develops

- See notes above

### PROPYLTHIOURACIL

**Indications** hyperthyroidism

**Cautions** monitor for hepatotoxicity

**Hepatotoxicity** Severe hepatic reactions have been reported, including fatal cases and cases requiring liver transplant—discontinue if significant liver-enzyme abnormalities develop

Counselling Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, dark urine, or pruritus develop

**Hepatic impairment** reduce dose (see also Hepatotoxicity above)

**Renal impairment** use three-quarters normal dose if eGFR 10–50 mL/minute/1.73 m²; use half normal dose if eGFR less than 10 mL/minute/1.73 m²

**Pregnancy** neonatal goitre and hypothyroidism; see also notes above

**Breast-feeding** monitor infant’s thyroid status but amount in milk probably too small to affect infant; high doses may affect neonatal thyroid function; see also notes above

**Side-effects** see under Carbimazole; leucopenia; rarely cutaneous vasculitis, thrombocytopenia, aplastic anaemia, hypoprothrombinaemia, hepatic disorders (including hepatitis, hepatic failure, encephalopathy, hepatic necrosis; see also Hepato-
6.3 Corticosteroids

6.3.1 Replacement therapy

The adrenal cortex normally secretes hydrocortisone (cortisol) which has glucocorticoid activity and weak mineralocorticoid activity. It also secretes the mineralocorticoid aldosterone.

In deficiency states, physiological replacement is best achieved with a combination of hydrocortisone (section 6.3.2) and the mineralocorticoid fludrocortisone; hydrocortisone alone does not usually provide sufficient mineralocorticoid activity for complete replacement.

In Addison’s disease or following adrenalectomy, hydrocortisone 20 to 30 mg daily by mouth is usually required. This is given in 2 doses, the larger in the morning and the smaller in the evening, mimicking the normal diurnal rhythm of cortisol secretion. The optimum daily dose is determined on the basis of clinical response. Glucocorticoid therapy is supplemented by fludrocortisone 50 to 300 micrograms daily.

In acute adrenocortical insufficiency, hydrocortisone is given intravenously (preferably as sodium succinate) in doses of 100 mg every 6 to 8 hours in sodium chloride intravenous infusion 0.9%.

In hypopituitarism glucocorticoids should be given as in adrenocortical insufficiency, but since production of aldosterone is also regulated by the renin-angiotensin system a mineralocorticoid is not usually required. Additional replacement therapy with levothyroxine (section 6.2.1) and sex hormones (section 6.4) should be given as indicated by the pattern of hormone deficiency.

FLUDCORTRISONE ACETATE

Indications mineralocorticoid replacement in adrenocortical insufficiency

Cautions section 6.3.2; interactions: Appendix 1 (corticosteroids)

Contra-indications section 6.3.2

Hepatic impairment section 6.3.2

Renal impairment section 6.3.2

Pregnancy section 6.3.2

Breast-feeding section 6.3.2

Side-effects section 6.3.2

Dose

50–300 micrograms daily; CHILD 1 month–18 years see BNF for Children

Florinef® (Squibb) Tablets, scored, fludrocortisone acetate 100 micrograms. Net price 100-tab pack = £5.05. Label: 10, steroid card

6.3.2 Glucocorticoid therapy

In comparing the relative potencies of corticosteroids in terms of their anti-inflammatory (glucocorticoid) effects it should be borne in mind that high glucocorticoid activity in itself is of no advantage unless it is accompanied by relatively low mineralocorticoid activity (see Disadvantages of Corticosteroids below). The mineralocorticoid activity of fludrocortisone (section 6.3.1) is so high that its anti-inflammatory activity is of no clinical relevance. The table below shows equivalent anti-inflammatory doses.

Equivalent anti-inflammatory doses of corticosteroids

The relatively high mineralocorticoid activity of hydrocortisone, and the resulting fluid retention, makes it unsuitable for disease suppression on a long-term basis. However, hydrocortisone can be used for adrenal replacement therapy (section 6.3.1). Hydrocortisone is used on a short-term basis by intravenous injection for the emergency management of some conditions. The relatively moderate anti-inflammatory potency of hydrocortisone also makes it a useful topical corticosteroid for the management of inflammatory skin conditions because side-effects (both topical and systemic) are less marked (section 13.4).

Prednisolone and prednisone have predominantly glucocorticoid activity. Prednisolone is the corticosteroid most commonly used by mouth for long-term disease suppression.

Betamethasone and dexamethasone have very high glucocorticoid activity in conjunction with insignificant mineralocorticoid activity. This makes them particularly suitable for high-dose therapy in conditions where fluid retention would be a disadvantage.

Betamethasone and dexamethasone also have a long duration of action and this, coupled with their lack of mineralocorticoid action makes them particularly suitable for conditions which require suppression of corticotropin (corticotrophin) secretion (e.g. congenital adrenal hyperplasia). Some esters of betamethasone and of beclometasone (beclometasone) exert a considerably more marked topical effect (e.g. on the skin or the lungs) than when given by mouth; use is made of this to obtain topical effects whilst minimising systemic side-effects (e.g. for skin applications and asthma inhalations).

Deflazacort has a high glucocorticoid activity; it is derived from prednisolone.
Use of corticosteroids

Dosages of corticosteroids vary widely in different diseases and in different patients. If the use of a corticosteroid can save or prolong life, as in exfoliative dermatitis, pemphigus, acute leukaemia or acute transplant rejection, high doses may need to be given, because the complications of therapy are likely to be less serious than the effects of the disease itself.

When long-term corticosteroid therapy is used in some chronic diseases, the adverse effects of treatment may become greater than the disabilities caused by the disease. To minimise side-effects the maintenance dose should be kept as low as possible.

When potentially less harmful measures are ineffective corticosteroids are used topically for the treatment of inflammatory conditions of the skin (section 13.4). Corticosteroids should be avoided or used only under specialist supervision in psoriasis (section 13.5).

Corticosteroids are used both topically (by rectum) and systemically (by mouth or intravenously) in the management of ulcerative colitis and Crohn’s disease (section 1.5). They are also included in locally applied creams for haemorrhoids (section 1.7.2).

Use can be made of the mineralocorticoid activity of fludrocortisone to treat postural hypotension in autonomic neuropathy (section 6.1.5).

High-dose corticosteroids should be avoided for the management of septic shock. However, there is evidence that administration of lower doses of hydrocortisone (50 mg intravenously every 6 hours) and fludrocortisone (50 micrograms daily by mouth) is of benefit in adrenocortical insufficiency resulting from septic shock.

Dexamethasone and betamethasone have little if any mineralocorticoid action and their long duration of action makes them particularly suitable for suppressing corticotropin secretion in congenital adrenal hyperplasia where the dose should be tailored to clinical response and by measurement of adrenal androgens and 17-hydroxyprogesterone. In common with all glucocorticoids their suppressive action on the hypothalamic-pituitary-adrenal axis is greatest and most prolonged when they are given at night. In most individuals a single dose of 1 mg of dexamethasone at night, is sufficient to inhibit corticotropin secretion for 24 hours. This is the basis of the ‘overnight dexamethasone suppression test’ for diagnosing Cushing’s syndrome.

Betamethasone and dexamethasone are also appropriate for conditions where water retention would be a disadvantage.

A corticosteroid may be used in the management of raised intracranial pressure or cerebral oedema that occurs as a result of malignancy (see also Prescribing in Palliative Care p.); high doses of betamethasone or dexamethasone are generally used. However, a corticosteroid should not be used for the management of head injury or stroke because it is unlikely to be of benefit and may even be harmful.

In acute hypersensitivity reactions such as angioedema of the upper respiratory tract and anaphylaxis, corticosteroids are indicated as an adjunct to emergency treatment with adrenaline (epinephrine) (section 3.4.3). In such cases hydrocortisone (as sodium succinate) by intravenous injection in a dose of 100 to 300 mg may be required.
steroid replacement, in patients who have taken more than 10 mg prednisolone daily (or equivalent) within 3 months of surgery, is:

- **Minor surgery under general anaesthesia**—usual oral corticosteroid dose on the morning of surgery or hydrocortisone 25–50 mg (usually the sodium succinate) intravenously at induction; the usual oral corticosteroid dose is recommenced after surgery
- **Moderate or major surgery**—usual oral corticosteroid dose on the morning of surgery and hydrocortisone 25–50 mg 3 times a day by intravenous injection for 24 hours after moderate surgery or for 48–72 hours after major surgery; the usual pre-operative oral corticosteroid dose is recommenced on stopping hydrocortisone injections

Patients on long-term corticosteroid treatment should carry a Steroid Treatment Card (see p. 487) which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment.

**Infections**

Prolonged courses of corticosteroids increase susceptibility to infections and severity of infections; clinical presentation of infections may also be atypical. Serious infections e.g. septicemia and tuberculosis may reach an advanced stage before being recognised, and amoebiasis or strongyloidiasis may be activated or exacerbated (exclude before initiating a corticosteroid in those at risk or with suggestive symptoms). Fungal or viral ocular infections may also be exacerbated (see also section 11.4.1).

**Chickenpox** Unless they have had chickenpox, patients receiving oral or parenteral corticosteroids for purposes other than replacement should be regarded as being at risk of severe chickenpox (see Steroid Treatment Card). Manifestations of fulminant illness include pneumonia, hepatitis and disseminated intravascular coagulation; rash is not necessarily a prominent feature.

Passive immunisation with varicella–zoster immunoglobulin (section 14.5.2) is needed for exposed non-immune patients receiving systemic corticosteroids or for those who have used them within the previous 3 months. Confirmed chickenpox warrants specialist care and urgent treatment (section 5.3.2.1). Corticosteroids should not be stopped and dosage may need to be increased.

Topical, inhaled or rectal corticosteroids are less likely to be associated with an increased risk of severe chickenpox.

**Measles** Patients taking corticosteroids should be advised to take particular care to avoid exposure to measles and to seek immediate medical advice if exposure occurs. Prophylaxis with intramuscular normal immunoglobulin (section 14.5.1) may be needed.

**Withdrawal of corticosteroids**

The magnitude and speed of dose reduction in corticosteroid withdrawal should be determined on a case-by-case basis, taking into consideration the underlying condition that is being treated, and individual patient factors such as the likelihood of relapse and the duration of corticosteroid treatment. **Gradual withdrawal of systemic corticosteroids should be considered in those whose disease is unlikely to relapse and have:**

- received more than 40 mg prednisolone (or equivalent) daily for more than 1 week;
- been given repeat doses in the evening;
- received more than 3 weeks’ treatment;
- recently received repeated courses (particularly if taken for longer than 3 weeks);
- taken a short course within 1 year of stopping long-term therapy;
- other possible causes of adrenal suppression.

Systemic corticosteroids may be stopped abruptly in those whose disease is unlikely to relapse and who have received treatment for 3 weeks or less and who are not included in the patient groups described above.

During corticosteroid withdrawal the dose may be reduced rapidly down to physiological doses (equivalent to prednisolone 7.5 mg daily) and then reduced more slowly. Assessment of the disease may be needed during withdrawal to ensure that relapse does not occur.

**STEROID TREATMENT CARD**

I am a patient on STEROID treatment which must not be stopped suddenly

- If you have been taking this medicine for more than three weeks, the dose should be reduced gradually when you stop taking steroids unless your doctor says otherwise.
- Read the patient information leaflet given with the medicine.
- Always carry this card with you and show it to anyone who treats you (for example a doctor, nurse, pharmacist or dentist). For one year after you stop the treatment, you must mention that you have taken steroids.
- If you become ill, or if you come into contact with anyone who has an infectious disease, consult your doctor promptly. If you have never had chickenpox, you should avoid close contact with people who have chickenpox or shingles. If you do come into contact with chickenpox, see your doctor urgently.
- Make sure that the information on the card is kept up to date.
Psychiatric reactions

Systemic corticosteroids, particularly in high doses, are linked to psychiatric reactions including euphoria, nightmares, insomnia, irritability, mood lability, suicidal thoughts, psychotic reactions, and behavioural disturbances. A serious paranoid state or depression with risk of suicide can be induced, particularly in patients with a history of mental disorder. These reactions frequently subside on reducing the dose or discontinuing the corticosteroid but they may also require specific management. Patients should be advised to seek medical advice if psychiatric symptoms (especially depression and suicidal thoughts) occur and they should also be alert to the rare possibility of such reactions during withdrawal of corticosteroid treatment.

Systemic corticosteroids should be prescribed with care in those predisposed to psychiatric reactions, including those who have previously suffered corticosteroid-induced psychosis, or who have a personal or family history of psychiatric disorders.

Advice to patients

A patient information leaflet should be supplied to every patient when a systemic corticosteroid is prescribed. Patients should especially be advised of the following (for details, see Infections, Adrenal Suppression, Psychiatric Reactions, and Withdrawal of Corticosteroids above):

- **Immunosuppression**. Prolonged courses of corticosteroids can increase susceptibility to infection and serious infections can go unrecognised. Unless already immune, patients are at risk of severe chickenpox and should avoid close contact with people who have chickenpox or shingles. Similarly, precautions should also be taken against contracting measles.

- **Adrenal suppression**. If the corticosteroid is given for longer than 3 weeks, treatment must not be stopped abruptly. Adrenal suppression can last for a year or more after stopping treatment and the patient must mention the course of corticosteroid when receiving treatment for any illness or injury.

- **Mood and behaviour changes**. Corticosteroid treatment, especially with high doses, can alter mood and behaviour early in treatment—the patient can become confused, irritable and suffer from delusion and suicidal thoughts. These effects can also occur when corticosteroid treatment is being withdrawn. Medical advice should be sought if worrying psychological changes occur.

- **Other serious effects**. Serious gastro-intestinal, musculoskeletal, and ophthalmic effects which require medical help can also occur; for details see Side-effects of Corticosteroids, p. 487.

Hepatic impairment

When corticosteroids are administered orally or parenterally, the plasma-drug concentration may be increased in patients with hepatic impairment. Corticosteroids should be used with caution in hepatic impairment and the patient should be monitored closely.

Renal impairment

Oral and parenteral preparations of corticosteroids should be used with caution in patients with renal impairment.

Pregnancy and breast-feeding

The benefit of treatment with corticosteroids during pregnancy and breast-feeding outweighs the risk; pregnant women with fluid retention should be monitored closely. Corticosteroid cover is required during labour. Following a review of the data on the safety of systemic corticosteroids used in pregnancy and breast-feeding the CSM (May 1998) has concluded:

- corticosteroids vary in their ability to cross the placenta; betamethasone and dexamethasone cross the placenta readily while 88% of prednisolone is inactivated as it crosses the placenta;

- there is no convincing evidence that systemic corticosteroids increase the incidence of congenital abnormalities such as cleft palate or lip;

- when administration is prolonged or repeated during pregnancy, systemic corticosteroids increase the risk of intra-uterine growth restriction; there is no evidence of intra-uterine growth restriction following short-term treatment (e.g. prophylactic treatment for neonatal respiratory distress syndrome);

- any adrenal suppression in the neonate following prenatal exposure usually resolves spontaneously after birth and is rarely clinically important;

- prednisolone appears in small amounts in breast milk but maternal doses of up to 40 mg daily are unlikely to cause systemic effects in the infant; infants should be monitored for adrenal suppression if the mothers are taking a higher dose.
Side-effects of corticosteroids

Overdosage or prolonged use can exaggerate some of the normal physiological actions of corticosteroids leading to mineralocorticoid and glucocorticoid side-effects.

Mineralocorticoid side-effects include hypertension, sodium and water retention, and potassium and calcium loss. They are most marked with fludrocortisone, but are significant with hydrocortisone, corticotropin, and tetracosactide. Mineralocorticoid actions are negligible with the high potency glucocorticoids, betamethasone and dexamethasone, and occur only slightly with methylprednisolone, prednisolone, and triamcinolone.

Glucocorticoid side-effects include diabetes and osteoporosis (section 6.6), which is a danger, particularly in the elderly, as it can result in osteoporotic fractures for example of the hip or vertebrae; in addition high doses are associated with avascular necrosis of the femoral head. Muscle wasting (proximal myopathy) can also occur. Corticosteroid therapy is also weakly linked with peptic ulceration and perforation; there is no conclusive evidence that the use of enteric-coated preparations of prednisolone reduces the risk of peptic ulceration. See also Psychiatric Reactions, p. 486.

High doses of corticosteroids can cause Cushing’s syndrome, with moon face, striae, and acne; it is usually reversible on withdrawal of treatment, but this must always be gradually tapered to avoid symptoms of acute adrenal insufficiency (important: see also Adrenal Suppression, p. 484).

In children, administration of corticosteroids may result in suppression of growth. For the effect of corticosteroids given in pregnancy, see Pregnancy and Breast-feeding, p. 486.

Side-effects can be minimised by using lowest effective dose for minimum period possible.

Other side-effects include: gastro-intestinal effects: dyspepsia, abdominal distension, acute pancreatitis, oesophageal ulceration and candidiasis; musculoskeletal effects: muscle weakness, vertebral and long bone fractures, tendon rupture; endocrine effects: menstrual irregularities and amenorrhoea, hirsutism, weight gain, hypercholesterolaemia, hyperlipidaemia, negative nitrogen and calcium balance, increased appetite; increased susceptibility to and severity of infection, reactivation of dormant tuberculosis; neuropsychiatric effects: psychological dependence, insomnia, increased intracranial pressure with papilloedema in children (usually after withdrawal), aggravation of schizophrenia, aggravation of epilepsy; ophthalmic effects: glaucoma, papilloedema, posterior subcapsular cataracts, corneal or scleral thinning and exacerbation of ophthalmic viral or fungal disease, increased intra-ocular pressure, exophthalmos; also impaired healing, petechiae, ecchymoses, facial erythema, suppression of skin test reactions, urticaria, hyperhidrosis, skin atrophy, bruising, telangiectasia, myocardial rupture following recent myocardial infarction, congestive heart failure, leucocytosis, hyperglycaemia, thromboembolism, nausea, malaise, hiccup, headache, vertigo.

For other references to the side-effects of corticosteroids see section 3.2 (asthma), section 11.4 (eye) and section 13.4 (skin).
Pregnancy  see notes above  
Breast-feeding  see notes above  
Side-effects  see notes above; also perineal irritation may follow intravenous administration of the phosphate ester  
Dose  
- By mouth, usual range 0.5–10 mg daily; CHILD 10–100 micrograms/kg daily; see also Administration (above)  
- By intramuscular injection or slow intravenous injection or infusion, see under preparations  
Dexamethasone (Non-proprietary)  
Tablets, dexamethasone 500 micrograms, net price 28-tab pack = £48.00; 2 mg, 50-tab pack = £21.16. 100-tab pack = £12.05. Label: 10, steroid card, 21 Oral solution, sugar-free, dexamethasone (as sodium phosphate) 2 mg/5 mL, net price 75-mL = £32.50, 150-mL = £42.30. Label: 10, steroid card, 21 Brands include Dexone®, Martapone®.  
Injection, dexamethasone (as sodium phosphate) 4 mg/mL, net price 1-mL amp = 91p. Label: 10, steroid card  
Dose  By intramuscular injection or slow intravenous injection or infusion, 0.4–20 mg; CHILD 200–400 micrograms/kg daily  
Cerebral oedema, by intravenous injection 8–16 mg initially, then 5 mg by intramuscular injection or intravenous injection every 6 hours as required for 2–4 days then gradually reduced and stopped over 5–7 days. Adjunctive treatment of bacterial meningitis, (starting before or before first dose of antibacterial treatment), [unlicensed indication], by intravenous injection 8.3 mg every 6 hours for 4 days, CHILD 3 months–18 years see BNF for Children.  
Injection, dexamethasone (as sodium phosphate) 3.3 mg/mL, net price 1-mL amp = £1.14, 2-mL vial = £4.80. Label: 10, steroid card  
Dose  By intramuscular injection or slow intravenous injection or infusion, 0.4–20 mg; CHILD 167–333 micrograms/kg daily  
Cerebral oedema associated with malignancy, by intravenous injection 8.3 mg initially, then 3.3 mg by intramuscular injection every 6 hours as required for 2–4 days then gradually reduced and stopped over 5–7 days. Adjunctive treatment of bacterial meningitis, (starting before or before first dose of antibacterial treatment), [unlicensed indication], by intravenous injection 8.3 mg every 6 hours for 4 days, CHILD 3 months–18 years see BNF for Children.  
Dose  By mouth, replacement therapy, 20–30 mg daily in divided doses—see section 6.3.1; CHILD 1 month–18 years see BNF for Children  
By intramuscular injection or slow intravenous injection or infusion, 100–500 mg, 3–4 times in 24 hours or as required; CHILD by slow intravenous injection up to 1 year 25 mg, 1–5 years 50 mg, 6–12 years 100 mg  
Hydrocortisone (Non-proprietary)  
Tablets, scored, hydrocortisone 10 mg, net price 30-tab pack = £58.52, 20 mg, 30-tab pack = £65.03. Label: 10, steroid card.  
Efcortesol® (AMCo)  
Injection, hydrocortisone 100 mg (as sodium phosphate)/mL, net price 1-mL amp = £1.08, 5-mL amp = £4.89. Label: 10, steroid card.  
Solu-Cortef® (Pharmacia)  
Injection, powder for reconstitution, hydrocortisone (as sodium succinate). Net price 100-mg vial = 92p. 100-mg vial with 2-mL amp water for injections = £1.16. Label: 10, steroid card  
Modified release  
Plenadren® (ViroPharma)  
Tablets, m/4, hydrocortisone 5 mg (pink), net price 50-tab pack = £24.50; 20 mg (white), 50-tab pack = £40.00. Label: 10, steroid card.  
Dose  replacement in adrenocortical insufficiency, ADULT over 18 years, usual dose 20–30 mg once daily in the morning, adjusted according to response.  
Note  When switching from immediate-release hydrocortisone tablets to Plenadren® use same total daily dose. Bioavailability of Plenadren® lower than immediate-release tablets—monitor clinical response  
METHYLPREDNISOLONE  
Indications  suppression of inflammatory and allergic disorders; severe inflammatory bowel disease (section 1.5); cerebral oedema associated with malignancy; see also notes above; rheumatic disease (section 10.1.2); skin (section 13.4)  
Cautions  see notes above; also rapid intravenous administration of large doses associated with cardiovascular collapse  
Contra-indications  see notes above  
Hepatic impairment  see notes above  
Renal impairment  see notes above  
Pregnancy  see notes above  
Breast-feeding  see notes above  
Side-effects  see notes above  
Dose  
- By mouth, usual range 2–40 mg daily; see also Administration (above)  
- By intramuscular injection or slow intravenous injection or infusion, initially 10–500 mg; graft rejection, up to 1 g daily by intravenous infusion for up to 3 days  
Medrone® (Pfizer)  
Tablets, scored, methylprednisolone 2 mg (pink), net price 30-tab pack = £3.88; 4 mg, 30-tab pack = £6.19; 16 mg, 30-tab pack = £17.17; 100 mg (blue), 20-tab pack = £48.32. Label: 10, steroid card.  
1. (BNF) restriction does not apply where administration is for saving life in emergency
**Solu-Medrone®** *(Pharmacia)*

Injection, powder for reconstitution, methylprednisolone (as sodium succinate) (all with solvent). Net price 40-mg vial = £1.58; 125-mg vial = £4.75; 500-mg vial = £9.60; 1-g vial = £17.30; 2-g vial = £32.86. Label: 10, steroid card.

**Intramuscular depot**

Depo-Medrone® *(Pharmacia)*

Injection (aqueous suspension), methylprednisolone acetate 40 mg/mL. Net price 1-mL vial = £3.44; 2-mL vial = £5.18; 3-mL vial = £8.96. Label: 10, steroid card.

Dose *by deep intramuscular injection* into gluteal muscle, 40–120 mg, a second injection may be given after 2–3 weeks if required.

---

**PREDNISOLONE**

**Indications** suppression of inflammatory and allergic disorders; see also notes above; inflammatory bowel disease (section 1.5); asthma (section 3.1 and section 3.2); croup (section 3.1); immunosuppression (section 8.2.2); rheumatic disease (section 10.1.2); eye (section 11.1.4.1); ear (section 12.1.1)

**Cautions** see notes above; also Duchenne’s muscular dystrophy (possible transient rhabdomyolysis and myoglobinuria following strenuous physical activity)

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

**Dose**

- By mouth, initially, up to 10–20 mg daily (severe disease, up to 60 mg daily), preferably taken in the morning after breakfast; can often be reduced within a few days but may need to be continued for several weeks or months

  Maintenance, usual range, 2.5–15 mg daily, but higher doses may be needed; cushingoid side-effects increasingly likely with doses above 7.5 mg daily

- By *intramuscular injection*, prednisolone acetate (section 10.1.2.2), 25–100 mg once or twice weekly

**Prednisolone** *(Non-proprietary)*

Tablets, prednisolone 1 mg, net price 28-tab pack = £1.03; 5 mg, 28-tab pack = £1.31; 25 mg, 56-tab pack = £4.00. Label: 10, steroid card, 21

Tablets, e/c, prednisolone 2.5 mg (brown), net price 28-tab pack = £1.86; 100-tab pack = £13.43; 5 mg (red), 28-tab pack = £1.89, 100-tab pack = £13.54. Label: 5, 10, steroid card, 25

Brands include *Deltaisol®*, *Kenalog®*

Soluble tablets, prednisolone 5 mg (as sodium phosphate), net price 30-tab pack = £42.78. Label: 10, steroid card, 13, 21

Injection, see section 10.1.2.2

**Prednisone**

**Indications** moderate to severe rheumatoid arthritis (section 10.1.2.1)

---

**Sex hormones**

**6.4.1 Female sex hormones and their modulators**

**6.4.2 Male sex hormones and antagonists**

**6.4.3 Anabolic steroids**

---

**6.4.1 Female sex hormones and their modulators**

**6.4.1.1 Oestrogens and HRT**

**6.4.1.2 Progestogens and progestosterone receptor modulators**

**6.4.1.3 Oestrogens and HRT**

Oestrogens are necessary for the development of female secondary sexual characteristics; they also stimulate myometrial hypertrophy with endometrial hyperplasia.

In terms of oestrogenic activity *natural oestrogens* (estradiol (oestradiol), estrone (oestrone), and estriol (oestradiol)) have a more appropriate profile for hormone replacement therapy (HRT) than *synthetic oestrogens* (ethinylestradiol (ethinyloestradiol) and mestranol). Tibolone has oestrogenic, progestogenic and weak androgenic activity.
Oestrogen therapy is given cyclically or continuously for a number of gynaecological conditions. If long-term therapy is required in women with a uterus, a progestogen should normally be added to reduce the risk of cystic hyperplasia of the endometrium (or of endometriotic foci in women who have had a hysterectomy) and possible transformation to cancer. Oestrogens are no longer used to suppress lactation because of their association with thromboembolism.

Hormone replacement therapy

Hormone replacement therapy (HRT) with small doses of an oestrogen (together with a progestogen in women with a uterus) is appropriate for alleviating menopausal symptoms such as vaginal atrophy or vasomotor instability. Oestrogen given systemically in the perimenopausal and postmenopausal period or tibolone given in the postmenopausal period also diminish postmenopausal osteoporosis (section 6.6.1) but other drugs (section 6.6) are preferred. Menopausal atrophic vaginitis may respond to a short course of a topical vaginal oestrogen preparation (section 7.2.1) used for a few weeks and repeated if necessary.

Systemic therapy with an oestrogen or drugs with oestrogenic properties alleviates the symptoms of oestrogen deficiency such as vasomotor symptoms. Tibolone combines oestrogenic and progestogenic activity with weak androgenic activity; it is given continuously, without cyclical progestogen.

HRT may be used in women with early natural or surgical menopause (before age 45 years), since they are at high risk of osteoporosis. For early menopause, HRT can be given until the approximate age of natural menopause (i.e. until age 50 years). Alternatives to HRT should be considered if osteoporosis is the main concern (section 6.6).

Clonidine (section 2.5.2 and section 4.7.4.2) may be used to reduce vasomotor symptoms in women who cannot take an oestrogen, but clonidine may cause unacceptable side-effects.

HRT increases the risk of venous thromboembolism, stroke, endometrial cancer (reduced by a progestogen), breast cancer, and ovarian cancer; there is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. For details of these risks see HRT Risk table, below.

- Tibolone increases the risk of breast cancer but to a lesser extent than with combined HRT.
- Evidence suggests an increased risk of endometrial cancer with tibolone. After 2.7 years of use (in women of average age 68 years), 1 extra case of endometrial hyperplasia and 4 extra cases of endometrial cancer were diagnosed compared with placebo users.
- The risk of endometrial cancer cannot be reliably estimated in those using combined HRT because the addition of progestogen for at least 10 days per 28-day cycle greatly reduces the additional risk, and addition of a daily progestogen eliminates the additional risk. The risk of endometrial cancer in women who have not used HRT increases with body mass index (BMI); the increased risk of endometrial cancer in users of oestrogen-only HRT or tibolone is more apparent in women who are not overweight.
- Limited data does not suggest an increased risk of thromboembolism with tibolone compared with combined HRT or women not taking HRT.
- Although the level of risk of thromboembolism associated with non-oral routes of administration of HRT has not been established, it may be lower for the transdermal route.
- Tibolone increases the risk of stroke about 2.2 times from the first year of treatment; risk of stroke is age-dependent and therefore the absolute risk of stroke with tibolone increases with age.
- Increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause.
- There is insufficient data to draw a conclusion on the risk of coronary heart disease with tibolone.

**Note** Where background incidence or additional cases have not been included in the table, this indicates a lack of available data. NS indicates a non-significant difference.

---

1. Tibolone increases the risk of breast cancer but to a lesser extent than with combined HRT.
2. Evidence suggests an increased risk of endometrial cancer with tibolone. After 2.7 years of use (in women of average age 68 years), 1 extra case of endometrial hyperplasia and 4 extra cases of endometrial cancer were diagnosed compared with placebo users.
3. The risk of endometrial cancer cannot be reliably estimated in those using combined HRT because the addition of progestogen for at least 10 days per 28-day cycle greatly reduces the additional risk, and addition of a daily progestogen eliminates the additional risk. The risk of endometrial cancer in women who have not used HRT increases with body mass index (BMI); the increased risk of endometrial cancer in users of oestrogen-only HRT or tibolone is more apparent in women who are not overweight.
4. Limited data does not suggest an increased risk of thromboembolism with tibolone compared with combined HRT or women not taking HRT.
5. Although the level of risk of thromboembolism associated with non-oral routes of administration of HRT has not been established, it may be lower for the transdermal route.
6. Tibolone increases the risk of stroke about 2.2 times from the first year of treatment; risk of stroke is age-dependent and therefore the absolute risk of stroke with tibolone increases with age.
7. Increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause.
8. There is insufficient data to draw a conclusion on the risk of coronary heart disease with tibolone.
The minimum effective dose of HRT should be used for the shortest duration. Treatment should be reviewed at least annually and for osteoporosis alternative treatments considered (section 6.6). HRT does not prevent coronary heart disease or protect against a decline in cognitive function and it should not be prescribed for these purposes. Experience of treating women over 65 years with HRT is limited.

For the treatment of menopausal symptoms the benefits of short-term HRT outweigh the risks in the majority of women, especially in those aged under 60 years.

**Risk of breast cancer** It is estimated that using all types of HRT, including tibolone, increases the risk of breast cancer within 1–2 years of initiating treatment, see HRT Risk table, p. 490 for details. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping.

Radiological detection of breast cancer can be made more difficult as mammographic density can increase within 5 years of stopping.

**Risk of endometrial cancer** The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT, see HRT Risk table, p. 490 for details.

In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

**Risk of ovarian cancer** Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer, see HRT Risk table, p. 490 for details; this excess risk disappears within a few years of stopping.

**Risk of venous thromboembolism** Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use, see HRT Risk table, p. 490 for details.

In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits. See below for advice on surgery.

**Travel** involving prolonged immobility further increases the risk of deep vein thrombosis, see under Travel in section 7.3.1.

**Risk of stroke** Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke. Tibolone increases the risk of stroke about 2.2 times from the first year of treatment, see HRT Risk table, p. 490 for details.

**Risk of coronary heart disease** HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause, see HRT Risk table, p. 490 for details. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

**Choice** The choice of HRT for an individual depends on an overall balance of indication, risk, and convenience. A woman with a uterus normally requires oestrogen with cyclical progestogen for the last 12 to 14 days of the cycle or a preparation which involves continuous administration of an oestrogen and a progestogen (or one which provides both oestrogenic and progestogenic activity in a single preparation). Continuous combined preparations or tibolone are not suitable for use in the perimenopause or within 12 months of the last menstrual period; women who use such preparations may bleed irregularly in the early stages of treatment—if bleeding continues endometrial abnormality should be ruled out and consideration given to changing to cyclical HRT.

An oestrogen alone is suitable for continuous use in women without a uterus. However, in endometriosis, endometrial foci may remain despite hysterectomy and the addition of a progestogen should be considered in these circumstances.

An oestrogen may be given by mouth or by transdermal administration, which avoids first-pass metabolism. For the use of topical HRT preparations see section 7.2.1.

**Contraception** HRT does not provide contraception and a woman is considered potentially fertile for 2 years after her last menstrual period if she is under 50 years, and for 1 year if she is over 50 years. A woman who is under 50 years and free of all risk factors for venous and arterial disease can use a low-oestrogen combined oral contraceptive pill (section 7.3.1) to provide both relief of menopausal symptoms and contraception; it is recommended that the oral contraceptive be stopped at 50 years of age since there are more suitable alternatives. If any potentially fertile woman needs HRT, non-hormonal contraceptive measures (such as condoms) are necessary.

Measurement of follicle-stimulating hormone can help to determine fertility, but high measurements alone (particularly in women aged under 50 years) do not necessarily preclude the possibility of becoming pregnant.

**Surgery** Major surgery under general anaesthesia, including orthopaedic and vascular leg surgery, is a predisposing factor for venous thromboembolism and it may be prudent to stop HRT 4–6 weeks before surgery (see Risk of Venous Thromboembolism, above); it should be restarted only after full mobilisation. If HRT is continued or if discontinuation is not possible (e.g. in non-elective surgery), prophylaxis with unfractionated or low molecular weight heparin and graduated compression hosiery is advised.

**Reasons to stop HRT** For circumstances in which HRT should be stopped, see p. 537.

---

**OESTROGENS FOR HRT**

Note: Relates only to small amounts of oestrogens given for hormone replacement therapy.

**Indications** see notes above and under preparations.

**Cautions** prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer (see notes above); migraine (or migraine-like...

---

---
headaches; diabetes (increased risk of heart disease); history of breast nodules or fibrocystic disease—closely monitor breast status (risk of breast cancer, see notes above); risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative); uterine fibroids may increase in size, symptoms of endometriosis may be exacerbated; history of endometrial hyperplasia; factors predisposing to thromboembolism (see notes above); presence of anti-phospholipid antibodies (increased risk of thrombotic events); increased risk of gall-bladder disease reported; hypophysal tumours; acute porphyria (see section 9.8.2); interactions: Appendix 1 (oestrogens)

Other conditions
The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present, see above). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

Contra-indications
oestrogen-dependent cancer, history of breast cancer, active thrombophlebitis, active or recent arterial thromboembolic disease (e.g. angina or myocardial infarction), venous thromboembolism, or history of recurrent venous thromboembolism (unless already on anticoagulant treatment), thrombophilic disorder, liver disease (where liver function tests have failed to return to normal).

Dubin-Johnson and Rotor syndromes (or monitor closely), untreated endometrial hyperplasia, undiagnosed vaginal bleeding

Hepatic impairment
see Combined Hormonal Contraceptives, section 7.3.1

Renal impairment
see Other Conditions, above

Pregnancy
see Combined Hormonal Contraceptives, section 7.3.1

Breast-feeding
see Combined Hormonal Contraceptives, section 7.3.1

Side-effects
see notes above for risks of long-term use: nausea and vomiting, abdominal cramps and bloating, weight changes, breast enlargement and tenderness, premenstrual-like syndrome, sodium and fluid retention, cholestatic jaundice, glucose intolerance, altered blood lipids—may lead to pancreatitis, rashes and chloasma, changes in libido, depression, mood changes, headache, migraine, dizziness, leg cramps (rule out venous thrombosis), vaginal candidiasis, contact lenses may irritate; transdermal delivery systems may cause contact sensitisation (possible severe hypersensitivity reaction on continued exposure), and headache has been reported on vigorous exercise

Withdrawal bleeding
Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. The aim of continuous combined HRT (where a combination of oestrogen and progestogen is taken, usually in a single tablet, throughout each 28-day treatment cycle) is to avoid bleeding, but irregular bleeding may occur during the early treatment stages (if it continues endometrial abnormality should be excluded and consideration given to cyclical HRT instead)

Dose
• See under preparations

Conceiving on patches
Patch should be removed after 3–4 days (i.e., once a week in case of 7-day patch) and replaced with fresh patch on slightly different site; recommended sites: clean, dry, unbroken areas of skin on trunk below waistline, not to be applied on or near breasts or under waistband. If patch falls off in bath allow skin to cool before applying new patch

Conjugated oestrogens with progestogen
For prescribing information on progestogens, see section 6.4.1.2

Premique® (Pfizer)
Premique® Low Dose tablets, m/r, ivory, s/c, conjugated oestrogen (equine) 300 micrograms and medroxyprogesterone acetate 1.5 mg, net price 3 x 28-tab pack = £8.15

Dose
menopausal symptoms in a woman with a uterus, 1 tablet daily continuously

Premique® tablets, s/c, blue, conjugated oestrogen (equine) 625 micrograms and medroxyprogesterone acetate 5 mg, net price 3 x 28-tab pack = £10.61

Dose
menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 tablet daily continuously

Prempar-C® (Bayer)
Prempar-C® 1.25 Calendar pack, s/c, 28 maroon tablets, conjugated oestrogens (equine) 625 micro- grams; 12 light brown tablets, norgestrel 150 micro- grams (equiv. levonorgestrel 75 micrograms), net price 3 x 40-tab pack = £8.25

Dose
menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 maroon tablet daily continuously, starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), and 1 brown tablet daily on days 17–28 of each 28-day treatment cycle; subsequent courses are repeated without interval

Prempar-C® 0.625 Calendar pack, s/c, 28 yellow tablets, conjugated oestrogens (equine) 1.25 mg; 12 light brown tablets, norgestrel 150 micrograms (equiv. levonorgestrel 75 micrograms), net price 3 x 40-tab pack = £7.40

Dose
see under 0.625 Calendar pack, but taking 1 yellow tablet daily continuously (instead of 1 maroon tablet) if symptoms not fully controlled with lower strength

Estradiol with progestogen
For prescribing information on progestogens, see section 6.4.1.2

Angelio® (Bayo)
Tablets, f/c, red, estradiol 1 mg, drospirenone 2 mg, net price 3 x 28-tab pack = £29.00

Dose
menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 12 months previously, 1 tablet daily continuously (if changing from cyclical HRT begin treatment the day after finishing oestrogen plus progestogen phase)

Cautions
use with care if an increased concentration of potassium might be hazardous

Renal impairment
avoid if eGFR less than 30 mL/minute/1.73 m²

Climagest® (Novartis)
Climagest® 1-mg tablets, 16 grey-blue, estradiol valerate 1 mg; 12 white, estradiol valerate 1 mg and norethisterone 1 mg, net price 28-tab pack = £5.51; 3 x 28-tab pack = £16.02

Dose
menopausal symptoms, 1 grey-blue tablet daily for 16 days, starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent) then 1 white tablet for 12 days; subsequent courses are repeated without interval

Climagest® 2-mg tablets, 16 blue, estradiol valerate 2 mg; 12 yellow, estradiol valerate 2 mg and norethisterone 1 mg, net price 28-tab pack = £5.51; 3 x 28-tab pack = £16.02

Dose
see Climagest® 1-mg, but starting with 1 blue tablet daily (instead of 1 grey-blue tablet) if symptoms not controlled with lower strength
Evorel® (Novartis) (SM) Tablets, pink, estradiol valerate 2 mg, norethisterone 700 micrograms, net price 1 × 28-tab pack = £9.92; 3 × 28-tab pack = £29.78. **Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus whose last menstrual period occurred over 12 months previously, 1 tablet daily continuously.

Clinorette® (ReSource Medical) (SM) Tablets, f/c, 16 white, estradiol 2 mg; 12 pink, estradiol 2 mg and norethisterone 1 mg, net price 3 × 28-tab pack = £9.23. **Dose** menopausal symptoms and osteoporosis prophylaxis (daily on 6.6), in women with a uterus, 1 white tablet daily for 16 days starting on day 5 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 pink tablet daily for 12 days; subsequent courses repeated without interval.

Cyclo-Progynova® (Meda) (TM) Cyclo-Progynova® 2-mg tablets, s/c, 11 white, estradiol valerate 2 mg; 10 brown, estradiol valerate 2 mg and norgestrel 500 micrograms (≡ levonorgestrel 250 micrograms), net price per pack = £3.11. **Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus, 1 white tablet daily for 11 days, starting on day 5 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 brown tablet daily for 10 days, followed by a 7-day tablet-free interval.

Eliste-Duet® (Meda) (TM) Eliste-Duet® 1-mg tablets, 16 white, estradiol 1 mg; 12 green, estradiol 1 mg and norethisterone acetate 1 mg, net price 3 × 28-tab pack = £9.20. **Dose** menopausal symptoms, 1 white tablet daily for 16 days starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 green tablet daily for 12 days; subsequent courses are repeated without interval.

Eliste-Duet® 2-mg tablets, 16 orange, estradiol 2 mg; 12 grey, estradiol 2 mg, norethisterone acetate 1 mg, net price 3 × 28-tab pack = £9.20. **Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1 orange tablet daily for 16 days, starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent) then 1 grey tablet daily for 12 days, subsequent courses are repeated without interval. **Elleste-Duet® Conti® tablets, f/c, grey, estradiol 2 mg, norethisterone acetate 1 mg, net price 3 × 28-tab pack = £17.02. **Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 12 months previously, 1 tablet daily on a continuous basis (if changing from cyclical HRT begin treatment at the end of scheduled bleed).

Evorel® (Oanssen) (TM) Evorel® Conti® patches, self-adshesive, (releasing estradiol approx. 50 micrograms/24 hours and norethisterone acetate approx. 170 micrograms/24 hours), net price 8-patch pack = £13.00, 24-patch pack = £37.22. Counselling, administration. **Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 patch to be applied twice weekly continuously.

Evorel® Sequi® combination pack, 4 self-adshesive patches of Evorel® 50 (releasing estradiol approx. 50 micrograms/24 hours) and 4 self-adshesive patches of Evorel® Conti® (releasing estradiol approx. 50 micrograms/24 hours and norethisterone acetate approx. 170 micrograms/24 hours), net price 8-patch pack = £11.09. Counselling, administration. **Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 Evorel® 50 patch to be applied twice weekly for 2 weeks, starting within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), followed by 1 Evorel® Conti® patch twice weekly for 2 weeks; subsequent courses are repeated without interval.

Femoston® (Abbott Healthcare) (TM) Femoston® 1 mg/10 mg tablets, f/c, 14 white, estradiol 1 mg; 14 grey, estradiol 1 mg, dydrogesterone 10 mg, net price 3 × 28-tab pack = £16.16. **Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 white tablet daily for 14 days, starting within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent) then 1 grey tablet daily for 14 days; subsequent courses repeated without interval.

Femoston® 2 mg/10 mg tablets, f/c, 14 red, estradiol 2 mg; 14 yellow, estradiol 2 mg, dydrogesterone 10 mg, net price 3 × 28-tab pack = £16.16. **Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 red tablet daily for 14 days, starting within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent) then 1 yellow tablet daily for 14 days; subsequent courses repeated without interval, where therapy required for menopausal symptoms alone. Femoston® 1 mg/10 mg given initially and Femoston® 2 mg/10 mg substituted if symptoms not controlled.

Femoston®-conti 0.5 mg/2.5 mg tablets, f/c, yellow, estradiol 0.5 mg, dydrogesterone 2.5 mg, net price 3 × 28-tab pack = £20.36. **Dose** menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously, 1 tablet daily continuously (if changing from cyclical HRT begin treatment the day after finishing oestrogen plus progesterone phase).

Femoston®-conti 1 mg/5 mg tablets, f/c, salmon, estradiol 1 mg, dydrogesterone 5 mg, net price 3 × 28-tab pack = £24.43. **Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 12 months previously, 1 tablet daily continuously (if changing from cyclical HRT begin treatment the day after finishing oestrogen plus progesterone phase).

FemSeven® Conti (TEVA UK) (TM) Patches, self-adshesive (releasing estradiol approx. 50 micrograms/24 hours and levonorgestrel approx. 7 micrograms/24 hours); net price 4-patch pack = £15.48, 12-patch pack = £44.12. Counselling, administration. **Dose** menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously, 1 patch to be applied once a week continuously.

FemSeven® Sequi (TEVA UK) (TM) Combination pack, self-adshesive patches of FemSeven® Sequi Phase 1 (releasing estradiol approx. 50 micrograms/24 hours) and of FemSeven® Sequi Phase 2 (releasing estradiol approx. 50 micrograms/24 hours and levonorgestrel approx. 10 micrograms/24 hours); net price 1-month pack (2 of each) = £13.18, 3-month pack (6 of each) = £37.54. Counselling, administration. **Dose** menopausal symptoms in women with a uterus, 1 Phase 1 patch applied once a week for 2 weeks followed by 1 Phase 2 patch once a week for 2 weeks; subsequent courses are repeated without interval.

Indivina® (Orion) (TM) Indivina® 1 mg/2.5 mg tablets, estradiol valerate 1 mg, medroxyprogesterone acetate 2.5 mg, net price 3 × 28-tab pack = £20.58. Indivina® 1 mg/5 mg tablets, estradiol valerate 1 mg, medroxyprogesterone acetate 5 mg, net price 3 × 28-tab pack = £20.58.
6.4.1 Female sex hormones and their modulators

**Estradiol only**

**Bedel®** (ReSource Medical)  
Tablets, f/c, estradiol 2 mg, net price 3 × 28-tab pack = £5.07  
Dose  
menopausal symptoms and osteoporosis prophylaxis  
(see section 6.6), with cyclical progestogen for 12–14 days of each cycle in women with a uterus, 2 mg daily starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent)

**Climaval®** (Novartis)  
Tablets, estradiol valerate 1 mg (grey-blue), net price 1 × 28-tab pack = £2.94, 3 × 28-tab pack = £8.82; 2 mg (blue), 1 × 28-tab pack = £2.94, 3 × 28-tab pack = £8.82  
Dose  
menopausal symptoms (if patient has had a hysterectomy), 1–2 mg daily

**Elleste-Solo®** (Meda)  
Elleste-Solo 1-mg tablets, estradiol 1 mg, net price 3 × 28-tab pack = £5.06  
Dose  
menopausal symptoms with cyclical progestogen for 12–14 days of each cycle in women with a uterus, 1 mg daily starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent)

**Estraderm MX®** (Novartis)  
Estraderm MX 100 patch 28-tab pack = £19.99. Counselling, administration

**Indivina®** 2 mg/5 mg tablets, estradiol valerate 2 mg, medroxyprogesterone acetate 5 mg, net price 3 × 28-tab pack = £20.58

**Dose**  
menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 3 years previously, 1 tablet daily continuously, initiate therapy with Indivina® 1 mg/2.5 mg tablets and adjust according to response, start at end of scheduled bleed if changing from cyclical HRT

**Kliofem®** (Novo Nordisk)  
Tablets, f/c, yellow, estradiol 2 mg, norethisterone acetate 1 mg, net price 3 × 28-tab pack = £11.43  
Dose  
menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 12 months previously, 1 tablet daily continuously, start at end of scheduled bleed if changing from cyclical HRT

**Nuvelle® Continuous** (Bayer)  
Tablets, f/c, pink, estradiol 2 mg, norethisterone acetate 1 mg, net price 3 × 28-tab pack = £19.00  
Dose  
menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus, 1 tablet daily for 16 days then 1 white tablet daily for 12 days; subsequent courses are repeated without interval, start treatment with red tablet at any time or if changing from cyclical HRT, start treatment the day after finishing oestrogen plus progestogen phase

**Tridestra®** (Orion)  
Tablets, 70 white, estradiol valerate 2 mg: 14 blue, estradiol valerate 2 mg and medroxyprogesterone acetate 20 mg; 7 yellow, inactive, net price 91-tab pack = £20.49  
Dose  
menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus, 1 red tablet daily for 70 days then 1 blue tablet daily for 14 days, then 1 yellow tablet daily for 7 days; subsequent courses are repeated without interval

**Trisequens®** (Novo Nordisk)  
Tablets, 12 blue, estradiol 2 mg; 10 white, estradiol 2 mg, norethisterone acetate 1 mg; 6 red, estradiol 1 mg, net price 3 × 28-tab pack = £11.10  
Dose  
menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 blue tablet daily for 12 days followed by 1 white tablet for 10 days, then 1 red tablet daily for 6 days; subsequent courses are repeated without interval

**Estradiol only**

**Elleste-Solo®** (Meda)  
Elleste-Solo 1-mg tablets, estradiol 1 mg, net price 3 × 28-tab pack = £5.06  
Dose  
menopausal symptoms with cyclical progestogen for 12–14 days of each cycle in women with a uterus, 1 mg daily starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent)

**Estraderm MX®** (Novartis)  
Patches, self-adhesive, estradiol, MX 40 patch (releasing approx. 40 micrograms/24 hours), net price 8-patch pack = £5.19; MX 80 patch (releasing approx. 80 micrograms/24 hours), 8-patch pack = £5.99. Counselling, administration

**Estradiol®** (Novartis)  
Patches, self-adhesive, estradiol, 25’’ patch (releasing approx. 25 micrograms/24 hours), net price 8-patch pack = £4.99; ‘‘27.5’’ patch (releasing approx. 37.5 micrograms/24 hours), 8-patch pack = £5.00;
‘50’ patch (releasing approx. 50 micrograms/24 hours), 8-patch pack = £5.02; ‘75’ patch (releasing approx. 75 micrograms/24 hours), 8-patch pack = £5.83; ‘100’ patch (releasing approx. 100 micrograms/24 hours), 8-patch pack = £6.06. Counselling, administration

Dose

Menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1 patch to be applied twice weekly continuously, with cyclical progesterone for 12–14 days of each cycle in women with a uterus; for menopausal symptoms, initiate therapy with 50 patch; subsequently adjust according to response

Evorel® (Janssen) Tablets, self-adhesive, estradiol, 25’ patch (releasing approx. 25 micrograms/24 hours), net price 8-patch pack = £3.42, ‘50’ patch (releasing approx. 50 micrograms/24 hours), 8-patch pack = £3.88, 24-patch pack = £11.66; ‘75’ patch (releasing approx. 75 micrograms/24 hours), 8-patch pack = £4.12; ‘100’ patch (releasing approx. 100 micrograms/24 hours), 8-patch pack = £4.28. Counselling, administration

Dose

Menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1 patch to be applied twice weekly continuously starting within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), with cyclical progesterone for 12–14 days of each cycle in women with a uterus; therapy should be initiated with Evorel 50 patch; subsequently adjust according to response; dose may be reduced to Evorel 25 patch after first month if necessary for menopausal symptoms only

FemSeven® (TEVA UK) Tablets, self-adhesive, estradiol, ‘50’ patch (releasing approx. 50 micrograms/24 hours), net price 4-patch pack = £6.04, 12-patch pack = £18.02; ‘75’ patch (releasing approx. 75 micrograms/24 hours), net price 4-patch pack = £6.98; ‘100’ patch (releasing approx. 100 micrograms/24 hours), net price 4-patch pack = £7.28. Counselling, administration

Dose

Menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1 patch to be applied once a week continuously, with cyclical progesterone for 12–14 days of each cycle in women with a uterus; initiate therapy with FemSeven 50 patches for the first few months, subsequently adjust according to response

Oestrogel® (Besins) Gel, estradiol 0.06%, net price 64-dose pump pack = £4.80. Counselling, administration

Dose

Menopausal symptoms and osteoporosis prophylaxis (see section 6.6). 2 measures (estradiol 1.5 mg) to be applied over an area twice that of the template provided once daily continuously, starting within 5 days of menstruation (or anytime if cycles have ceased or are infrequent), with cyclical progesterone for at least 12 days of each cycle in women with a uterus; for menopausal symptoms may be increased if necessary after 1 month to max. 4 measures daily

Counselling

Apply gel to clean, dry, intact skin such as arms, shoulders or inner thighs and allow to dry for 5 minutes before covering with clothing. Not to be applied on lips or near breasts or on vulval region. Avoid skin contact with another person (particularly male) and avoid other skin products or washing the area for at least 1 hour after application

Progynova® TS (Bayer) Patches, self-adhesive, Progynova® TS 50 (releasing estradiol approx. 50 micrograms/24 hours), net price 12-patch pack = £18.90; Progynova® TS 100 (releasing estradiol approx. 100 micrograms/24 hours), 12-patch pack = £20.70. Counselling, administration

Dose

Menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1 patch to be applied once a week continuously or 1 patch per week for 3 weeks followed by a 7-day patch-free interval (cyclical), with cyclical progesterone for 12–14 days of each cycle in women with a uterus; initiate therapy with Progynova TS 50, subsequently adjust according to response

Note

Women receiving Progynova TS 100 patches for menopausal symptoms may continue with this strength for osteoporosis prophylaxis (see section 6.6)

Sandrena® (Orion) Gel, estradiol (0.1%), 500 microgram/500 mg sachet, net price 28-sachet pack = £5.08, 1 mg/1 g sachet, 28-sachet pack = £5.85. Counselling, administration

Excipients

Include propylene glycol (see section 13.1.3)

Dose

Menopausal symptoms, estradiol 1 mg (1 g gel) to be applied once daily over area 1–2 times size of hand, with cyclical progesterone for 12–14 days of each cycle in women with a uterus; dose may be adjusted after 2–3 cycles to lowest effective dose (usual dose of estradiol 0.5–1.5 mg (0.5–1.5 g gel) daily)

Counselling

Apply gel to intact areas of skin such as lower trunk or thighs, using right and left sides on alternate days. Wash hands after application. Not to be applied on the breasts or face and avoid contact with eyes. Allow area of application to dry for 5 minutes and do not wash area for at least 1 hour

Zumenon® (Abbott Healthcare) Tablets, £/f, estradiol 1 mg, net price 84-tab pack = £6.89; 2 mg (red), 84-tab pack = £6.89

Dose

Menopausal symptoms, initially 1 mg daily starting within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent), with cyclical progesterone for 12–14 days of each cycle in women with a uterus; therapy should be initiated with 1 ‘100’ patch; subsequently adjust according to response

Estradiol, estriol and estrone

Hormonin® (AMCo) Tablets, pink, estradiol 600 micrograms, estrisol 270 micrograms, estrone 1.4 mg, net price 84-tab pack = £7.93

Dose

Menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1–2 tablets daily starting within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), with cyclical progesterone for 12–14 days of each cycle in women with a uterus

Note

Hormonin® tablets can be given continuously or cyclically (21 days out of 28)

TIBOLONE

Indications

Short-term treatment of symptoms of oestrogen deficiency (including women being treated with gonadotrophin releasing hormone analogues); osteoporosis prophylaxis in women at high risk of fractures when other prophylaxis contra-indicated or not tolerated

Cautions

See Hormone Replacement Therapy, p. 490 and under Oestrogens for HRT; vaginal bleeding (investigate for endometrial cancer if bleeding continues beyond 6 months or after stopping treatment); history of liver disease, epilepsy, migraine, diabetes mellitus, hypertriglyceridaemia; withdraw if signs of thromboembolic disease, abnormal liver function tests or cholestatic jaundice; see also Note below; interactions: Appendix 1 (tibolone)
Contra-indications  see notes above and under Oestrogens for HRT; history of cardiovascular or cerebrovascular disease (e.g. thrombophlebitis, thromboembolism), uninvestigated vaginal bleeding

Hepatic impairment  avoid in acute liver disease or if history of liver disease and liver function tests not returned to normal

Renal impairment  risk of fluid retention—patients with renal impairment should be closely monitored

Pregnancy  avoid; toxicity in animal studies

Breast-feeding  avoid

Side-effects  see notes above; also abdominal pain, weight changes, vaginal bleeding, leucorrhoea, facial hair, and rarely amenia; gastro-intestinal disturbances, oedema, dizziness, headache, migraine, depression, breast cancer (see notes above and section 6.4.1.1), arthralgia, myalgia, visual disturbances, seborrhoeic dermatitis, rash and pruritus also reported

Dose
● 2.5 mg daily

Note  Unsuitable for use in the premenopause (unless being treated with gonadotrophin-releasing hormone analogue) and as (or with) an oral contraceptive; also unsuitable for use within 12 months of last menstrual period (may cause irregular bleeding). If transferring from cyclical HRT, start at end of regimen; if transferring from continuous-combined HRT, start at any time

Livial® (MSD) Tablets, tibolone 2.5 mg, net price 28-tab pack = £10.36; 3 x 28-tab pack = £31.08

6.4.1 Female sex hormones and their modulators

3.2.1 Contraception

Contraceptives (section 7.3.1) and under Oestrogens for HRT; history of cardiovascular or cerebrovascular disease (e.g. thrombophlebitis, thromboembolism), uninvestigated vaginal bleeding

Hepatic impairment  avoid in acute liver disease or if history of liver disease and liver function tests not returned to normal

Renal impairment  risk of fluid retention—patients with renal impairment should be closely monitored

Breast-feeding  avoid

Side-effects  see Combined Hormonal Contraceptives, section 7.3.1

Pregnancy  avoid; toxicity in animal studies

Dose
● 21=tab pack = £139.22; 50 micrograms, 21-tab pack = £139.22; 1 mg, 28-tab pack = £139.22

RALOXIFENE HYDROCHLORIDE

Indications  treatment and prevention of postmenopausal osteoporosis; unlike hormone replacement therapy, raloxifene does not reduce menopausal vasomotor symptoms.

Raloxifene may reduce the incidence of oestrogen-receptor-positive breast cancer but its role in established breast cancer is not yet clear. The manufacturer advises avoiding its use during treatment for breast cancer.

Contra-indications  history of venous thromboembolism, undiagnosed uterine bleeding, endometrial cancer, cholestasis

Hepatic impairment  avoid

Renal impairment  caution in mild to moderate impairment; avoid in severe impairment

Side-effects  hot flushes, leg cramps, peripheral oedema, influenza-like symptoms; less commonly venous thromboembolism, thrombophlebitis; rarely rashes, gastro-intestinal disturbances, hypertension, arterial thromboembolism, headache (including migraine), breast discomfort, thrombocytopenia

Dose
● 60 mg once daily

Evisita® (Daiichi Sankyo) Tablets, 1 mg, net price 28-tab pack = £17.06; 84-tab pack = £59.59

Progestogens and progesterone receptor modulators

There are two main groups of progestogen, progesterone and its analogues (dydrogesterone and medroxyprogesterone) and testosterone analogues (norethisterone and norgestrel). The newer progestogens (desogestrel, norgestimate, and gestodene) are all derivatives of norgestrel; levonorgestrel is the active isomer of norgestrel and has twice its potency. Progesterone
and its analogues are less androgenic than the testo-
sterone derivatives and neither progesterone nor dydro-
gestosterone causes virilisation.

Where endometriosis requires drug treatment, it may
respond to a progestogen, e.g. norethisterone, adminis-
tered on a continuous basis. Danazol and gonadorelin
analogues are also available (section 6.7.2).

Although oral progestogens have been used widely for
menorrhagia they are relatively ineffective compared with
traxanamic acid (section 2.11) or, particularly where dysmenorrhoea is also a factor, mefenamic acid (section 10.1.1); the levonorgestrel-releasing intra-
uterine system (section 7.3.2.3) may be particularly
useful for women also requiring contraception. Oral
progestogens have also been used for severe dys-
menorrhoea, but where contraception is also required
in younger women the best choice is a combined oral
contraceptive (section 7.3.1).

Progestogens have also been advocated for the allevia-
tion of premenstrual symptoms, but no convincing
physiological basis for such treatment has been shown.

Progestogens have been used for the prevention of
miscarriage in women with a history of recurrent mis-
carriage but there is no evidence of benefit and they are
not recommended for this purpose. In pregnant women
with antiphospholipid antibody syndrome who have
suffered recurrent miscarriage, administration of low-
dose aspirin (section 2.9) and a prophylactic dose of a
low molecular weight heparin (section 2.8.1) may
decrease the risk of fetal loss (use under specialist
supervision only).

Hormone replacement therapy In women with a
uterus a progestogen needs to be added to long-term oestrogen therapy for hormone replacement, to prevent
cystic hyperplasia of the endometrium and possible
transformation to cancer; it can be added on a cyclical
or a continuous basis (see section 6.4.1.1). Combined
packs incorporating suitable progestogen tablets are
available, see p. 492.

Oral contraception Desogestrel, gestodene, levo-
norgestrel, norethisterone, and norgestrel are used in
combined oral contraceptives and in progestogen-only
contraceptives (section 7.3.1 and section 7.3.2).

Cancer Progestogens also have a role in neoplastic
disease (section 8.3.2).

Cautions Progestogens should be used with caution
in conditions that may worsen with fluid retention e.g.
epilepsy, hypertension, migraine, asthma, or cardiac
dysfunction, and in those susceptible to thrombemo-
bolism (particular caution with high dose). Care is also
required in those with a history of depression. Progesto-
gen can decrease glucose tolerance and patients with
diabetes should be monitored closely. For interactions
see Appendix 1 (progestogens).

Contra-indications Progestogens should be
avoided in patients with a history of liver tumours.
They are also contra-indicated in those with genital or
breast cancer (unless progestogens are being used in the
management of these conditions), severe arterial dis-
ease, undiagnosed vaginal bleeding and acute porphyria
(section 9.8.2). Progestogens should not be used if there
is a history during pregnancy of idiopathic jaundice,
severe pruritus, or pemphigoid gestations.

Side-effects Side-effects of progestogens include
menstrual disturbances, premenstrual-like syndrome
(including bloating, fluid retention, breast tenderness),
weight change, nausea, headache, dizziness, insomnia,
drowsiness, depression, change in libido; also skin reac-
tions (including urticaria, pruritus, rash, and acne),
hirsutism and alopecia. Jaundice and anaphylactoid
reactions have also been reported.

**DYDROGESTERONE**

**Indications** HRT (section 6.4.1.1)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** avoid; see also Combined Hor-
monal Contraceptives, section 7.3.1

**Renal impairment** use with caution

**Pregnancy** not known to be harmful

**Breast-feeding** present in milk—no adverse effects

**Side-effects** see notes above

**Dose**
- See under combined preparations (section 6.4.1.1)

**MEDROXYPREGESTERONE ACETATE**

**Indications** see under Dose; contraception (section
7.3.2.2); malignant disease (section 8.3.2)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** section 8.3.2

**Renal impairment** use with caution

**Pregnancy** section 8.3.2

**Breast-feeding** section 8.3.2

**Side-effects** see notes above; indigestion

**Dose**
- By mouth, 2.5–10 mg daily for 5–10 days beginning on
day 16 to 21 of cycle, repeated for 2 cycles in dys-
functional uterine bleeding and 3 cycles in secondary
amenorrhoea

- Mild to moderate endometriosis, 10 mg 3 times daily
for 90 consecutive days, beginning on day 1 of cycle

- Progestogen opposition of oestrogen HRT, 10 mg
daily for the last 14 days of each 28-day oestrogen
HRT cycle

**Provera**® (Pharmacia) 

Tablets, all scored, medroxyprogesterone acetate
2.5 mg (orange), net price 30-tab pack = £1.84; 5 mg
(blue), 10-tab pack = £1.23; 10 mg (white), 10-tab
pack = £2.47, 90-tab pack = £22.16

**Climanor®** (ReSource Medical) 

Tablets, f/c, medroxyprogesterone acetate 5 mg, net
price 28-tab pack = £3.27

**Combined preparations**

Section 6.4.1.1

**NORETHISTERONE**

**Indications** see under Dose; HRT (section 6.4.1.1);
contraception (section 7.3.1 and section 7.3.2); malig-
nant disease (section 8.3.2)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** section 8.3.2

**Renal impairment** use with caution

**Pregnancy** section 8.3.2
**6.4.1 Female sex hormones and their modulators**

**Endocrine system**

**Breast-feeding** see section 8.3.2

**Side-effects** see notes above

**Dose**
- Endometriosis, by mouth, 10–15 mg daily for 4–6 months or longer, starting on day 5 of cycle (if spotting occurs increase dose to 20–25 mg daily, reduced once bleeding has stopped)
- Dysfunctional uterine bleeding, menorrhagia (but see notes above), by mouth, 5 mg 3 times daily for 10 days to arrest bleeding; to prevent bleeding 5 mg twice daily from day 19 to 26
- Dysmenorrhea (but see notes above), by mouth, 5 mg 3 times daily from day 5 to 24 for 3–4 cycles
- Premenstrual syndrome (but not recommended, see notes above), by mouth, 5 mg 2–3 times daily from day 19 to 26 for several cycles
- Postponement of menstruation, by mouth, 5 mg 3 times daily starting 3 days before expected onset (menstruation occurs 2–3 days after stopping)

**Norethisterone (Non-proprietary)**

- **Tablets**, norethisterone 5 mg, net price 30-tab pack = £2.04
- **Primolut N**
  - **Tablets**, norethisterone 5 mg, net price 30-tab pack = £2.26

**Combined preparations**

Section 6.4.1.1

**PROGESTERONE**

**Indications** see under preparations

**Cautions** see notes above

**Contra-indications** see notes above; missed or incomplete miscarriage

**Hepatic impairment** avoid; see also Combined Hormonal Contraceptives, section 7.3.1

**Renal impairment** use with caution

**Pregnancy** not known to be harmful

**Breast-feeding**—present in milk

**Side-effects** see notes above; injection-site reactions; with rectal administration, pain, diarrhoea and flatulence; with vaginal administration, local irritation

**Dose**
- See under preparations

**Crinone**

- **Vaginal gel**, progesterone 90 mg/application (8%), net price 15 = £30.83
  - **Dose** by vagina, infertility due to inadequate luteal phase, insert 1 applicatorful daily starting either after documented ovulation or on day 18–21 of cycle. In vitro fertilisation, daily application continued for 30 days after laboratory evidence of pregnancy

**Cyclogest**

- **Pessaries**, progesterone 200 mg, net price 15 = £8.95; 400 mg, 15 = £12.96
  - **Dose** by vagina or rectum, premenstrual syndrome and post-natal depression, 200 mg daily to 400 mg twice daily; for premenstrual syndrome start on day 12–14 and continue until onset of menstruation (but not recommended, see notes above); rectally if barrier methods of contraception are used, in patients who have recently given birth or in those who suffer from vaginal infection or recurrent cystitis

**Gestone**

- **Injection**, progesterone 50 mg/mL, net price 1-mL amp = £4.50, 2-mL amp = £4.50
  - **Dose** by deep intramuscular injection into buttock, dysfunctional uterine bleeding, 5–10 mg daily for 5–10 days until 2 days before expected onset of menstruation
  - **Recurrent miscarriage due to inadequate luteal phase** (but not recommended, see notes above) or following in vitro fertilisation or gamete intra-fallopian transfer, 25–100 mg 2–7 times a week from day 15, or day of embryo or gamete transfer, until 8–16 weeks of pregnancy; max. 200 mg daily

**Lubion**

- **Injection**, progesterone, net price 25-mg vial = £8.00
  - **Dose** by subcutaneous or intramuscular injection, supplementation of luteal phase during assisted reproductive technology (ART) treatment in women for whom vaginal preparations are inappropriate, 25 mg once daily from day of oocyte retrieval up to week 12 of pregnancy

**Utrogestan**

- **Capsules**, progesterone (micronised) 100 mg, net price 30-cap pack = £5.13; 200 mg 15-cap pack = £5.13. Counselling, administration
  - **Excipients** include arachis (peanut) oil
  - **Counselling** Capsules should be taken at bedtime on an empty stomach
  - **Dose** by mouth, progestogenic opposition of oestrogen HRT 200 mg once daily on days 15–26, or 100 mg once daily on days 1–25, of each 28-day oestrogen HRT cycle
  - **Vaginal capsule**, progesterone (micronised) 200 mg, net price 21 vaginal capsules = £21.00
  - **Excipients** include arachis (peanut) oil

**Ulipristal acetate**

Ulipristal acetate is a progesterone receptor modulator with a partial progesterone antagonist effect. Ulipristal is used in the pre-operative treatment of moderate to severe symptoms of uterine fibroids; it is also used as an hormonal emergency contraceptive (see section 7.3.5).

**Progesterone receptor modulators**

**Ulipristal acetate**

- **Indications** pre-operative treatment of moderate to severe symptoms of uterine fibroids
- **Cautions** uncontrolled severe asthma; non-hormonal contraceptive methods (barrier methods or intra-uterine device) should be used during treatment and for 12 days after stopping, if required; **interactions**: see Appendix 1 (ulipristal)
- **Contra-indications** undiagnosed vaginal bleeding, vaginal bleeding not caused by uterine fibroids; uterine, ovarian, cervical, or breast cancer
- **Hepatic impairment** caution in moderate to severe impairment—no information available
- **Renal impairment** caution in severe impairment—no information available
- **Pregnancy** manufacturer advises avoid—no information available
- **Breast-feeding** manufacturer advises avoid—no information available
- **Side-effects** nausea, abdominal pain, oedema, hot flushes, headache, dizziness, malaise, menstrual disturbances, uterine haemorrhage, endometrial thickening, ovarian cyst (including rupture), breast pain,
pelvic pain, myalgia, acne, hyperhidrosis; less commonly dyspepsia, dry mouth, flatulence, constipation, epistaxis, anxiety, urinary incontinence

Dose

- **ADULT** over 18 years, 5 mg daily for up to 3 months starting during the first week of menstruation; if necessary, repeat course once, starting during the second menstruation after first course completed; max. 2 courses of 3 months

**Esmya®** (Gedeon Richter) ▼ [BM]
Tablets, sulpiridate acetate 5 mg, net price 28-tab pack = £114.13

### 6.4.2 Male sex hormones and antagonists

Androgens cause masculinisation; they may be used as replacement therapy in castrated adults and in those who are hypogonadal due to either pituitary or testicular disease. In the normal male they inhibit pituitary gonadotrophin secretion and depress spermatogenesis. Androgens also have an anabolic action which led to the development of anabolic steroids (section 6.4.3).

Androgens are useless as a treatment of impotence and impaired spermatogenesis unless there is associated hypogonadism; they should not be given until the hypogonadism has been properly investigated. Treatment should be under expert supervision.

When given to patients with hypopituitarism they can lead to normal sexual development and potency but not to fertility. If fertility is desired, the usual treatment is with gonadotrophins or pulsatile gonadotrophin-releasing hormone (section 6.5.1) which will stimulate spermatogenesis as well as androgen production.

Caution should be used when androgens or chorionic gonadotrophin are used in treating boys with delayed puberty since the fusion of epiphyses is hastened and may result in short stature; skeletal maturation should be monitored.

Intramuscular depot preparations of testosterone esters are preferred for replacement therapy. Testosterone enantate, propionate or undecanoate, or alternatives, are preferred for replacement therapy. Testosterone enanate has a longer duration of action, may result in short stature; skeletal maturation should be monitored.

Intramuscular injection once a month, although more frequent dose intervals are often necessary. Implants of testosterone can be used for hypogonadism; the implants are replaced every 4 to 5 months.

Testosterone implants can be used in postmenopausal women as an adjunct to hormone replacement therapy.

### TESTOSTERONE AND ESTERS

**Indications** see under preparations

**Cautions** cardiac impairment, elderly, ischaemic heart disease, hypertension, epilepsy, migraine, diabetes mellitus, skeletal metastases (risk of hypercalcaemia), undergoing regular examination of the prostate and breast during treatment; monitor full blood count, lipid profile and liver function; pre-pubertal boys (see notes above and under Side-effects); interactions: Appendix 1 (testosterone)

**Women** Regularly assess for androgenic side-effects; women should be advised to report any signs of virilisation e.g. deepening of the voice or hirsutism

**Contra-indications** breast cancer in men, prostate cancer, history of primary liver tumours, hypercalcaemia, necrotic syndrome

**Hepatic impairment** avoid if possible—fluid retention and dose-related toxicity

**Renal impairment** caution—potential for fluid retention

**Pregnancy** avoid; causes masculinisation of female fetus

**Breast-feeding** avoid; may cause masculinisation in the female infant or precocious development in the male infant; high doses suppress lactation

**Side-effects** prostate abnormalities and prostate cancer, headache, depression, gastro-intestinal bleeding, nausea, vomiting, cholestatic jaundice, changes in libido, gynaecomastia, polycystic ovaries, anxiety, irritability, nervousness, asthenia, paraesthesia, hypertension, electrolyte disturbances including sodium retention with oedema and hypercalcaemia, weight gain; increased bone growth, muscle cramps, arthralgia; androgenic effects such as hirsutism, male-pattern baldness, seborrhoea, acne, pruritus, excessive frequency and duration of penile erection, precocious sexual development and premature closure of epiphyses in pre-pubertal males, suppression of spermatogenesis in men and virilism in women; rarely liver tumours; sleep apnoea also reported; with buccal tablets and gel, local irritation and allergic reactions, and taste disturbances

**Dose**

- See under preparations

#### Oral

**Restandol® Testocaps (MSD) [BA2]**
Capsules, orange, testosterone undecanoate 40 mg in oily solution, net price 30-cap pack = £8.55; 60-cap pack = £17.10. Label: 21, 25
**Dose** androgen deficiency, 120–160 mg daily for 2–3 weeks; maintenance 40–120 mg daily

#### Buccal

**Striant® SR (The Urology Co.) [BA2]**
Mucoadhesive buccal tablets, m/r, testosterone 30 mg, net price 60-tab pack = £28.00. Counselling, see under Dose below.
**Dose** hypogonadism, 30 mg every 12 hours; CHILD and ADOLESCENT under 18 years not recommended
**Counselling** Place round side of tablet on gum above front teeth and hold lip firmly over the gum for 30 seconds. If tablet detaches within 4 hours of next dose, replace with new tablet which is considered the second dose for the day.

#### Intramuscular

**Testosterone Enantate (Non-proprietary) [BA2]**
Injection (oily), testosterone enantate 250 mg/mL, net price 1-mL amp = £19.62
**Dose** by slow intramuscular injection, hypogonadism, initially 250 mg every 2–3 weeks; maintenance 250 mg every 3–6 weeks

Breast cancer, 250 mg every 2–3 weeks

**Nebido®** (Bayer) [BA2]
**Injection (oily)**, testosterone undecanoate 250 mg/mL, net price 4-mL amp = £80.00; 4-mL vial = £80.00
**Dose** by deep intramuscular injection over 2 minutes, hypogonadism in men over 18 years, 1 g every 10–14 weeks; if necessary, second dose may be given after 6 weeks to achieve rapid steady state plasma testosterone levels and then every 10–14 weeks
6.4.2 Male sex hormones and antagonists

**Sustanon 250** (MSD) 674
Injection (oily), testosterone propionate 30 mg, testosterone phenylpropionate 60 mg, testosterone isocaproate 60 mg, and testosterone decanoate 100 mg/mL, net price 1-mL amp = £2.45
Excipients include arachis (peanut) oil, benzyl alcohol (see Excipients p. 2)
Dose by deep intramuscular injection, androgen deficiency, 1 mL usually every 3 weeks

**Viromone** (Nordic) 675
Injection, testosterone propionate 50 mg/mL, net price 2-mL amp = £4.50
Dose by intramuscular injection, androgen deficiency, 50 mg 2–3 times weekly
Delayed puberty, 50 mg weekly
Breast cancer in women, 100 mg 2–3 times weekly

**Implant**

**Testosterone** (MSD) 676
Implant, testosterone 100 mg, net price = £9.99; 200 mg = £15.17
Dose by implantation, male hypogonadism, 100–600 mg; 600 mg usually maintains plasma-testosterone concentration within the normal range for 4–5 months

**Transdermal preparations**

**Testim** (Ferring) 677
Gel, testosterone 50 mg/5 g tube, net price 30-tube pack = £32.00. Counseling, administration
Excipients include propylene glycol (see section 13.1.3)
Dose hypogonadism due to testosterone deficiency in men (over 18 years), 50 mg testosterone (5 g gel) applied once daily; subsequent application adjusted according to response: max. 100 mg (10 g gel) daily
Counseling Squeeze entire content of tube on to one palm and apply as a thin layer on clean, dry, healthy skin of shoulder or upper arm, preferably in the morning after washing or bathing (if 2 tubes required use 1 per shoulder or upper arm), rub in and allow to dry before putting on clothing to cover site; wash hands with soap after application, avoid washing application site for at least 6 hours
Avoid skin contact with application sites to prevent testosterone transfer to other people, especially pregnant women and children—consult product literature

**Testogel** (Bayer) 678
Gel, testosterone 50 mg/5 g sachet, net price 30-sachet pack = £31.11. Counseling, administration
Excipients include propylene glycol (see section 13.1.3)
Dose hypogonadism due to androgen deficiency in men (over 18 years), 50 mg testosterone (5 g gel) to be applied once daily; subsequent application adjusted according to response in 25-mg (2.5 g gel) increments to max. 100 mg (10 g gel) daily
Counseling Apply thin layer of gel on clean, dry, healthy skin such as shoulders, arms or abdomen, immediately after sachet is opened. Not to be applied on genital area as high alcohol content may cause local irritation. Allow to dry for 3–5 minutes before dressing. Wash hands with soap and water after applying gel, avoid shower or bath for at least 6 hours
Avoid skin contact with gel application sites to prevent testosterone transfer to other people, especially pregnant women and children—consult product literature

**Tostran** (ProStrakan) 679
Gel, testosterone 2% (10 mg/metered application), net price 60-g multidose dispenser = £28.67. Counseling, administration
Excipients include butylhydroxytoluene, propylene glycol (see section 13.1.3)
Dose hypogonadism due to testosterone deficiency in men (over 18 years), initially 60 mg testosterone (3 g gel) applied once daily; subsequent applications adjusted according to response: max. 80 mg (4 g gel) daily
Counseling Apply gel on clean, dry, intact skin of abdomen or both inner thighs, preferably in the morning. Gently rub in with a finger until dry before dressing. Wash hands with soap and water after applying gel; avoid washing application site for at least 2 hours. Not to be applied on genital area.
Avoid skin contact with gel application sites to prevent testosterone transfer to other people, especially pregnant women and children—consult product literature

**MESTEROLONE**

**Indications** see under Dose
**Cautions** see under Testosterone and Esters
**Contra-indications** see under Testosterone and Esters
**Hepatic impairment** see under Testosterone and Esters
**Renal impairment** see under Testosterone and Esters
**Pregnancy** see under Testosterone and Esters
**Breast-feeding** see under Testosterone and Esters
**Side-effects** see under Testosterone and Esters but spermatogenesis unimpaired
**Dose**
- Androgen deficiency and male infertility associated with hypogonadism, 25 mg 3–4 times daily for several months, reduced to 50–75 mg daily in divided doses for maintenance; CHILD not recommended

**Pro-Viron** (Bayer) 680
Tablets, scored, mesterolone 25 mg. Net price 30-tab pack = £4.19

**Anti-androgens**

**Cyproterone acetate**
Cyproterone acetate is an anti-androgen used in the treatment of severe hypersexuality and sexual deviation in the male. It inhibits spermatogenesis and produces reversible infertility (but is not a male contraceptive); abnormal sperm forms are produced. Fully informed consent is recommended and an initial spermogram. As hepatic tumours have been produced in animal studies, careful consideration should be given to the risk/benefit ratio before treatment. Cyproterone acetate is also used as an adjunct in prostatic cancer (section 8.3.4.2) and in the treatment of acne and hirsutism in women (section 13.6.2).

**CYPROTERONE ACETATE**

**Indications** see notes above; prostate cancer (section 8.3.4.2)
**Cautions** ineffective for male hypersexuality in chronic alcoholism (relevance to prostate cancer not known); blood counts initially and throughout treatment; monitor hepatic function regularly (liver function tests should be performed before treatment, see also under Side-effects below); monitor adrenocortical function regularly; diabetes mellitus (see also Contra-indications)
**Driving** Fatigue and lassitude may impair performance of skilled tasks (e.g. driving)
**Contra-indications** (do not apply in prostate cancer), severe diabetes (with vascular changes), sickle-cell anaemia, liver-disease including Dubin-Johnson and Rotor syndromes, previous or existing liver tumours, malignant or wasting diseases, meningioma or history of meningioma, severe depression, history of thromboembolic disorders; youths under 18 years (may arrest bone maturation and testicular development)
**Hepatic impairment** avoid—dose-related toxicity; see also side-effects, p. 643

**Side-effects** fatigue and lassitude, breathlessness, weight changes, reduced sebum production (may clear acne), changes in hair pattern, gynaecomastia (rarely leading to galactorrhoea and benign breast nodules); rarely hypersensitivity reactions, rash and osteoporosis; inhibition of spermatogenesis (see notes above); hepatotoxicity reported (including jaundice, hepatitis and hepatic failure (fatalities reported at dosages of 100 mg and above, usually in men treated for advanced prostate cancer), see section 8.3.4.2 for details and warnings)

**Dose**
- **ADULT** over 18 years, male hypersexuality, 50 mg twice daily after food

**Cyproterone Acetate (Non-proprietary) **(Pharmaceutical Group)
Tablets, cyproterone acetate 50 mg, net price 56-tab pack = £29.00. Label: 21, counselling, driving

**Androcur®** (Baycr) 
Tablets, scored, cyproterone acetate 50 mg, net price 56-tab pack = £29.25. Label: 21, counselling, driving

### Dutasteride and finasteride

**Dutasteride and finasteride** are specific inhibitors of the enzyme 5α-reductase, which metabolises testosterone into the more potent androgen, dihydrotestosterone. This inhibition of testosterone metabolism leads to reduction in prostate size, with improvement in urinary flow rate and in obstructive symptoms. Dutasteride and finasteride are alternatives to alpha-blockers (section 7.4.1) particularly in men with a significantly enlarged prostate. Finasteride is also licensed for use with doxazosin in the management of benign prostatic hyperplasia.

A low strength of finasteride is licensed for treating male-pattern baldness in men (section 13.9).

**Cautions** Dutasteride and finasteride decrease serum concentration of prostate cancer markers such as prostate-specific antigen; reference values may need adjustment. Both dutasteride and finasteride are excreted in semen and use of a condom is recommended if sexual partner is pregnant or likely to become pregnant. Women of childbearing potential should avoid handling crushed or broken tablets of finasteride and leaking capsules of dutasteride.

**Side-effects** The side-effects of dutasteride and finasteride include impotence, decreased libido, ejaculation disorders, and breast tenderness and enlargement.

---

**DUTASTERIDE**

**Indications** benign prostatic hyperplasia

**Cautions** see notes above; **interactions:** Appendix 1 (dutasteride)

**Male breast cancer** Cases of male breast cancer have been reported. Patients or their carers should be told to promptly report to their doctor any changes in breast tissue such as lumps, pain, or nipple discharge

**Hepatic impairment** avoid in severe impairment—no information available

**Side-effects** see notes above

---

**FINASTERIDE**

**Indications** benign prostatic hyperplasia; male-pattern baldness in men (section 13.9)

**Cautions** see notes above; also obstructive uropathy

**Male breast cancer** Cases of male breast cancer have been reported. Patients or their carers should be told to promptly report to their doctor any changes in breast tissue such as lumps, pain, or nipple discharge

**Side-effects** see notes above; also testicular pain, hypersensitivity reactions (including lip and face swelling, pruritus and rash); male breast cancer also reported (see Cautions above)

**Dose**
- 5 mg daily, review treatment at 3–6 months and then every 6–12 months (may require several months’ treatment before benefit is obtained)

**Finasteride (Non-proprietary)** (Pharmaceutical Group)
Tablets, finasteride 5 mg, net price 28-tab pack = £1.48

**Proscar®** (MSD) (Pharmaceutical Group)
Tablets, blue, f/c, finasteride 5 mg, net price 28-tab pack = £13.94

### 6.4.3 Anabolic steroids

Anabolic steroids have some androgenic activity but they cause less virilisation than androgens in women. They are used in the treatment of some aplastic anae-
mias (section 9.1.3). Anabolic steroids have been given for osteoporosis in women but they are no longer advocated for this purpose.

The protein-building properties of anabolic steroids have not proved beneficial in the clinical setting. Their use as body builders or tonics is unjustified; some athletes abuse them.

**NANDROLONE**

**Indications** osteoporosis in postmenopausal women (but not recommended, see notes above); aplastic anaemia (section 9.1.3)

**Cautions** cardiac impairment, hypertension, diabetes mellitus, epilepsy, migraine; monitor skeletal maturation in young patients; skeletal metastases (risk of hypercalcaemia); **interactions:** Appendix 1 (anabolic steroids)

**Contra-indications** prostate cancer, male breast cancer, acute porphyria (section 9.8.2)

**Hepatic impairment** use in severe hepatic impairment only if benefit outweighs risk

**Renal impairment** use with caution—may cause sodium and water retention

**Side-effects** acne, sodium retention with oedema, virilisation with high doses including voice changes
Anti-oestrogens

The anti-oestrogens clomifene (clomiphene) and tamoxifen (section 8.3.4.1) are used in the treatment of female infertility due to oligomenorrhoea or secondary amenorrhoea (e.g., associated with polycystic ovarian disease). They induce gonadotrophin release by occupying oestrogen receptors in the hypothalamus, thereby interfering with feedback mechanisms; choriconic gonadotrophin is sometimes used as an adjunct. Patients should be warned that there is a risk of multiple pregnancy (rarely more than twins).

**PREGNANCY** exclude pregnancy before treatment; possible effects on fetal development

**Breast-feeding** may inhibit lactation

**Side-effects** visual disturbances (withdraw), ovarian hyperstimulation (withdraw), hot flushes, abdominal discomfort, occasionally nausea, vomiting, depression, insomnia, breast tenderness, headache, intermenstrual spotting, menorrhagia, endometriosis, convulsions, weight gain, rashes, dizziness, hair loss

**Dose**

- 50 mg daily for 5 days, starting within about 5 days of onset of menstruation (preferably on 2nd day) or at any time (normally preceded by a progestogen-induced withdrawal bleed) if cycles have ceased; second course of 100 mg daily for 5 days may be given in absence of ovulation; most patients who are going to respond will do so to first course; 3 courses should constitute adequate therapeutic trial; long-term cyclical therapy not recommended—see CSM advice, above

**Clomifene** (Non-proprietary) Tablets, clomifene citrate 50 mg, net price 30-tab pack = £21.74

**Clomid®** (Sanofi-Aventis) Tablets, yellow, scored, clomifene citrate 50 mg. Net price 30-tab pack = £8.46

**Anterior pituitary hormones**

**Corticotrophins**

Tetracosactide (tetracosactrin), an analogue of corticotropin (ACTH), is used to test adrenocortical function; failure of the plasma cortisol concentration to rise after administration of tetracosactide indicates adrenocortical insufficiency.

Both corticotropin and tetracosactide were formerly used as alternatives to corticosteroids in conditions such as Crohn’s disease or rheumatoid arthritis; their value was limited by the variable and unpredictable therapeutic response and by the waning of their effect with time.

**TETRACOSACTIDE**

(Tetracosactrin)

**Indications** see notes above

**Cautions** as for corticosteroids, section 6.3.2; important: risk of anaphylaxis (medical supervision; consult product literature); history of atopic allergy (e.g., asthma, eczema, hayfever); history of hypersensitivity; interactions: Appendix 1 (corticosteroids)

**Contra-indications** as for corticosteroids, section 6.3.2; avoid injections containing benzyl alcohol in neonates (see under preparations); history of hypersensitivity to corticotrophins

**Hepatic impairment** see section 6.3.2

**Renal impairment** see section 6.3.2

**Pregnancy** avoid (but may be used diagnostically if essential)

**Breast-feeding** avoid (but may be used diagnostically if essential)

**Side-effects** as for corticosteroids, section 6.3.2

**Dose**

- See under preparations below
**Gonadotrophins**

Follicle-stimulating hormone (FSH) and luteinising hormone (LH) together (as in **human menopausal gonadotrophin**), follicle-stimulating hormone alone (as in **follitropin**), or chorionic gonadotrophin, are used in the treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene, or in superovulation treatment for assisted conception (such as *in vitro* fertilisation).

The gonadotrophins are also occasionally used in the treatment of hypogonadotropic hypogonadism and associated oligospermia. There is no justification for their use in primary gonadal failure.

Chorionic gonadotrophin has also been used in delayed puberty in the male to stimulate endogenous testosterone production, but has little advantage over testosterone (section 6.4.2).

### CHORIONIC GONADOTROPIN

**Human Chorionic Gonadotrophin (HCG)**

A preparation of a glycoprotein fraction secreted by the placenta and obtained from the urine of pregnant women having the action of the pituitary luteinising hormone.

**Indications** see notes above

**Cautions** cardiac impairment, asthma, epilepsy, migraine; prepubertal boys (risk of premature epiphyseal closure or precocious puberty)

**Contra-indications** androgen-dependent tumours

**Renal impairment** use with caution

**Side-effects** oedema (particularly in males—reduce dose), headache, tiredness, mood changes, gynaecomastia, local reactions; may aggravate ovarian hyperstimulation, multiple pregnancy

**Dose**

- By subcutaneous or intramuscular injection, according to patient’s response

**Choragon®** (Ferring) **Injection**, powder for reconstitution, chorionic gonadotrophin. Net price 5000-unit amp (with solvent) = £23.26. For intramuscular injection

**Pregnyl®** (MSD) **Injection**, powder for reconstitution, chorionic gonadotrophin. Net price 1500-unit amp = £2.12; 5000-unit amp = £3.15 (both with solvent). For subcutaneous or intramuscular injection

### SYNACTHEN® DEPOT

**Synacthen®** (Alliance) **Injection** (aqueous suspension), tetracosactide acetate 1 mg/mL, with zinc phosphate complex. Net price 1-mL amp = £4.18

**Excipients** include benzyl alcohol (avoid in neonates, see Excipients p. 2)

**Dose** diagnostic (5-hour test), by intramuscular injection, 1 mg as a single dose

**Note** Formerly used therapeutically by intramuscular injection, in an initial dose of 1 mg daily (or every 12 hours in acute cases); reduced to 1 mg every 2–3 days, then 1 mg weekly (or 500 micrograms every 2–3 days) but value was limited (see notes above)

**CHORIOGONADOTROPIN ALFA**

(Human chorionic gonadotropin)

**Indications** see notes above

**Cautions** acute porphyria (section 9.8.2)

**Contra-indications** ovarian enlargement or cyst (unless caused by polycystic ovarian disease); ectopic pregnancy in previous 3 months; active thrombembolic disorders; hypothalamus, pituitary, ovarian, uterine or mammary malignancy

**Side-effects** nausea, vomiting, abdominal pain; headache, tiredness; injection-site reactions; ovarian hyperstimulation syndrome; rarely diarrhoea, depression, irritability, breast pain; ectopic pregnancy and ovarian torsion reported

**Dose**

- By subcutaneous injection, according to patient’s response

**Ovitrelle®** (Merck Serono) **Injection**, choriogonadotropin alfa, net price 6500-unit/0.5 mL (250-micrograms/0.5 mL) prefilled syringe or prefilled pen = £31.38

### CORIFOLLITROPIN ALFA

**Indications** controlled ovarian stimulation in combination with a gonadotrophin-releasing hormone antagonist

**Cautions** risk factors for thromboembolism; risk of ovarian hyperstimulation syndrome; acute porphyria (section 9.8.2)

**Contra-indications** ovarian enlargement or cyst; polycystic ovarian syndrome; tumours of hypothalamus, pituitary, ovaries, uterus, or breast; vaginal bleeding of unknown cause; history of ovarian hyperstimulation syndrome

**Renal impairment** avoid

**Breast-feeding** avoid

**Side-effects** nausea; headache, fatigue; ovarian hyperstimulation, pelvic pain, breast pain; *less commonly* vomiting, abdominal distension and pain, diarrhoea, constipation, dizziness, ovarian torsion; *also reported* ectopic pregnancy, miscarriage, and multiple pregnancies

**Dose**

- By subcutaneous injection, body-weight under 60 kg, 100 micrograms; body-weight over 60 kg, 150 micrograms

**Elonva®** (MSD) **Injection**, prefilled syringe, corifollitropin alfa, net price 100 micrograms/0.5 mL = £638.00; 150 micrograms/0.5 mL = £638.00

### FOLLITROPIN ALFA and BETA

(Recombinant human follicle stimulating hormone)

**Indications** see notes above

**Cautions** acute porphyria (section 9.8.2)

**Contra-indications** see under Human Menopausal Gonadotrophins

**Pregnancy** avoid

**Breast-feeding** avoid

**Side-effects** see under Human Menopausal Gonadotrophins
Endocrine system

6.5.1 Hypothalamic and anterior pituitary hormones and anti-oestrogens

**Dose**

- By subcutaneous or intramuscular injection, according to patient’s response

**Follitropin alfa**

**Gonal-F** (Merck Serono) 

Injection, powder for reconstitution, follitropin alfa. Net price 75-unit amp = £21.02; 450 units/0.75 mL, multidose vial = £126.10; 1050 units/1.75 mL, multidose vial = £294.22 (all with solvent). For subcutaneous injection

Injection, prefilled pen, follitropin alfa 600 units/mL, net price 0.5 mL (300 units) = £94.00, 0.75 mL (450 units) = £141.00, 1.5 mL (900 units) = £282.00. For subcutaneous injection

**Follitropin alfa with lutropin alfa**

**Pergoveris** (Merck Serono) 

Injection, powder for reconstitution, follitropin alfa 150 units (11 micrograms), lutropin alfa 75 units (3 micrograms), net price per vial (with solvent) = £60.29. For subcutaneous injection

**Follitropin beta**

**Puregon** (MSD) 

Injection, follitropin beta 100 units/mL, net price 0.5 mL (50-unit) vial = £18.03; 200 units/mL, 0.5 mL (100-unit) vial = £36.06; 0.36 mL (300-unit) cartridge = £97.41, 0.72 mL (600-unit) cartridge = £194.82, 1.08 mL (900-unit) cartridge = £292.23, (cartridges for use with Puregon pen). For subcutaneous (cartridges and vials) or intramuscular injection (vials)

**Excipients** may include neomycin and streptomycin

**LUTROPIN ALFA**

(Recombinant human luteinising hormone)

**Indications** see notes above

**Cautions** acute porphyria (section 9.8.2)

**Contra-indications** ovarian enlargement or cyst (unless caused by polycystic ovarian disease); undiagnosed vaginal bleeding; tumours of hypothalamus and pituitary; ovarian, uterine or mammary carcinoma

**Side-effects** nausea, vomiting, abdominal and pelvic pain; headache, somnolence; injection-site reactions; ovarian hyperstimulation syndrome, ovarian cyst, breast pain, ectopic pregnancy; thromboembolism, adnexal torsion, and haemoperitoneum

**Dose**

- By subcutaneous injection, in conjunction with follitropin alfa, according to response

**Luveris** (Merck Serono) 

Injection, powder for reconstitution, lutropin alfa, net price 75-unit vial = £31.38 (with solvent)

**Growth hormone**

Growth hormone is used to treat deficiency of the hormone in children and in adults (see NICE guidance below). In children it is used in Prader-Willi syndrome, Turner syndrome, chronic renal insufficiency, short children considered small for gestational age at birth, and short stature homeobox-containing gene (SHOX) deficiency.

Growth hormone of human origin (HGH; somatotrophin) has been replaced by a growth hormone of human sequence, somatropin, produced using recombinant DNA technology.
Mecasermin, a human insulin-like growth factor-I (rhIGF-I), is licensed to treat growth failure in children with short stature caused by a deficiency of growth hormone (section 6.7.4).

Treatment should be discontinued if growth velocity increases by less than 50% from baseline in the first year of treatment.

www.nice.org.uk/TA188

NICE guidance

Somatropin for the treatment of growth failure in children (May 2010)

Somatropin is recommended for children with growth failure who:

- have growth-hormone deficiency;
- have Turner syndrome;
- have Prader-Willi syndrome;
- have chronic renal insufficiency;
- are born small for gestational age with subsequent growth failure at 4 years of age or later;
- have short stature homeobox-containing gene (SHOX) deficiency.

Treatment should be discontinued if growth velocity increases by less than 50% from baseline in the first year of treatment.

www.nice.org.uk/TA64

NICE guidance

Somatropin for adults with growth hormone deficiency (August 2003)

Somatropin is recommended in adults only if the following 3 criteria are fulfilled:

- Severe growth hormone deficiency, established by an appropriate method;
- Impaired quality of life, measured by means of a specific questionnaire;
- Already receiving treatment for another pituitary hormone deficiency.

Somatropin treatment should be discontinued if the quality of life has not improved sufficiently by 9 months.

Severe growth hormone deficiency developing after linear growth is complete but before the age of 25 years should be treated with growth hormone; treatment should continue until adult peak bone mass has been achieved. Treatment for adult-onset growth hormone deficiency should be stopped only when the patient and the patient’s physician consider it appropriate.

Treatment with somatropin should be initiated and managed by a physician with expertise in growth hormone disorders; maintenance treatment can be prescribed in the community under a shared-care protocol.

Note Dose formerly expressed in units; somatropin 1 mg = 3 units

SOMATROPIN

(Recombinant Human Growth Hormone)

Indications see under Dose

Cautions diabetes mellitus (adjustment of antidiabetic therapy may be necessary), papilloedema (see under Side-effects), relative deficiencies of other pituitary hormones (notably hypothyroidism—manufacturers recommend periodic thyroid function tests but limited evidence of clinical value), history of malignant disease, disorders of the epiphysis of the hip (monitor for limping), resolved intracranial hypertension (monitor closely), initiation of treatment close to puberty not recommended in child born small for gestational age; Silver-Russell syndrome; rotate subcutaneous injection sites to prevent lipoatrophy; interactions: Appendix 1 (somatropin)

Contra-indications evidence of tumour activity (complete antitumour therapy and ensure intracranial lesions inactive before starting); not to be used after renal transplantation or for growth promotion in children with closed epiphyses (or near closure in Prader-Willi syndrome); severe obesity or severe respiratory impairment in Prader-Willi syndrome

Pregnancy discontinue if pregnancy occurs—no information available

Breast-feeding no information available

Side-effects headache, funduscopic for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting if papilloedema confirmed benign intracranial hypertension (rare cases reported); fluid retention (peripheral oedema), arthralgia, myalgia, carpal tunnel syndrome, paraesthesia, antibody formation, hypothyroidism, insulin resistance, hyperglycaemia, hypoglycaemia, reactions at injection site; leukaemia in children with growth hormone deficiency also reported

Dose

- Gonadal dysgenesis (Turner syndrome), by subcutaneous injection, 45–50 micrograms/kg daily or 1.4 mg/m² daily
- Deficiency of growth hormone in children, by subcutaneous or intramuscular injection, 23–39 micrograms/kg daily or 0.7–1 mg/m² daily
- Growth disturbance in short children born small for gestational age whose growth has not caught up by 4 years or later, by subcutaneous injection, 35 micrograms/kg daily or 1 mg/m² daily
- Prader-Willi syndrome, by subcutaneous injection in children with growth velocity greater than 1 cm/year, in combination with energy-restricted diet, 35 micrograms/kg daily or 1 mg/m² daily; max. 2.7 mg daily
- Chronic renal insufficiency in children (renal function decreased to less than 50%), by subcutaneous injection, 45–50 micrograms/kg daily or 1.4 mg/m² daily (higher doses may be needed) adjusted if necessary after 6 months
- Adult growth hormone deficiency, by subcutaneous injection, initially 150–300 micrograms daily, gradually increased if required to max. 1 mg daily; use minimum effective dose (requirements may decrease with age)
- SHOX deficiency in children, by subcutaneous injection, 45–50 micrograms/kg daily

Genotropin® (Pharmacia) 104.2

Injection, two-compartment cartridge containing powder for reconstitution, somatropin (rbe) and diluent, net price 5.3-mg (16-unit) cartridge = £92.15, 12-mg (36-unit) cartridge = £208.65. For use with Genotropin® Pen device (available free of charge from clinics). For subcutaneous injection

GoQuick® injection, two-compartment, multi-dose disposable, prefilled pen containing powder for reconstitution, somatropin (rbe) and diluent, net price 5.3-mg (16-unit) prefilled pen = £92.15; 12-mg (36-unit) prefilled pen = £208.65. For subcutaneous injection
**Endocrine System**

6.5.1 Hypothalamic and anterior pituitary hormones and anti-oestrogens  BNF 68

**MiniQuick® injection**, two-compartment single-dose syringe containing powder for reconstitution, somatropin (rbe) and diluent, net price 0.2-mg (0.6-unit) syringe = £3.48; 0.4-mg (1.2-unit) syringe = £6.95; 0.6-mg (1.8-unit) syringe = £10.43; 0.8-mg (2.4-unit) syringe = £13.91; 1-mg (3-unit) syringe = £17.39; 1.2-mg (3.6-unit) syringe = £20.87; 1.4-mg (4.2-unit) syringe = £24.34; 1.6-mg (4.8-unit) syringe = £27.82; 1.8-mg (5.4-unit) syringe = £31.30; 2-mg (6-unit) syringe = £34.77. For subcutaneous injection

**Humatrope® (Lilly)** (BN4.2)

**Injection**, powder for reconstitution, somatropin (rbe), net price 6-mg (18-unit) cartridge = £108.00; 12-mg (36-unit) cartridge = £216.00; 24-mg (72-unit) cartridge = £432.00; all supplied with diluent. For subcutaneous or intramuscular injection, cartridges for subcutaneous injection

**Norditropin® (Novo Nordisk)** (BN4.2)

**Simplex® injection**, somatropin (epro) 3.3 mg (10 units)/mL, net price 1.5-mL (5-mg, 15-unit) cartridge = £106.35; 6.7 mg (20 units)/mL, 1.5-mL (10-mg, 30-unit) cartridge = £212.70; 10 mg (30 units)/mL, 1.5-mL (15-mg, 45-unit) cartridge = £319.05. For use with appropriate NordiPen® device (available free of charge from clinics). For subcutaneous injection

**NordiFlex® injection**, multidose disposable prefilled pen, somatropin (rbe) 10 mg (30 units)/mL, net price 1.5 mL (15-mg, 45-unit) prefilled pen = £347.70. For use with NovoFine® or NovoTwist® needles. For subcutaneous injection

**NutropinAQ® (Ipsen)** (BN4.2)

**Injection**, somatropin (rbe), net price 10 mg (30 units) 2-mL cartridge = £203.00. For use with NutropinAQ® Pen® device (available free of charge from clinics). For subcutaneous injection

**Omnitrope® (Sandoz)** (BN4.2)

**Injection**, somatropin (rbe) 3.3 mg (10 units)/mL, net price 1.5 mL (5-mg, 15-unit) cartridge = £73.75; 6.7 mg (20 units)/mL, 1.5 mL (10-mg, 30-unit) cartridge = £147.50. For use with Omnitrope Pen® and Omnitrope Pen 10® devices respectively (both available free of charge from clinics). For subcutaneous injection

**Excipients** include benzyl alcohol (in 5-mg cartridge) (avoid in neonates, see Excipients, p. 2)

**Note** Biosimilar medicine, see p. 1

**Saizen® (Merck Serono)** (BN4.2)

**Injection**, somatropin (rmc) 5.83 mg (17.5 units)/mL, net price 1.05 mL (6-mg, 18-unit) cartridge = £139.08; 8 mg (24 units)/mL, 1.5 mL (12-mg, 36-unit) cartridge = £278.16; 2.5 mL (20-mg, 60-unit) cartridge = £463.60. For use with coolclick® needle-free autoinjector device or easypod® autoinjector device (available free of charge from clinics). For subcutaneous injection

**Click.easy®, powder for reconstitution**, somatropin (rmc), net price 8 mg (24-unit) vial (1 click easy® device with diluent) = £185.44. For use with one click easy® autoinjector device or cool.click® needle-free autoinjector device or easypod® autoinjector device (available free of charge from clinics). For subcutaneous injection

**Zomacton® (Ferring)** (BN4.2)

**Injection**, powder for reconstitution, somatropin (rbe), net price 4-mg (12-unit) vial (with diluent) = £79.69, for use with ZomaJet 2® Vision needle-free device (available free of charge from clinics) or with needles and syringes; 10 mg (30-unit) vial (with diluent) = £199.23, for use with ZomaJet Vision X® needle-free device (available free of charge from clinics) or with needles and syringes. For subcutaneous injection

**Excipients** include benzyl alcohol (in 4-mg vial) (avoid in neonates, see Excipients, p. 2)

**Growth hormone receptor antagonists**

**Pegvisomant** is a genetically modified analogue of human growth hormone and is a highly selective growth hormone receptor antagonist. Pegvisomant is licensed for the treatment of acromegaly in patients with inadequate response to surgery, radiation, or both, and to treatment with somatostatin analogues. Pegvisomant should be initiated only by physicians experienced in the treatment of acromegaly.

**PEGVISOMANT**

**Indications** see notes above

**Cautions** liver disease (monitor liver enzymes every 4–6 weeks for 6 months or if symptoms of hepatitis develop); diabetes mellitus (adjustment of antidiabetic therapy may be necessary); possible increase in female fertility

**Pregnancy** avoid

**Breast-feeding** avoid

**Side-effects** diarrhoea, constipation, nausea, vomiting, abdominal distension, dyspepsia, flatulence, elevated liver enzymes; hypertension; headache, asthenia, dizziness, drowsiness, tremor, sleep disturbances; influenza-like syndrome, weight gain, hyperglycaemia, hypoglycaemia; arthralgia, myalgia; injection-site reactions (rotate injection sites to avoid lipohypertrophy), sweating, pruritus, rash; fatigue; hypercholesterolaemia; less commonly thrombocytopenia, leucopenia, leucocytosis, bleeding tendency

**Dose**

- By subcutaneous injection, initially 80 mg, then 10 mg daily, increased in steps of 5 mg daily according to response; max. 30 mg daily; CHILD not recommended

**Somavert® (Pfizer)** (BN4.2)

**Injection**, powder for reconstitution, pegvisomant, net price 10-mg vial = £50.00; 15-mg vial = £75.00; 20-mg vial = £100.00 (all with solvent)

**Thyrotrophin**

**Thyrotropin alfa** is a recombinant form of thyrotropin (thyroid stimulating hormone). It is licensed for use with or without radiiodine imaging, together with serum thyroglobulin testing, for the detection of thyroid remnants and thyroid cancer in post-thyroidectomy patients. It is also licensed to increase radioiodine uptake for the ablation of thyroid remnant tissue in suitable post-thyroidectomy patients.

**THYROTROPIN ALFA**

**(Recombinant human thyroid stimulating hormone, rhTSH)**

**Indications** see notes above and product literature

**Cautions** presence of thyroglobulin autoantibodies may give false negative results
**Contra-indications**
- hypersensitivity to bovine or human thyrotrophin

**Pregnancy**
- avoid

**Breast-feeding**
- avoid

**Side-effects**
- nausea, vomiting; headache, dizziness, fatigue; *less commonly* asthenia, paraesthesia, back pain, influenza-like symptoms, rash, urticaria; rarely diarrhoea; *very rarely* palpitation, flushing, dyspnoea, pain at site of metastases, tremor, arthralgia, myalgia, hyperhidrosis, and injection-site reactions including pain, pruritus, and rash

**Dose**
- by intramuscular injection into the gluteal muscle, 900 micrograms every 24 hours for 2 doses, consult product literature

**Thyrogen**
- (Genzyme) 
- Injection, powder for reconstitution, thyrotropin alfa
- 900 micrograms/vial, net price = £291.52

---

**Hypothalamic hormones**

Gonadorelin when injected intravenously in normal subjects leads to a rapid rise in plasma concentrations of both luteinising hormone (LH) and follicle-stimulating hormone (FSH). It has not proved to be very helpful, however, in distinguishing hypothalamic from pituitary lesions. *Gonadorelin analogues* are indicated in endometriosis and infertility (section 6.7.2) and in breast and prostate cancer (section 8.3.4).

---

**GONADORELIN**
- (GnRHa; GnRh; LH–RH)
- **Indications** see preparations below
- **Cautions** pituitary adenoma
- **Pregnancy** avoid
- **Breast-feeding** avoid

**Side-effects**
- rarely, nausea, headache, abdominal pain, increased menstrual bleeding; rarely, hyper-sensitivity reaction on repeated administration of large doses; irritation at injection site

**Dose**
- See under preparations

**Gonadorelin (intrapharm)**
- **Injection**, powder for reconstitution, gonadorelin
- Net price 100-microgram vial (with diluent) = £67.00 (hosp. only)
- **Excipients** include benzyl alcohol (avoid in neonates, see Excipients p. 2)
- **Dose** for assessment of pituitary function (adults), by subcutaneous or intravenous injection, 100 micrograms

---

**DESMOPRESSIN**
- **Indications** see under Dose
- **Cautions** see under Vasopressin; less pressor activity, but still considerable caution in cardiovascular disease and in hypertension (not indicated for nocturnal enuresis or nocturia in these circumstances); elderly (avoid for nocturnal enuresis and nocturia in those over 65 years); also considerable caution in cystic fibrosis; in nocturia and nocturnal enuresis limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards; in nocturia periodic blood pressure and weight checks needed to monitor for fluid overload; **interactions**: Appendix 1 (desmopressin)

**Hyponatraemic convulsions**
- Patients being treated for primary nocturnal enuresis should be warned to avoid fluid overload (including during swimming) and to stop taking desmopressin during an episode of vomiting or diarrhoea (until fluid balance normal). The risk of hyponatraemic convulsions can also be minimised by keeping to the recommended starting doses and by avoiding concomitant use of drugs which increase secretion of vasopressin (e.g. tricyclic antidepressants)

**Contra-indications**
- cardiac insufficiency and other conditions treated with diuretics; psychogenic polydipsia and polydipsia in alcohol dependence

**Renal impairment**
- use with caution; antidiuretic effect may be reduced
- **Pregnancy** small oxytocic effect in third trimester; increased risk of pre-eclampsia
- **Breast-feeding** not known to be harmful

**Side-effects**
- fluid retention, and hyponatraemia (in more serious cases with convulsions) on administration without restricting fluid intake; stomach pain,
headache, nausea, vomiting, allergic reactions, and emotional disturbance in children also reported; epistaxis, nasal congestion, rhinitis with nasal spray

**Dose**
- **By mouth** (as desmopressin acetate)
  - Diabetes insipidus, treatment, **ADULT** and **CHILD** initially 300 micrograms daily (in 3 divided doses); maintenance, 300–600 micrograms daily in 3 divided doses; range 0.2–1.2 mg daily
  - Primary nocturnal enuresis, **ADULT** (under 65 years) and **CHILD** over 5 years 200 micrograms at bedtime, only increased to 400 micrograms if lower dose not effective (important: see also Cautions); withdraw for at least 1 week for reassessment after 3 months
  - Postoperative polyuria or polydipsia, adjust dose according to urine osmolality
- **Sublingually** (as desmopressin base)
  - Diabetes insipidus, treatment, **ADULT** and **CHILD** initially 180 micrograms daily in 3 divided doses; range 120–720 micrograms daily
  - Primary nocturnal enuresis, **ADULT** (under 65 years) and **CHILD** over 5 years 120 micrograms at bedtime, only increased to 240 micrograms if lower dose not effective (important: see also Cautions); withdraw for at least 1 week for reassessment after 3 months
  - Polyuria or polydipsia after hypophysectomy, adjust dose according to urine osmolality
- **Intranasally** (as desmopressin acetate)
  - Diabetes insipidus, treatment, **ADULT** and **CHILD** 20 micrograms (limit fluid intake to 500 mL from 1 hour before to 8 hours after administration)
  - Diabetes insipidus, treatment, **ADULT** 10–40 micrograms daily (in 1–2 divided doses); **CHILD** 5–20 micrograms daily; infants may require lower doses
  - Nocturia associated with multiple sclerosis (when other treatments have failed), **ADULT** (under 65 years) 10–20 micrograms at bedtime (important: see also Cautions), dose not to be repeated within 24 hours
  - Renal function testing (empty bladder at time of administration and limit fluid intake to 500 mL from 1 hour before until 8 hours after administration), **ADULT** 40 micrograms; **INFANT** under 1 year 10 micrograms (restrict fluid intake to 50% at next 2 feeds to avoid fluid overload), **CHILD** 1–15 years 20 micrograms
  - Mild to moderate haemophilia and von Willebrand's disease, **ADULT** 300 micrograms (one 150-microgram spray into each nostril) 30 minutes before surgery or when bleeding; may be repeated at intervals of 12 hours (or at intervals of at least 3 days if self-administered)
  - Fibrinolytic response testing, **ADULT** 300 micrograms (one 150-microgram spray into each nostril); blood sampled after 1 hour for fibrinolytic activity
- **By injection** (as desmopressin acetate)
  - Diabetes insipidus, diagnosis (subcutaneous or intramuscular), **ADULT** and **CHILD** 2 micrograms (limit fluid intake to 500 mL from 1 hour before to 8 hours after administration)
  - Diabetes insipidus, treatment (subcutaneous, intramuscular or intravenous), **ADULT** 1–4 micrograms daily; **INFANT** and **CHILD** 400 micrograms
  - Renal function testing (empty bladder at time of administration and limit fluid intake to 500 mL from 1 hour before until 8 hours after administration) (subcutaneous or intramuscular), **ADULT** and **CHILD** 2 micrograms; **INFANT** 400 micrograms (restrict fluid intake to 50% at next 2 feeds)

Mild to moderate haemophilia and von Willebrand's disease, (subcutaneous or intravenous), **ADULT** and **CHILD** over 1 month 300 nanograms/kg as a single dose immediately before surgery or after trauma; may be repeated at intervals of 12 hours

Fibrinolytic response testing, (subcutaneous or intravenous), **ADULT** and **CHILD** 300 nanograms/kg; blood sampled after 20 minutes for fibrinolytic activity

Lumbar-puncture-associated headache, consult product literature

**Desmopressin acetate** (Non-proprietary)

**Tablets**, desmopressin acetate 100 micrograms, net price 90-tab pack = £61.40; 200 micrograms, 30-tab pack = £9.03, 90-tab pack = £39.20. Counselling, fluid intake, see above

**Nasal spray**, desmopressin acetate 10 micrograms/ metered spray, net price 6-ML unit (60 metered sprays) = £9.34. Counselling, fluid intake, see above

Brands include **Presiners®**

**Note** Children requiring dose of less than 10 micrograms should be given **DDAVP® intranasal solution**

**DDAVP®** (Ferring)

**Tablets**, both scored, desmopressin acetate 100 micrograms, net price 90-tab pack = £44.12; 200 micrograms, 90-tab pack = £88.23. Counselling, fluid intake, see above

**Oral lyophilisates** (**DDAVP® Melt**), desmopressin (as acetate) 60 micrograms, net price 100-tab pack = £50.53; 120 micrograms, 100-tab pack = £101.07; 240 micrograms, 100-tab pack = £202.14. Label: 26, counselling, fluid intake, see above. For sublingual administration

**Intranasal solution**, desmopressin acetate 100 micrograms/mL. Net price 2.5-ML dropper bottle and catheter = £9.72. Counselling, fluid intake, see above

**Injection**, desmopressin acetate 4 micrograms/mL. Net price 1-ML amp = £1.32

**DesmoMelt®** (Ferring)

**Oral lyophilisates**, desmopressin (as acetate) 120 micrograms, net price 30-tab pack = £30.34; 240 micrograms, 30-tab pack = £60.68. Label: 26, counselling, fluid intake, see above. For sublingual administration

**Desmotabs®** (Ferring)

**Tablets**, scored, desmopressin acetate 200 micrograms, net price 30-tab pack = £29.43. Counselling, fluid intake, see above

**Desmospray®** (Ferring)

**Nasal spray**, desmopressin acetate 10 micrograms/ metered spray. Net price 6-ML unit (60 metered sprays) = £25.02. Counselling, fluid intake, see above

**Note** Children requiring dose of less than 10 micrograms should be given **DDAVP® intranasal solution**

**Oclim®** (Ferring)

**Nasal spray**, desmopressin acetate 150 micrograms/ metered spray. Net price 2.5-ML unit (25 metered sprays) = £57.60. Counselling, fluid intake, see above

**Injection**, desmopressin acetate 15 micrograms/mL. Net price 1-ML amp = £19.22
TERLIPRESSIN ACETATE

Indications  bleeding from oesophageal varices

Cautions  elderly; uncontrolled hypertension; vascular disease; heart disease; history of QT-interval prolongation; concomitant use of drugs that prolong the QT-interval; arrhythmia; respiratory disease; septic shock; electrolyte and fluid disturbances

Renal impairment  use with caution in chronic renal failure

Pregnancy  avoid unless benefits outweigh risk—uterine contractions and increased intra-uterine pressure in early pregnancy, and decreased uterine blood flow reported

Breast-feeding  avoid unless benefits outweigh risk—no information available

Side-effects  abdominal cramps, diarrhoea, hypertension, peripheral ischaemia, pallor, arrhythmia, bradycardia, headache; less commonly nausea, vomiting, hot flushing, angina, myocardial infarction, tachycardia, intestinal ischaemia, bronchospasm, respiratory failure, pulmonary oedema, convulsions, hyponatraemia; rarely dyspnoea; very rarely stroke, hyperglycaemia; also reported heart failure, skin necrosis

Dose  
- See under preparations

Glypressin® (Ferring)  
Injection, powder for reconstitution, terlipressin acetate, net price 1-mg vial with 5 mL diluent = £18.47

Injection, solution for injection, terlipressin acetate, 0.12 mg/mL, net price 1-mg (8.5 mL) amp = £19.39

Dose  by intravenous injection, 2 mg every 4 hours until bleeding controlled (after initial dose, may reduce to 1 mg every 4 hours if not tolerated or body-weight under 50 kg); max. duration 48 hours; CHILD under 18 years see BNF for Children

Variquel® (Sinclair IS)  
Injection, powder for reconstitution, terlipressin acetate, net price 1-mg vial with 5 mL diluent = £17.90

Dose  by intravenous injection over 1 minute, initially 1 mg if body-weight under 50 kg (initial dose 1.5 mg if body-weight 50–70 kg, or 2 mg if body-weight over 70 kg), then 1 mg every 4–6 hours for up to 72 hours; CHILD under 18 years see BNF for Children

VASOPRESSIN

Indications  pituitary diabetes insipidus; bleeding from oesophageal varices

Cautions  heart failure, hypertension, asthma, epilepsy, migraine or other conditions which might be aggravated by water retention; avoid fluid overload

Contra-indications  vascular disease (especially disease of coronary arteries) unless extreme caution, chronic nephritis (until reasonable blood nitrogen concentrations attained)

Renal impairment  see Contra-indications

Pregnancy  oxytocic effect in third trimester

Breast-feeding  not known to be harmful

Side-effects  fluid retention, pallor, tremor, sweating, vertigo, headache, nausea, vomiting, belching, abdominal cramps, desire to defecate, hypersensitivity reactions (including anaphylaxis), constriction of coronary arteries (may cause anginal attacks and myocardial ischaemia), peripheral ischaemia and rarely gangrene

Dose  
- By subcutaneous or intramuscular injection, diabetes insipidus, 5–20 units every four hours
- By intravenous infusion, initial control of variceal bleeding, 20 units over 15 minutes

Synthetic vasopressin

Argpressin (Non-proprietary)  
Injection, argpressin (synthetic vasopressin) 20 units/mL, net price 1-mL amp = £22.50 (hosp. only)

Antidiuretic hormone antagonists

Demeclocycline  (section 5.1.3) can be used in the treatment of hyponatraemia resulting from inappropriate secretion of antidiuretic hormone, if fluid restriction alone does not restore sodium concentration or is not tolerable. Demeclocycline is thought to act by directly blocking the renal tubular effect of antidiuretic hormone. Initially 0.9–1.2 g is given daily in divided doses, reduced to 600–900 mg daily for maintenance.

Tolvaptan

Tolvaptan is a vasopressin V2-receptor antagonist licensed for the treatment of hyponatraemia secondary to syndrome of inappropriate antidiuretic hormone secretion; treatment duration with tolvaptan is determined by the underlying disease and its treatment.

Rapid correction of hyponatraemia during tolvaptan therapy can cause osmotic demyelination, leading to serious neurological events; close monitoring of serum-sodium concentration and fluid balance is essential

TOLVAPTAN

Indications  see notes above

Cautions  ensure adequate fluid intake (monitor for dehydration in patients who are fluid-restricted); monitor serum-sodium concentration and fluid balance no later than 6 hours after initiating treatment and every 6 hours during the first 1–2 days of treatment and until dose stabilised; discontinue if rapid rise in serum-sodium concentration (greater than 12 mmol/litre in 24 hours or 18 mmol/litre in 48 hours); diabetes mellitus; pseudohyponatraemia associated with diabetes mellitus (exclude before treatment); increased risk of demyelination syndrome in alcoholism, hypoxia, or malnutrition if rapid correction of hyponatraemia; avoid concomitant drugs that increase serum-sodium concentration; discontinue and perform liver-function tests promptly if symptoms of hepatic encephalopathy (anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, dark urine, pruritus); Interactions: Appendix 1 (tolvaptan)

Contra-indications  anuria; volume depletion; hyper- volaemic hyponatraemia; hypervolaemia; impaired perception of thirst

Hepatic impairment  use with caution in severe impairment—no information available; see also Cautions above

Renal impairment  no information available in severe impairment

Pregnancy  avoid—toxicity in animal studies

Breast-feeding  avoid—present in milk in animal studies
6.6 Drugs affecting bone metabolism

### Side-effects
Nausea, constipation, dry mouth, postural hypotension, thirst, decreased appetite, fever, malaise, hyperglycaemia, urinary frequency, hyperkalaemia, dehydration, echocymosis, increased blood creatinine, pruritus, neurological disturbance (following rapid correction of hyponatraemia); less commonly taste disturbance, renal impairment; also reported hepatic impairment (discontinue), hypernatraemia, hyperuricaemia, hypoglycaemia, syncope, dizziness.

### Dose
- **ADULT** over 18 years, 15 mg once daily, increased as required to max. 60 mg daily.

**Samsca** *(Otsuka)*
- Tablets, blue, tolvaptan 15 mg, net price 10-tab pack = £746.80; 30 mg, 10-tab pack = £746.80

### Osteoporosis
Osteoporosis occurs most commonly in postmenopausal women and in those taking long-term oral corticosteroids (glucocorticosteroids). Other risk factors for osteoporosis include low body weight, cigarette smoking, excess alcohol intake, lack of physical activity, family history of osteoporosis, and early menopause.

Those at risk of osteoporosis should maintain an adequate intake of calcium and vitamin D and any deficiency should be corrected by increasing dietary intake or taking supplements.

Elderly patients, especially those who are housebound or live in residential or nursing homes, are at increased risk of calcium and vitamin D deficiency and may benefit from supplements (section 9.5.1.1 and section 9.6.4). Reversible secondary causes of osteoporosis such as hyperthyroidism, hyperparathyroidism, osteomalacia or hypogonadism should be excluded, in both men and women, before treatment for osteoporosis is initiated.

### Postmenopausal osteoporosis
The bisphosphonates (alendronic acid and risedronate, section 6.6.2) are effective for preventing postmenopausal osteoporosis. **Hormone replacement therapy** (HRT section 6.4.1.1) is an option where other therapies are contra-indicated, cannot be tolerated, or if there is a lack of response. The CSM has advised that HRT should not be considered first-line therapy for long-term prevention of osteoporosis in women over 50 years of age. HRT is of most benefit for the prophylaxis of postmenopausal osteoporosis if started early in menopause and continued for up to 5 years, but bone loss resumes (possibly at an accelerated rate) on stopping HRT. Women of Afro-Caribbean origin appear to be less susceptible to osteoporosis than those who are white or of Asian origin.

**Alendronate** is recommended for the primary prevention of osteoporotic fractures in postmenopausal women.

**Risedronate or etidronate** [now discontinued] are recommended as alternatives for women:
- in whom alendronate is contra-indicated or not tolerated and
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance.

**Strontium ranelate** [but see also Strontium Ranelate, p. 518] is recommended as an alternative for women:
- in whom alendronate and either risedronate or etidronate are contra-indicated or not tolerated and
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance.

**Raloxifene** (section 6.4.1.1) is licensed for the prophylaxis and treatment of vertebral fractures in postmenopausal women.

**NICE guidance**

**Alendronate,** etidronate, risedronate, raloxifene and strontium ranelate for the primary prevention of osteoporotic fragility fractures in postmenopausal women

Alendronate is recommended as a treatment option for the primary prevention of osteoporotic fractures in the following susceptible postmenopausal women:

- Women over 70 years who have an independent risk factor for fracture (parental history of hip fracture, alcohol intake of 4 or more units per day, or rheumatoid arthritis) or an indicator of low bone mineral density (body mass index under 22 kg/m², ankylosing spondylitis, Crohn’s disease, prolonged immobility, untreated premature menopause, or rheumatoid arthritis) and confirmed osteoporosis.
- Women aged 65–69 years who have an independent risk factor for fracture and confirmed osteoporosis.
- Women under 65 years who have an independent risk factor for fracture and at least one additional indicator of low bone mineral density and confirmed osteoporosis.

Risedronate or etidronate [now discontinued] are recommended as alternatives for women:

- in whom alendronate is contra-indicated or not tolerated and
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance.

Strontium ranelate [but see also Strontium Ranelate, p. 518] is recommended as an alternative for women:

- in whom alendronate and either risedronate or etidronate are contra-indicated or not tolerated and
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance.

Raloxifene is not recommended as a treatment option in postmenopausal women for primary prevention of osteoporotic fractures.

**www.nice.org.uk/TA160**

1. Available at [www.nice.org.uk/TA160](http://www.nice.org.uk/TA160)
Corticosteroid-induced osteoporosis  To reduce the risk of osteoporosis doses of oral corticosteroids should be as low as possible and courses of treatment as short as possible. The risk of osteoporosis may be related to cumulative dose of corticosteroids; even intermittent courses can therefore increase the risk. The greatest rate of bone loss occurs during the first 6–12 months of corticosteroid use and so early steps to prevent the development of osteoporosis are important. Long-term use of high-dose inhaled corticosteroids may contribute to corticosteroid-induced osteoporosis.

Alendronate is recommended as a treatment option for the secondary prevention of osteoporotic fractures in susceptible postmenopausal women. Risedronate or etidronate are recommended as alternatives for women:

- in whom alendronate is contra-indicated or not tolerated
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture (parental history of hip fracture, alcohol intake of 4 or more units per day, or rheumatoid arthritis, as indicated in the full NICE guidance).

Strontium ranelate is recommended as an alternative for women:

- in whom alendronate and either risedronate or etidronate are contra-indicated or not tolerated
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance.

Teriparatide is recommended as an alternative for women:

- in whom alendronate and either risedronate or etidronate, or strontium ranelate are contra-indicated or not tolerated, or where treatment with alendronate, risedronate or etidronate has been unsatisfactory (indicated by another fragility fracture and a decline in bone mineral density despite treatment for 1 year) and
- who comply with particular combinations of bone mineral density measurement, age, and number of fractures, as indicated in the full NICE guidance.

1. Available at www.nice.org.uk/TA161

6.6.1 Calcitonin and parathyroid hormone

Calcitonin is involved with parathyroid hormone in the regulation of bone turnover and hence the maintenance of calcium balance and homoeostasis. Calcitonin (salmon) is used to lower the plasma-calcium concentration in patients with hypercalcaemia associated with malignancy, see also section 9.5.1.2. Calcitonin is also licensed for treatment of Paget’s disease of bone when other treatments are ineffective or inappropriate; it is also licensed for the prevention of acute bone loss due to sudden immobility. Calcitonin is no longer recommended for the prevention or treatment of postmenopausal osteoporosis because the benefits are outweighed by the risk of malignancy associated with long-term use.

Recombinant parathyroid hormone is used for the treatment of postmenopausal osteoporosis. Teriparatide (a recombinant fragment of parathyroid hormone) is used for the treatment of postmenopausal osteoporosis. Osteoporosis in men at increased risk of fracture, and corticosteroid-induced osteoporosis. The Scottish Medicines Consortium, p. 4 has advised (February 2007) that parathyroid hormone (Preopect®) should be initiated by specialists experienced in the treatment of osteoporosis; also that the use of teriparatide (Forteo®) (December 2003) in postmenopausal women should be restricted to the treatment of established (severe) osteoporosis and should be initiated by specialists experienced in the treatment of osteoporosis.

Cinacalcet (section 9.5.1.2) is licensed for the treatment of hypercalcaemia in parathyroid carcinoma.
reactions, rash, hypersensitivity reactions including pruritus; also reported tremor

**Dose**
- Hypercalcaemia of malignancy (see also section 9.5.1.2), **ADULT** over 18 years, by **subcutaneous** or **intramuscular** injection, 100 units every 6–8 hours adjusted according to response; max. 400 units every 6–8 hours; in severe or emergency cases, by intravenous infusion, up to 10 units/kg over at least 6 hours
- Paget’s disease of bone, **ADULT** over 18 years, by **subcutaneous** or **intramuscular injection**, 50 units 3 times weekly to 100 units daily adjusted according to response; max. duration of treatment 3 months (6 months in exceptional circumstances)
- Prevention of acute bone loss due to sudden immobility, **ADULT** over 18 years, by **subcutaneous** or **intramuscular injection**, 100 units daily in 1–2 divided doses, reduced to 50 units daily at start of mobilisation; duration of treatment 2 weeks, max. 4 weeks

**Miacalcic®** (Novartis)  
**Injection**, calcitonin (salmon) 50 units/mL, net price 1-mL amp = £34.21; 100 units/mL, 1-mL amp = £63.84; 200 units/mL, 2-mL vial = £24.60  
For subcutaneous or intramuscular injection and for dilution and use as an intravenous infusion

**PARATHYROID HORMONE**  
(Human recombinant parathyroid hormone)

**Indications** treatment of osteoporosis in postmenopausal women at high risk of fractures (to reduce the risk of vertebral fractures) (see also notes above)

**Cautions** monitor serum or urinary calcium concentration at 1, 3 and 6 months after initiation of treatment (consult product literature for guidance if serum-calcium concentration raised); active or previous urolithiasis; concomitant cardiac glycosides

**Contra-indications** previous radiation therapy to skeleton, pre-existing hypercalcaemia, metabolic bone disease (including hyperparathyroidism and Paget’s disease), unexplained raised levels of alkaline phosphatase

**Hepatic impairment** avoid

**Renal impairment** avoid if eGFR less than 30 mL/minute/1.73m²

**Pregnancy** avoid

**Breast-feeding** avoid

**Side-effects** nausea, vomiting, dyspepsia, constipation, diarrhoea; palpitation; headache, dizziness, fatigue, asthenia; transient hypercalcaemia; hypercalciuria; muscle cramp, pain in extremities, back pain; injection-site reactions; **less commonly** abdominal pain, altered sense of smell, taste disturbance, anorexia, influenza, hyperuricaemia

**Dose**
- By **subcutaneous injection**, 100 micrograms daily, max. duration of treatment 24 months

**Protect®** (Nycomed)  
**Injection**, dual-chamber cartridge containing powder for reconstitution, parathyroid hormone (rDNA) and diluent, net price 1.61-mg (14-dose) cartridge = £156.24. For use with **Protact®** pen device.

---

**TERIPARATIDE**

**Indications** treatment of osteoporosis in postmenopausal women and in men at increased risk of fractures; treatment of corticosteroid-induced osteoporosis; see also notes above

**Contra-indications** pre-existing hypercalcaemia, skeletal malignancies or bone metastases, metabolic bone diseases, including Paget’s disease and hyperparathyroidism, unexplained raised alkaline phosphatase, previous radiation therapy to the skeleton

**Renal impairment** caution in moderate impairment; avoid if severe

**Pregnancy** avoid

**Breast-feeding** avoid

**Side-effects** gastro-intestinal disorders (including nausea, reflux and haemorrhoids); palpitation; dyspnoea; headache, fatigue, asthenia, depression, dizziness, vertigo; anaemia, increased sweating, muscle cramps, sciatica, myalgia, arthralgia; **less commonly** urinary disorders, hypercalcaemia; injection-site reactions; **rarely** hypersensitivity reactions

**Dose**
- By **subcutaneous injection**, 20 micrograms daily; max. duration of treatment 24 months (course not to be repeated)

**Forsteo®** (Lilly)  
**Injection**, teriparadate 250 micrograms/mL, net price 2.4-mL prefilled pen = £271.88

---

**6.6.2 Bisphosphonates and other drugs affecting bone metabolism**

**Bisphosphonates**

Bisphosphonates are adsorbed onto hydroxyapatite crystals in bone, slowing both their rate of growth and dissolution, and therefore reducing the rate of bone turnover. Bisphosphonates have an important role in the prophylaxis and treatment of osteoporosis and corticosteroid-induced osteoporosis; **alendronic acid** or **risedronate sodium** are considered the drugs of choice for these conditions (see also section 6.6).

Bisphosphonates are also used in the treatment of Paget’s disease, hypercalcaemia of malignancy (section 9.5.1.2), and in bone metastases in breast cancer (section 8.3.4.1). Etidronate disodium can impair bone mineralisation when used continuously or in high doses.
Renal impairment
avoid if eGFR less than 35 mL/minute/1.73 m²

Contra-indications
abnormalities of oesophagus and upper gastro-intestinal disorders (dysphagia, gastritis, peptic ulceration, hypersensitivity reactions (including urticaria and angioedema), atypical femoral fractures with long-term use (see MHRA/CHM advice, above); myalgia, malaise, and fever at initiation of treatment; very rarely severe skin reactions (including Stevens-Johnson syndrome), osteonecrosis of the jaw (see Bisphosphonates: Osteonecrosis of the Jaw, above)

Discontinuation of bisphosphonate treatment in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of treatment of individual patients, particularly after 5 or more years of use. Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate. Discontinuation of bisphosphonate treatment in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

MHR[A/CHM advice
Bisphosphonates: atypical femoral fractures (June 2011)
Atypical femoral fractures have been reported rarely with bisphosphonate treatment, mainly in patients receiving long-term treatment for osteoporosis. The need to continue bisphosphonate treatment for osteoporosis should be re-evaluated periodically based on an assessment of the benefits and risks of treatment for individual patients, particularly after 5 or more years of use. Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate. Discontinuation of bisphosphonate treatment in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

A L E N D R O N I C ACID

Indications see under Dose

Cautions upper gastro-intestinal disorders (dysphagia, symptomatic oesophageal disease, gastritis, duodenitis, or ulcers—see also under Contra-indications and Side-effects); history (within 1 year) of ulcers, active gastro-intestinal bleeding, or surgery of the upper gastro-intestinal tract; correct disturbances of calcium and mineral metabolism (e.g. vitamin-D deficiency, hypocalcaemia) before starting and monitor serum-calcium concentration during treatment; consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw, see Bisphosphonates: Osteonecrosis of the Jaw, above); exclude other causes of osteoporosis; atypical femoral fractures, see MHR[A/CHM advice, above; interactions: Appendix 1 (bisphosphonates)

Contra-indications abnormalities of oesophagus and other factors which delay emptying (e.g. stricture or achalasia), hypocalcaemia

Renal impairment avoid if eGFR less than 35 mL/minute/1.73 m²

Pregnancy avoid
Breast-feeding no information available

Side-effects oesophageal reactions (see below), abdominal pain and distension, dyspepsia, regurgitation, melena, diarrhoea or constipation, flatulence, muscularkeletal pain, headache; rarely rash, pruritus, erythema, photosensitivity, uveitis, scleritis, transient decrease in serum calcium and phosphate; nausea, vomiting, gastritis, peptic ulceration, hypersensitivity reactions (including urticaria and angioedema), atypical femoral fractures with long-term use (see MHRA/CHM advice, above); myalgia, malaise, and fever at initiation of treatment; very rarely severe skin reactions (including Stevens-Johnson syndrome), osteonecrosis of the jaw (see Bisphosphonates: Osteonecrosis of the Jaw, above)

Oesophageal reactions Severe oesophageal reactions (oesophagitis, oesophageal ulcers, oesophageal scarring and oesophageal erosions) have been reported; patients should be advised to stop taking the tablets and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain

Dose
- Treatment of postmenopausal osteoporosis, 10 mg daily or 70 mg once weekly
- Treatment of osteoporosis in men, 10 mg daily
- Prevention and treatment of corticosteroid-induced osteoporosis in postmenopausal women not receiving hormone replacement therapy, 10 mg daily

Counselling Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet

Alendronic acid (Non-proprietary) Tablets, alendronic acid (as sodium alendronate) 70 mg once weekly = 84p. Counselling, administration

Oral solution, sugar-free, alendronic acid (as sodium alendronate) 70 mg/100 mL, net price 4 × 100 mL = £22.80. Counselling, administration

Counselling Oral solution should be swallowed as a single 100 mL dose with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patients should stand or sit upright for at least 30 minutes after taking the solution.

Fosamax® (MSD) Tablets, alendronic acid (as sodium alendronate) 10 mg, net price 28-tab pack = £23.12. Counselling, administration

Fosamax® Once Weekly (MSD) Tablets, alendronic acid (as sodium alendronate) 70 mg, net price 4-tab pack = £22.80. Counselling, administration

With colecaltifero For prescribing information on colecaltifero, see section 9.6.4

Fosavance® (MSD) Tablets, alendronic acid (as sodium alendronate) 70 mg, colecaltifero 70 micrograms (2 800 units), net price 4-tab pack = £22.80. Counselling, administration

Dose treatment of postmenopausal osteoporosis in women at risk of vitamin D deficiency, 1 tablet once weekly

Counselling Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet
**ETIDRONATE DISODIUM**

**Indications** Paget’s disease of bone

**Cautions** consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw, see Bisphosphonates: Osteonecrosis of the Jaw, p. 513); atypical femoral fractures, see MHRA/CHM advice, p. 513; **interactions:** Appendix 1 (bisphosphonates)

**Contra-indications** osteomalacia

**Renal impairment** reduce dose in mild impairment; avoid in moderate to severe renal impairment

**Pregnancy** avoid

**Breast-feeding** no information available

**Side-effects** nausea, diarrhoea or constipation, abdominal pain, increased bone pain, also increased risk of fractures with high doses (discontinue if fractures occur); rarely exacerbation of asthma, skin reactions (including angioedema, rash, urticaria and pruritus); transient hyperphosphataemia, headache, paraesthesia, peripheral neuropathy, atypical femoral fractures (see MHRA/CHM advice, p. 513); **very rarely** osteonecrosis of the jaw (see Bisphosphonates: Osteonecrosis of the Jaw, p. 513); blood disorders (including leucopenia, agranulocytosis and pancytopenia) also reported

**Dose**
- Paget’s disease of bone. 5 mg/kg as a single daily dose for up to 6 months; doses above 10 mg/kg daily for up to 3 months may be used with caution but doses above 20 mg/kg daily are not recommended; after interval of not less than 3 months may be repeated where evidence of reactivation—including biochemical indices (avoid premature retreatment)
- Monitoring: Serum phosphate, serum alkaline phosphatase, and (if possible) urinary hydroxyproline should be measured before starting and at intervals of 3 months—consult product literature for further details

**Counselling** Avoid food for at least 2 hours before and after treatment, particularly calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids

**Didronel®** (Warner Chilcott)

**Tablets**, etidronate disodium 200 mg. Net price 60-tab pack = £19.48. Counselling, food and calcium (see above)

**IBANDRONIC ACID**

**Indications** see under Dose

**Cautions** consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw, see Bisphosphonates: Osteonecrosis of the Jaw, p. 513); atypical femoral fractures, see MHRA/CHM advice, p. 513; monitor renal function and serum calcium, phosphate and magnesium; cardiac disease (avoid fluid overload); **interactions:** Appendix 1 (bisphosphonates)

**Contra-indications** hypocalcaemia; oral route abnormalities of the oesophagus and other factors which delay emptying (e.g. stricture or achalasia)

**Renal impairment** for treatment of osteoporosis, avoid if eGFR less than 30 mL/minute/1.73 m²; for reduction of bone damage in bone metastases, if eGFR 30–50 mL/minute/1.73 m² reduce intravenous dose to 4 mg and infuse over 1 hour, reduce oral dose to 50 mg on alternative days, if eGFR less than 30 mL/minute/1.73 m² reduce intravenous dose to 2 mg and infuse over 1 hour, reduce oral dose to 50 mg once weekly

**Pregnancy** avoid

**Breast-feeding** avoid—present in milk in animal studies

**Side-effects** hypocalcaemia, hypophosphataemia, influenza-like symptoms (including fever, chills, and muscle pain); bone pain; oesophageal reactions (see below), diarrhoea, nausea, vomiting, gastritis, abdominal pain, dyspepsia, pharyngitis; headache, asthenia, rash; very rarely anaemia, atypical femoral fractures (see MHRA/CHM advice, p. 513); hypersensitivity reactions (pruritus, bronchospasm and angioedema reported); urticaria; injection-site reactions; **very rarely** osteonecrosis of the jaw (see Bisphosphonates: Osteonecrosis of the Jaw, p. 513); oesophageal reactions. Severe oesophageal reactions reported with all oral bisphosphonates; patients should be advised to stop tablets and seek medical attention for symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn

**Dose**
- Reduction of bone damage in bone metastases in breast cancer, **by mouth**, 50 mg daily, or **by intravenous infusion**, 6 mg every 3–4 weeks
- Hypercalcemia of malignancy by intravenous infusion, according to serum calcium concentration, 2–4 mg in single infusion
- Treatment of postmenopausal osteoporosis, **by mouth**, 150 mg once a month or **by intravenous injection** over 15–30 seconds, 3 mg every 3 months
- **CHILD** not recommended

**Counselling** Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes (ibandronic acid tablets, 50 mg) or 1 hour (Bonviva® tablets, 150 mg) before first food or drink (other than water) of the day; or another oral medicine; patient should stand or sit upright for at least 1 hour after taking tablet

**Ibandronic acid** (Non-proprietary) **Pos**

**Tablets**, ibandronic acid 50 mg, net price 28-tab pack = £11.99. Counselling, administration

**Brands include** Ibandro®

**Bondeonat®** (Roche) **Pos**

**Tablets**, 1/150 mg, ibandronic acid 50 mg, net price 28-tab pack = £183.69. Counselling, administration

**Concentrate for intravenous infusion**, ibandronic acid 1 mg/mL, net price 2-mL vial = £89.36, 6-mL vial = £183.69

**Bonviva®** (Roche) **Pos**

**Tablets**, 3/150 mg, ibandronic acid 150 mg, net price 1-tab pack = £18.40, 3-tab pack = £55.21. Counselling, administration

**Injection**, ibandronic acid 1 mg/mL, net price 3-mL prefilled syringe = £68.64

**PAMIDRONATE DISODIUM**

Pamidronate disodium was formerly called aminoethylxophosphylidenediphosphonate disodium (APD)

**Indications** see under Dose

**Cautions** assess renal function before each dose; ensure adequate hydration; cardiac disease (especially in elderly); previous thyroid surgery (risk of hypocalcaemia); monitor serum electrolytes, calcium and phosphate—possibility of convulsions due to electrolyte changes; avoid concurrent use with other
Calcium and vitamin D supplements

CHILD

By slow intravenous infusion

Dose

Side-effects

- Hypophosphataemia, fever and influenza-like symptoms (sometimes accompanied by malaise, rigors, fatigue and flushes); nausea, vomiting, anorexia, abdominal pain, diarrhoea, constipation; symptomatic hypocalcaemia (paresthesia, tetany), hypomagnesaemia, headache, insomnia, drowsiness; hypertension; anaemia, thrombocytopenia, lymphopenia, cytopenia; rash, arthralgia, myalgia, bone pain; rarely muscle cramps, atypical femoral fractures (see MHRA/CHM advice, p. 513), dyspnoea, agitation, confusion, dizziness, lethargy; leucopenia, hypotension, puritus, hyperkalaemia or hypokalaemia, and hypernatraemia; osteonecrosis of the jaw (see Bisphosphonates: Osteonecrosis of the Jaw, p. 513), isolated cases of seizures, hallucinations, haematuria, acute renal failure, deterioration of renal disease, conjunctivitis and other ocular symptoms; atrial fibrillation, and reactivation of herpes simplex and zoster also reported; also injection-site reactions

Hepatic impairment

- Caution in severe hepatic impairment

Renal impairment

- Max. infusion rate 20 mg/hour; avoid if eGFR less than 30 mL/minute/1.73 m², except in life-threatening hypercalcaemia if benefit outweighs risk; if renal function deteriorates in patients with bone metastases, withhold dose until serum creatinine returns to within 10% of baseline value

Pregnancy

- Avoid

Breast-feeding

- Avoid

Side-effects

- Abdominal pain, dyspepsia, nausea, diarrhoea, constipation, headache, musculoskeletal pain; rarely arthralgia, myalgia, bone pain; rarely muscle cramps, atypical femoral fractures (see MHRA/CHM advice, p. 513), dyspnoea, agitation, confusion, dizziness, lethargy; leucopenia, hypotension, puritus, hyperkalaemia or hypokalaemia, and hypernatraemia; osteonecrosis of the jaw (see Bisphosphonates: Osteonecrosis of the Jaw, p. 513), isolated cases of seizures, hallucinations, haematuria, acute renal failure, deterioration of renal disease, conjunctivitis and other ocular symptoms; atrial fibrillation, and reactivation of herpes simplex and zoster also reported; also injection-site reactions

Dose

- By slow intravenous infusion (via cannula in a relatively large vein), see also Appendix 4

- Hypercalcaemia of malignancy, according to serum calcium concentration 15–60 mg in single infusion or in divided doses over 2–4 days; max. 90 mg per treatment course

- Osteolytic lesions and bone pain in bone metastases associated with breast cancer or multiple myeloma, 90 mg every 4 weeks (or every 3 weeks to coincide with chemotherapy in breast cancer)

- Paget’s disease of bone, 30 mg once a week for 6 weeks (total dose 180 mg) or 30 mg in first week then 60 mg every other week (total dose 210 mg); max. total 360 mg (in divided doses of 60 mg) per treatment course; may be repeated every 6 months

- CHILD not recommended

Calcium and vitamin D supplements

Oral supplements are advised to minimise potential risk of hypocalcaemia for those with mainly lytic bone metastases or multiple myeloma at risk of calcium or vitamin D deficiency (e.g. through malabsorption or lack of exposure to sunlight) and in those with Paget’s disease

Pamidronate disodium

NON-proprietary

Concentrate for intravenous infusion, pamidronate disodium 3 mg/mL, net price 5-mL vial = £13.33, 10-mL vial = £26.66, 60 mg/mL, 10-mL vial = £53.33; 9 mg/mL, 10-mL vial = £80.00; 15 mg/mL, 1-mL vial = £29.83, 2-mL vial = £59.66, 4-mL vial = £119.32, 6-mL vial = £170.46

Aredia Dry Powder

NON-proprietary

Intravenous infusion, powder for reconstitution, pamidronate disodium, net price 15-mg vial = £29.83; 30-mg vial = £59.66; 90-mg vial = £170.45 (all with diluent)

**RISEDRONATE SODIUM**

Indications

- see under Dose

Cautions

- Oesophageal abnormalities and other factors which delay transit or emptying (e.g. stricture or achalasia—see also under Side-effects); correct hypocalcaemia before starting, correct other disturbances of bone and mineral metabolism (e.g. vitamin D deficiency) at onset of treatment; consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw, see Bisphosphonates: Osteonecrosis of the Jaw, p. 513); atypical femoral fractures, see MHRA/CHM advice, p. 513; interactions: Appendix 1 (bisphosphonates)

Contra-indications

- Hypocalcaemia (see Cautions above)

Renal impairment

- Avoid if eGFR less than 30 mL/minute/1.73 m²

Pregnancy

- Avoid

Breast-feeding

- Avoid

Side-effects

- Abdominal pain, dyspepsia, nausea, diarrhoea, constipation, headache, musculoskeletal pain; less commonly oesophagitis, oesophageal ulcer, dysphagia, gastritis, duodenitis, uveitis; rarely glossitis, oesophageal stricture, atypical femoral fractures (see MHRA/CHM advice, p. 513); also reported gastroduodenal ulceration, herpetic disorders, Stevens-Johnson syndrome, toxic epidermal necrolysis, hair loss, cutaneous vasculitis, osteonecrosis of the jaw (see Bisphosphonates: Osteonecrosis of the Jaw, p. 513)

Oesophageal reactions

- Patients should be advised to stop taking the tablets and seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn

Dose

- Paget’s disease of bone, 30 mg daily for 2 months; may be repeated if necessary after at least 2 months

- Treatment of postmenopausal osteoporosis to reduce risk of vertebral or hip fractures, 5 mg daily or 35 mg once weekly

- Prevention of osteoporosis (including corticosteroid-induced osteoporosis) in postmenopausal women, 5 mg daily

- Treatment of osteoporosis in men at high risk of fractures, 35 mg once weekly

CHILD

- see BNF for Children Counselling

Counselling

- Swallow tablets whole with full glass of water, on rising, take on an empty stomach at least 30 minutes before first food or drink of the day or, if taking at any other time of the day, avoid food and drink for at least 2 hours before or after risedronate (particularly avoid calcium-containing products e.g. milk, also avoid iron and mineral supplements and antacid); stand or sit upright for at least 30 minutes; do not take tablets at bedtime or before rising

Risedronate Sodium

NON-proprietary

Tablets

- risedronate sodium 5 mg, net price 28-tab pack = £13.24; 30 mg, 28-tab pack = £105.70; 35 mg, 4-tab pack = £1.08. Counselling, administration, food, and calcium (see above)
SO D I U M  Clodronate

Indications see under Dose

Cautions monitor renal and hepatic function and white cell count; also monitor serum calcium and phosphate periodically; renal dysfunction reported in patients receiving concomitant NSAIDs; maintain adequate fluid intake during treatment; consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw, see Bisphosphonates: Osteonecrosis of the Jaw, p. 513); atypical femoral fractures, see MHRA/CHM advice, p. 513; interactions: Appendix 1 (bisphosphonates)

Contra-indications acute gastro-intestinal inflammatory conditions

Renal impairment use half normal dose if eGFR 10–30 mL/minute/1.73 m²; avoid if eGFR less than 10 mL/minute/1.73 m²

Pregnancy avoid

Breast-feeding manufacturer advises avoid—no information available

Side-effects nausea, vomiting, diarrhoea, skin reactions, bronchospasm; rarely atypical femoral fractures (see MHRA/CHM advice, p. 513); very rarely osteonecrosis of the jaw (see Bisphosphonates: Osteonecrosis of the Jaw, p. 513); also reported renal impairment

Dose

- Osteolytic lesions, hypercalcaemia and bone pain associated with skeletal metastases in patients with breast cancer or multiple myeloma, by mouth, 1.6 g daily in single or 2 divided doses increased if necessary to a max. of 3.2 g daily in 2 divided doses

Counselling Avoid food for 2 hours before and 1 hour after treatment, particularly calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids; maintain adequate fluid intake

Bonefos (Bayer) Capsules, yellow, sodium clodronate 400 mg, net price 120-cap pack = £139.83. Counselling, food and calcium

Tablets, f/c, scored, sodium clodronate 800 mg, net price 60-tab pack = £146.43. Counselling, food and calcium

Clasteon (Beacon) Capsules, blue/white, sodium clodronate 400 mg, net price 30-cap pack = £34.96, 120-cap pack = £139.83. Counselling, food and calcium

Loron 520 (Intrapharm) Tablets, f/c, scored, sodium clodronate 520 mg, net price 60-tab pack = £152.59. Label: 10, patient information leaflet, counselling, food and calcium

Dose 2 tablets daily in single or two divided doses, may be increased to max. 4 tablets daily

ZOLEDRONIC ACID

Indications see under preparations

Cautions correct disturbances of calcium metabolism (e.g. vitamin D deficiency, hypocalcaemia) before starting; monitor serum electrolytes, calcium, phosphate and magnesium; cardiac disease (avoid fluid overload); consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw, see Bisphosphonates: Osteonecrosis of the Jaw, p. 513); atypical femoral fractures, see MHRA/CHM advice, p. 513; interactions: Appendix 1 (bisphosphonates)

Renal function Renal impairment and renal failure have been reported. Before each dose ensure patient is hydrated and assess renal function. Continue to monitor renal function in patients at risk, such as those with pre-existing renal impairment, those of advanced age, those taking concomitant nephrotoxic drugs or diuretics, or those who are dehydrated. Use with caution with concomitant medicines that affect renal function

Contra-indications women of child-bearing potential

Hepatic impairment caution in severe hepatic impairment—limited information available

Renal impairment avoid if serum creatinine above 400 micromol/litre in tumour-induced hypercalcaemia; in advanced malignancies involving bone, if eGFR 50–60 mL/minute/1.73 m² reduce dose to 3.5 mg every 3–4 weeks, if eGFR 40–50 mL/minute/1.73 m² reduce dose to 3.3 mg every 3–4 weeks, if eGFR 30–40 mL/minute/1.73 m² reduce dose to 3 mg every 3–4 weeks, avoid if eGFR less than 30 mL/minute/1.73 m² (or if serum creatinine greater than 265 micromol/litre); if renal function deteriorates in patients with bone metastases, withhold dose until serum creatinine returns to within 10% of baseline value; avoid in Paget’s disease, treatment of postmenopausal osteoporosis and osteoporosis in men if eGFR less than 35 mL/minute/1.73 m²; see also Cautions above

Pregnancy avoid—toxicity in animal studies

Breast-feeding avoid—no information available
Denosumab

Denosumab is a human monoclonal antibody that inhibits osteoclast formation, function, and survival, thereby decreasing bone resorption.

Side-effects

hypophosphataemia, anaemia, influenza-like symptoms including bone pain, myalgia, arthralgia, fever and rigors; gastro-intestinal disturbances; atrial fibrillation; headache, dizziness, conjunctivitis, renal impairment (rarely acute renal failure); less commonly anorexia, taste disturbance, dry mouth, stomatitis, chest pain, hypertension, hypotension, dyspnoea, cough, paraesthesia, tremor, anxiety, lethargy, sleep disturbance, blurred vision, weight gain, pruritus, rash, sweating, muscle cramps, haematuria, proteinuria, urinary frequency, hypersensitivity reactions (including angioedema), anaphylaxis, peripheral oedema, thrombocytopenia, leucopenia, hypomagnesaemia, hypokalaemia, also injection-site reactions; rarely bradycardia, confusion, hyperkalaemia, hypernatraemia, pancytopenia, osteonecrosis of the jaw (see Bisphosphonates: Osteonecrosis of the Jaw, p. 513), atypical femoral fractures (see MHRA/CHM advice, p. 513); very rarely uveitis and episcleritis

Dose

• See under preparations

Aclasta® (Novartis) 

Intravenous infusion, zoledronic acid 50 micrograms/mL, net price 100-mL bottle = £253.38

Dose

Treatment of Paget’s disease of bone, by intravenous infusion, 5 mg as a single dose over at least 15 minutes

Note

At least 500 mg elemental calcium twice daily (with vitamin D, section 9.6.4) for at least 10 days is recommended following infusion.

Treatment of postmenopausal osteoporosis and osteoporosis in men (including corticosteroid-induced osteoporosis), by intravenous infusion, 5 mg over at least 15 minutes once a year

Note

In patients with a recent low-trauma hip fracture, the dose should be given 2 or more weeks following hip fracture repair; before first infusion give 50 000–125 000 units of vitamin D (section 9.6.4)

Note

The Scottish Medicines Consortium (p. 4) has advised (February 2008) that in postmenopausal women Aclasta® is accepted for restricted use within the NHS Scotland for the treatment of osteoporosis in those for whom oral treatment options for osteoporosis are inappropriate and when initiated by a specialist

Zometa® (Novartis) 

Concentrate for intravenous infusion, zoledronic acid, 800 micrograms/mL, net price 5-mL (4-mg) vial = £174.17

Solution for intravenous infusion, zoledronic acid, 40 micrograms/mL, net price 100-mL (4-mg) bottle = £174.14

Dose

reduction of bone damage in advanced malignancies involving bone, by intravenous infusion, 4 mg over at least 15 minutes every 3–4 weeks; CHILD not recommended

Note

Calcium 500 mg daily and vitamin D 400 units daily should also be taken

Hypercalcaemia of malignancy, by intravenous infusion, 4 mg as a single dose over at least 15 minutes; CHILD not recommended

Note

The Scottish Medicines Consortium (p. 4) has advised (May 2003) that for the prevention of skeletal-related events Zometa® is accepted for restricted use within NHS Scotland for the treatment of patients with breast cancer and multiple myeloma if prescribed by an oncologist

NICE guidance

Denosumab for the prevention of osteoporotic fractures in postmenopausal women (October 2010)

Denosumab is recommended as a treatment option for the primary prevention of osteoporotic fragility fractures in postmenopausal women at increased risk of fractures:

• who are unable to comply with the special instructions for administering alendronate and either risedronate or etidronate, or have an intolerance of, or a contra-indication to, those treatments and

• who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance (available at www.nice.org.uk/TA204).

Denosumab is recommended as a treatment option for the secondary prevention of osteoporotic fragility fractures only in postmenopausal women at increased risk of fractures who are unable to comply with the special instructions for administering alendronate and either risedronate or etidronate, or have an intolerance of, or a contra-indication to, those treatments.

www.nice.org.uk/TA204

The Scottish Medicines Consortium (p. 4) has advised (November 2010) that denosumab (Prolia®) is accepted for restricted use within NHS Scotland for the treatment of osteoporosis in postmenopausal women at increased risk of fractures who have a bone mineral density T-score <-2.5 and >-4.0 and for whom bisphosphonates are unsuitable.

NICE guidance

Denosumab for the prevention of skeletal-related events in adults with bone metastases from solid tumours (October 2012)

Denosumab is recommended for the prevention of skeletal-related events in adults with bone metastases from breast cancer and from solid tumours other than prostate if:

• bisphosphonates would otherwise be prescribed, and

• the manufacturer provides denosumab with the discount agreed in the patient access scheme.

Denosumab is not recommended for preventing skeletal-related events in adults with bone metastases from prostate cancer.

Patients with bone metastases from solid tumours currently receiving denosumab whose disease does not meet the above criteria can continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA265
Strontium ranelate stimulates bone formation and reduces bone resorption. Strontium ranelate treatment has been associated with an increased risk of serious cardiovascular disease, including myocardial infarction, and the risk should be assessed before treatment and regularly during treatment. Strontium ranelate should be initiated only by specialists for the treatment of severe osteoporosis in postmenopausal women or men at high risk of fracture for whom other treatments have failed.

Atypical femoral fractures have been reported rarely in patients receiving denosumab for the long-term treatment (2.5 or more years) of postmenopausal osteoporosis. Patients should be advised to report any new or unusual thigh, hip, or groin pain during treatment with denosumab. Discontinuation of denosumab in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

**DOSAGE**

**Dose**

See under preparations

**Prolia® (Amgen)**

*Injection*, denosumab 60 mg/mL, net price 1-mL prefilled syringe = £183.00

*Dose* treatment of postmenopausal osteoporosis in women at increased risk of fractures and bone loss associated with hormone ablation in men with prostate cancer at increased risk of fractures, by subcutaneous injection, 60 mg every 6 months

**Note** Supplementation with calcium and vitamin D

**XGEVA® (Amgen)**

*Injection*, denosumab 70 mg/mL, net price 1.7-mL (120-mg) vial = £309.86

*Dose* reduction of bone damage in patients with bone metastases from solid tumours, ADULT over 18 years, by subcutaneous injection, 120 mg every 4 weeks

*Note* Calcium 500 mg daily and vitamin D 400 units daily should also be taken

**STRONTIUM RANELATE**

**Indications**

See notes above

**Cautions**

predisposition to cardiovascular disease—assess risk before and every 6–12 months during treatment; interferes with colorimetric measurements of calcium in blood and urine; *interactions*: Appendix 1 (strontium ranelate)

**Contra-indications**

current or previous venous thromboembolic event, ischaemic heart disease, peripheral arterial disease, cerebrovascular disease, or uncontrolled hypertension; temporary or prolonged immobilisation

**Renal impairment**

avoid if eGFR less than 30 mL/minute/1.73 m²

**Side-effects**

nausea, diarrhoea, venous thromboembolism, myocardial infarction, headache, dermatitis, eczema; very rarely hypersensitivity reactions, including rash, pruritus, urticaria, and angioedema—see Severe Allergic Reactions, below; also reported gastro-oesophageal reflux, dyspepsia, abdominal pain, vomiting, constipation, flatulence, stomatitis, peripheral oedema, bone marrow suppression, alopecia

**Severe allergic reactions**

Severe allergic reactions, including drug rash with eosinophilia and systemic symptoms (DRESS), have been reported in patients taking strontium ranelate. DRESS starts with rash, fever, swollen glands, and increased white cell count, and it can affect the liver, kidneys and lungs; DRESS can also be fatal. Patients should be advised to stop taking strontium ranelate and consult their doctor immediately if skin rash develops. Treatment with strontium ranelate should not be restarted.

**Dose**

• 2 g once daily in water, preferably at bedtime

**Counselling**

Avoid food for 2 hours before and after taking granules, particularly calcium-containing products e.g. milk; also preferably avoid concomitant antacids containing aluminium and magnesium hydroxides for 2 hours after taking granules

**Protelos® (Servier)**

*Granules*, yellow, strontium ranelate, 2 g/sachet, net price 28-sachets = £27.08. Label: 5, 13, counselling, food and calcium

**Excipients**

include aspartame (section 9.4.1)
Nausea, constipation, and headache are common side-effects to bromocriptine, but its duration of action is longer. It has similar side-effects to bromocriptine, however patients intolerant of bromocriptine may be able to tolerate cabergoline (and vice versa).

Quinagolide is a non-ergot dopamine D<sub>2</sub> agonist; it has actions and uses similar to those of ergot-derived dopamine agonists, but its side-effects differ slightly.

**Cautions** see notes below; also bromocriptine and cabergoline should be used with caution in patients with a history of peptic ulcer, particularly in acromegalic patients. Treatment should be withdrawn if gastrointestinal bleeding occurs. In hyperprolactinaemic patients, the source of the hyperprolactinaemia should be established (i.e. exclude pituitary tumour before treatment).

Bromocriptine and cabergoline should be used with caution in patients with Raynaud’s syndrome and cardiovascular disease (see also Contra-indications under Bromocriptine, below). Monitor for fibrotic disease (see Fibrotic Reactions, below). Caution is also advised in patients with a history of serious mental disorders (especially psychotic disorders) and in those with acute porphyria (see section 9.8.2). Tolerance may be reduced by alcohol.

**Contra-indications** Bromocriptine and cabergoline should not be used in patients with hypersensitivity to ergot alkaloids. They are contra-indicated in those with cardiac valvulopathy (exclude before treatment, see Fibrotic Reactions, below). They should also be avoided in pre-eclampsia (see also Contra-indications under Bromocriptine, below).

**Side-effects** Nausea, constipation, and headache are common side-effects of bromocriptine and cabergoline. Paraesthesia has been reported rarely. Other reported side-effects include hypotension (see also Hypotensive Reactions, below), drowsiness (see also Driving, below), dyskinesia, pathological gambling, increased libido, hypersexuality, leg cramps, allergic skin reactions, alopecia, and peripheral oedema. Bromocriptine and cabergoline have been associated with pleuritis, pleural effusion, cardiac valvulopathy, pericardial effusion, constrictive pericarditis, and retroperitoneal, pleural, and pulmonary fibrosis (see Fibrotic Reactions).

**Ergot-derived dopamine-receptor agonists**

**Bromocriptine**, cabergoline, lisuride [discontinued], and pergolide have been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions. Exclude cardiac valvulopathy with echocardiography before starting treatment with these ergot derivatives for chronic endocrine disorders (excludes suppression of lactation) or Parkinson’s disease; it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful. Patients taking cabergoline or pergolide should be regularly monitored for cardiac fibrosis, by echocardiography (within 3–6 months of initiating treatment and subsequently at 6–12 month intervals).

**Driving**

**Sudden onset of sleep** Excessive daytime sleepiness and sudden onset of sleep can occur with dopaminergic drugs. Patients starting treatment with these drugs should be warned of the possibility of these effects and of the need to exercise caution when driving or operating machinery.

**Patients** who have suffered excessive sedation or sudden onset of sleep should refrain from driving or operating machines until those effects have stopped recurring.

**Hypotensive reactions** Hypotensive reactions can be disturbing in some patients during the first few days of treatment with bromocriptine, cabergoline, or quinagolide—monitor blood pressure for a few days after starting treatment and following dosage increases; particular care should be exercised when driving or operating machinery.

**Suppression of lactation** Although bromocriptine and cabergoline are licensed to suppress lactation, they are not recommended for routine suppression (or for the relief of symptoms of postpartum pain and engorgement) that can be adequately treated with simple analgesics and breast support. If a dopamine-receptor agonist is required, cabergoline is preferred. Quinagolide is not licensed for the suppression of lactation.

**Fibrotic Reactions**

Ergot-derived dopamine-receptor agonists, bromocriptine, cabergoline, lisuride [discontinued], and pergolide have been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions. Exclude cardiac valvulopathy with echocardiography before starting treatment with these ergot derivatives for chronic endocrine disorders (excludes suppression of lactation) or Parkinson’s disease; it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful. Patients taking cabergoline or pergolide should be regularly monitored for cardiac fibrosis, by echocardiography (within 3–6 months of initiating treatment and subsequently at 6–12 month intervals).

**Indications** see notes above and under Dose; Parkinson’s disease (section 4.9.1)

**Cautions** see notes above; also specialist evaluation—monitor for pituitary enlargement, particularly during pregnancy; monitor visual field to detect secondary field loss in macroprolactinoma; contraceptive advice if appropriate (oral contraceptives may increase prolactin concentration); interactions: Appendix 1 (bromocriptine)

**Contra-indications** see notes above; also hypertension in postpartum women or in puerperium (see also below)

**Postpartum or puerperium** Should not be used postpartum or in puerperium in women with high blood pressure, coronary artery disease, or symptoms (or history) of serious mental disorder; monitor blood pressure carefully (especially during first few days) in postpartum women. Very rarely hypertension, myocardial infarction, seizures or stroke (both sometimes preceded by severe headache or visual disturbances), and mental disorders have been reported in postpartum women given bromocriptine for lactation suppression—caution with antidepressant therapy and avoid other ergot alkaloids. Discontinue immediately if hypertension, unrelenting headache, or signs of CNS toxicity develop.

**Hepatic Impairment** dose reduction may be necessary

**Pregnancy** see Cautions above

**Breast-feeding** suppresses lactation; avoid breast feeding for about 5 days if lactation prevention fails

**Side-effects** see notes above; also nasal congestion; less commonly vomiting, postural hypotension, fatigue, dizziness, dry mouth; also, particularly with high doses, confusion, psychomotor excitement, hallucinations; rarely diarhoea, gastro-intestinal bleeding, gastric ulcer, abdominal pain, tachycardia, bradycardia, arrhythmia, insomnia, psychosis, visual disturbances, tinnitus; very rarely vasospasm of fingers and toes particularly in patients with Raynaud’s syndrome, and
Endocrine system

520 6.7.2 Drugs affecting gonadotrophins  BNF 68

effects like neuroleptic malignant syndrome on withdrawal; urinary incontinence, leucopenia; thrombocytopaenia, hyponatraemia, reversible hearing loss, increased libido, and hypersexuality also reported

Dose

- Prevention or suppression of lactation (but see notes above and under Cautions). 2.5 mg on day 1 (prevention) or daily for 2–3 days (suppression); then 2.5 mg twice daily for 14 days
- Hypogonadism, galactorrhoea, infertility, initially 1–1.25 mg at bedtime, increased gradually; usual dose 7.5 mg daily in divided doses, increased if necessary to max. 30 mg daily, usual dose in infertility without hyperprolactinaemia, 2.5 mg twice daily
- Acromegaly, initially 1–1.25 mg at bedtime, increase gradually to 5 mg every 6 hours
- Prolactinoma, initially 1–1.25 mg at bedtime; increased gradually to 5 mg every 6 hours (occasional patients may require up to 30 mg daily)
- CHILD under 15 years, not recommended

Bromocriptine (Non-proprietary) (Parlodel® Tablets, bromocriptine (as mesilate) 1 mg, net price 100-tab pack = £60.10; 2.5 mg, 30-tab pack = £66.21. Label: 10, 21, counselling, driving, see notes above

Parlodel® (Meda) (Parlodel® Capsules, bromocriptine (as mesilate) 5 mg (blue/white), net price 100-cap pack = £37.57. 10 mg (white), 100-cap pack = £69.50. Label: 10, 21, counselling, driving, see notes above

Cabergoline (Parlodel® Tablett, scored, cabergoline 500 micrograms, net price 8-tab pack = £34.33. Label: 10, 21, counselling, driving, see notes above

Dostinex® (Pharmacia) (Cabergoline® Tablets, scored, cabergoline 500 micrograms. Net price 8-tab pack = £30.04. Label: 10, 21, counselling, driving, see notes above

Note Dispense in original container (contains desiccant)

Quinagolide

Indications see notes above and under Dose

Cautions see notes above; history of psychotic illness; advise non-hormonal contraception if pregnancy not desired; interactions: Appendix 1 (quinagolide)

Contra-indications hypersensitivity to quinagolide (but not ergot alkaloids)

Hepatic impairment avoid—no information available

Renal impairment avoid—no information available

Pregnancy discontinue when pregnancy confirmed unless medical reason for continuing (specialist advice needed)

Breast-feeding suppresses lactation

Side-effects nausea, vomiting, anorexia, abdominal pain, constipation or diarrhoea; syncope, hypotension (see also notes above), oedema, flushing; nasal congestion; headache, dizziness, fatigue, insomnia; very rarely psychosis

Dose

- Hyperprolactinaemia, 25 micrograms at bedtime for 3 days; increased at intervals of 3 days in steps of 25 micrograms to usual maintenance dose of 75–150 micrograms daily; for doses higher than 300 micrograms daily increase in steps of 75–150 micrograms at intervals of not less than 4 weeks; CHILD not recommended

Norgloc® (Ferring) (Tablets, quinagolide (as hydrochloride) 75 micrograms (white), net price 30-tab pack = £27.00; starter pack of 3 × 25-microgram tabs (pink) with 3 × 50-microgram tabs (blue) = £4.50. Label: 10, 21, counselling, driving, see notes above

Note Dispense in original container (contains desiccant)

6.7.2 Drugs affecting gonadotrophins

Danazol inhibits pituitary gonadotrophins; it combines androgenic activity with antioestrogenic and anti-progestogenic activity. It is licensed for the treatment of endometriosis and for the relief of severe pain and tenderness in benign fibrocystic breast disease where other measures have proved unsatisfactory. It may also be effective in the long-term management of hereditary angioedema [unlicensed indication].

Cetrorelix and ganirelix are luteinising hormone releasing hormone agonists, which inhibit the release
of gonadotrophins (luteinising hormone and follicle-stimulating hormone). They are used in the treatment of infertility by assisted reproductive techniques.

**CETRORELIX**

**Indications** adjunct in the treatment of female infertility (under specialist supervision)

**Hepatic impairment** avoid in moderate or severe liver impairment

**Renal impairment** avoid in moderate or severe renal impairment

**Pregnancy** avoid in confirmed pregnancy

**Breast-feeding** avoid

**Side-effects** nausea, headache, injection site reactions; rarely hypersensitivity reactions

**Dose**

- By subcutaneous injection into the lower abdominal wall, either 250 micrograms in the morning, starting on day 5 or 6 of ovarian stimulation with gonadotrophins (or each evening starting on day 5 of ovarian stimulation); continue throughout administration of gonadotrophin including day of ovulation induction (or evening before ovulation induction)

- or 3 mg on day 7 of ovarian stimulation with gonadotrophins; if ovulation induction not possible on day 5 after 3-mg dose, additional 250 micrograms once daily until day of ovulation induction

**Cetrotil®** (Merck Serono)

**Injection** powder for reconstitution, cetrotrelax (as acetate), net price 250-micrograms vial = £22.61; 3-mg vial = £19.86 (both with solvent)

**DANAZOL**

**Indications** see notes above and under Dose

**Cautions** cardiac impairment (avoid if severe), elderly, polycythaemia, epilepsy, diabetes mellitus, hypertension, migraine, lipoprotein disorder, history of thrombosis or thromboembolic disease; withdraw if virilisation (may be irreversible on continued use); non-hormonal contraceptive methods should be used, if appropriate; **interactions**: Appendix 1 danazol

**Contra-indications** ensure that patients with amenorrhoea are not pregnant; thromboembolic disease; undiagnosed genital bleeding; androgen-dependent tumours; acute porphyria (section 9.8.2)

**Hepatic impairment** caution in hepatic impairment (avoid if severe)

**Renal impairment** caution in renal impairment (avoid if severe)

**Pregnancy** avoid; has weak androgenic effects and virilisation of female fetus reported

**Breast-feeding** no data available but avoid because of possible androgenic effects in infant

**Side-effects** nausea, dizziness, skin reactions including rashes, photosensitivity and exfoliative dermatitis, fever, backache, nervousness, mood changes, anxiety, changes in libido, vertigo, fatigue, epigastric and pleuritic pain, headache, weight gain; menstrual disturbances, vaginal dryness and irritation, flushing and reduction in breast size; musculo-skeletal spasm, joint pain and swelling, hair loss; androgenic effects including acne, oily skin, oedema, hirsutism, voice changes and rarely clitoral hypertrophy (see also Cautions); temporary alteration in lipoproteins and other metabolic changes, insulin resistance; thrombotic events; leucopenia, thrombocytopenia, eosinophilia, reversible erythrocytosis or polycythaemia reported; headache and visual disturbances may indicate benign intracranial hypertension; rarely cholestatic jaundice, pancreatitis, peliosis hepatitis and benign hepatic adenomata

**Dose** **Note** in women of child-bearing potential, treatment should start during menstruation, preferably on day 1

- Endometriosis, 200–800 mg daily in up to 4 divided doses, adjusted to achieve amenorrhoea, usually for 3–6 months

- Severe pain and tenderness in benign fibrocystic breast disease not responding to other treatment, 300 mg daily in divided doses usually for 3–6 months

- Hereditary angioedema [unlicensed indication], initially 100–200 mg daily, reduced according to response

**Danazol (Non-proprietary) (DB2)**

**Capsules** danazol 100 mg, net price 28-cap pack = £7.64, 60-cap pack = £16.38; 200 mg, 56-cap pack = £54.60

**Danol®** (Sanofi-Aventis)

**Capsules** danazol 100 mg (grey/white), net price 60-cap pack = £16.38; 200 mg (pink/white), 60-cap pack = £32.43

**GANIRELIX**

**Indications** adjunct in the treatment of female infertility (under specialist supervision)

**Hepatic impairment** avoid in moderate or severe hepatic impairment

**Renal impairment** avoid in moderate to severe renal impairment

**Pregnancy** avoid in confirmed pregnancy—toxicity in animal studies

**Breast-feeding** avoid—no information available

**Side-effects** nausea, headache, malaise, injection-site reactions; very rarely hypersensitivity reactions including rash, facial oedema, and dyspnoea also reported

**Dose**

- By subcutaneous injection preferably into the upper leg (rotate injection sites to prevent lipoatrophy), 250 micrograms in the morning (or each afternoon) starting on day 5 or 6 of ovarian stimulation with gonadotrophins; continue throughout administration of gonadotrophins including day of ovulation induction (if administering in afternoon, give last dose in afternoon before ovulation induction)

**Orgalutran®** (MSD)

**Injection** ganirelix, 500 micrograms/mL, net price 0.5-mL prefilled syringe = £21.48

**Gonadorelin analogues**

**Administration of gonadorelin analogues** produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

Gonadorelin analogues are used in the treatment of endometriosis, precocious puberty, infertility, male hypersexuality with severe sexual deviation, anaemia due to uterine fibroids (together with iron supplementa-
Endocrine system

6.7.2 Drugs affecting gonadotrophins

**BUSERELIN**

**Indications** see under Dose; prostate cancer (section 8.3.4.2); early and advanced breast cancer (section 8.3.4.1)

**Cautions** see notes above; polycystic ovarian disease; diabetes

**Contra-indications** see notes above; hormone-dependent tumours

**Pregnancy** use non-hormonal contraceptives during treatment; see also notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; withdrawal bleeding

**Dose**

- By subcutaneous injection into anterior abdominal wall (as Zoladex®)

   Endometriosis, 3.6 mg every 28 days; max. duration of treatment 6 months (do not repeat)

   Endometrial thinning before intra-uterine surgery, 3.6 mg (may be repeated after 28 days if uterus is large or to allow flexible surgical timing)

   Before surgery in women who have anaemia due to uterine fibroids, 3.6 mg every 28 days (with supplementary iron); max. duration of treatment 3 months

   Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (under specialist supervision), after exclusion of pregnancy.

**GOSERELIN**

**Indications** see under Dose: prostate cancer (section 8.3.4.2); early and advanced breast cancer (section 8.3.4.1)

**Cautions** see notes above; polycystic ovarian disease; diabetes

**Contra-indications** see notes above

**Pregnancy** use non-hormonal contraceptives during treatment; see also notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; withdrawal bleeding

**Dose**

- Endometriosis, intranasally, 300 micrograms (one 150-microgram spray in each nostril) 3 times daily (starting on days 1 or 2 of menstruation); max. duration of treatment 6 months (do not repeat)

- Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (under specialist supervision), by subcutaneous injection, 200–500 micrograms daily given as a single injection (occasionally up to 500 micrograms twice daily may be needed) starting in early follicular phase (day 1) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down-regulation achieved (usually about 1–3 weeks) then maintained during gonadotrophin administration (stopping gonadotrophin and buserelin on administration of chorionic gonadotrophin at appropriate stage of follicular development)

**Counselling** Avoid use of nasal decongestants before and for at least 30 minutes after treatment

**Suprecur®** (Sanofi-Aventis) (Tul)

Nasal spray, buserelin (as acetate) 150 micrograms/ metered spray. Net price 2 × 100-dose pack (with metered dose pumps) = £87.63. Counselling, nasal decongestants

**Injection**, buserelin (as acetate) 1 mg/mL. Net price 5.5-mL vial = £13.76

**BUSERELIN**

**Indications** see under Dose: prostate cancer (section 8.3.4.2); before intra-uterine surgery. Use of leuprolide and triptorelin for 3 to 4 months before surgery reduces the uterine volume, fibroid size and associated bleeding. For women undergoing hysterec- tomy or myomectomy, a vaginal procedure is made more feasible following the use of a gonadorelin analog- gue.

**Cautions** Non-hormonal, barrier methods of contra- ception should be used during entire treatment period with gonadorelin analogues; also use with caution in patients with metabolic bone disease because decrease in bone mineral density can occur.

**Contra-indications** Gonadorelin analogues are contra- indicated for use longer than 6 months in the treat- ment of endometriosis (do not repeat) and when there is unexplained vaginal bleeding.

**Pregnancy** The use of gonadorelin analogues in pregnancy is contra-indicated. Pregnancy should be excluded before treatment; the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

**Breast-feeding** Gonadorelin analogues are contra- indicated in breast-feeding.

**Side-effects** Side-effects of the gonadorelin analo- gues related to the inhibition of oestrogen production include menopausal-like symptoms (e.g. hot flushes, increased sweating, vaginal dryness, dyspareunia and loss of libido) and a decrease in trabecular bone density; these effects can be reduced by hormone replacement (e.g. with an oestrogen and a progestogen or with tibolone). Side-effects of gonadorelin analogues also include headache (rarely migraine) and hypersensitivity reactions including urticaria, pruritus, rash, asthma and anaphylaxis; when treating uterine fibroids, bleeding associated with fibroid degeneration can occur; spray formulations can cause irritation of the nasal mucosa including nose bleeds; local reactions at injection site can occur; other side-effects also reported with some gonadorelin analogues include palpitation, hyper- tension, ovarian cysts (may require withdrawal), changes in breast size, musculoskeletal pain or weak- ness, visual disturbances, paraesthesia, changes in scalp and body hair, oedema of the face and extremities, weight changes, and mood changes including depres- sion.
3.6 mg to achieve pituitary down-regulation (usually 1–3 weeks) then gonadotrophin is administered (stopping gonadotrophin on administration of chorionic gonadotrophin at appropriate stage of follicular development)

## LEUPRORELIN ACETATE

### Indications
- See under Dose; prostate cancer (section 8.3.4.2)
- Endometriosis, women over 18 years, 200 micrograms
- Dose see notes above; acne
- Breast-feeding see notes above
- Contra-indications see notes above
- Pregnancy
- Breast-feeding see notes above
- Side-effects see notes above; breast tenderness; nausea, vomiting, diarrhea, anorexia; fever, chills; sleep disturbances, dizziness, fatigue, leucopenia, thrombocytopenia, altered blood lipids, pulmonary embolism; spinal fracture, paralysis, hypotension and worsening of depression also reported
- Dose
  - By subcutaneous or intramuscular injection (as Synarel® SR DCS)
    - Endometriosis, 3.75 mg as a single dose in first 5 days of menstrual cycle then every month for max. 6 months (course not to be repeated)
    - Endometrial thinning before intra-uterine surgery, 3.75 mg as a single dose (given between days 3 and 5 of menstrual cycle) 5–6 weeks before surgery
    - Reduction of size of uterine fibroids and of associated bleeding before surgery, 3.75 mg as a single dose every month usually for 3–4 months (max. 6 months)
  - By intramuscular injection (as Prostap® 3 DCS)
    - Endometriosis, 11.25 mg as a single dose in first 5 days of menstrual cycle then every 3 months for max. 6 months (course not to be repeated)

### Preparations
- See section 8.3.4.2

## NAFARELIN

### Indications
- See under Dose
- Cautions see notes above
- Pregnancy see notes above
- Breast-feeding see notes above
- Side-effects see notes above; acne
- Dose
  - Endometriosis, women over 18 years, 200 micrograms twice daily as one spray in one nostril in the morning and one spray in the other nostril in the evening (starting on days 2–4 of menstruation), max. duration of treatment 6 months (do not repeat)
  - Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (under specialist supervision), 400 micrograms (one spray in each nostril) twice daily starting in early follicular phase (day 2) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down-regulation achieved (usually within 4 weeks) then maintained (usually for 8–12 days) during gonadotrophin administration (stopping gonadotrophin and nafarelin on administration of chorionic gonadotrophin at follicular maturity); discontinue if down-regulation not achieved within 12 weeks
  - Counselling: Avoid use of nasal decongestants before and for at least 30 minutes after treatment; repeat dose if sneezing occurs during or immediately after administration

### Note
- Each vial includes an overage to allow accurate dispensing.
- Label: 10, patient information leaflet, counselling, see above

### Preparations
- See section 8.3.4.2

## TRIPOTRELIN

### Indications
- Endometriosis; precocious puberty; reduction in size of uterine fibroids; male hypersexuality with severe sexual deviation; advanced prostate cancer (section 8.3.4.2)
- Cautions see notes above
- Contra-indications see notes above
- Pregnancy see notes above
- Breast-feeding see notes above
- Side-effects see notes above; also gastro-intestinal disturbances; in precocious puberty, withdrawal bleeding in females may occur in the first month of treatment; asthenia
- Dose
  - See under preparations below

### Decapeptyl® SR (Ipsen) (Phar)
- Injection, (powder for suspension), m/r, triptorelin (as acetate), net price 3-mg vial (with diluent) = £69.00
- Dose by intramuscular injection, endometriosis and reduction in size of uterine fibroids, 3 mg every 4 weeks starting during first 5 days of menstrual cycle; for uterine fibroids continue treatment for at least 3 months; max. duration of treatment 6 months (not to be repeated)
- Note Each vial includes an overage to allow accurate administration of 3-mg dose

### Gonapeptyl Depot® (Ferring) (Phar)
- Injection, (powder for suspension), triptorelin (as acetate), net price 3.75-mg prefilled syringe (with prefilled syringe of vehicle) = £81.69
- Dose by subcutaneous or deep intramuscular injection, endometriosis and reduction in size of uterine fibroids, 3.75 mg every 4 weeks starting during first 5 days of menstrual cycle; max. duration of treatment 6 months (not to be repeated)
- Precocious puberty, 11.25 mg every 3 months; discontinue when bone maturation consistent with age of 12 years in girls or 13–14 years in boys
- Note Each vial includes an overage to allow accurate administration of 11.25-mg dose

### Gonapeptyl Depot® (Pharmacia) (Phar)
- Injection, (powder for suspension), triptorelin (as acetate), 11.25 mg every 3 months; discontinue when bone maturation consistent with age of 12 years in girls or over 13 years in boys
- Note Each vial includes an overage to allow accurate administration of 3-mg dose

### Note
- Precocious puberty, 11.25 mg every 3 months; discontinue when bone maturation consistent with age of 12 years in girls or over 13 years in boys
- Note Each vial includes an overage to allow accurate administration of 11.25-mg dose

### Gonapeptyl Depot® (Pharmacia) (Phar)
- Injection, (powder for suspension), triptorelin (as acetate), net price 3.75-mg prefilled syringe (with prefilled syringe of vehicle) = £81.69
- Dose by subcutaneous or deep intramuscular injection, endometriosis and reduction in size of uterine fibroids, 3.75 mg every 4 weeks starting during first 5 days of menstrual cycle; max. duration of treatment 6 months (not to be repeated)
- Precocious puberty, 11.25 mg every 3 months; discontinue when bone maturation consistent with age of 12 years in girls or 13–14 years in boys
- Note Each vial includes an overage to allow accurate administration of 11.25-mg dose

### Gonapeptyl Depot® (Pharmacia) (Phar)
- Injection, (powder for suspension), triptorelin (as acetate), 11.25 mg every 3 months; discontinue when bone maturation consistent with age of 12 years in girls or over 13 years in boys
- Note Each vial includes an overage to allow accurate administration of 3-mg dose
6.7.3 Metyrapone

Metyrapone is a competitive inhibitor of 11β-hydroxylase in the adrenal cortex; the resulting inhibition of cortisol (and to a lesser extent aldosterone) production leads to an increase in ACTH production which, in turn, leads to increased synthesis and release of cortisol precursors. It may be used as a test of anterior pituitary function.

Although most types of Cushing’s syndrome are treated surgically, that which occasionally accompanies carcinoma of the bronchus is not usually amenable to surgery. Metyrapone has been found helpful in controlling the symptoms of the disease; it is also used in other forms of Cushing’s syndrome to prepare the patient for surgery. The dosages used are either low, and tailored to cortisol production; see notes above.

Contra-indications severe osteoporosis
Dose by intramuscular injection, male hyposexuality with severe sexual deviation, 11.25 mg every 12 weeks

Breast pain (mastalgia)

Once any serious underlying cause for breast pain has been ruled out, most women will respond to reassurance and reduction in dietary fat; withdrawal of an oral contraceptive or of hormone replacement therapy may help to resolve the pain.

Mild, non-cyclical breast pain is treated with simple analgesics (section 4.7.1); moderate to severe pain, cyclical pain or symptoms that persist for longer than 6 months may require specific drug treatment.

Danazol (section 6.7.2) is licensed for the relief of severe pain and tenderness in benign fibrocystic breast disease which has not responded to other treatment.

Tamoxifen (section 8.3.4.1) may be a useful adjunct in the treatment of mastalgia [unlicensed indication] especially when symptoms can definitely be related to cyclic oestrogen production; it may be given on the days of the cycle when symptoms are predicted.

Treatment for breast pain should be reviewed after 6 months and continued if necessary. Symptoms recur in about 50% of women within 2 years of withdrawal of therapy but may be less severe.

6.7.4 Somatomedins

Somatomedins are a group of polypeptide hormones structurally related to insulin and commonly known as insulin-like growth factors (IGFs). Mecasermin, a human insulin-like growth factor-I (rhIGF-I), is the principal mediator of the somatotropic effects of human growth hormone and is used to treat growth failure in children and adolescents with severe primary insulin-like growth factor-I deficiency.

MECASERMIN
(Recombinant human insulin-like growth factor-I; rhIGF-I)

Indications see notes above
Cautions correct hypothyroidism before initiating treatment; diabetes mellitus (adjustment of antidiabetic therapy may be necessary), monitor ECG before and on termination of treatment (and during treatment if ECG abnormal), papilloedema (see under Side-effects), monitor for disorders of the epiphysis of the hip (monitor for limping), monitor for signs of tonsillar hypertrophy (snoring, sleep apnoea, and chronic middle ear effusions).

Contra-indications evidence of tumour activity (discontinue treatment)

Pregnancy avoid unless essential; contraception advised in women of child-bearing potential

Breast-feeding avoid

Side-effects headache, fundoscopy for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension (rare cases reported); cardiomyogel, ventricular hypertrophy, tachycardia; convulsions, sleep apnoea, night terrors, dizziness, nervousness; tonsillar hypertrophy (see Cautions above); hypoglycaemia (especially in first month, and in younger children), hyperglycaemia, gynaecomastia; arthralgia, myalgia;
visual disturbance, impaired hearing; antibody formation; injection-site reactions (rotate site)

**Dose**

- **By subcutaneous injection, ADOLESCENT and CHILD** over 2 years, initially 40 micrograms/kg twice daily for 1 week, if tolerated increase dose in steps of 40 micrograms/kg to max. 120 micrograms/kg twice daily; discontinue if no response within 1 year

  **Counselling**: Dose should be administered just before or after food; do not increase dose if a dose is missed

  **Note**: Reduce dose if hypoglycaemia occur despite adequate food intake; withhold injection if patient unable to eat

**Increlex®** (Ipsen)

- **Injection**, mecasermin 10 mg/mL; net price 4-mL vial = £605.00. Counselling, administration

  **Excipients** include benzyl alcohol (avoid in neonates, see Excipients, p. 2)
7 Obstetrics, gynaecology, and urinary-tract disorders

7.1 Drugs used in obstetrics
7.1.1 Prostaglandins and oxytocics
7.1.2 Mifepristone
7.1.3 Myometrial relaxants

7.2 Treatment of vaginal and vulval conditions
7.2.1 Preparations for vaginal and vulval changes

7.4.1 Drugs for urinary retention
7.4.2 Drugs for urinary frequency, enuresis, and incontinence
7.4.3 Drugs used in urological pain
7.4.4 Bladder instillations and urological surgery
7.4.5 Drugs for erectile dysfunction

For hormonal therapy of gynaecological disorders see section 6.4.1 (including HRT), section 6.5.1 and section 6.7.2.

7.1 Drugs used in obstetrics

7.1.1 Prostaglandins and oxytocics

Prostaglandins and oxytocics are used to induce abortion or induce or augment labour and to minimise blood loss from the placental site. They include oxytocin, carbetocin, ergometrine, and the prostaglandins. All induce uterine contractions with varying degrees of pain according to the strength of contractions induced.

Induction of abortion
Gemeprost, a prostaglandin administered vaginally as pessaries, is suitable for the medical induction of late therapeutic abortion; gemeprost is also used to ripen the cervix before surgical abortion, particularly in primigravidas. The prostaglandin misoprostol (section 7.1.2) is given by mouth, buccally, sublingually, or vaginally, to induce medical abortion [unlicensed indication]; intravaginal use ripens the cervix before surgical abortion [unlicensed indication]. Extra-amniotic dinoprostone is rarely used nowadays.

Pre-treatment with mifepristone (section 7.1.2) can facilitate the process of medical abortion. It sensitises the uterus to subsequent administration of a prostaglandin and, therefore, abortion occurs in a shorter time and with a lower dose of prostaglandin.

Induction and augmentation of labour
Dinoprostone is available as vaginal tablets, pessaries and vaginal gels for the induction of labour. The intravenous solution is rarely used; it is associated with more side-effects.

Oxytocin (Syntocinon®) is administered by slow intravenous infusion, using an infusion pump, to induce or augment labour, usually in conjunction with amniotomy. Uterine activity must be monitored carefully and...
Prevention and treatment of haemorrhage

Bleeding due to incomplete miscarriage or abortion can be controlled with ergometrine and oxytocin (Syntometrine®) given intramuscularly, the dose is adjusted according to the patient’s condition and blood loss. This is commonly used before surgical evacuation of the uterus, particularly when surgery is delayed. Oxytocin and ergometrine combined are more effective in early pregnancy than either drug alone.

Active management of the third stage of labour reduces the risk of postpartum haemorrhage; oxytocin is given by intramuscular injection [unlicensed] on delivery of the anterior shoulder or, at the latest, immediately after the baby is delivered. Alternatively, ergometrine 500 micrograms with oxytocin 5 units (Syntometrine® 1 mL) can be given by intramuscular injection in the absence of hypertension; oxytocin alone causes less nausea, vomiting, and hypertension than when given with ergometrine.

In excessive uterine bleeding, any placental products remaining in the uterus should be removed. Oxytocic drugs are used to treat postpartum haemorrhage caused by uterine atony; treatment options are as follows:

- oxytocin 5 units by slow intravenous injection (dose may be repeated), followed in severe cases by intravenous infusion of oxytocin 40 units in 500 mL infusion fluid (prolonged administration—see Appendix 4) at a rate that controls uterine atony or
- ergometrine 250–500 micrograms by intramuscular injection or
- ergometrine 250–500 micrograms by slow intravenous injection (use with caution—risk of hypertension) or
- ergometrine 500 micrograms with oxytocin 5 units (Syntometrine® 1 mL) by intramuscular injection

Carboprost has an important role in severe postpartum haemorrhage unresponsive to ergometrine and oxytocin.

Misoprostol [unlicensed] can be used in postpartum haemorrhage when oxytocin, ergometrine, and carboprost are not available or are inappropriate.

CARBETOCIN

Indications preventive of uterine atony after caesarean section

Cautions history of asthma, glaucoma, and raised intra-ocular pressure; allergy to prostaglandins; use with caution in patients with a history of peptic ulceration or other conditions associated with increased risk of bleeding; avoid if severe; migraine; asthma

Contra-indications pre-eclampsia and eclampsia; epilepsy

Hepatic impairment manufacturer advises avoid

Renal impairment manufacturer advises avoid

Side-effects nausea, vomiting, abdominal pain, metallic taste; flushing, hypotension, chest pain; dyspnoea; headache, tremor, dizziness; anaemia; back pain; pruritus; feeling of warmth, chills; tachycardia and sweating also reported

Dose

- By slow intravenous injection over 1 minute, a single dose of 100 micrograms, as soon as possible after delivery, preferably before removal of placenta

Pabal® (Ferring) Injection, carbetocin 100 micrograms/mL, net price 1 mL amp = £17.64

DINOPROSTONE

Indications see notes above and under preparations below

Cautions history of asthma, glaucoma and raised intra-ocular pressure; allergy to prostaglandins; use with caution in patients with a history of peptic ulceration or other conditions associated with increased risk of bleeding; avoid if severe; migraine; asthma

Contra-indications pre-eclampsia and eclampsia; epilepsy

Hepatic impairment manufacturer advises avoid

Renal impairment manufacturer advises avoid

Side-effects nausea, vomiting, diarrhoea; other side-effects include uterine hypertonus, severe uterine
contractions, pulmonary or amniotic fluid embolism, abruptio placenta, fetal distress, maternal hypotension, bronchospasm, rapid cervical dilation, fever, backache; uterine hypercontractility with or without fetal bradycardia; low Apgar scores; cardiac arrest, uterine rupture, stillbirth or neonatal death also reported; vaginal symptoms (warmth, irritation, pain); after intravenous administration—shivering, shivering, headache, dizziness, temporary pyrexia and raised white blood cell count; disseminated intravascular coagulation reported; also local tissue reaction and erythema after intravenous administration and possibility of infection after extra-amniotic administration

**Dose**
- See under preparations, below
- **Important** Do not confuse dose of Prostin E2® vaginal gel with that of Prostin E2® vaginal tablets—not bioequivalent.

**Prepess**® (Perring) 7.1.1 Prostaglandins and oxytocics BNF 68

**Pessaries** (within retrieval device), releasing dinoprostone approx. 10 mg over 24 hours; net price 1- pessary pack = £30.00

**Dose by vagina**, cervical ripening and induction of labour at term, 1 pessary (in retrieval device) inserted high into posterior fornix and removed when cervical ripening adequate; if oxytocin necessary, remove 30 minutes before oxytocin infusion, remove if cervical ripening inadequate after 24 hours (dose not to be repeated)

**Prostin E2® (Pharmacia)**

**Intravenous solution**, for dilution and use as an infusion, dinoprostone 1 mg/mL, net price 0.75-mL amp = £8.52; 10 mg/mL, 0.5-mL amp = £18.40 (both hosp. only; rarely used, consult product literature for dose and indications)

**Extra-amniotic solution**, dinoprostone 10 mg/mL, net price 0.5-mL amp (with diluent) = £18.40 (hosp. only; less commonly used nowadays, consult product literature for dose and indications)

**Vaginal gel**, dinoprostone 400 micrograms/mL, net price 2.5 mL (1 mg) = £13.28; 800 micrograms/mL, 2.5 mL (2 mg) = £13.28

**Dose by vagina**, induction of labour, inserted high into posterior fornix (avoid administration into cervical canal), 1 mg (unfavouable primigravida 2 mg), followed after 6 hours by 1–2 mg if required; max. (gel) 3 mg (unfavourable primigravida 4 mg)

**Vaginal tablets**, dinoprostone 3 mg, net price 8-vaginal tab pack = £106.23

**Dose by vagina**, induction of labour, inserted high into posterior fornix, 3 mg, followed after 6–8 hours by 3 mg if labour is not established; max. 6 mg (vaginal tablets)

**Note** Prostin E2 Vaginal Gel and Vaginal Tablets are not bioequivalent

**ERGOMETRINE MALEATE**

**Indications** see notes above

**Cautions** cardiac disease; hypertension; multiple pregnancy; acute porphyria (section 9.8.2); interactions: Appendix 1 (ergot alkaloids)

**Contra-indications** induction of labour, first and second stages of labour, vascular disease, severe cardiac disease, sepsis, severe hypertension, eclampsia

**Hepatic impairment** manufacturer advises caution in mild or moderate impairment and avoid in severe impairment

**Renal impairment** manufacturer advises caution in mild or moderate impairment and avoid in severe impairment

**Side-effects** nausea, vomiting, abdominal pain; chest pain, arrhythmias (including bradycardia), palpitation, hypertension, vasocostriction; dyspnoea, pulmonary oedema; headache, dizziness; tinnitus; rash; very rarely myocardial infarction

**Dose**
- See notes above

**Ergometrine** (Non-proprietary) 7.1.1 Prostaglandins and oxytocics BNF 68

**Injection**, ergometrine maleate 500 micrograms/mL, net price 1-mL amp = 93p

- **With oxytocin**

**Syntometrine® (Alliance)**

**Injection**, ergometrine maleate 500 micrograms, oxytocin 5 units/mL, net price 1-mL amp = £1.57

**Dose** by intramuscular injection, 1 mL; by intravenous injection, no longer recommended

**GESEPROMST**

**Indications** see under Dose

**Cautions** obstructive airways disease, cardiovascular insufficiency, raised intra-ocular pressure, cervicitis or vaginitis; interactions: Appendix 1 (prostaglandins)

**Important** For warnings relating to use of gemeprost in a patient undergoing induction of abortion with mifepristone, see under Mifepristone and Note below

**Contra-indications** unexplained vaginal bleeding, uterine scarring, placenta praevia

**Renal impairment** manufacturer advises avoid

**Side-effects** vaginal bleeding and uterine pain; nausea, vomiting, or diarrhoea; headache, muscle weakness, dizziness, flushing, chills, backache, dyspnoea, chest pain, palpitation and mild pyrexia; uterine rupture reported (most commonly in multiparas or if history of uterine surgery or if given with invravenous oxytocics); also reported severe hypertension, coronary artery spasm and myocardial infarction

**Dose**
- **By vagina**, cervical ripening prior to first trimester surgical abortion, 1 mg inserted into posterior fornix 3 hours before surgery
- **Second trimester abortion**, 1 mg inserted into posterior fornix every 3 hours for max. of 5 administrations; second course may begin 24 hours after start of treatment (if treatment fails pregnancy should be terminated by another method)
- **Second trimester intra-uterine death**, 1 mg inserted into posterior fornix every 3 hours for max. of 5 administrations only; monitor for coagulopathy

**Note** If used in combination with mifepristone, carefully monitor blood pressure and pulse for 3 hours

**Gemeprost** (Sanofi-Aventis) 7.1.1 Prostaglandins and oxytocics BNF 68

**Pessaries**, gemeprost 1 mg, net price 5-pessary pack = £215.00

**OXYTOCIN**

**Indications** see under Dose and notes above

**Cautions** induction or enhancement of labour—presence of borderline cephalopelvic disproportion (avoid if significant), secondary uterine inertia, mild or moderate pregnancy-induced hypertension or cardiac disease, women over 35 years or with history of lower-uterine segment caesarean section (see also under Contra-indications below); risk factors for disseminated intravascular coagulation; monitor for disseminated intravascular coagulation after parturi- tion; avoid large infusion volumes and restrict fluid
intake by mouth (risk of hypotraemia and water-intoxication—see also Appendix 4); effects enhanced by concomitant prostoglandins (very careful monitoring of uterine activity); caudal block anaesthesia (may enhance hypertensive effects of sympathomimetic vasopressors); see also interactions: Appendix 1 (oxytocin).

**Contra-indications** hypotonic uterine contractions, fetal distress; any condition where spontaneous labour or vaginal delivery inadvisable; avoid prolonged administration in oxytocin-resistant uterine inertia, severe pre-eclamptic toxoaemia, or severe cardiovascular disease

**Side-effects** nausea, vomiting; arthralgia; headache; rarely disseminated intravascular coagulation, rash, and anaphylactoid reactions (with dyspnoea, hypotension, or shock); uterine spasm (may occur at low doses), uterine hypertonus (usually with excessive doses—may cause fetal distress, asphyxia, and death, or may lead to hypertonicity, tetanic contractions, soft-tissue damage or uterine rupture); water intoxication and hyponatraemia associated with high doses with large infusion volumes of electrolyte-free fluid (see also under Dose below); placental abruption and amniotic fluid embolism also reported on overdosage

**Dose** Induction of labour for medical reasons or stimulation of labour in hypotonic uterine inertia, by intravenous infusion (not to be started for at least 6 hours after administration of vaginal prostaglandin), initially 0.001–0.004 units/minute, increased at intervals of at least 30 minutes until a maximum of 3–4 contractions occur every 10 minutes (0.01 units/minute is often adequate) up to max. 0.02 units/minute; if regular contractions not established after total of 5 units stop induction attempt (may be repeated next day starting again at 0.001–0.004 units/minute)

**Important** Careful monitoring of fetal heart rate and uterine motility essential for dose titration (avoid intravenous injection during labour); discontinue immediately in uterine hyperactivity or fetal distress

**Caesarean section, by slow intravenous injection immediately after delivery,** 5 units

**Prevention of postpartum haemorrhage, after delivery of placenta, by slow intravenous injection,** 5 units (if infusion used for induction or enhancement of labour, increase rate during third stage and for next few hours).

**Important** Avoid rapid intravenous injection (may transiently reduce blood pressure)

**Note** Can be given in a dose of 10 units by intramuscular injection (unlicensed route) instead of oxytocin with ergometrine (Syntometrine®), see notes above

**Treatment of postpartum haemorrhage,** by slow intravenous injection, 5 units (dose may be repeated), followed in severe cases by intravenous infusion of 40 units in 500 mL infusion fluid at a rate sufficient to control uterine atony

**Important** Avoid rapid intravenous injection (may transiently reduce blood pressure); prolonged administration, see warning below

**Incomplete, inevitable, or missed miscarriage,** by slow intravenous injection, 5 units followed if necessary by intravenous infusion, 0.02–0.04 units/minute or faster

**Important** Prolonged intravenous administration at high doses with large volume of fluid (which is possible in inevitable or missed miscarriage or postpartum haemorrhage) may cause water intoxication with hyponatraemia. To avoid: use electrolyte-containing diluent (i.e. not glucose), increase oxytocin concentration to reduce fluid, restrict fluid intake by mouth, monitor fluid and electrolytes.

**Note** Oxytocin doses in the BNF may differ from those in the product literature

**Syntocinon® (Alliance®)**

**Injection**, oxytocin, net price 5 units/mL, 1-mL amp = 80p; 10 units/mL, 1-mL amp = 91p

**With ergometrine**

See Syntometrine®, p. 528

**7.1.1 Drugs affecting the ductus arteriosus**

This section is not included in the BNF. For the management of ductus arteriosus, see BNF for Children section 2.14.

**7.1.2 Mifepristone**

Mifepristone, an antiprogestin steroid, sensitises the myometrium to prostaglandin-induced contractions and ripens the cervix. For termination of pregnancy, a single dose of mifepristone is followed by administration of a prostaglandin (gemeprost or misoprostol [unlicensed]). Guidelines of the Royal College of Obstetricians and Gynaecologists (November 2011) include the following [unlicensed] regimens for inducing medical abortion:

- For gestation up to 49 days, mifepristone 200 mg by mouth followed 24–48 hours later by misoprostol 400 micrograms by mouth
- For gestation at 50–63 days, mifepristone 200 mg by mouth followed 24–48 hours later by misoprostol 800 micrograms vaginally, buccally, or sublingually; if abortion has not occurred 4 hours after misoprostol dose, a further dose of misoprostol 400 micrograms may be given vaginally or by mouth
- For gestation between 9 and 13 weeks, mifepristone 200 mg by mouth followed 36–48 hours later by misoprostol 800 micrograms vaginally, followed if necessary by a maximum of 4 further doses at 3-hourly intervals of misoprostol 400 micrograms vaginally or by mouth
- For gestation between 13 and 24 weeks, mifepristone 200 mg by mouth followed 36–48 hours later by misoprostol 800 micrograms vaginally, followed if necessary by a maximum of 4 further doses at 3-hourly intervals of misoprostol 400 micrograms vaginally or by mouth; if abortion has not occurred 3 hours after the last dose of misoprostol, a further dose of mifepristone may be given, and misoprostol may be recommended 12 hours later

**MIFEPRISTONE**

**Indications** see under dose

**Cautions** asthma (avoid if severe and uncontrolled); haemorrhagic disorders and anticoagulant therapy; prostatic heart valve or history of endocarditis (see section 5.1 table 2); risk factors for or existing cardiovascular disease; adrenal suppression (may require corticosteroid); interactions: Appendix 1 (mifepristone)

**Important** For warnings relating to use of gemeprost in a patient undergoing induction of abortion with mifepristone, see under Gemeprost

**Contra-indications** uncontrolled severe asthma; suspected ectopic pregnancy (use other specific means of termination); chronic adrenal failure; acute porphyria (section 9.8.2)

**Hepatic impairment** manufacturer advises avoid

**Renal impairment** manufacturer advises avoid
7 Obstetrics, gynaecology, and urinary-tract disorders

7.1.3 Myometrial relaxants

**Side-effects** gastro-intestinal cramps; uterine contractions, vaginal bleeding (sometimes severe) may occur between administration of mifepristone and surgery (and rarely abortion may occur before surgery); less commonly hypersensitivity reactions including rash and urticaria; rarely hypotension, malaise, headache, fever, hot flushes, dizziness, and chills; infections (including toxic shock syndrome) also reported

**Dose**

- Medical termination of intra-uterine pregnancy of up to 94 days gestation, by mouth, mifepristone 600 mg as a single dose under medical supervision followed 36–48 hours later (unless abortion already complete) by gemoprost 1 mg by vagina or misoprostol 400 micrograms by mouth [unlicensed]; alternative regimen, mifepristone 200 mg by mouth as a single dose followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina; observe for at least 3 hours (or until bleeding or pain at acceptable level); follow-up visit within 2 weeks to verify complete expulsion and to assess vaginal bleeding

- Medical termination of intra-uterine pregnancy of 50–63 days gestation, by mouth, mifepristone 600 mg (200 mg also effective) as a single dose under medical supervision, followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina; observe for at least 3 hours (or until bleeding or pain at acceptable level); follow-up visit within 2 weeks to verify complete expulsion and to assess vaginal bleeding

- Medical termination of pregnancy of 13–24 weeks gestation (in combination with a prostaglandin), by mouth, mifepristone 600 mg (200 mg may be effective) as a single dose under medical supervision followed 36–48 hours later by gemoprost 1 mg by vagina every 3 hours up to max. 5 mg or misoprostol (see above [unlicensed]); if abortion does not occur, 24 hours after start of treatment repeat course of gemeprost 1 mg by vagina up to max. 5 mg; follow-up visit after appropriate interval to assess vaginal bleeding

- Cervical ripening before mechanical cervical dilatation for termination of pregnancy of up to 84 days gestation, by mouth, mifepristone 200 mg as a single dose under medical supervision 36–48 hours before procedure

- Termination of pregnancy of 13–24 weeks gestation (in combination with a prostaglandin), by mouth, mifepristone 600 mg (200 mg may be effective) as a single dose under medical supervision followed 36–48 hours later by gemeprost 1 mg by vagina or misoprostol (see above [unlicensed]); if abortion does not occur, 24 hours after start of treatment repeat course of gemeprost 1 mg by vagina up to max. 5 mg; follow-up visit after appropriate interval to assess vaginal bleeding

**Contra-indications** eclampsia and severe pre-eclampsia, intra-uterine infection, intra-uterine fetal death, antepartum haemorrhage (requiring immediate delivery), placenta praevia, abruptio placenta, intra-uterine growth restriction with abnormal fetal heart rate, premature rupture of membranes after 30 weeks’ gestation.

**Cautions** monitor blood loss after delivery; intra-uterine growth restriction; abnormal placental site

**Indications** uncomplicated premature labour (see notes above)

**Notes** Careful monitoring of blood pressure and pulse essential for 3 hours after administration of gemeprost pessary (risk of profound hypotension)

**Labour induction in fetal death in utero**

- Labour induction in fetal death in utero where prostaglandin or oxytocin inappropriate, by mouth, mifepristone 600 mg daily as a single dose for 2 days under medical supervision; if labour not started within 72 hours of first dose, another method should be used

**Mifegyne® (Nordic)**

- Tablets, yellow, mifepristone 200 mg, net price 3-tab pack = £52.66 (supplied to NHS hospitals and premises approved under Abortion Act 1967). Label: 10, patient information leaflet

**Tractocile® (Ferring)**

- Injection, atosiban (as acetate) 7.5 mg/mL, net price 0.9-mL (6.75-mg) vial = £18.41

**Concentrate for intravenous infusion, atosiban (as acetate) 7.5 mg/mL, net price 5-mL vial = £52.82

Gained by using the delay to administer corticosteroid therapy or to implement other measures which improve perinatal health (including transfer to a unit with neonatal intensive care facility).

The oxytocin receptor antagonist, atosiban, is licensed for the inhibition of uncomplicated premature labour between 24 and 33 weeks of gestation. Atosiban may be preferable to a beta2 agonist because it has fewer side-effects.

The dihydropyridine calcium-channel blocker nifedipine (section 2.6.2) also has fewer side-effects than a beta2 agonist. Nifedipine (unlicensed indication) can be given initially in a dose of 20 mg followed by 10–20 mg 3–4 times daily adjusted according to uterine activity.

The beta2 agonists salbutamol and terbutaline are licensed for inhibiting uncomplicated premature labour between 22 and 37 weeks of gestation to permit a delay in delivery of up to 48 hours. Use of high-dose short-acting beta2 agonists in obstetric indications has been associated with serious, sometimes fatal cardiovascular events in the mother and fetus, particularly when used on a prolonged period of time. Oral therapy is no longer recommended and parenteral therapy should be restricted to a maximum duration of 48 hours, given under the supervision of a specialist, and with close monitoring (see under Beta2 agonists).

**Indometacin** (section 10.1.1), a cyclo-oxygenase inhibitor, also inhibits labour [unlicensed indication] and it can be useful in situations where a beta2 agonist is not appropriate; however, there are concerns about neonatal complications such as transient impairment of renal function and premature closure of ductus arteriosus.

**Atosiban**

**ATOSIBAN**

**Indications** uncomplicated premature labour (see notes above)

**Cautions** monitor blood loss after delivery; intra-uterine growth restriction; abnormal placental site

**Contra-indications** eclampsia and severe pre-eclampsia, intra-uterine infection, intra-uterine fetal death, antepartum haemorrhage (requiring immediate delivery), placenta praevia, abruptio placenta, intra-uterine growth restriction with abnormal fetal heart rate, premature rupture of membranes after 30 weeks’ gestation

**Hepatic impairment** no information available

**Renal impairment** no information available

**Side-effects** nausea, vomiting, tachycardia, hypotension, headache, dizziness, hot flushes, hyperglycaemia, injection-site reaction; less commonly pruritus, rash, fever, insomnia

**Dose**

- By intravenous injection, initially 6.75 mg over 1 minute, then by intravenous infusion 18 mg/hour for 3 hours, then 6 mg/hour for up to 45 hours; max. duration of treatment 48 hours

**Tractocile® (Ferring)**

- Injection, atosiban (as acetate) 7.5 mg/mL, net price 0.9-mL (6.75-mg) vial = £18.41

- Concentrate for intravenous infusion, atosiban (as acetate) 7.5 mg/mL, net price 5-mL vial = £52.82
**Beta₂ agonists**

**Cautions** Beta₂ agonists should be used with caution in patients with hypertension, mild to moderate pre-eclampsia, hyperthyroidism, and hypokalaemia (particular risk with potassium-depleting diuretics—see also Hypokalaemia, p. 186). Patients with suspected cardiovascular disease should be assessed by a cardiologist before initiating therapy—see also Contra-indications, below. It is important to monitor blood pressure, pulse rate (should not exceed 120 beats per minute), ECG (discontinue treatment if signs of myocardial ischaemia develop), blood glucose and lactate concentrations, and the patient’s fluid and electrolyte status (avoid over-hydration—discontinue drug immediately and initiate diuretic therapy if pulmonary oedema occurs). Beta₂ agonists should also be used with caution in diabetes—monitor blood glucose (risk of hyperglycaemia and ketoacidosis, especially with intravenous beta₂ agonists).

**Contra-indications** Beta₂ agonists are contra-indicated in patients with a history of cardiac disease and in patients with significant risk factors for myocardial ischaemia; they should also be avoided in pulmonary hypertension, antepartum haemorrhage, intra-uterine infection, intra-uterine fetal death, placenta praevia, abruptio placenta, threatened miscarriage, cord compression, and eclampsia or severe pre-eclampsia.

**Side-effects** Side-effects of the beta₂ agonists include nausea, vomiting, pulmonary oedema (see Cautions above), palpitation, tachycardia, arrhythmias, myocardial ischaemia, hypotension, peripheral vasodilation, headache, tremor, hyperglycaemia, hypokalaemia (see Cautions), muscle cramps and tension, and hypersensitivity reactions (including angioedema, urticaria, rash, bronchospasm, hypotension, and collapse).

---

**SALBUTAMOL**

*(Albuterol)*

**Indications** uncomplicated premature labour under specialist supervision (see notes above); asthma (section 3.1.1)

**Cautions** see notes above; interactions: Appendix 1 (sympathomimetics, beta₂)

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**

- By intravenous infusion, initially 10 micrograms/minute for 20 minutes, increased every 20 minutes in steps of 2.5 micrograms/minute until contractions have ceased (more than 10 micrograms/minute should seldom be given—20 micrograms/minute should not be exceeded), continue for 1 hour then decrease every 20 minutes in steps of 2.5 micrograms/minute to lowest dose that maintains suppression; max. total duration 48 hours

**Preparations**

Section 3.1.1.1

---

**TERBUTALINE SULFATE**

**Indications** uncomplicated premature labour under specialist supervision (see notes above); asthma (section 3.1.1)

**Cautions** see notes above; interactions: Appendix 1 (sympathomimetics, beta₂)

**Contra-indications** see notes above

**Side-effects** see notes above; also reported sleep disturbances and behavioural disturbances.

**Dose**

- By intravenous infusion, 5 micrograms/minute for 20 minutes, increased every 20 minutes in steps of 2.5 micrograms/minute until contractions have ceased (more than 10 micrograms/minute should seldom be given—20 micrograms/minute should not be exceeded), continue for 1 hour then decrease every 20 minutes in steps of 2.5 micrograms/minute to lowest dose that maintains suppression; max. total duration 48 hours

**Preparations**

Section 3.1.1.1

---

**7.2 Treatment of vaginal and vulval conditions**

**7.2.1 Preparations for vaginal and vulval changes**

**7.2.2 Vaginal and vulval infections**

Symptoms are often restricted to the vulva, but infections almost invariably involve the vagina which should also be treated. Applications to the vulva alone are likely to give only symptomatic relief without cure. *Aqueous medicated douches* may disturb normal vaginal acidity and bacterial flora.

**Topical anaesthetic agents** give only symptomatic relief and may cause sensitivity reactions. They are indicated only in cases of pruritus where specific local causes have been excluded.

Systemic drugs are required in the treatment of infections such as gonorrhoea and syphilis (section 5.1).

**7.2.1 Preparations for vaginal and vulval changes**

**Topical HRT for vaginal atrophy**

A cream containing an oestrogen may be applied on a short-term basis to improve the vaginal epithelium in *menopausal atrophic vaginitis*. It is *important* to bear in mind that topical oestrogens should be used in the *smallest effective* amount to minimise systemic effects. Modified-release vaginal tablets and an impregnated vaginal ring are now also available.

The risk of endometrial hyperplasia and carcinoma is increased when *systemic* oestrogens are administered alone for prolonged periods (section 6.4.1.1). The endometrial safety of long-term or repeated use of topical vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.

Topical oestrogens are also used in postmenopausal women before vaginal surgery for prolapse when there is epithelial atrophy.

For a general comment on hormone replacement therapy, including the role of topical oestrogens, see section 6.4.1.1.
OESTROGENS, TOPICAL

Indications  see notes above

Cautions  see notes above; see also Oestrogens for HRT (section 6.4.1.1); interrupt treatment periodically to assess need for continued treatment

Contra-indications  see notes above; see also Oestrogens for HRT (section 6.4.1.1)

Hepatic Impairment  see Combined Hormonal Contraceptives, section 7.3.1

Pregnancy  see Combined Hormonal Contraceptives, section 7.3.1

Breast-feeding  avoid; adverse effects on lactation; see also Combined Hormonal Contraceptives, section 7.3.1

Side-effects  see notes above; see also Oestrogens for HRT (section 6.4.1.1); local irritation

Gynest® (Marlborough) Sublingual tablets, f/c, estradiol 0.01%, net price 20 tablets = £4.67 Excipients include arachis (peanut) oil

Contraceptives, section 7.3.1

Dose  for postmenopausal urogenital conditions (not suitable for vasomotor symptoms or osteoporosis prophylaxis), to be inserted into upper third of vagina and worn continuously; replace after 3 months, max. duration of continuous treatment 2 years

Vaginal ring

Esting® (Pharmacia) Sublingual tablets, f/c, estradiol 0.5mg in disposable applicators, net price 24-applicator pack = £10.62

Excipients none as listed in section 13.1.3

Condoms none as listed in section 13.1.3

Dose  insert 1 applicator-dose daily for 2–3 weeks, then reduce to twice a week; attempts to reduce or discontinue should be made at 3–6 month intervals with re-examination

Ortho-Gynest® (Lanssen) Pessaries, estradiol 50 micrograms, net price 15 pessaries = £4.17

Excipients include butylated hydroxytoluene

Condoms  damage latex condoms and diaphragms

Dose  insert 1 applicator-dose daily, preferably in the evening until improvement occurs, reduced to 1 applicator twice a week; attempts to discontinue should be made at 3–6 month intervals with re-examination

Ovestin® (MSD) Sublingual tablets, f/c, estradiol 0.1%, net price 15 tablets = £4.73

Excipients include cetyl alcohol, polysorbates, stearyl alcohol

Condoms  may damage latex condoms and diaphragms

Dose  insert 1 pessary daily, preferably in the evening, until improvement occurs; maintenance 1 pessary twice a week; attempts to reduce or discontinue should be made at 3–6 month intervals with re-examination

Vagifem® (Novo Nordisk) Sublingual tablets, f/c, estradiol 10 micrograms in disposable applicators, net price 24-applicator pack = £16.72

Excipients none as listed in section 13.1.3

Condoms  no evidence of damage to latex condoms and diaphragms

Dose  insert 1 vaginal tablet daily for 2 weeks then reduce to 1 tablet twice weekly

Non-hormonal preparations for vaginal atrophy

Replens MD® and Sylk® are acidic, non-hormonal vaginal moisturisers; Replens MD® provides a high moisture content for up to 3 days.

7.2.2 Vaginal and vulval infections

Effective specific treatments are available for the common vaginal infections.

Fungal infections

Candidal vulvitis can be treated locally with cream, but is almost invariably associated with vaginal infection which should also be treated. Vaginal candidiasis is treated primarily with antifungal pessaries or cream inserted high into the vagina (including during menstruation). Single-dose preparations offer an advantage when compliance is a problem. Local irritation may occur on application of vaginal antifungal products.

Imidazole drugs ( clotrimazole, econazole, fenticonazole, and miconazole) are effective against candida in short courses of 1 to 14 days according to the preparation used; treatment can be repeated if initial course fails to control symptoms or if symptoms recur. Vaginal applications may be supplemented with antifungal cream for vulvitis and to treat other superficial sites of infection.

Oral treatment of vaginal infection with fluconazole or itraconazole (section 5.2.1) is also effective.

Vulvovaginal candidiasis in pregnancy

Vulvovaginal candidiasis is common during pregnancy and can be treated with vaginal application of an imidazole (such as clotrimazole), and a topical imidazole cream for vulvitis. Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. Oral antifungal treatment should be avoided during pregnancy.

Recurrent vulvovaginal candidiasis

Recurrent of vulvovaginal candidiasis is particularly likely if there are predisposing factors, such as antibacterial therapy, pregnancy, diabetes mellitus, or possibly oral contraceptive use. Reservoirs of infection may also lead to recontamination and should be treated; these include other skin sites such as the digits, nail beds, and umbilicus as well as the gastro-intestinal tract and the bladder. The partner may also be the source of re-infection and, if symptomatic, should be treated with a topical imidazole cream at the same time.

Treatment against candida may need to be extended for 6 months in recurrent vulvovaginal candidiasis. Some recommended regimens [all unlicensed] include:

- initially, fluconazole (section 5.2.1) by mouth 150 mg every 72 hours for 3 doses, then 150 mg once every week for 6 months;
- initially, intravaginal application of a topical imidazole for 10–14 days, then clotrimazole vaginally 500-mg pessary once every week for 6 months;
- initially, intravaginal application of a topical imidazole for 10–14 days, then itraconazole (section 5.2.1) by mouth 50–100 mg daily for 6 months.
7.2.2 Vaginal and vulval infections

**Clotrimazole**

- **Side-effects**: occasional local irritation
- **Interactions**: normal
- **Cautions**: see notes above
- **Indications**: see notes above

**Cream**

- **Dose**: insert 1 pessary at night as a single dose; can be repeated once if necessary
- **Condoms**: damages latex condoms and diaphragms
- **Excipients**: include benzyl alcohol, cetostearyl alcohol, polysorbates
- **Brands for sale to the public**:
  - **Cream Combi**, clotrimazole 10% vaginal cream and 2% topical cream, net price 5-g vaginal cream (with applicator) = £4.50
  - **Cream**, clotrimazole 1%, net price 20 g = £2.14; 50 g = £3.50
  - **Excipients**: include hydroxybenzoates (parabens)

**Cream Combi**

- **Dose**: insert 1 vaginal capsule at night as a single dose; can be repeated once if necessary
- **Condoms**: damages latex condoms and diaphragms
- **Excipients**: include hydrobenzoates (parabens)

**Cream**

- **Dose**: insert 1 g at night as a single dose; can be repeated once if necessary
- **Condoms**: damages latex condoms and diaphragms
- **Excipients**: include benzyl alcohol, cetostearyl alcohol, polysorbates

**Gyno-Pevaryl**

- **Dose**: insert 1 vaginal capsule at night for 3 nights; course can be repeated once if necessary
- **Excipients**: include cetyl alcohol, hydrogenated wool fat, propylene glycol
- **Brands for sale to the public**:
  - **Gyno-Pevaryl**, econazole nitrate 150 mg, net price 3 pessaries = £4.17
  - **Gyno-Pevaryl**, econazole nitrate 2% topical cream, net price 20 g = £4.24

**Thrush Cream**

- **Dose**: apply to anogenital area twice daily for 7 days; course can be repeated once if necessary
- **Condoms**: damages latex condoms and diaphragms
- **Excipients**: include butylated hydroxyanisole

**Gyno-Daktarin**

- **Dose**: insert 5-g applicatorful intravaginally twice daily for 3 days; course can be repeated once if necessary
- **Excipients**: include hydroxybenzoates (parabens)

**Nizoral**

- **Dose**: insert 1 vaginal capsule at night as a single dose; can be repeated once if necessary
- **Excipients**: include hydrobenzoates (parabens)

**Intravaginal cream**

- **Dose**: insert 1 g at night as a single dose; can be repeated once if necessary
- **Condoms**: damages latex condoms and diaphragms
- **Excipients**: include hydroxybenzoates (parabens)

**Cream**

- **Dose**: apply to anogenital area 2–3 times daily
- **Condoms**: damages latex condoms and diaphragms
- **Excipients**: include hydroxybenzoates (parabens)

**Pessary Combi**

- **Dose**: insert 1 pessary at night as a single dose; can be repeated once if necessary
- **Condoms**: damages latex condoms and diaphragms
- **Excipients**: include benzyl alcohol, cetostearyl alcohol, polysorbates

---

**PREPARATIONS FOR VAGINAL AND VULVAL CANDIDIASIS**

**Indications**: see notes above

**Cautions**

- **Interactions**: Appendix 1 (miconazole)
- **Pregnancy**: see notes above
- **Side-effects**: occasional local irritation

**Dose**

- See under preparations below

**Clotrimazole** (Non-proprietary)

- **Cream** (topical), clotrimazole 1%, net price 20 g = £1.26; 50 g = £3.15
- **Condoms**: check with manufacturer of cream for effect on latex condoms and diaphragms
- **Dose**: apply to anogenital area 2–3 times daily
- **Pessary**, clotrimazole 500 mg, net price 1 pessary with applicator = £3.12
- **Dose**: insert 1 pessary at night as a single dose; can be repeated once if necessary

**Canesten**® (Bayer Consumer Care)

- **Cream** (topical), clotrimazole 1%, net price 20 g = £2.14; 50 g = £3.50
- **Excipients**: include benzyl alcohol, cetostearyl alcohol, polysorbates
- **Condoms**: damages latex condoms and diaphragms
- **Dose**: apply to anogenital area 2–3 times daily
- **Pessary**, clotrimazole 2%, net price 20 g = £4.46
- **Excipients**: include benzyl alcohol, cetostearyl alcohol, polysorbates
- **Condoms**: damages latex condoms and diaphragms
- **Dose**: apply to anogenital area 2–3 times daily
- **Intravaginal cream** (10% VC®), clotrimazole 10%, net price 5-g applicant pack = £4.50
- **Excipients**: include benzyl alcohol, cetostearyl alcohol, polysorbates
- **Condoms**: damages latex condoms and diaphragms
- **Dose**: insert 5 g at night as a single dose; can be repeated once if necessary
- **Note**: Brands for sale to the public include Canesten® Internal Cream

**Cream Combi**, clotrimazole 10% vaginal cream and 2% topical cream, net price 5-g vaginal cream (with applicator) and 10-g topical cream = £8.21
- **Excipients**: include benzyl alcohol, cetostearyl alcohol, polysorbates
- **Condoms**: damages latex condoms and diaphragms
- **Dose**: see under individual components

**Pessaries**, clotrimazole 100 mg, net price 6 pessaries with applicator = £3.50; 200 mg, 3 pessaries with applicator = £3.10
- **Condoms**: damages latex condoms and diaphragms
- **Dose**: insert 200 mg for 3 nights or 100 mg for 6 nights; course can be repeated once if necessary

**Pessary Combi**, clotrimazole 500 mg pessary and cream (topical) 2%, net price 1 pessary and 10-g cream = £8.21
- **Condoms**: damages latex condoms and diaphragms
- **Excipients**: include benzyl alcohol, cetostearyl alcohol, polysorbates
- **Dose**: see under individual components

**Soft Gel Pessary**, clotrimazole 500 mg, net price 1 pessary with applicator = £6.41
- **Condoms**: damages latex condoms and diaphragms
- **Dose**: insert 1 pessary at night as a single dose; can be repeated once if necessary

---

**Soft Gel Pessary Combi**, clotrimazole 500-mg soft gel pessary and cream (topical) 2%, net price 1 pessary and 10-g cream = £5.73
- **Excipients**: include benzyl alcohol, cetostearyl alcohol, polysorbates
- **Condoms**: damages latex condoms and diaphragms
- **Dose**: see under individual components

**Gyno-Daktarin**® (Janssen)

- **Intravaginal cream**, miconazole nitrate 2%, net price 78 g with applicators = £4.33
- **Excipients**: include butylated hydroxyanisole
- **Condoms**: damages latex condoms and diaphragms
- **Dose**: insert 5-g applicatorful once daily for 10–14 days or twice daily for 7 days; course can be repeated once if necessary, topical, apply to anogenital area twice daily
- **Ovule** (= vaginal capsule) (Gyno-Daktarin 1®), miconazole nitrate 1.2 g in a fatty basis, net price 1 ovule = £2.94
- **Excipients**: include hydroxybenzoates (parabens)
- **Condoms**: damages latex condoms and diaphragms
- **Dose**: insert 1 ovule at night as a single dose; can be repeated once if necessary

**Gyno-Pevaryl**® (Janssen)

- **Cream**, econazole nitrate 1%, net price 15 g = £2.11; 30 g = £3.78
- **Excipients**: none as listed in section 13.1.3
- **Condoms**: damages latex condoms and diaphragms
- **Dose**: insert 5-g applicatorful intravaginally and apply to vulva at night for at least 14 nights; course can be repeated once if necessary
- **Note**: Applicator available separately from Marlborough
- **Pessaries**, econazole nitrate 150 mg, net price 3 pessaries = £4.17
- **Excipients**: none as listed in section 13.1.3
- **Condoms**: damages latex condoms and diaphragms
- **Dose**: ADULT and CHILD over 16 years, insert 1 pessary for 3 nights; course can be repeated once if necessary
- **Pessary** (Gyno-Pevaryl 1®), econazole nitrate 150 mg, formulated for single-dose therapy, net price 1 pessary with applicator = £3.69
- **Excipients**: none as listed in section 13.1.3
- **Condoms**: damages latex condoms and diaphragms
- **Dose**: ADULT and CHILD over 16 years, insert 1 pessary at night as a single dose; can be repeated once if necessary

**Gynoxin®** (Recordati)

- **Intravaginal cream**, fenticonazole nitrate 2%, net price 30 g with applicator = £3.74
- **Excipients**: include cetyl alcohol, hydrogenated wool fat, propylene glycol
- **Condoms**: damages latex condoms and diaphragms
- **Dose**: insert 5-g applicatorful intravaginally twice daily for 3 days

**Vaginal capsule**, fenticonazole nitrate 200 mg, net price 3 vaginal capsules = £2.42
- **Excipients**: include hydrobenzoates (parabens)
- **Condoms**: damages latex condoms and diaphragms
- **Dose**: insert 1 vaginal capsule at night for 3 nights

**Vaginal capsule**, fenticonazole nitrate 600 mg, net price 1 vaginal capsule = £2.62
- **Excipients**: include hydrobenzoates (parabens)
- **Condoms**: damages latex condoms and diaphragms
- **Dose**: insert 1 vaginal capsule at night as a single dose

**Nizoral**® (Janssen)

- **Cream** (topical), ketoconazole 2%, net price 30 g = £4.24
- **Excipients**: include polysorbates, propylene glycol, stearyl alcohol
- **Condoms**: effect on latex condoms and diaphragms not yet known
- **Dose**: ADULT over 18 years, apply to anogenital area once or twice daily
7 Obstetrics, gynaecology, and urinary-tract disorders

Other infections

Trichomonal infections commonly involve the lower urinary tract as well as the genital system and need systemic treatment with metronidazole or tinidazole (section 5.1.11).

Bacterial infections with Gram-negative organisms are particularly common in association with gynaecological operations and trauma. Metronidazole is effective against certain Gram-negative organisms, especially Bacteroides spp. and can be used prophylactically in gynaecological surgery.

Clindamycin cream and metronidazole gel are indicated for bacterial vaginosis.

Vaginal preparations intended to restore normal acidity may prevent recurrence of vaginal infections and permit the re-establishment of the normal vaginal flora.

The antiviral drugs aciclovir, famciclovir, and valaciclovir can be used in the treatment of genital infection due to herpes simplex virus, the HSV type 2 being a major cause of genital ulceration; they have a beneficial effect on virus shedding and healing, generally giving relief from pain and other symptoms. See section 5.3.2.1 for systemic preparations, and section 13.10.3 for topical preparations.

PREPARATIONS FOR OTHER VAGINAL INFECTIONS

Balance Activ Rx® (BBI Healthcare)

Vaginal gel, lactic acid 4.9%, glycogen 0.1%, net price 7 x 5 mL-tube = £5.25

Excipients include propylene glycol

Dose prevention of bacterial vaginosis, insert contents of 1 tube once or twice weekly

Dalacin® (Pharmacia) (Pharmacia)

Cream, clindamycin 2% (as phosphate), net price 40-g pack with 7 applicators = £10.86

Excipients include benzyl alcohol, cetostearyl alcohol, polysorbates, propylene glycol

Dose prevention of bacterial vaginosis, insert contents of 1 tube once or twice weekly

Relactagel® (KoRus)

Vaginal gel, lactic acid 4.5%, glycogen 0.1%, net price 7 x 5 mL-tube = £5.25

Excipients include propylene glycol

Cautions not recommended if trying to conceive

Side-effects mild irritation

Dose prevention of bacterial vaginosis, ADULT over 18 years insert contents of 1 tube at night for 2–3 nights after menstruation

Zidoval® (Meda) (Meda)

Vaginal gel, metronidazole 0.75%, net price 40-g pack with 5 applicators = £4.31

Excipients include disodium edetate, hydroxybenzoates (parabens), propylene glycol

Cautions not recommended during menstruation; some absorption may occur, see section 5.1.11 for systemic effects

Side-effects local effects including irritation, candidiasis, abnormal discharge, pelvic discomfort

Dose bacterial vaginosis, insert 5-g applicatorful at night for 5 nights

7.3 Contraceptives

7.3.1 Combined hormonal contraceptives

7.3.2 Progestogen-only contraceptives

7.3.3 Spermicidal contraceptives

7.3.4 Contraceptive devices

7.3.5 Emergency contraception

The Fraser Guidelines should be followed when prescribing contraception for women under 16 years. The UK Medical Eligibility Criteria for Contraceptive Use (available at www.fsrh.org) is published by the Faculty of Sexual and Reproductive Healthcare; it categorises the risks of using contraceptive methods with pre-existing medical conditions.

Hormonal contraception is the most effective method of fertility control, but can have major and minor side-effects, especially for certain groups of women.

Intra-uterine devices are a highly effective method of contraception but may produce undesirable local side-effects. They may be used in women of all ages irrespective of parity, but are less appropriate for those with an increased risk of pelvic inflammatory disease.

Barrier methods alone (condoms, diaphragms, and caps) are less effective but can be reliable for well-motivated couples if used in conjunction with a spermicide. Occasionally sensitivity reactions occur. A female condom (Femidom®) is also available; it is pre-lubricated but does not contain a spermicide.

7.3.2 Progestogen-only contraceptives

Oral contraceptives containing an oestrogen and a progestogen (‘combined oral contraceptives’) are effective preparations for general use. Advantages of combined oral contraceptives include:

- reliable and reversible;
- reduced dysmenorrhoea and menorrhagia;
- reduced incidence of premenstrual tension;
- less symptomatic fibroids and functional ovarian cysts;
- less benign breast disease;
- reduced risk of ovarian and endometrial cancer;
- reduced risk of pelvic inflammatory disease.

Combined oral contraceptives containing a fixed amount of an oestrogen and a progestogen in each active tablet are termed ‘monophasic’, those with varying amounts of the two hormones are termed ‘phasic’. A transdermal patch and a vaginal ring, both containing an oestrogen with a progestogen, are also available.

Choice The majority of combined oral contraceptives contain ethinylestradiol as the oestrogen component; mestranol and estradiol are also used. The ethinylestradiol content of combined oral contraceptives ranges from 20 to 40 micrograms. Generally a preparation with the lowest oestrogen and progestogen content

1. See Department of Health Guidance (July 2004): Best practice guidance for doctors and other health professionals on the provision of advice and treatment to young people under 16 on contraception, sexual and reproductive health. Available at tinyurl.com/bpg16
which gives good cycle control and minimal side-effects in the individual woman is chosen. It is recommended that combined hormonal contraceptives are not continued beyond 50 years of age since more suitable alternatives exist.

- **Low strength preparations** (containing ethinylestradiol 20 micrograms) are particularly appropriate for women with risk factors for circulatory disease, provided a combined oral contraceptive is otherwise suitable.

- **Standard strength preparations** (containing ethinylestradiol 30 or 35 micrograms or in 30–40 microgram phased preparations) are appropriate for standard use—but see Risk of Venous Thromboembolism below. Phased preparations are generally reserved for women who either do not have withdrawal bleeding or who have breakthrough bleeding with monophasic products.

The progestogens desogestrel, drospirenone, and gestodene (in combination with ethinylestradiol) may be considered for women who have side-effects (such as acne, headache, depression, breast symptoms, and breakthrough bleeding) with other progestogens. Drospirenone, a derivative of spironolactone, has anti-androgenic and anti-mineralocorticoid activity; it should be used with care if an increased plasma-potassium concentration might be hazardous.

The progestogen dienogest is combined with estradiol in the combined oral contraceptive *Qlaira*. Nomegestrol is the progestogen contained in the combined oral contraceptive *Zoely*, in combination with estradiol.

The progestogen norelgestromin is combined with ethinylestradiol in a transdermal patch (*Evra*).

The vaginal contraceptive ring contains the progestogen etonogestrel combined with ethinylestradiol (*NuvaRing*).

### Risk of venous thromboembolism

There is an increased risk of venous thromboembolic disease in users of combined hormonal contraceptives particularly during the first year and possibly after re-starting combined hormonal contraceptives following a break of four weeks or more. This risk is considerably smaller than that associated with pregnancy (about 60 cases of venous thromboembolic disease per 100 000 pregnancies). In all cases the risk of venous thromboembolism increases with age and in the presence of other risk factors, such as obesity. The risk also varies depending on the type of progestogen, see the Combined Hormonal Contraception and Risk of Venous Thromboembolism table for details.

Provided that women are informed of the relative risks of venous thromboembolism and accept them, the choice of oral contraceptive is for the woman together with the prescriber jointly to make in light of her individual medical history and any contra-indications.

Combined hormonal contraceptives also slightly increase the risk of arterial thromboembolism; however, there is no evidence to suggest that this risk varies between different preparations.

### Travel

Women taking oral contraceptives or using the patch or vaginal ring are at an increased risk of deep-vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

### Missed pill

The critical time for loss of contraceptive protection is when a pill is omitted at the beginning or end of a cycle (which lengthens the pill-free interval).

If a woman forgets to take a pill, it should be taken as soon as she remembers, and the next one taken at the normal time (even if this means taking 2 pills together). A missed pill is one that is 24 or more hours late; for women taking *Qlaira* or *Zoely*, see below. If a woman misses only one pill, she should take an active pill as soon as she remembers and then resume normal pill-taking. No additional precautions are necessary. If a woman misses 2 or more pills (especially from the first 7 in a packet), she may not be protected. She should take an active pill as soon as she remembers and then resume normal pill-taking. In addition, she must either abstain from sex or use an additional method of contraception such as a condom for the next 7 days. If these 7 days run beyond the end of the packet, the next packet should be started at once, omitting the pill-free interval (or, in the case of everyday (ED) pills, omitting the 7 inactive tablets). A missed pill for a woman taking *Qlaira* or *Zoely* is one that is 12 hours or more late; for information on how to manage missed pills in women taking *Qlaira* or *Zoely*, refer to product literature.

Emergency contraception (section 7.3.5) is recommended if 2 or more combined oral contraceptive tablets are missed from the first 7 tablets in a packet and unprotected intercourse has occurred since finishing the last packet.

### Delayed application or detached patch

If a patch is partly detached for less than 24 hours, reapply to the same site or replace with a new patch immediately; no additional contraception is needed and the next patch should be applied on the usual ‘change day’. If a patch remains detached for more than 24 hours or if the user is not aware when the patch became detached, then stop the current contraceptive cycle and start a new cycle by applying a new patch, giving a new ‘Day 1’; an additional non-hormonal contraceptive must be used concurrently for the first 7 days of the new cycle. If application of a new patch at the start of a new cycle is delayed, contraceptive protection is lost. A new patch...
should be applied as soon as remembered giving a new ‘Day 1’; additional non-hormonal methods of contraception should be used for the first 7 days of the new cycle. If application of a patch in the middle of the cycle is delayed (i.e. the patch is not changed on day 8 or day 15):

- for up to 48 hours, apply a new patch immediately; next patch ‘change day’ remains the same and no additional contraception is required;
- for more than 48 hours, contraceptive protection may have been lost. Stop the current cycle and start a new 4-week cycle immediately by applying a new patch giving a new ‘Day 1’; additional non-hormonal contraception should be used for the first 7 days of the new cycle.

If the patch is not removed at the end of the cycle (day 22), remove it as soon as possible and start the next cycle on the usual ‘change day’, the day after day 28; no additional contraception is required.

If application of a patch in the middle of the cycle is delayed (i.e. the patch is not changed on day 8 or day 15), remove it as soon as possible and start a new cycle on the usual ‘change day’, the day after day 28; no additional contraception is required.

If the vaginal ring is expelled for less than 3 hours, rinse the ring with cool water and reinsert immediately; no additional contraception is needed.

If the ring remains outside the vagina for more than 3 hours or if the user does not know when the ring was expelled, contraceptive protection may be reduced:

- If ring expelled during week 1 or 2 of cycle, rinse ring with cool water and reinsert; use additional precautions (barrier methods) for next 7 days;
- If ring expelled during week 3 of cycle, either insert a new ring to start a new cycle or allow a withdrawal bleed and insert a new ring no later than 7 days after ring was expelled; latter option only available if ring was used continuously for at least 7 days before expulsion.

If insertion of a new ring at the start of a new cycle is delayed, contraceptive protection is lost. A new ring should be inserted as soon as possible; additional precautions (barrier methods) should be used for the first 7 days of the new cycle. If intercourse occurred during the extended ring-free interval, pregnancy should be considered.

No additional contraception is required if removal of the ring is delayed by up to 1 week (4 weeks of continuous use). The 7-day ring-free interval should be observed and subsequently a new ring should be inserted. Contraceptive protection may be reduced with continuous use of the ring for more than 4 weeks—pregnancy should be ruled out before inserting a new ring.

If the ring breaks during use, remove it and insert a new ring immediately; additional precautions (barrier methods) should be used for the first 7 days of the new cycle.

**Diarrhoea and vomiting**

Vomiting and persistent, severe diarrhoea can interfere with the absorption of combined oral contraceptives. If vomiting occurs within 2 hours of taking a combined oral contraceptive another pill should be taken as soon as possible. In cases of persistent vomiting or severe diarrhoea lasting more than 24 hours, additional precautions should be used during and for 7 days (9 days for *Qlaira®*) after recovery (see also under Missed pill, above). If the vomiting and diarrhoea occurs during the last 7 tablets, the next pill-free interval should be omitted (in the case of ED tablets the inactive ones should be omitted).

**Interactions**

The effectiveness of combined oral contraceptives, progestogen-only oral contraceptives (section 7.3.2.1), contraceptive patches, and vaginal rings can be considerably reduced by interaction with drugs that induce hepatic enzyme activity (e.g. carbamazepine, eslicarbazepine, nevirapine, oxcarbazepine, phenytoin, phenobarbital, primidone, ritonavir, St John’s Wort, topiramate, and, above all, rifabutin and rifampicin). A condom together with a long-acting method, such as an injectable contraceptive, may be more suitable for patients with HIV infection or at risk of HIV infection; advice on the possibility of interaction with antiretroviral drugs should be sought from HIV specialists.

Women taking combined hormonal contraceptives who require enzyme-inducing drugs should be advised to change to a contraceptive method that is unaffected by enzyme-inducers (e.g. some parenteral progestogen-only contraceptives (p. 543), intra-uterine devices) for the duration of treatment and for 4 weeks after stopping. If a change in contraceptive method is undesirable or inappropriate the following options should be discussed:

- **For a short course (2 months or less) of an enzyme-inducing drug**, continue with a combined oral contraceptive providing ethinylestradiol 30 micrograms or more daily and use a ‘tricycling’ regimen (i.e. taking 3 packets of monophasic tablets without a break followed by a shortened tablet-free interval of 4 days [unlicensed use]). Additional contraceptive precautions should also be used whilst taking the enzyme-inducing drug and for 4 weeks after stopping. Another option (except for rifampicin or rifabutin—see below) is to follow the advice for long-term courses, below.

  - For women using combined hormonal contraceptives or vaginal rings, additional contraceptive precautions are also required whilst taking the enzyme-inducing drug and for 4 weeks after stopping. Concomitant administration runs beyond the 3 weeks of patch or vaginal ring use, a new treatment cycle should be started immediately, without a patch-free or ring-free break.

  - **For a long-term course (over 2 months) of an enzyme-inducing drug** (except rifampicin or rifabutin—see below), adjust the dose of combined oral contraceptive to provide ethinylestradiol 50 micrograms or more daily [unlicensed use] and use a ‘tricycling’ regimen (as above); continue for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping.

    - If breakthrough bleeding occurs (and all other causes are ruled out) it is recommended that the dose of ethinylestradiol is increased by increments of 10 micrograms up to a maximum of 70 micrograms daily [unlicensed use], or to use additional precautions, or to change to a method unaffected by enzyme-inducing drugs.

    - Contraceptive patches and vaginal rings are not recommended for women taking enzyme-inducing drugs over a long period.

    - **For a long-term course (over 2 months) of rifampicin or rifabutin**, an alternative method of contraception (such as an IUD) is always recommended because they are such potent enzyme-inducing drugs; the alternative method of contraception should be continued for 4 weeks after stopping the enzyme-inducing drug.
For information on interactions of oral progestogen-only contraceptives, see also p. 539; for information on interactions of parenteral progestogen-only contraceptives, see also p. 543; for information on interactions of the intra-uterine progestogen-only device, see also p. 544; for information on interactions of hormonal emergency contraception, see also p. 547.

Antibacterials that do not induce liver enzymes Latest recommendations are that no additional contraceptive precautions are required when combined oral contraceptives are used with antibacterials that do not induce liver enzymes, unless diarrhoea or vomiting occur (see above). These recommendations should be discussed with the woman, who should also be advised that guidance in patient information leaflets may differ.

It is also currently recommended that no additional contraceptive precautions are required when contraceptive patches or vaginal rings are used with antibacterials that do not induce liver enzymes, unless diarrhoea or vomiting occur. However, there is a lack of evidence to support this interaction.

Surgery Oestrogen-containing contraceptives should preferably be discontinued (and adequate alternative contraceptive arrangements made) 4 weeks before major elective surgery and all surgery to the legs or surgery which involves prolonged immobilisation of a lower limb; they should normally be recommenced at the first menses occurring at least 2 weeks after full mobilisation. A progestogen-only contraceptive may be offered as an alternative and the oestrogen-containing contraceptive restarted after mobilisation, as above. When discontinuation of an oestrogen-containing contraceptive is not possible, e.g. after trauma or if a patient admitted for an elective procedure is still on an oestrogen-containing contraceptive, thromboprophylaxis (with unfractionated or low molecular weight heparin and graduated compression hosiery) is advised. These recommendations do not apply to minor surgery with short duration of anaesthesia, e.g. laparoscopic sterilisation or tooth extraction, or to women using oestrogen-free hormonal contraceptives.

Reason to stop immediately Combined hormonal contraceptives or hormone replacement therapy (HRT) should be stopped (pending investigation and treatment), if any of the following occur:

- sudden severe chest pain (even if not radiating to left arm);
- sudden breathlessness (or cough with blood-stained sputum);
- unexplained swelling or severe pain in calf of one leg;
- severe stomach pain;
- serious neurological effects including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body;
- hepatitis, jaundice, liver enlargement;
- blood pressure above systolic 160 mmHg or diastolic 95 mmHg;
- prolonged immobility after surgery or leg injury;
- detection of a risk factor which contra-indicates treatment (see Cautions and Contra-indications under Combined Hormonal Contraceptives below or under Oestrogens for HRT (section 6.4.1.1)).

COMBINED HORMONAL CONTRACEPTIVES

Indications contraception; menstrual symptoms (section 6.4.1.2)

Cautions see notes above; risk factors for venous thromboembolism (see below and also notes above), arterial disease and migraine, see below; personal or family history of hyperlipidaemia (increased risk of pancreatitis); hyperprolactinaemia (seek specialist advice); history of severe depression especially if induced by hormonal contraceptive; undiagnosed breast mass; gene mutations associated with breast cancer (e.g. BRCA 1); sickle-cell disease; inflammatory bowel disease including Crohn’s disease; reduced efficacy of contraceptive patch in women with body-weight $\geq 90$ kg; active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice; interactions: see above and Appendix 1 (oestrogens, progestogens)

Risk factors for venous thromboembolism See also notes above. Use with caution if any of following factors present but avoid if two or more factors present:

- family history of venous thromboembolism in first-degree relative aged under 45 years (avoid contraceptive containing desogestrel or gestodene, or avoid if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
- obesity—body mass index $\geq 30$ kg/m$^2$ avoid if body mass index $\geq 35$ kg/m$^2$ unless no suitable alternative;
- long-term immobilisation e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast);
- history of superficial thrombophlebitis;
- age over 35 years (avoid if over 50 years);
- smoking.

Risk factors for arterial disease Use with caution if any one of following factors present but avoid if two or more factors present:

- family history of arterial disease in first degree relative aged under 45 years (avoid if atherogenic lipid profile);
- diabetes mellitus (avoid if diabetes complications present);
- hypertension—blood pressure above systolic 140 mmHg or diastolic 90 mmHg (avoid if blood pressure above systolic 160 mmHg or diastolic 95 mmHg);
- smoking (avoid if smoking 40 or more cigarettes daily);
- age over 35 years (avoid if over 50 years);
- obesity (avoid if body mass index $\geq 35$ kg/m$^2$ unless no suitable alternative);
- migraine without aura (avoid if migraine with aura (focal symptoms), or severe migraine frequently lasting over 72 hours despite treatment, or migraine treated with ergot derivatives).

Migraine Women should report any increase in headache frequency or onset of focal symptoms (discontinue
immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour—see also Reason To Stop Immediately in notes above)

Contra-indications see notes above; personal history of venous or arterial thrombosis, severe or multiple risk factors for arterial disease or for venous thromboembolism (see above), heart disease associated with pulmonary hypertension or risk of embolus; scarring treatment for varicose veins; migraine with aura (see also above); transient cerebral ischaemic attacks without headaches; systemic lupus erythematosus with (or unknown) antiphospholipid antibodies; acute porphyria (section 9.8.2); gallstones; history of haemolytic uraemic syndrome or history during pregnancy of pruritus, chloasma, photosensitivity; history of breast cancer but can be used after 5 years, if no evidence of disease and non-hormonal methods unacceptable; undiagnosed vaginal bleeding

Hepatic impairment avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours

Pregnancy not known to be harmful; for Zoely®—toxicity in animal studies

Breast-feeding avoid until weaning or for 6 months after birth (adverse effects on lactation)

Side-effects see notes above; also nausea, vomiting, abdominal cramps, liver impairment, hepatic tumours; fluid retention, thrombosis (more common when factor V Leiden present or in blood groups A, B, and AB; see also notes above), hypertension, changes in lipid metabolism; headache, depression, chorea, nervousness, irritability; changes in libido, breast tenderness, enlargement, and secretion; reduced menstrual loss, ‘spotting’ in early cycles, absence of withdrawal bleeding, amenorrhoea after discontinuation, changes in vaginal discharge, cervical erosion; contact lenses may irritate, visual disturbances; leg cramps; skin reactions, chloasma, photosensitivity; rarely gallstones and systemic lupus erythematosus Breast cancer There is a small increase in the risk of having breast cancer diagnosed in women taking the combined oral contraceptive pill, this relative risk may be due to an earlier diagnosis. In users of combined oral contraceptive pills the cancers are more likely to be localised to the breast. The most important factor for diagnosing breast cancer appears to be the age at which the contraceptive is stopped rather than the duration of use; any increase in the rate of diagnosis diminishes gradually during the 10 years after stopping and disappears by 10 years

Cervical cancer Use of combined oral contraceptives for 5 years or longer is associated with a small increased risk of cervical cancer, the risk diminishes after stopping and disappears by about 10 years. The risk of cervical cancer with transdermal patches and vaginal rings is not yet known

Note The possible small increase in the risk of breast cancer and cervical cancer should be weighed against the protective effect against cancers of the ovary and endometrium

Dose

By mouth, each tablet should be taken at approximate same time each day; if delayed, contraceptive protection may be lost (see missed pill, p. 535)

21-day combined (monophasic) preparations, 1 tablet daily for 21 days; subsequent courses repeated after a 7-day interval (during which withdrawal bleeding occurs); if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days

Every day (ED) combined (monophasic) preparations, 1 active tablet daily for 21 days, followed by 1 inactive tablet daily for 7 days (see also Combined Oral Contraceptives table, below); subsequent courses repeated without interval (withdrawal bleeding occurs when inactive tablets being taken); if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days; for Zoely® see Combined Oral Contraceptives table, below

Phasic preparations, see Combined Oral Contraceptives table, below

Changing to combined preparation containing different progestogen If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start the first active tablet of new brand immediately

Changing to Qlaira® start the first active Qlaira® tablet on the day after taking the last active tablet of the previous brand

Changing to Zoely® start the first active Zoely® tablet on the day after taking the last active tablet of the previous brand or, at the latest, the day after the tablet-free or inactive tablet interval of the previous brand

Changing from Qlaira® or Zoely® start the new brand after taking the last active tablet; if the inactive tablets are taken before starting new brand, additional precautions (barrier methods) should be used during first 7 days of taking the new brand

Changing from progestogen-only tablet If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start new brand immediately, additional precautions (barrier methods) necessary for first 7 days

Secondary amenorrhoea (exclude pregnancy) Start any day, additional precautions (barrier methods) necessary during first 7 days (9 days for Qlaira®)

After childbirth (not breast-feeding) Start 3 weeks after birth (increased risk of thrombosis if started earlier); later than 3 weeks postpartum additional precautions (barrier methods) necessary for first 7 days (9 days for Qlaira®)

After abortion or miscarriage Start same day

By transdermal application, apply first patch on day 1 of cycle, change patch on days 8 and 15; remove third patch on day 22 and apply new patch after 7-day patch-free interval to start subsequent contraceptive cycle

Note If first patch applied later than day 1, additional precautions (barrier methods) should be used for the next 7 days

Changing from combined oral contraception Apply patch on the first day of withdrawal bleeding; if no withdrawal bleeding within 5 days of taking last active tablet, rule out pregnancy before applying first patch. Unless patch is applied on first day of withdrawal bleeding, additional precautions (barrier methods) should be used concurrently for first 7 days

Changing from progestogen-only method From an implant, apply first patch on the day implant removed; from an injection, apply first patch when next injection due; from oral progestogen, first patch may be applied on any day after stopping pill. For all methods additional precautions (barrier methods) should be used concurrently for first 7 days

After childbirth (not breast-feeding) Start 4 weeks after birth, if started later than 4 weeks after birth additional precautions (barrier methods) should be used for first 7 days

After abortion or miscarriage Before 20 weeks’ gestation start immediately; no additional contraception required if started immediately. After 20 weeks’ gestation start on day 21 after abortion or on the first day of first spontaneous menstruation; additional precautions (barrier methods) should be used for first 7 days after applying the patch

By vagina, insert ring into vagina on day 1 of cycle and leave in for 7 weeks; remove ring on day 22; subsequent courses repeated after 7-day ring-free interval (during which withdrawal bleeding occurs)

Note If first ring inserted later than day 1, additional
7.3.2 Progestogen-only contraceptives

- **Oral (low and standard strength)**
  - For information on these preparations, see Combined Oral Contraceptives table, p. 540

- **Transdermal (standard strength)**
  - Ethinylestradiol with Norelgestromin
    - See Risk of Venous Thromboembolism (in notes above) before prescribing
    - **Evra® (Janssen)** Patch, self-adhesive (releasing ethinylestradiol approx. 33.9 micrograms/24 hours and norelgestromin approx. 203 micrograms/24 hours); net price 9-approx. 33.9 micrograms/24 hours and norelgestromin approx. 15 micrograms/24 hours and etonogestrel approx. 200 micrograms/24 hours, net price 3-ring pack = £27.00. Counselling, administration
    - **Dose** 1 patch to be applied once weekly for three weeks, followed by a 7-day patch-free interval; subsequent courses repeated after 7-day patch-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above
    - **Note** Adhesives or bandages should not be used to hold patch in place. If patch no longer sticky do not reapply but use a new patch.
    - The Scottish Medicines Consortium has advised (September 2003) that Evra® patches should be restricted for use in women who are likely to comply poorly with combined oral contraceptives

- **Vaginal (low strength)**
  - Ethinylestradiol with Etonogestrel
    - See Risk of Venous Thromboembolism (in notes above) before prescribing
    - **NuvaRing® (MSD)** Vaginal ring, releasing ethinylestradiol approx. 15 micrograms/24 hours and etonogestrel approx. 120 micrograms/24 hours, net price 3-ring pack = £27.00. Counselling, administration
    - **Dose** 1 ring to be inserted into the vagina, removed on day 22, subsequent courses repeated after 7-day ring-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above
    - **Counselling** The presence of the ring should be checked regularly. In case of expulsion see Expulsion, Delayed Insertion or Removal, or Broken Vaginal Ring, p. 536

- **Parenteral progestogen-only contraceptives**

- **Intra-uterine progestogen-only device**

7.3.2.1 Oral progestogen-only contraceptives

Oral progestogen-only preparations alter cervical mucus to prevent sperm penetration and may inhibit ovulation in some women; oral desogestrel-only preparations consistently inhibit ovulation and this is their primary mechanism of action. There is insufficient clinical trial evidence to compare the efficacy of oral progestogen-only contraceptives with each other or with combined hormonal contraceptives. Progestogen-only contraceptives offer a suitable alternative to combined hormonal contraceptives when oestrogens are contraindicated (including those with venous thrombosis or a past history or predisposition to venous thrombosis, heavy smokers, those with hypertension above systolic 160 mmHg or diastolic 95 mmHg, valvular heart disease, diabetes mellitus with complications, and migraine with aura). Menstrual irregularities (oligomenorrhea, menorrhagia) are more common but tend to resolve on long-term treatment.

**Interactions** Effectiveness of oral progestogen-only preparations is not affected by antibacterials that do not induce liver enzymes. The efficacy of oral progestogen-only preparations is, however, reduced by enzyme-inducing drugs and an alternative contraceptive method may be used, unaffected by the interacting drug, is recommended during treatment with an enzyme-inducing drug and for at least 4 weeks afterwards—see p. 536 and Appendix 1 (progestogens). For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, the progestogen-only oral method may be continued in combination with additional contraceptive precautions (e.g. barrier methods) for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping.

**Surgery** All progestogen-only contraceptives (including those given by injection) are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

**Starting routine** One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours (12 hours for desogestrel) contraceptive protection may be lost). Additional contraceptive precautions are not necessary when initiating treatment.

**Changing from a combined oral contraceptive** Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

</table>

1. Dose 1 tablet daily for 21 days starting on day 1–5 of cycle (if reasonably certain woman is not pregnant, first course can be started on any day of cycle); subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting and changing routines see under Dose above

2. Dose 1 tablet daily for 28 days starting on day 1–5 of cycle with first active tablet (withdrawal bleeding occurs when inactive tablets being taken) (if reasonably certain woman is not pregnant, first course can be started on any day of cycle); subsequent courses repeated without interval; for starting and changing routines see under Dose above

3. Dose 1 tablet daily for 28 days starting on day 1 of cycle with first active tablet (withdrawal bleeding occurs when inactive tablets being taken); subsequent courses repeated without interval; for starting and changing routines see under Dose above
After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

Missed pill The following advice is recommended: ‘If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours (12 hours for desogestrel) overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days.’

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception (see p. 547) if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours (12 hours for desogestrel) late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

Diarrhoea and vomiting Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours (12 hours for desogestrel) of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery (see also under Missed pill above).

**ORAL PROGESTOGEN-ONLY CONTRACEPTIVES**

(Progesterone-only pill, ‘POP’)

**Indications** contraception

**Cautions** arterial disease; sex-steroid dependent cancer; past ectopic pregnancy; malabsorption syndrome; active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice; systemic lupus erythematosus with positive (or unknown) anti-phospholipid antibodies; functional ovarian cysts; history of jaundice in pregnancy; **interactions:** see notes above and Appendix 1 (progestogens)

**Other conditions** The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory

**Contra-indications** undiagnosed vaginal bleeding; severe arterial disease; acute porphyria (section 9.8.2); history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable

**Hepatic impairment** caution in severe liver disease and recurrent cholestatic jaundice; avoid in liver tumour

**Pregnancy** not known to be harmful

**Breast-feeding** progestogen-only contraceptives do not affect lactation; see also After Childbirth above

**Side-effects** menstrual irregularities (see also notes above); nausea, vomiting, headache, diziness, breast discomfort, depression, skin disorders, disturbance of appetite, changes in libido

**Breast cancer** There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill, this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits

**Dose**

- 1 tablet daily at same time each day, starting on day 1 of cycle then continuously; if administration delayed for 3 hours (12 hours for desogestrel) or more it should be regarded as a ‘missed pill’, see notes above

**Desogestrel (Non-proprietary)** Tablets, desogestrel 75 micrograms, net price 3 × 28-tab pack = £3.51

**Brands include** Aizée®, Cerelle®, Norpro®

**Cerazette® (MSD)**

Tablets, t/c, desogestrel 75 micrograms, net price 3 × 28-tab pack = £6.88

The Scottish Medicines Consortium (p. 4) has advised (September 2003) that Cerazette® should be restricted for use in women who cannot tolerate oestrogen-containing contraceptives or in whom such preparations are contra-indicated

**Micronor®** (Janssen), norethisterone 35 micrograms, net price 3 × 28-tab pack = £1.80

**Norgeston®** (Bayer)

Tablets, s/c, levonorgestrel 30 micrograms, net price 35-tab pack = 92p

**Noriday®** (Pharmacia)

Tablets, norethisterone 35 micrograms, net price 3 × 28-tab pack = £2.10

**7.3.2.2 Parenteral progestogen-only contraceptives**

Medroxyprogesterone acetate (Depo-Provera®, SAYANA PRESS®) is a long-acting progestogen given by injection; it is at least as effective as the combined oral preparations but because of its prolonged action it should never be given without full counselling backed by the patient information leaflet. It may be used as a short-term or long-term contraceptive for women who have been counselled about the likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility. Troublesome bleeding has been reported in patients given medroxyprogesterone acetate in the immediate puerperium; delaying the first injection until 6 weeks after birth may minimise bleeding problems. If the woman is not breast-feeding, the first injection may be given within 5 days postpartum (she should be warned that the risk of troublesome bleeding may be increased). The manufacturers advise that in women who are breast-feeding, the first dose should be delayed until 6 weeks after birth; however, evidence suggests no harmful effect to infant if given earlier. The benefits of using medroxyprogesterone acetate in breast-feeding women outweigh any risks.

Reduction in bone mineral density and, rarely, osteoporosis and osteoporotic fractures have also been reported with medroxyprogesterone acetate. The
Norethisterone enantate (Noristerat®) is a long-acting progestogen given as an oily injection which provides contraception for 8 weeks; it is used as short-term interim contraception e.g. before vasectomy becomes effective.

An etonogestrel-releasing implant (Nexplanon®) is also available. It is a highly effective long-acting contraceptive, consisting of a single flexible rod that is inserted subdermally into the lower surface of the upper arm and provides contraception for up to 3 years. The manufacturer advises that in heavier women, blood-etonogestrel concentrations are lower and therefore the implant may not provide effective contraception during the third year; they advise that earlier replacement may be considered in such patients—however, evidence to support this recommendation is lacking. Local reactions such as bruising and itching can occur at the insertion site. The contraceptive effect of etonogestrel is rapidly reversed on removal of the implant. The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.

Implanon®, also an etonogestrel-releasing implant, has been discontinued (October 2010), but some women may have the implant in place until 2013.

Cautions, contra-indications, and side-effects

The cautions, contra-indications, and side-effects of oral progestogen-only contraceptives apply to parenteral progestogen-only contraceptives, except that parenteral preparations reliably inhibit ovulation and therefore protect against ectopic pregnancy and functional ovarian cysts.

Interactions

Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. The effectiveness of norethisterone intramuscular injection and medroxyprogesterone acetate intramuscular and subcutaneous injections is not affected by enzyme-inducing drugs and they may be continued as normal during courses of these drugs. However, effectiveness of the etonogestrel-releasing implant may be reduced by enzyme-inducing drugs and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with the enzyme-inducing drug and for at least 4 weeks after stopping. For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, the implant may be continued in combination with additional contraceptive precautions (e.g. condom) for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping it.

Indications

Contraception, see also notes above and under preparations (roles vary according to preparation)

Cautions

See notes above and under preparations; possible risk of breast cancer, see oral progestogen-only contraceptives (section 7.3.2.1); history during pregnancy of puritus or of deterioration of oto-sclerosis, disturbances of lipid metabolism; interactions: see notes above and Appendix 1 (progestogens)

Counselling

Full counselling backed by patient information leaflet required before administration

Contra-indications

See notes above; history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable

Hepatic impairment

See Oral Progestogen-only Contraceptives, section 7.3.2.1

Pregnancy

Not known to be harmful; for Implanon® or Nexplanon® if pregnancy occurs remove implant

Breast-feeding

Progestogen-only contraceptives do not affect lactation; see also notes above and under preparations

Side-effects

See notes above; injection-site reactions; with medroxyprogesterone acetate injection, weight gain also reported

Cervical cancer

Use of injectable progestogen-only contraceptives may be associated with a small increased risk of cervical cancer, similar to that seen with combined oral contraceptives, see p. 538. The risk of cervical cancer with other progestogen-only contraceptives is not yet known.

Dose

See under preparations

Injectable preparations

Depo-Provera® (Pfizer) injection (aqueous suspension), medroxyprogesterone acetate 150 mg/mL, net price 1-mL prefilled syringe = £6.01, 1-mL vial = £6.01. Counselling, see patient information leaflet

Dose by deep intramuscular injection, 150 mg within first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding); for long-term contraception, repeated every 12 weeks (if interval greater than 12 weeks, rule out pregnancy before next injection and advise patient to use additional contraceptive measures (e.g. barrier) for 14 days after the injection)

Noristerat® (Bayes) injection (only), norethisterone enantate 200 mg/mL, net price 1-mL amp = £4.05. Counselling, see patient information leaflet

Dose by deep intramuscular injection given very slowly into gluteal muscle, short-term contraception, 200 mg within first 5 days of cycle or immediately after parturition (duration 8 weeks), may be repeated once every 8 weeks (withhold breast-feeding for neonates with severe or persistent jaundice requiring medical treatment)

SAYANA PRESS® (Pfizer) injection (suspension), medroxyprogesterone acetate 104 mg/0.65 mL, net price 0.65-mL prefilled injector syringe = £6.90. Counselling, see patient information leaflet

Dose by subcutaneous injection into anterior thigh or abdomen, no hormonal contraceptive use in previous month, 104 mg within first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding), for long-term contraception, repeated every 13 weeks (if interval greater than 13 weeks and 7 days, rule out pregnancy before next injection), changing from other hormonal contraceptive, consult product literature
7.3.3 Spermicidal contraceptives

**Implants**

Nexplanon® (MSD)

Implant, containing etonogestrel 68 mg in radiopaque flexible rod, net price = £79.46. Counselling, see patient information leaflet

Dose by subdermal implantation, no hormonal contraceptive use in previous month, 1 implant inserted during first 5 days of cycle; postpartum, 1 implant inserted 21–28 days after delivery; in breast-feeding mothers, 1 implant inserted after 28 days postpartum; abortion or miscarriage in the second trimester, 1 implant inserted 21–28 days after abortion or miscarriage; abortion or miscarriage in first trimester, 1 implant inserted within 5 days; changing from other hormonal contraceptive, consult product literature, remove implant within 3 years of insertion.

**INTRA-UTERINE PROGESTOGEN-ONLY SYSTEM**

**Indications** see under preparation

**Cautions** see notes above; history of depression; advanced uterine atrophy; systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies; interactions: see notes above and Appendix 1 (progestogens)

**Contra-indications** see notes above; not suitable for emergency contraception

**Hepatic impairment** see Oral Progestogen-only Contraceptives, section 7.3.2.1

**Pregnancy** avoid if pregnancy occurs remove system

**Breast-feeding** progesterone-only contraceptives do not affect lactation

**Side-effects** see notes above; also abdominal pain, expulsion, peripheral oedema, depression (sometimes severe), nervousness, salpingitis, pelvic inflammatory disease, pelvic pain, back pain; rarely uterine perforation, hirsutism, hair loss, pruritus, migraine, rash

**Dose**

See under preparation

Mirena® (Bayer)

Intra-uterine system, T-shaped plastic frame (impregnated with barium sulfate and with threads attached to base) with polydimethylsiloxane reservoir releasing levonorgestrel 20 micrograms/24 hours, net price = £88.00. Counselling, see patient information leaflet

Dose contraception and menorrhagia, insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately after first-trimester termination by curettage; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 5 years.

Prevention of endometrial hyperplasia during oestrogen replacement therapy, insert during last days of menstruation or withdrawal bleeding or any time if amenorrhoeic, effective for 4 years.

**Note** When system is removed (and not immediately replaced) and pregnancy is not desired, remove during the first few days of menstruation, otherwise additional precautions (e.g. barrier methods) should be used for at least 7 days before removal.

**Cautions and contra-indications** Generally the cautions and contra-indications for the progesterone-only intra-uterine system are as for standard intra-uterine devices (section 7.3.4). Although the progesterone-only intra-uterine system produces little systemic progestogenic activity, it is usually avoided for 5 years after any evidence of breast cancer. However, the system can be considered for a woman in long-term remission from breast cancer who has menorrhagia and requires effective contraception. Since levonorgestrel is released close to the site of the main contraceptive action (on cervical mucus and endometrium) progestogenic side-effects and interactions are less likely; in particular, enzyme-inducing drugs are unlikely to significantly reduce the contraceptive effect of the progesterogen-only intra-uterine system and additional contraceptive precautions are not required.

**Side-effects** Initially, changes in the pattern and duration of menstrual bleeding (spotting or prolonged bleeding) are common; endometrial disorders should be ruled out before insertion and the patient should be fully counselled (and provided with a patient information leaflet). Improvement in progestogenic side-effects, such as mastalgia and in the bleeding pattern usually occurs a few months after insertion and bleeding may often become very light or absent. Functional ovarian cysts (usually asymptomatic) can occur and usually resolve spontaneously (ultrasound monitoring recommended).

**Spermicidal contraceptives**

Spermicidal contraceptives are useful additional safeguards but do not give adequate protection if used alone unless fertility is already significantly diminished (section 6.4.1.1). They have two components: a spermicide...
and a vehicle which itself may have some inhibiting effect on sperm activity. They are suitable for use with barrier methods, such as diaphragms or caps; however, spermicidal contraceptives are not generally recommended for use with condoms, as there is no evidence of any additional protection compared with non-spermicidal lubricants.

Spermicidal contraceptives are not suitable for use in those with or at high risk of sexually transmitted infections (including HIV); high frequency use of the spermicide nonoxinol ‘9’ has been associated with genital lesions, which may increase the risk of acquiring these infections.

The main excess risk of infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:

- they are under 25 years old
- they are over 25 years old and
- have a new partner or
- have had more than one partner in the past year or
- their regular partner has other partners.

In these women, pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, Neisseria gonorrhoeae) should be performed. If results are unavailable at the time of fitting an intra-uterine device for emergency contraception, appropriate prophylactic antibacterial cover should be given. The woman should be advised to attend as an emergency if she experiences sustained pain during the next 20 days. An intra-uterine device should not be removed in mid-cycle unless an additional contraceptive was used for the previous 7 days. If removal is essential post-coital contraception should be considered.

If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible.

The intra-uterine device (IUD) is a suitable contraceptive for women of all ages irrespective of parity; however, it is less appropriate for those with an increased risk of pelvic inflammatory disease (see below).

The most effective intra-uterine devices have at least 380 mm\(^2\) of copper and have banded copper on the arms. Smaller devices have been introduced to minimise side-effects; these consist of a plastic carrier wound with copper wire or fitted with copper bands; some also have a central core of silver to prevent fragmentation of the copper.

Fertility declines with age and therefore a copper intra-uterine device which is fitted in a woman over the age of 40, may remain in the uterus until menopause.

Fix\(^{®}\) (Marlborough)

- Gel, nonoxinol ‘9’ 2%, net price 30 g = £4.25
- Excipients include hydroxybenzoates (parabens), propylene glycol, sorbic acid
- Condoms no evidence of harm to latex condoms and diaphragms
- Pregnancy toxicity in animal studies
- Breast-feeding present in milk in animal studies

**INTRA-UTERINE CONTRACEPTIVE DEVICES**

**Indications** see notes above

**Cautions** see notes above; also anaemia, menorrhagia (progestogen intra-uterine system might be preferable, section 7.3.2.3), endometriosis, severe primary dysmenorrhoea, history of pelvic inflammatory disease, diabetes, fertility problems, nulliparity and young age, severely scarred uterus (including after endometrial resection) or severe cervical stenosis; drug- or disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression), epilepsy (risk of seizure at time of insertion); increased risk of expulsion if inserted before uterine involution, gynaecological examination before insertion, 6–8 weeks after then annually but counsel women to seek medical attention promptly in case of significant symptoms, especially pain; anticoagulant therapy (avoid if possible)

**Contra-indications** severe anaemia, recent sexually transmitted infection (if not fully investigated and treated), unexplained uterine bleeding, distorted or small uterine cavity, genital malignancy, acute trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration), pelvic inflammatory disease, established or marked immunosuppression; copper devices: copper allergy, Wilson’s disease, medical diathesis

**Pregnancy** remove device; if pregnancy occurs, increase likelihood that it may be ectopic

**Breast-feeding** not known to be harmful

**Side-effects** uterine or cervical perforation, displacement, expulsion; pelvic infection may be exacerbated, menorrhagia, dysmenorrhoea, allergy; on insertion: pain (alleviated by NSAID such as ibuprofen 30 minutes before insertion) and bleeding, occasionally epileptic seizure and vasovagal attack
Ancora® 375 Ag (RF Medical)
Intra-uterine device, copper wire with silver core, wound on vertical stem of U-shaped plastic carrier, surface area approx. 375 mm², impregnated with barium sulfate for radio-opacity, threads attached to base of vertical stem; preloaded in inserter, net price = £9.95
For uterine length over 6.5 cm; replacement every 5 years (see also notes above)

Ancora® 375 Cu (RF Medical)
Intra-uterine device, copper wire, wound on vertical stem of U-shaped plastic carrier, surface area approx. 375 mm², impregnated with barium sulfate for radio-opacity, threads attached to base of vertical stem; preloaded in inserter, net price = £7.95
For uterine length over 6.5 cm; replacement every 5 years (see also notes above)

Copper T 380A® (RF Medical)
Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier with copper sleeve on each arm, total surface area approx. 380 mm², impregnated with barium sulfate for radio-opacity, threads attached to base of vertical stem; pre-loaded in inserter, net price = £7.95
For uterine length over 6.5 cm; replacement every 5 years (see also notes above)

Cu-Safe® T300 (Williams)
Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 300 mm², impregnated with barium sulfate for radio-opacity, monofilament thread attached to base of vertical stem; with loading capsule, net price = £8.95
For uterine length 6.5–9 cm; replacement every 10 years (see also notes above)

Flexi-T® 300 (Durbin)
Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 300 mm², impregnated with barium sulfate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £9.47
For uterine length over 5 cm; replacement every 5 years (see also notes above)

Flexi-T® + 380 (Durbin)
Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier with copper sleeve on each arm, total surface area approx. 380 mm², impregnated with barium sulfate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £10.06
For uterine length over 6 cm; replacement every 5 years (see also notes above)

GyneFix® (Williams)
Intra-uterine device, 6 copper sleeves with surface area of 330 mm² on polypropylene thread, net price = £27.11
Suitable for all uterine sizes; replacement every 5 years

Load® 375 (Durbin)
Intra-uterine device, copper wire, wound on vertical stem of U-shaped plastic carrier, surface area approx. 375 mm², impregnated with barium sulfate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £8.52
For uterine length over 7 cm; replacement every 5 years (see also notes above)

Mini TT 380® Slimline (Durbin)
Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier with copper sleeves fitted flush on to distal portion of each horizontal arm, total surface area approx. 380 mm², impregnated with barium sulfate for radio-opacity, thread attached to base of vertical stem; easy-loading system, no capsule, net price = £12.46
For minimum uterine length 5 cm; replacement every 5 years (see also notes above)

Multiload® Cu375 (MSD)
Intra-uterine device, as Load® 375, with copper surface area approx. 375 mm² and vertical stem length 3.5 cm, net price = £9.24
For uterine length 6–9 cm; replacement every 5 years (see also notes above)

Multi-Safe® 375 (Williams)
Intra-uterine device, copper wire, wound on vertical stem of U-shaped plastic carrier, surface area approx. 375 mm², impregnated with barium sulfate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £8.96
For uterine length over 6–9 cm; replacement every 5 years (see also notes above)

Multi-Safe® 375 Short Stem (Williams)
Intra-uterine device, copper wire, wound on vertical stem of U-shaped plastic carrier, surface area approx. 375 mm², impregnated with barium sulfate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £8.80
For uterine length 5–7 cm; replacement every 5 years (see also notes above)

Neo-Safe® T380 (Williams)
Intra-uterine device, copper wire, wound on vertical stem of U-shaped plastic carrier, surface area approx. 380 mm², impregnated with barium sulfate for radio-opacity, threads attached to base of vertical stem, net price = £13.31
For uterine length 6.5–9 cm; replacement every 5 years (see also notes above)

Novaplus T 380® Ag (RF Medical)
Intra-uterine device, copper wire with silver core, wound on vertical stem of U-shaped plastic carrier, surface area approx. 380 mm², impregnated with barium sulfate for radio-opacity, threads attached to base of vertical stem, net price = £12.50
‘Mini’ size for minimum uterine length 5 cm; ‘Normal’ size for uterine length 6.5–9 cm; replacement every 5 years (see also notes above)

Novaplus T 380® Cu (RF Medical)
Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm², impregnated with barium sulfate for radio-opacity, threads attached to base of vertical stem; preloaded in inserter, net price = £10.95
‘Mini’ size for minimum uterine length 5 cm; ‘Normal’ size for uterine length 6.5–9 cm; replacement every 5 years (see also notes above)

Nova-T® 380 (Bayel)
Intra-uterine device, copper wire with silver core, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm², impregnated with barium sulfate for radio-opacity, threads attached to base of vertical stem, net price = £15.20
For uterine length 6.5–9 cm; replacement every 5 years (see also notes above)
T-Safe® 380A QuickLoad (Williams)
Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier with copper collar on the distal portion of each arm, total surface area approx. 380 mm², impregnated with barium sulfate for radio-opacity, thread attached to base of vertical stem; easy-loading system, no capsule, net price = £11.22
For uterine length 5–7 cm; replacement every 5 years (see also notes above)

TT 380® Slimline (Durbin)
Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier, with copper sleeves fitted flush on to distal portion of each horizontal arm, total surface area approx. 380 mm², impregnated with barium sulfate for radio-opacity, thread attached to base of vertical stem; easy-loading system, no capsule, net price = £12.46
For uterine length 6.5–9 cm; replacement every 10 years (see also notes above)

UT 380 Short® (Durbin)
Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm², impregnated with barium sulfate for radio-opacity, thread attached to base of vertical stem; net price = £11.22
For uterine length 5–7 cm; replacement every 5 years (see also notes above)

UT 380 Standard® (Durbin)
Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm², impregnated with barium sulfate for radio-opacity, thread attached to base of vertical stem; net price = £11.22
For uterine length 6.5–9 cm; replacement every 5 years (see also notes above)

Other contraceptive devices

Silicone contraceptive caps
Brands include FemCap®

Silicone Contraceptive Pessary
Silicone, sizes 22, 26, and 30 mm, net price = £15.29

Rubber contraceptive diaphragms
Type A Diaphragm with Flat Metal Spring
Transparent rubber with flat metal spring, sizes 55–95 mm (rising in steps of 5 mm), net price = £6.22
Brands include Reflexions®

Silicone contraceptive diaphragms
Type A Diaphragm with Flat Metal Spring
Silicone with flat metal spring, sizes 60–90 mm (rising in steps of 5 mm), net price = £10.29
Brands include Mirror 380®

Type C Arcing Spring Diaphragm
Silicone with arcing spring, sizes 60–90 mm (rising in steps of 5 mm), net price = £8.35
Brands include Mirror 380®

Hormonal methods
Hormonal emergency contraceptives include levonorgestrel and ulipristal: either drug should be taken as soon as possible after unprotected intercourse to increase efficacy.

Levonorgestrel is effective if taken within 72 hours (3 days) of unprotected intercourse and may also be used between 72 and 96 hours after unprotected intercourse [unlicensed use], but efficacy decreases with time. Ulipristal, a progesterone receptor modulator, is effective if taken within 120 hours (5 days) of unprotected intercourse.

Levonorgestrel is less effective than insertion of an intra-uterine device (see below). Ulipristal is as effective as levonorgestrel, but its efficacy compared to an intra-uterine device is not yet known.

If vomiting occurs within 2 hours of taking levonorgestrel or within 3 hours of taking ulipristal, a replacement dose should be given.

When prescribing or supplying hormonal emergency contraception, women should be advised:

- that their next period may be early or late;
- that a barrier method of contraception needs to be used until the next period;
- to seek medical attention promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy;
- to return in 3 to 4 weeks if the subsequent menstrual bleed is abnormally light, heavy or brief, or is absent, or if she is otherwise concerned (if there is any doubt as to whether menstruation has occurred, a pregnancy test should be performed at least 3 weeks after unprotected intercourse).

Interactions
The effectiveness of levonorgestrel, and possibly ulipristal, is reduced in women taking enzyme-inducing drugs (and possibly for 4 weeks after stopping); a copper intra-uterine device can be offered instead. If the copper intra-uterine device is undesirable or inappropriate, the dose of levonorgestrel should be increased to a total of 3 mg taken as a single dose [unlicensed dose—advise women accordingly]. There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers.

LEVONORGESTREL

Indications
Emergency contraception

Cautions
see notes above; past ectopic pregnancy; severe malabsorption syndromes; active thymolistic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice; interactions: see notes above and Appendix 1 (progestogens)

Contra-indications
Acute porphyria (section 9.8.2)

Pregnancy
Not known to be harmful

Breast-feeding
Progestogen-only contraceptives do not affect lactation

Side-effects
Menstrual irregularities (see also notes above), nausea, low abdominal pain, fatigue, headache, dizziness, breast tenderness, vomiting
548  7.4 Drugs for genito-urinary disorders

**Dose**
- 1.5 mg as a single dose as soon as possible after coitus, preferably within 12 hours but no later than after 72 hours (but see also notes above)

**Levonelle® One Step (Bayer)**
- Tablets, levonorgestrel 1.5 mg, net price 1-tab pack = £13.83

**Levonelle® 1500 (Bayer)**
- Tablets, levonorgestrel 1.5 mg, net price 1-tab pack = £5.20

**ULLIPRISTAL ACETATE**

**Indications** emergency contraception; uterine fibroids, see section 6.4.1.2

**Cautions** see notes above; uncontrolled severe asthma; effectiveness of combined hormonal and progestogen-only contraceptives may be reduced—additional precautions (barrier methods) required for 14 days for combined and parenteral progestogen-only hormonal contraceptives (16 days for *Quatra®*) and 9 days for oral progestogen-only contraceptives; interactions: see notes above and Appendix 1 (ullipristal)

**Contra-indications** repeated use within a menstrual cycle

**Hepatic impairment** manufacturer advises avoid in severe impairment—no information available

**Pregnancy** limited information available

**Breast-feeding** manufacturer advises avoid for 1 week after administration—present in milk

**Side-effects** gastro-intestinal disturbances (including nausea, vomiting, diarrhoea, and abdominal pain), dizziness, fatigue, headache, menstrual irregularities (see notes above), back pain, muscle spasms; less commonly tremor, hot flushes, uterine spasm, breast tenderness, dry mouth, blurred vision, pruritus, and rash

**Dose**
- 30 mg as a single dose as soon as possible after coitus, but no later than after 120 hours

**ellaOne® (HRA Pharma)**
- Tablets, ulipristal acetate 30 mg, net price 1-tab pack = £16.95

**Intra-uterine device**

Insertion of an intra-uterine device is more effective than oral levonorgestrel for emergency contraception. A copper intra-uterine contraceptive device (section 7.3.4) can be inserted up to 120 hours (5 days) after unprotected intercourse; sexually transmitted infections should be tested for and treatment of the device should usually be covered by antibacterial prophylaxis (e.g. azithromycin 1 g by mouth as a single dose). If intercourse has occurred more than 5 days previously, the device can be inserted up to 5 days after the earliest likely calculated ovulation (i.e. within the minimum period before implantation), regardless of the number of episodes of unprotected intercourse earlier in the cycle.

1. Can be sold to women over 16 years; when supplying emergency contraception to the public, pharmacists should refer to guidance issued by the Royal Pharmaceutical Society

**7.4 Drugs for genito-urinary disorders**

**7.4.1 Drugs for urinary retention**

Acute retention is painful and is treated by catheterisation.

Chronic retention is painless and often long-standing. Catheterisation is unnecessary unless there is deterioration of renal function. After the cause has initially been established and treated, drugs may be required to increase detrusor muscle tone.

**Benign prostatic hyperplasia** is treated either surgically or medically with alpha-blockers (see below). Dutasteride and finasteride (section 6.4.2) are alternatives to alpha-blockers, particularly in men with a significantly enlarged prostate. Tadalafil (section 7.4.5), a phosphodiesterase type-5 inhibitor, may also be used in the management of benign prostatic hyperplasia.

**Alpha-blockers**

The alpha-,selective alpha blockers, alfuzosin, doxazosin, indoramin, prazosin, tamsulosin and terazosin relax smooth muscle in benign prostatic hyperplasia producing an increase in urinary flow-rate and an improvement in obstructive symptoms.

**Cautions** Since alpha-,selective alpha blockers reduce blood pressure, patients receiving antihypertensive treatment may require reduced dosage and specialist supervision. Caution is required in the elderly and in patients undergoing cataract surgery (risk of intra-operative floppy iris syndrome). For interactions, see Appendix 1 (alpha-blockers).

**Contra-indications** Alpha-blockers should be avoided in patients with a history of postural hypotension and micturition syncope.

**Side-effects** Side-effects of alpha-,selective alpha blockers include drowsiness, hypotension (notably postural hypotension), syncope, asthenia, diziness, depression, headache, dry mouth, gastro-intestinal disturbances, oedema, blurred vision, intra-operative floppy iris syndrome (most strongly associated with tamsulosin), rhinitis, erectile disorders (including priapism), tachycardia, and palpitations. Hypersensitivity reactions including rash, pruritus and angioedema have also been reported.

**ALFUZOSIN HYDROCHLORIDE**

**Indications** benign prostatic hyperplasia

**Cautions** see notes above; discontinue if angina worsens; acute heart failure; history of QT-interval pro-
DOXAZOSIN

**Indications** benign prostatic hyperplasia; hypertension (section 2.5.4)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** section 2.5.4

**Side-effects** see notes above and section 2.5.4

**Dose**
- Initially 1 mg daily; dose may be doubled at intervals of 1–2 weeks according to response, up to max. 8 mg daily; usual maintenance 2–4 mg daily

**Preparations**
Section 2.5.4

**INDORAMIN**

**Indications** benign prostatic hyperplasia; hypertension (section 2.5.4)

**Cautions** see notes above and section 2.5.4

**Contra-indications** see notes above and section 2.5.4

**Hepatic impairment** section 2.5.4

**Renal impairment** section 2.5.4

**Side-effects** see notes above and section 2.5.4

**Dose**
- 20 mg twice daily; increased if necessary by 20 mg every 2 weeks to max. 100 mg daily in divided doses; ELDERLY, 20 mg at night may be adequate

**Preparations**
Section 2.5.4

**PRAZOSIN**

**Indications** benign prostatic hyperplasia; hypertension, congestive heart failure and Raynaud’s syndrome (section 2.5.4)

**Cautions** see notes above and section 2.5.4

**Contra-indications** see notes above and section 2.5.4

**Hepatic impairment** section 2.5.4

**Renal impairment** section 2.5.4

**Side-effects** see notes above and section 2.5.4

**Dose**
- Initially 500 micrograms twice daily for 3–7 days, subsequently adjusted according to response; usual maintenance (and max.) 2 mg twice daily; ELDERLY initiate with lowest possible dose

First dose effect First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patient should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely

**Preparations**
Section 2.5.4

**TAMSULOSIN HYDROCHLORIDE**

**Indications** benign prostatic hyperplasia

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** avoid in severe impairment

**Renal impairment** use with caution if eGFR less than 30 mL/minute/1.73 m²

**Side-effects** see notes above

**Dose**
- 400 micrograms daily

**Preparations**
Section 2.5.4

**TENSOLIN HYDROCHLORIDE**

**Indications** benign prostatic hyperplasia; hypertension (section 2.5.4)

**Cautions** see notes above and section 2.5.4

**Contra-indications** see notes above

**Hepatic impairment** avoid in severe impairment

**Renal impairment** use with caution if eGFR less than 30 mL/minute/1.73 m²

**Side-effects** see notes above

**Dose**
- Initially 1 mg daily; dose may be doubled at intervals of 1–2 weeks according to response, up to max. 8 mg daily; usual maintenance 2–4 mg daily

**Preparations**
Section 2.5.4

**TAMSULOSIN HYDROCHLORIDE**

**Indications** benign prostatic hyperplasia

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** avoid in severe impairment

**Renal impairment** use with caution if eGFR less than 30 mL/minute/1.73 m²

**Side-effects** see notes above

**Dose**
- 400 micrograms daily
Tamsulosin hydrochloride (Non-proprietary) (Tamsulosin hydrochloride 400 micrograms, net price 30-cap pack = £5.04. Label: 25, counselling, driving brands include Bazetham® MR, Contfit® XL, Difdorax® XL, Lomate® MR, Finex® PR, Flarsiv® XL, Stromaze® MR, Tolbyphen® MR Flomaxtra® XL (Astellas) (Terazosin)(Non-proprietary) Tablets, m/r, tamsulosin hydrochloride 400 micrograms, net price 30-tab pack = £10.47. Label: 25, counselling, driving With dutasteride For prescribing information on dutasteride, see section 6.4.2 Combodart® (GSK) (Flomaxtra® XL (Terazosin))(Non-proprietary) Tablets, m/r, brown/orange, tamsulosin hydrochloride 400 micrograms, dutasteride 500 micrograms, net price 30-cap pack = £19.80. Label: 25, counselling, Dose benzynic prostatic hyperplasia, 1 capsule daily With solifenacin For prescribing information on solifenacin, see section 7.4.2 Vesomni® (Astellas) (A) Tablets, m/r, f/c, red, tamsulosin hydrochloride 400 micrograms, solifenacin succinate 6 mg, net price 30-tab pack = £27.62. Label: 3, 25 Dose ADULT over 18 years, moderate to severe urinary frequency, urgency, and obstructive symptoms associated with benign prostatic hyperplasia when monotherapy ineffective, 1 tablet daily TERAZOSIN Indications benign prostatic hyperplasia, hypertension (section 2.5.4) Cautions see notes above and section 2.5.4 Driving May affect performance of skilled tasks e.g. driving Contra-indications see notes above Side-effects see notes above and section 2.5.4 Dose ● Initially 1 mg at bedtime; if necessary dose may be doubled at intervals of 1–2 weeks according to response, up to max. 10 mg once daily; usual maintenance 5–10 mg daily First dose effect First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patient should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely Terazosin (Non-proprietary) (Terazosin) Tablets, terazosin (as hydrochloride) 2 mg, net price 28-tab pack = £2.17; 5 mg, 28-tab pack = £2.48; 10 mg, 28-tab pack = £7.93. Counselling, initial dose, driving Hytrin® (A) (AMCo) (Hytrin®) Tablets, terazosin hydrochloride 2 mg (yellow) net price, 28-tab pack = £2.20; 5 mg (tan), 28-tab pack = £4.13; 10 mg (blue), 28-tab pack = £8.24; starter pack (for benign prostatic hyperplasia) of 7 x 1-mg tab with 14 x 2-mg tab and 7 x 5-mg tab = £10.97. Counselling, initial dose, driving Hytrin® is on sale to the public

Parasympathomimetics

The parasympathomimetic bethanechol increases detrusor muscle contraction. However, it has only a limited role in the relief of urinary retention; its use has been superseded by catheterisation.

BETHANECHOL CHLORIDE

Indications urinary retention, but see notes above Cautions autonomic neuropathy (use lower initial dose); Interactions: Appendix 1 (parasympathomimetics) Contra-indications peptic ulcer; intestinal or urinary obstruction; conditions where postural hypotension occurs may occur After vigorous intravenous administration, cardiovascular disorders (including recent myocardial infarction, bradycardia, and heart block); hypotension; obstructive airways disease; epilepsy; parkinsonism; hyperthyroidism Pregnancy manufacturer advises avoid—no information available Breast-feeding manufacturer advises avoid—no information available Side-effects nausea, vomiting, diarrhoea, abdominal pain, increased salivation, eructation; flushing, hypotension, bradycardia; bronchoconstriction, rhinorrhoea; headache; increased lacrimation; increased sweating Dose ● 10–25 mg 3–4 times daily half an hour before food Mytonotine® (Glenwood) (Mytonine®) Tablets, scored, bethanechol chloride 10 mg, net price 100-tab pack = £18.51; 25 mg, 100-tab pack = £27.26. Label: 22

7.4.2 Drugs for urinary frequency, enuresis, and incontinence

Urinary incontinence

Incontinence in adults which arises from detrusor instability is managed by combining drug therapy with conservative methods for managing urge incontinence such as pelvic floor exercises and bladder training; stress incontinence is generally managed by non-drug methods. Duloxetine, an inhibitor of serotonin and noradrenaline re-uptake can be added and is licensed for the treatment of moderate to severe stress incontinence in women; it may be more effective when used as an adjunct to pelvic floor exercises.

Antimuscarinic drugs reduce symptoms of urgency and urge incontinence and increase bladder capacity. Oxybutynin also has a direct relaxant effect on urinary smooth muscle. Side-effects limit the use of oxybutynin, but they may be reduced by starting at a lower dose. A modified-release preparation of oxybutynin is effective and has fewer side-effects; a transdermal patch is also available. The efficacy and side-effects of tolterodine are comparable to those of modified-release oxybutynin. Flavoxate has less marked side-effects but it is also less effective. Darifenacin, fesoterodine, propiverine, solifenacin, and trospium are newer antimuscarinic drugs licensed for urinary frequency, urgency, and incontinence. The need for continuing antimuscarinic

1. Tamsulosin hydrochloride 400 microgram capsules can be sold to the public for the treatment of functional symptoms of benign prostatic hyperplasia in men aged 45–75 years to be taken for up to 6 weeks before clinical assessment by a doctor, a proprietary brand Flomax Relief® MR is on sale to the public

7 Obstetrics, gynaecology, and urinary-tract disorders
drug therapy should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

The Scottish Medicines Consortium (p. 4) has advised (June 2008) that fesoterodine (Toviaz®) is accepted for restricted use within NHS Scotland as a second-line treatment for overactive bladder syndrome.

Purified bovine collagen implant (Contigen®, Bard) is indicated for urinary incontinence caused by intrinsic sphincter deficiency (poor or non-functioning bladder outlet mechanism). The implant should be inserted only by surgeons or physicians trained in the technique for injection of the implant.

Cautions Antimuscarinic drugs should be used with caution in the elderly (especially if frail), in those with autonomic neuropathy, and in those susceptible to angle-closure glaucoma. They should also be used with caution in hiatus hernia with reflux oesophagitis. Antimuscarinics can worsen hyperthyroidism, coronary artery disease, congestive heart failure, hypertension, prostatic hyperplasia, arrhythmias, and tachycardia. For interactions, see Appendix 1 (antimuscarinics).

Contra-indications Antimuscarinic drugs should be avoided in patients with myasthenia gravis, significant bladder outflow obstruction or urinary retention, severe ulcerative colitis, toxic megacolon, and in gastro-intestinal obstruction or intestinal atony.

Side-effects Side-effects of antimuscarinic drugs include dry mouth, gastro-intestinal disturbances including constipation, flatulence, taste disturbances, blurred vision, dry eyes, drowsiness, dizziness, fatigue, difficulty in micturition (less commonly urinary retention), palpitation, and skin reactions (including dry skin, rash, and photosensitivity); also headache, diarrhoea, angioedema, arthralgias, and tachycardia. Central nervous system stimulation, such as restlessness, disorientation, hallucination, and convulsion may occur; children are at higher risk of these effects. Antimuscarinic drugs can reduce sweating, leading to heat sensations and fainting in hot environments or in patients with fever, and very rarely may precipitate angle-closure glaucoma.

DULOXETINE

Indications moderate to severe stress urinary incontinence in women; major depressive disorder (section 4.3.4); diabetic neuropathy (section 4.3.4); generalised anxiety disorder (section 4.3.4)

Cautions elderly; cardiac disease; hypertension (avoid if uncontrolled); history of mania; history of seizures; raised intra-ocular pressure, susceptibility to angle-closure glaucoma; bleeding disorders or concomitant use of drugs that increase risk of bleeding; interactions: Appendix 1 (duloxetine)

Withdrawal Nausea, vomiting, headache, anxiety, dizziness, paraesthesia, sleep disturbances, and tremor are the most common features of abrupt withdrawal or masked reduction of the dose; dose should be reduced over at least 1–2 weeks

Hepatic impairment manufacturer advises avoid

Renal impairment avoid if eGFR less than 30 mL/minute/1.73 m²

Pregnancy toxicity in animal studies—avoid in patients with stress urinary incontinence; risk of neonatal withdrawal symptoms if used near term

Breast-feeding present in milk—manufacturer advises avoid

Side-effects nausea, vomiting, dyspepsia, constipation, diarrhoea, abdominal pain, weight changes, decreased appetite, flatulence, dry mouth, palpitation, hot flush; insomnia, abnormal dreams, paraesthesia, drowsiness, anxiety, headache, dizziness, fatigue, weakness, tremor, nervousness, anorexia; sexual dysfunction; visual disturbances; sweating, pruritus; less commonly gastritis, halitosis, hepatitis, bruxism, dysphagia, tachycardia, hypertension, postural hypotension, syncope, raised cholesterol, vertigo, taste disturbance, cold extremities, impaired temperature regulation, impaired attention, movement disorders, muscle twitching, musculoskeletal pain, thirst, stomatitis, hypothyroidism, urinary disorders, and photosensitivity; rarely mania; very rarely angle-closure glaucoma, also reported supratherapeutic arrhythmia, chest pain, hallucinations, suicidal behaviour (see Suicidal Behaviour and Antidepressant Therapy, p. 249), seizures, hypersensitivity reactions
including urticaria, angioedema, rash (including Stevens-Johnson syndrome) and anaphylaxis, hyponatraemia (see Hyponatraemia and Antidepressant Therapy, p. 248)

**Dose**
- **ADULT** over 18 years, 40 mg twice daily, assess for benefit and tolerability after 2–4 weeks

**Note** Initial dose of 20 mg twice daily for 2 weeks can minimise side-effects

**Yentreve**\(^\text{®} \) (Lilly) \(^\text{TM}\)
Capsules, duloxetine (as hydrochloride) 20 mg (blue), net price 28-cap pack = £18.48, 56-cap pack = £30.80; 40 mg (orange/blue), 56-cap pack = £36.96. Label: 2

**Cymbalta**\(^\text{®} \) (Lilly) \(^\text{TM}\)
Section 4.3.4 (major depressive episode, generalised anxiety disorder, and diabetic neuropathy)

**FLAVOXATE HYDROCHLORIDE**

**Indications** urinary frequency, urgency, and urge incontinence

**Caution** see notes above; gastro-oesophageal reflux

**Dose**
- **ADULT** over 18 years, 4 mg once daily, increased if necessary to max. 8 mg once daily

**Note** Max. 4 mg daily with concomitant atazanavir, clarithromycin, indinavir, iraconazole, ritonavir, saquinavir, or telithromycin; in patients with hepatic or renal impairment, consult product literature before concomitant use of cytochrome P450 enzyme inhibitors

**Renal impairment** increase dose cautiously if eGFR less than 30 mL/minute/1.73 m\(^2\); consult product literature before concomitant use of cytochrome P450 enzyme inhibitors

**Hepatic impairment** avoid in severe impairment—no information available; reduce dose to 25 mg once daily in moderate impairment; with concomitant use of strong cytochrome P450 inhibitors such as iraconazole, ritonavir, or clarithromycin reduce dose to 25 mg once daily in mild impairment and avoid in moderate impairment

**Contra-indications** severe hypertension

**Side-effects** tachycardia, urinary-tract infection; less commonly dyspepsia, gastritis, palpitation, atrial fibrillation, hypertension, vulvovaginal infection and pruritus, joint swelling, rash, pruritus

**Dose**
- **ADULT** over 18 years, 50 mg once daily

**Note** initial—lower dose in elderly, maximum—no information available; reduce dose to 25 mg once daily if eGFR 30–80 mL/minute/1.73 m\(^2\); max. 4 mg daily if eGFR less than 30 mL/minute/1.73 m\(^2\); consult product literature before concomitant use of cytochrome P450 enzyme inhibitors

**Breast-feeding** manufacturer advises caution—no information available

**Side-effects** see notes above; also vertigo, eosinophilia, leucopenia, urticaria, erythema, and pruritus

**Dose**
- **ADULT** and **CHILD** over 12 years, 200 mg 3 times daily

**Urisspas 200**\(^\text{®} \) (Recordati)
Tablets, f/c, flavoxate hydrochloride 200 mg, net price 90-tab pack = £11.67. Label: 3

**MIRABEGRON**

**Indications** urinary frequency, urgency, and urge incontinence

**Cautions** history of QT-interval prolongation; concomitant use with drugs that prolong the QT interval; interactions: Appendix 1 (mirabegron)

**Contra-indications** severe hypertension

**Hepatic impairment** avoid in severe impairment—no information available; reduce dose to 25 mg once daily in moderate impairment; with concomitant use of strong cytochrome P450 inhibitors such as iraconazole, ritonavir, or clarithromycin reduce dose to 25 mg once daily in mild impairment and avoid in moderate impairment

**Renal impairment** avoid if eGFR less than 15 mL/minute/1.73 m\(^2\); no information available; reduce dose to 25 mg once daily if eGFR 15–29 mL/minute/1.73 m\(^2\); with concomitant use of strong cytochrome P450 inhibitors such as iraconazole, ritonavir, or clarithromycin reduce dose to 25 mg once daily if eGFR 30–89 mL/minute/1.73 m\(^2\) and avoid if eGFR less than 30 mL/minute/1.73 m\(^2\)

**Pregnancy** avoid—toxicity in animal studies; contraception advised in women of child-bearing potential

**Breast-feeding** avoid—present in milk in animal studies

**Side-effects** tachycardia, urinary-tract infection; less commonly dyspepsia, gastritis, palpitation, atrial fibrillation, hypertension, vulvovaginal infection and pruritus, joint swelling, rash, pruritus

**Dose**
- **ADULT** over 18 years, 50 mg once daily

**Betmiga**\(^\text{®} \) (Astellas) \(^\text{TM}\)
Tablets, m/r, mirabegron 25 mg (brown), net price 30-tab pack = £29.00; 50 mg (yellow), 30-tab pack = £29.00. Label: 25

**OXYBUTYNIN HYDROCHLORIDE**

**Indications** urinary frequency, urgency and incontinence, neurogenic bladder instability, and nocturnal enuresis associated with overactive bladder

**Cautions** see notes above; acute porphyria (section 9.8.2)

**Contra-indications** see notes above

**Hepatic impairment** manufacturer advises caution

**Renal impairment** manufacturer advises caution

**Pregnancy** manufacturers advise avoid unless essential—toxicity in animal studies

**Breast-feeding** manufacturers advise avoid—present in milk

**Side-effects** see notes above; also less commonly anorexia, facial flushing, rarely night terrors; application site reactions with patches; also reported cognitive impairment
Dose
- **ADULT** and **CHILD** over 12 years, initially 5 mg 2–3 times daily, increased if necessary to max. 5 mg 4 times daily; **ELDERLY** initially 2.5–3 mg twice daily, increased to 5 mg twice daily according to response and tolerance; **CHILD** 5–12 years, neurogenic bladder instability, 2.5–3 mg twice daily, increased to 5 mg 2–3 times daily; **CHILD** under 5 years see **BNF for Children**; **CHILD** 5–18 years, nocturnal enuresis associated with overactive bladder, 2.5–3 mg twice daily increased to 5 mg 2–3 times daily (last dose before bedtime)

**Dose** **ADULT** over 18 years, 60 mg once daily

**Nocturnal enuresis in children**

**Nocturnal enuresis** is common in young children, but persists in a small proportion by 10 years of age. For children under 5 years, reassurance and advice on the management of nocturnal enuresis can be useful for some families. Treatment may be considered in children over 5 years depending on their maturity and motivation, the frequency of nocturnal enuresis, and the needs of the child and their family.

Initially, advice should be given on fluid intake, diet, toileting behaviour, and reward systems; for children who do not respond to this advice, further treatment may be necessary. An **enuresis alarm** should be first-line treatment for motivated, well-supported children; alarms have a lower relapse rate than drug treatment when discontinued. Treatment should be reviewed after 4 weeks, and, if there are early signs of response, continued until a minimum of 2 weeks’ uninterrupted dry nights have been achieved. If complete dryness is not achieved after 3 months, only continue if the condition is still improving and the child remains motivated to use the alarm. If initial alarm treatment is unsuccessful, consider combination treatment with desmopressin (see below), or desmopressin alone if the alarm is no longer appropriate or desirable.

**Desmopressin** (section 6.5.2), an analogue of vasopressin, is given by oral or by sublingual administration; it should not be given intranasally for nocturnal enuresis due to an increased incidence of side-effects. Desmopressin alone can be offered to children over 5 years of age if an alarm is inappropriate or undesirable, or when rapid or short-term results are the priority (for example to cover periods away from home); desmopressin alone can also be used if there has been a partial response to a combination of desmopressin and an alarm following initial treatment with an alarm. Treatment should be assessed after 4 weeks and continued for 3 months if there are signs of response. Desmopressin should be

**TROSPAUM CHLORIDE**

**Indications** urinary frequency, urgency and incontinence

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** manufacturer advises caution in mild to moderate impairment; avoid in severe impairment

**Renal impairment** use with caution; reduce dose to 20 mg once daily or 20 mg on alternate days if eGFR 10–30 mL/minute/1.73 m²; avoid Regurin® XL

**Pregnancy** manufacturer advises caution

**Breast-feeding** manufacturer advises caution

**Side-effects** see notes above; rarely chest pain, dyspnoea, and asthenia; very rarely myalgia and arthralgia

**Dose**
- **ADULT** and **CHILD** over 12 years, 20 mg twice daily before food

**Tropism Chloride (Non-proprietary)**
- Tablets, f/c, tropism chloride 20 mg, net price 60-tab pack = £25.21. Label: 23

**Brands include** Flotro®

**Detrusitol®** (Pfizer)
- Capsules, m/r, tolterodine chloride 4 mg, net price 28-cap pack = £25.78. Label: 3, 25

**Brands Include** Santara XR®

**Dose** urinary frequency, urgency, and incontinence, **ADULT** over 18 years, 4 mg once daily

**Detrusitol® XL** (Pfizer)
- Capsules, blue, m/r, tolterodine chloride 4 mg, net price 28-cap pack = £25.78. Label: 3, 25

**Dose** urinary frequency, urgency and incontinence, **ADULT** over 18 years, 4 mg once daily
withdrawn at regular intervals (for 1 week every 3 months) for full reassessment. Particular care is needed to avoid fluid overload by restricting fluid intake from 1 hour before taking desmopressin until 8 hours after. When stopping treatment with desmopressin, gradual withdrawal should be considered.

Nocturnal enuresis associated with daytime symptoms (overflowing bladder) can be managed with antimuscarinic drugs (see Urinary incontinence, p. 550) in combination with desmopressin. Treatment should be prescribed only after specialist assessment and should be continued for 3 months; the course can be repeated if necessary.

The tricyclic antidepressant imipramine (section 4.3.1) may be considered for children who have not responded to all other treatments and have undergone specialist assessment, however, behavioural disturbances can occur and relapse is common after withdrawal. Treatment should not normally exceed 3 months unless a maintenance dosage is necessary.

The acute pain of ureteric colic may be relieved with pethidine (section 4.7.2). Diclofenac by injection or as suppositories (section 10.1.1) is also effective and compares favourably with pethidine; other non-steroidal anti-inflammatory drugs are occasionally given by injection.

Lidocaine gel is a useful topical application in urethral pain or to relieve the discomfort of catheterisation (section 15.2).

### 7.4.3 Drugs used in urological pain

**Alkalisation of urine**

Alkalisation of urine can be undertaken with potassium citrate. The alkalinising action may relieve the discomfort of cystitis caused by lower urinary tract infections. Sodium bicarbonate is used as a urinary alkalinising agent in some metabolic and renal disorders (section 9.2.1.3).

**POTASSIUM CITRATE**

**Indications** relief of discomfort in mild urinary-tract infections; alkalinisation of urine

**Cautions** cardiac disease; elderly; interactions: Appendix 1 (potassium salts)

**Renal impairment** close monitoring required—high risk of hyperkalaemia; avoid in severe impairment

**Side-effects** hyperkalaemia on prolonged high dosage, mild diuresis

**Dose**

- See under preparation

**Potassium Citrate Mixture BP**

Oral solution, potassium citrate 30%, citric acid monohydrate 5% in a suitable vehicle with a lemon flavour. Extramoraneous preparations should be recently prepared according to the following formula: potassium citrate 3 g, citric acid monohydrate 500 mg, syrup 2.5 mL, quillaia tincture 0.1 mL, lemon spirit 0.05 mL, double-strength chloroform water 3 mL, water to 10 mL. Contains about 28 mmol K⁺/10 mL. Label: 27

**Dose**

- 10 mL 3 times daily well diluted with water

Proprietary brands of potassium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections

**SODIUM BICARBONATE**

**Indications** relief of discomfort in mild urinary-tract infections; alkalinisation of urine

**Cautions** cardiac disease; patients on sodium-restricted diet; elderly; avoid prolonged use; interactions: Appendix 1 (antacids)

**Hepatic impairment** section 1.1.1

**Renal impairment** avoid; specialised role in some forms of renal disease, see section 9.2.1.3

**Pregnancy** use with caution

**Side-effects** eructation, alkalosis on prolonged use

**Dose**

- 3 g in water every 2 hours until urinary pH exceeds 7; maintenance of alkaline urine 5–10 g daily

**Preparations**

Section 9.2.1.3

### 7.4.4 Bladder instillations and urological surgery

**Bladder infection** Various solutions are available as irrigations or washouts.

Aqueous chlorhexidine (section 13.11.2) can be used in the management of common infections of the bladder but it is ineffective against most Pseudomonas spp. Solutions containing chlorhexidine 1 in 5000 (0.02%) are used but they may irritate the mucosa and cause burning and haematuria (in which case they should be discontinued); sterile sodium chloride solution 0.9% (physiological saline) is usually adequate and is preferred as a mechanical irritant.
Continuous bladder irrigation with amphotericin
50 micrograms/mL (section 5.2.3) may be of value in
mycotic infections.

**Dissolution of blood clots** Clot retention is usually
treated by irrigation with sterile sodium chloride solu-
tion 0.9% but sterile sodium citrate solution for
bladder irrigation 3% may also be helpful.

**Bladder cancer** Bladder instillations of doxorubicin
(section 8.1.2) and mitomycin (section 8.1.2) are used
for recurrent superficial bladder tumours. Such instilla-
tions reduce systemic side-effects; adverse effects on
the bladder (e.g. micturition disorders and reduction in
bladder capacity) may occur.

Installation of epirubicin (section 8.1.2) is used for
therapy and prophylaxis of certain forms of superficial
bladder cancer; installation of doxorubicin (section
8.1.2) is also used for some papillary tumours.

Installation of BCG (Bacillus Calmette-Guérin), a live
attenuated strain derived from *Mycobacterium bovis*
(section 8.2.4), is licensed for the treatment of primary or
recurrent bladder carcinoma *in-situ* and for the preven-
tion of recurrence following transurethral resection.

**Interstitial cystitis** Dimethyl sulfoxide may be
used for symptomatic relief in patients with interstitial
cysts (Hunner’s ulcer). 50 mL of a 50% solution
*(Rimso-50®—available from ‘special-order’ manufac-
turers or specialist importing companies, p. 1104)* is
instilled into the bladder, retained for 15 minutes, and
voided by the patient. Treatment is repeated at intervals
of 2 weeks. Bladder spasm and hypersensitivity reac-
tions may occur and long-term use requires ophthalmic,
renal, and hepatic assessment at intervals of 6 months.

**Interactions:** see Appendix 1 (dimethyl sulfoxide).

**SODIUM CITRATE**

**Indications** bladder washouts, see notes above

**Sterile Sodium Citrate Solution for Bladder
Irrigation**

sodium citrate 3%, dilute hydrochloric acid 0.2%, in
purified water, freshly boiled and cooled, and steri-
lised

**Urological surgery**

There is a high risk of fluid absorption from the irrigant
used in endoscopic surgery within the urinary tract; if
this occurs in excess, hypervolaemia, haemolysis, and
renal failure may result. Glycine irrigation solution
1.5% is the irrigant of choice for transurethral resection
of the prostate gland and bladder tumours; sterile sodi-
num chloride solution 0.9% (physiological saline) is
used for percutaneous renal surgery.

**GLYCINE**

**Indications** bladder irrigation during urological sur-
gery; see notes above

**Cautions** see notes above

**Side-effects** see notes above

**Glycine Irrigation Solution** (Non-proprietary)

Irrigation solution, glycine 1.5% in water for injec-
tions

Maintenance of indwelling urinary
catheters

The deposition which occurs in catheterised patients is
usually chiefly composed of phosphate and to minimise
this the catheter (if latex) should be changed at least as
often as every 6 weeks. If the catheter is to be left for
longer periods a silicone catheter should be used

**CATHETER PATENCY SOLUTIONS**

**Chlorhexidine 0.02%**

**Brands include** Uro-Tainer Chlorhexidine®, net price
100-mL sachet = £2.70

**Sodium chloride 0.9%**

**Brands include** OptiFlo S®, net price 50- and 100-mL
sachets = £3.30; Uriflex S®, 100-mL sachet = £3.45;
Uriflex SP®, with integral drug additive port, 100-mL
sachet = £3.45; Uro-Tainer Sodium Chloride®, 50-
and 100-mL sachets = £3.45; Uro-Tainer M®, with
integral drug additive port, 50- and 100-mL sachets
= £2.90

**Solution G**

Citrice acid 3.23%, magnesium oxide 0.38%, sodium
bicarbonate 0.7%, disodium edetate 0.01%. Brands
include OptiFlo G®, net price 50- and 100-mL
sachets = £3.50; Uriflex G®, 100-mL sachet = £2.40;
Uro-Tainer® Twin Baby G, 2 x 30-mL = £4.72

**Solution R**

Citrice acid 6%, gluconolactone 0.8%, magnesium
carbonate 2.8%, disodium edetate 0.01%. Brands
include OptiFlo R®, net price 50- and 100-mL
sachets = £3.50; Uriflex R®, 100-mL sachet = £2.40;
Uro-Tainer® Twin Soluto R, 2 x 30-mL = £4.72

**Diluents for bladder instillation**

**SODIUM CHLORIDE**

**Indications** diluent for instillation of drugs to the
bladder

**Sodium Chloride 0.9% Solution for Intravesical
Use** (Non-proprietary)

Intravesical instillation, sodium chloride 0.9%, net
price 50-mL bag = £9.66

**7.4.5 Drugs for erectile dysfunction**

Reasons for failure to produce a satisfactory erection
include psychogenic, vascular, neurogenic, and endocrine
abnormalities; impotence can also be drug-induced.
Intracavernosal injection or urethral application of
vasoactive drugs under careful medical supervision is
used for both diagnostic and therapeutic purposes.

Erectile disorders may also be treated with drugs given
by mouth which increase the blood flow to the penis.
Drugs should be used with caution if the penis is
deformed (e.g. in angulation, cavernosal fibrosis, and
Peyronie’s disease).

**Priapism** If priapism occurs with alprostadil, treat-
ment should not be delayed more than 6 hours and is as
follows:
Initial therapy by penile aspiration—using aseptic technique a 19–21 gauge butterfly needle inserted into the corpus cavernosum and sterile physiological saline introduced through the first needle and drained through the second. If aspiration and lavage of corpora are unsuccessful, cautious intracavernosal injection of a sympathomimetic (section 2.7.2) with action on alpha-adrenergic receptors, continuously monitoring blood pressure and pulse (extreme caution: coronary heart disease, hypertension, cerebral ischaemia or if taking antidepressant) as follows:

- Intracavernosal injections of phenylephrine 100–200 micrograms (0.5–1 mL of a 200 microgram/mL solution) every 5–10 minutes; max. total dose 1 mg [unlicensed indication] \textit{important: if suitable strength of phenylephrine injection not available may be specially prepared by diluting 0.1 mL of the phenylephrine 1% (10 mg/mL) injection (section 2.7.2) to 5 mL with sodium chloride 0.9%}; alternatively
- Intracavernosal injections of adrenaline 10–20 micrograms (0.5–1 mL of a 20 microgram/mL solution) every 5–10 minutes; max. total dose 100 micrograms [unlicensed indication] \textit{important: if suitable strength of adrenaline not available may be specially prepared by diluting 0.1 mL of the adrenaline 1 in 1000 (1 mg/mL, section 3.4.3) injection to 5 mL with sodium chloride 0.9%}; alternatively
- Intracavernosal injection of metaraminol (\textit{caution: has been associated with fatal hypertensive crises}; metaraminol 1 mg (0.1 mL of 10 mg/mL metaraminol injection, section 2.7.2) is diluted to 50 mL with sodium chloride injection 0.9% and given carefully by slow injection into the corpora in 5-mL injections every 15 minutes [unlicensed indication].

If necessary the sympathetic injections can be followed by further aspiration of blood through the same butterfly needle.

If sympathomimetics unsuccessful, urgent surgical referral for management (possibly including shunt procedure).

**Prescribing on the NHS**

Drug treatments for erectile dysfunction may only be prescribed on the NHS under certain circumstances (see individual preparations). The Department of Health (England) has recommended that treatment should also be available from specialist services when the condition is causing severe distress; specialist centres should use form FP10(HP) or form HBP in Scotland or form WP10HP in Wales and endorse them ‘SLS’ if the treatment is to be dispensed in the community. The following criteria should be considered when assessing distress:

- significant disruption to normal social and occupational activities;
- a marked effect on mood, behaviour, social and environmental awareness;
- a marked effect on interpersonal relationships.

**Alprostadil**

**Alprostadil** (prostaglandin E$_1$) is given by intracavernosal injection or intrarectal application for the management of erectile dysfunction (after exclusion of treatable medical causes); it is also used as a diagnostic test.

### ALPROSTADIL

**Indications**

erectile dysfunction (including aid to diagnosis)

**Cautions**

priapism—patients should be instructed to report any erection lasting 4 hours or longer—for management, see section 7.4.5; anatomical deformations of penis (painful erection more likely)—follow up regularly to detect signs of penile fibrosis (consider discontinuation if angulation, cavernosal fibrosis or Peyronie’s disease develop); \textit{interactions:} Appendix 1 (prostaglandins)

**Contra-indications**

predisposition to prolonged erection (as in sickle cell anaemia, multiple myeloma or leukaemia); not for use with other agents for erectile dysfunction, in patients with penile implants or when sexual activity medically inadvisable; urethral application also contra-indicated in urethral stricture, severe hypospadias, severe curvature, balanitis, urethritis

**Side-effects**

hypotension, hypertension; dizziness, headache; penile pain, other localised pain (buttocks, leg, testicular, abdominal); influenza-like syndrome; urethral burning, urethral bleeding; injection site reactions including penile fibrosis, penile oedema, penile rash, haematomy, haemosiderin deposits; \textit{less commonly} nausea, dry mouth, vasodilatation, syncope, supraventricular extrasystole, rapid pulse, asthenia, leg cramps, pelvic pain, scrotal or testicular oedema, scrotal erythema, testicular thickening, micturition difficulties, haematuria, mydriasis, and sweating; local reactions including penile warmth, pruritus, irritation, penile numbness or sensitivity, balanitis, phimosis, priapism (see section 7.4.5 and under Cautions), abnormal ejaculation; \textit{rarely} vertigo, urinary-tract infection, and hypersensitivity reactions (including rash, erythema, urticaria, and anaphylaxis)

**Dose**

- See under preparations below

**Intracavernosal injection**

- **Caverject** (Pharmacia) \( \text{Pfizer} \)

  **Injection**, powder for reconstitution, alprostadil, net price 5-microgram vial = £7.75; 10-microgram vial = £9.24; 20-microgram vial = £11.94; 40-microgram vial = £21.58 (all with diluent-filled syringe, needles and swabs)

1. \( \text{for treatment of erectile dysfunction except in men who:} \)

- have diabetes, multiple sclerosis, Parkinson’s disease, poliomyelitis, prostate cancer, severe pelvic injury, single gene neurological disease, spina bifida, or spinal cord injury;
- are receiving dialysis for renal failure;
- have had radical pelvic surgery, prostatectomy (including transurethral resection of the prostate), or kidney transplant;

  - were receiving Caverject®, Erecnos®, MUSE®, Viagra®, or Viridal® for erectile dysfunction, at the expense of the NHS, on 14 September 1998;
  - are suffering severe distress as a result of impotence (prescribed in specialist centres only, see notes above).

The prescription must be endorsed ‘SLS’.  

---

**BNF 68**

7 Obstetrics, gynaecology and urinary-tract disorders

**7.4.5 Drugs for erectile dysfunction**

557
7.4.5 Drugs for erectile dysfunction

Caverject® Dual Chamber, double-chamber cartridges (containing alprostadil and diluent), net price 10-microgram cartridge (for doses 2.5–10 micrograms) = £7.35; 20-microgram cartridge (for doses 5–20 micrograms) = £9.50 (both with needles).

Dose by direct intracavernosal injection, ADULT over 18 years, erectile dysfunction, first dose 2.5 micrograms, second dose 5 micrograms (if some response to first dose) or 7.5 micrograms (if no response to first dose), increasing in steps of 5–10 micrograms to obtain dose suitable for producing erection lasting not more than 1 hour (neurological dysfunction, first dose 1.25 micrograms, second dose 2.5 micrograms, third dose 5 micrograms, increasing in steps of 5–10 micrograms to obtain suitable dose), if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; usual dose 5–20 micrograms; max. 60 micrograms; max. frequency of injection not more than 3 times per week with at least 24 hour interval between injections.

Note: The first dose must be given by medically trained personnel; self-administration may only be undertaken after proper training.

Aid to diagnosis, 10–20 micrograms as a single dose (where evidence of neurological dysfunction, initially 5 micrograms and max. 10 micrograms)—consult product literature for details.

Viridal® Duo (UCB Pharma) (PL) (PH) (PB) (PD)

Dose by direct intracavernosal injection, ADULT over 18 years, erectile dysfunction, initially 5 micrograms (2.5 micrograms in neurogenic erectile dysfunction) increasing in steps of 2.5–5 micrograms to obtain dose suitable for producing erection not lasting more than 1 hour; usual range 10–20 micrograms; max. 40 micrograms; max. frequency of injection not more than 2–3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours.

Note: The first dose must be given by medically trained personnel; self-administration may only be undertaken after proper training.

\(^{1}\) Urethral application

Counselling: If partner pregnant barrier contraception should be used.

\(^{1}\) MUSE® (Meda) (PH) (PB) (PD)

Urethral application, alprostadil, net price 250-microgram single-use applicator = £11.30, 1-mg single-use applicator = £11.56 (all strengths also available in packs of 6 applicators)

Condoms: No evidence of harm to latex condoms and diaphragms.

Dose by direct urethral application, ADULT over 18 years, erectile dysfunction, initially 250 micrograms adjusted according to response (usual range 0.125–1 mg); max. 2 doses in 24 hours and 7 doses in 7 days.

Note: During initiation of treatment MUSE® should be used under medical supervision; self-administration may only be undertaken after proper training.

AID to diagnosis, 500 micrograms as a single dose.

Phosphodiesterase type-5 inhibitors

Avanafil, sildenafil, tadalafil, and vardenafil are phosphodiesterase type-5 inhibitors licensed for the treatment of erectile dysfunction; they are not recommended for use with other treatments for erectile dysfunction. The patient should be assessed appropriately before prescribing avanafil, sildenafil, tadalafil or vardenafil. Since these drugs are given by mouth there is a potential for drug interactions.

Cautions: Avanafil, sildenafil, tadalafil, and vardenafil should be used with caution in cardiovascular disease, left ventricular outflow obstruction, anatomical deformation of the penis (e.g., angulation, cavernosal fibrosis, Peyronie’s disease), and in those with a predisposition to priapism (e.g., in sickle-cell disease, multiple myeloma, or leukaemia). Concomitant treatment with a phosphodiesterase type-5 inhibitor and an alpha-blocker (section 2.5.4 and section 7.4.1) can increase the risk of postural hypotenison—initiate treatment with a phosphodiesterase type-5 inhibitor (at a low dose) only once the patient is stable on the alpha-blocker; see also interactions: Appendix 1 (avanafil, sildenafil, tadalafil, vardenafil).

Contra-indications: Avanafil, sildenafil, tadalafil, and vardenafil are contra-indicated in patients receiving nitrates, in patients in whom vasodilation or sexual activity are inadvisable, or in patients with a previous history of non-arteritic anterior ischaemic optic neuropathy. In the absence of information, manufacturers contra-indicate these drugs in hypotension (avoid if systolic blood pressure below 90 mmHg), recent stroke, unstable angina, and myocardial infarction.

Side-effects: The side-effects of avanafil, sildenafil, tadalafil, and vardenafil include dyspepsia, nausea, vomiting, headache (including migraine), flushing, dizziness, myalgia, back pain, visual disturbances (non-arteritic anterior ischaemic optic neuropathy has been reported—stop drug if sudden visual impairment occurs), and nasal congestion. Less common side-effects include painful red eyes, palpitation, tachycardia, hypotension, hypertension, epistaxis. Other side-effects reported rarely include syncope, hypersensitivity reactions (including rash, facial oedema, and Stevens-Johnson syndrome), and priapism. Serious cardiovascular events (including arrhythmia, unstable angina, and myocardial infarction), seizures, sudden hearing loss (discontinue drug and seek medical advice), and retinal vascular occlusion have also been reported.
**AVANAFIL**

**Indications** erectile dysfunction

**Cautions** see notes above; also bleeding disorders or active peptic ulceration; **interactions**: Appendix 1 (avanafil)

**Contra-indications** see notes above; also life-threatening arrhythmia in previous 6 months; blood pressure >170/100 mmHg; mild to severe heart failure; hereditary degenerative retinal disorders

**Hepatic impairment** use lowest effective initial dose in mild to moderate impairment, adjusted according to response; manufacturer advises avoid in severe impairment—no information available

**Renal impairment** avoid if eGFR less than 30 mL/minute/1.73 m²

**Side-effects** see notes above; also less commonly malaise, drowsiness; rarely dry mouth, gastritis, abdominal pain, diarrhoea, hyperbilirubinaemia, peripheral oedema, hyperactivity, insomnia, weight gain, genital irritation, pollakiuria, increased serum creatinine, gown, muscle spasms, haematuria

**Dose**

- **ADULT** over 18 years, initially 100 mg (patients on alpha-blocker therapy 50 mg) approx. 30 minutes before sexual activity; subsequent doses adjusted according to response to 50–200 mg as a single dose as needed; max. 1 dose in 24 hours (max. single dose 200 mg)

  **Note** Max. 100 mg once every 48 hours with concomitant moderate inhibitors of cytochrome P450 enzyme CYP3A4 e.g. aripiprazole, diltiazem, erythromycin, fluconazole, fosamprenavir, or verapamil

  **Note** Onset of effect may be delayed if taken with food

**Sildenafil (Non-proprietary) (Pfizer)**

**Tablets**

- *Sildenafil* (as citrate), 25 mg, net price 4-tab pack = £1.08, 8-tab pack = £2.62; 50 mg, 4-tab pack = £1.15, 8-tab pack = £2.90; 100 mg, 4-tab pack = £2.23, 8-tab pack = £3.10

**Nipatra® (AMCo)**

**Chewable tablets**

- *Sildenafil* (as citrate), 25 mg, net price 4-tab pack = £1.05, 8-tab pack = £2.10; 50 mg, 4-tab pack = £1.03, 8-tab pack = £2.06; 100 mg, 4-tab pack = £1.11, 8-tab pack = £2.22. Label: 24

**Excipients** include aspartame (section 9.4.1)

**Viagra® (Pfizer)**

**Tablets**

- all blue, if/c, sildenafil (as citrate), 25 mg, net price 4-tab pack = £16.59, 8-tab pack = £33.19; 50 mg, 4-tab pack = £21.27, 8-tab pack = £42.54; 100 mg, 4-tab pack = £23.50, 8-tab pack = £46.99

**Revatio® (Pfizer)**

Section 2.5.1 (pulmonary hypertension)

---

**TADALAFIL**

**Indications** benign prostatic hyperplasia; erectile dysfunction; pulmonary hypertension (section 2.5.1)

**Cautions** see notes above; **interactions**: Appendix 1 (tadalafil)

**Contra-indications** see notes above; also mild to severe heart failure, uncontrolled arrhythmias, uncontrolled hypertension

**Hepatic impairment** max. dose 10 mg; manufacturer advises caution in severe impairment and for regular once-daily dosing—no information available

**Renal impairment** max. dose 10 mg if eGFR less than 30 mL/minute/1.73 m² (avoid regular once-daily dosing)

**Side-effects** see notes above; also increased sweating, abdominal pain, and transient amnesia reported

**Dose**

- Erectile dysfunction, **ADULT** over 18 years, initially 10 mg at least 30 minutes before sexual activity, subsequent doses adjusted according to response, up to 20 mg as a single dose; max. 1 dose in 24 hours (but daily dose of 10–20 mg not recommended); for patients who anticipate sexual activity at least twice weekly, 5 mg once daily can be taken, reduced to 2.5 mg once daily according to response

  **Note** Effect of intermittent dosing may persist for longer than 24 hours

- Benign prostatic hyperplasia, **ADULT** over 18 years, 5 mg once daily

---

**For treatment of erectile dysfunction except in men who:**

- have diabetes, multiple sclerosis, Parkinson’s disease, poliomyelitis, prostate cancer, severe pelvic injury, single gene neurological disease, spina bifida, or spinal cord injury
- are receiving dialysis for renal failure
- have had radical pelvic surgery, prostatectomy (including transurethral resection of the prostate), or kidney transplant
- were receiving Caverject®, Eren諾® MUSE®, Viagro®, or Virdal® for erectile dysfunction, at the expense of the NHS, on 14 September 1998
- are suffering severe distress as a result of impotence (prescribed in specialist centres only, see notes above)

The prescription must be endorsed ‘SLS’.
VARDENAFIL

Indications erectile dysfunction
Cautions see notes above; also elderly; bleeding disorders or active peptic ulceration; susceptibility to prolongation of QT interval (including concomitant use of drugs which prolong QT interval); interactions: Appendix 1 (vardenafil)
Contra-indications see notes above; also hereditary degenerative retinal disorders
Hepatic impairment initial dose 5 mg in mild to moderate impairment, increased subsequently according to response (max. 10 mg in moderate impairment); manufacturer advises avoid in severe impairment
Renal impairment initial dose 5 mg if eGFR less than 30 mL/minute/1.73 m²
Side-effects see notes above; also less commonly drowsiness, dyspnoea, increased lacrimation, photosensitivity; rarely anxiety, transient amnesia, hypotension, and raised intra-ocular pressure
Dose
- See under preparations

Levitra® (Bayer) Tablets, all orange, f/c, vardenafil (as hydrochloride trihydrate) 5 mg, net price 4-tab pack = £7.56, 8-tab pack = £15.12; 10 mg, 4-tab pack = £14.08, 8-tab pack = £28.16; 20 mg, 4-tab pack = £23.48, 8-tab pack = £46.96
Dose ADULT over 18 years, initially 10 mg (patients on alpha-blocker therapy 5 mg) approx. 25–60 minutes before sexual activity; subsequent doses adjusted according to response up to max. 20 mg as a single dose; max. 1 dose in 24 hours
Note Onset of effect may be delayed if taken with high-fat meal
Ordispersible tablets, vardenafil (as hydrochloride) 10 mg, net price 4-tab pack = £17.88
Excipients include aspartame
Dose ADULT over 18 years, 10 mg approx. 25–60 minutes before sexual activity; max. 10 mg in 24 hours (dose form not suitable for patients with moderate hepatic impairment, or for initiation of therapy in patients taking alpha-blockers, or if eGFR less than 30 mL/minute/1.73 m²)

The prescription must be endorsed ‘SLS’.

7.4.6 Drugs for premature ejaculation

Papaverine and phentolamine
Although not licensed the smooth muscle relaxant papaverine has also been given by intracavernosal injection for erectile dysfunction. Patients with neurological or psychogenic impotence are more sensitive to the effect of papaverine than those with vascular abnormalities. Phentolamine is added if the response is inadequate [unlicensed indication]. Persistance of the erection for longer than 4 hours is an emergency, see advice in section 7.4.5.

DAPOXETINE

Indications premature ejaculation (see notes above)
Cautions bleeding disorders; concomitant use of drugs that increase risk of bleeding; epilepsy (avoid if uncontrolled, discontinue if convulsions develop); susceptibility to angle-closure glaucoma; interactions: Appendix 1 (dapoxetine)
Postural hypotension and syncope Postural hypotension and syncope reported. Test for postural hypotension before starting treatment—avoid dapoxetine if postural hypotension occurs. Patients should be advised to maintain hydration and to sit or lie down until prodromal symptoms such as nausea, dizziness, and sweating abate
Contra-indications significant cardiac disease; history of syncope; history of mania, bipolar disorder, or severe depression; discontinue if psychiatric disorder develops
Hepatic impairment avoid in moderate to severe impairment
Renal impairment use with caution if eGFR 30–80 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m²
Side-effects nausea, vomiting, diarrhoea, constipation, abdominal pain, abdominal distension, dyspepsia, dry mouth, flushing, sweating, hypertension, malaise, irritability, dizziness, headache, anxiety, agitation, abnormal dreams, sleep disturbances, drowsiness, tremor, paraesthesia, impaired attention, sexual dysfunction, visual disturbances, tinnitus; less commonly syncope, sinus arrest, bradycardia, tachycardia, hypotension (including postural hypotension), restlessness, taste disturbances, depression, mood disturbances (discontinue), confusion, abnormal thoughts, vertigo, bruxism, mydriasis, eye pain, pru-
ritus; rarely defaecation urgency, sudden onset of sleep

**Dose**

- **ADULT** 18–64 years, initially 30 mg approx. 1–3 hours before sexual activity, subsequent doses adjusted according to response to max. 60 mg as a single dose; max. 1 dose in 24 hours; review treatment after 4 weeks (or 6 doses) and at least every 6 months thereafter

**Note** Max. single dose 30 mg with concomitant aprepitant, clarithromycin, diltiazem, erythromycin, fluconazole, fosamprenavir, and verapamil; use 60-mg dose with caution with concomitant potent inhibitors of cytochrome P450 enzyme CYP2D6

**Priligy**® (Menarini) ▼ 43H

*Tablets, Ifc*; dapoxetine (as hydrochloride), 30 mg (light grey), net price 3-tab pack = £14.71, 6-tab pack = £26.48; 60 mg (grey), 3-tab pack = £19.12, 6-tab pack = £34.42. Label: 2, 25, counselling, postural hypotension
# Malignant disease and immunosuppression

## 8 Cytotoxic drugs

### 8.1 Alkylating drugs

- **8.1.1 Alkylating drugs**

## 8.4 Other antineoplastic drugs

- **8.4.1 Other antineoplastic drugs**

---

The chemotherapy of cancer is complex and should be confined to specialists in oncology. Cytotoxic drugs have both anti-cancer activity and the potential to damage normal tissue; most cytotoxic drugs are teratogenic. Chemotherapy may be given with a curative intent or it may aim to prolong life or to palliate symptoms. In an increasing number of cases chemotherapy may be combined with radiotherapy or surgery or both as either neoadjuvant treatment (initial chemotherapy aimed at shrinking the primary tumour, thereby rendering local therapy less destructive or more effective) or as adjuvant treatment (which follows definitive treatment of the primary disease, when the risk of subclinical metastatic disease is known to be high). All cytotoxic drugs cause side-effects and a balance has to be struck between likely benefit and acceptable toxicity.

### Guidelines for handling cytotoxic drugs

- Trained personnel should reconstitute cytotoxics;
- Reconstitution should be carried out in designated pharmacy areas;
- Protective clothing (including gloves, gowns, and masks) should be worn;
- The eyes should be protected and means of first aid should be specified;
- Pregnant staff should avoid exposure to cytotoxic drugs (all females of child-bearing age should be informed of the reproductive hazard);
- Use local procedures for dealing with spillages and safe disposal of waste material, including syringes, containers, and absorbent material;
- Staff exposure to cytotoxic drugs should be monitored.

Combinations of cytotoxic drugs, as continuous or pulsed cycles of treatment, are frequently more toxic than single drugs but have the advantage in certain tumours of enhanced response, reduced development of drug resistance and increased survival. However for some tumours, single-agent chemotherapy remains the treatment of choice.

Cytotoxic drugs fall into a number of classes, each with characteristic antitumour activity, sites of action, and toxicity. A knowledge of sites of metabolism and excretion is important because impaired drug handling as a
result of disease is not uncommon and may result in enhanced toxicity.

Intrathecal chemotherapy
A Health Service Circular (HSC 2008/001) provides guidance on the introduction of safe practice in NHS Trusts where intrathecal chemotherapy is administered; written local guidance covering all aspects of national guidance should be available. Support for training programmes is also available.

Copies, and further information may be obtained from:
Department of Health
PO Box 777
London SE1 6XH
Fax: 01623 724524

It is also available from the Department of Health website (www.dh.gov.uk).

Safe systems for cytotoxic medicines
NHS cancer networks have been established across the UK to bring together all stakeholders in all sectors of care, to work collaboratively to plan and deliver high quality cancer services for a given population. NHS cancer networks have websites containing information on local chemotherapy services and treatment (see www.cancer.nhs.uk/networks.htm).

Safe system requirements:
- cytotoxic drugs for the treatment of cancer should be given as part of a wider pathway of care coordinated by a multidisciplinary team;
- cytotoxic drugs should be prescribed, dispensed, and administered only in the context of a written protocol or treatment plan;
- injectable cytotoxic drugs should only be dispensed if they are prepared for administration;
- oral cytotoxic medicines should be dispensed with clear directions for use.

Risks of incorrect dosing of oral anti-cancer medicines
The National Patient Safety Agency has advised (January 2008) that the prescribing and use of oral cytotoxic medicines should be carried out to the same standard as parenteral cytotoxic therapy. Standards to be followed to achieve this include:
- non-specialists who prescribe or administer on-going oral cytotoxic medication should have access to written protocols and treatment plans, including guidance on the monitoring and treatment of toxicity;
- staff dispensing oral cytotoxic medicines should confirm that the prescribed dose is appropriate for the patient. Patients should have written information that includes details of the intended oral anti-cancer regimen, the treatment plan, and arrangements for monitoring, taken from the original protocol from the initiating hospital. Staff dispensing oral cytotoxic medicines should also have access to this information, and to advice from an experienced cancer pharmacist in the initiating hospital.

Doses
Doses of cytotoxic drugs are determined using a variety of different methods including body-surface area or body-weight. Alternatively, doses may be fixed. Doses may be further adjusted following consideration of a patient’s neutrophil count, renal and hepatic function, and history of previous adverse effects to the cytotoxic drug. Doses may also differ depending on whether a drug is used alone or in combination.

Safe system requirements:
- cytotoxic drugs for the treatment of cancer should be given as part of a wider pathway of care coordinated by a multidisciplinary team;
- cytotoxic drugs should be prescribed, dispensed, and administered only in the context of a written protocol or treatment plan;
- injectable cytotoxic drugs should only be dispensed if they are prepared for administration;
- oral cytotoxic medicines should be dispensed with clear directions for use.

Prescriptions should not be repeated except on the instructions of a specialist.

Side-effects of cytotoxic drugs
Side-effects common to most cytotoxic drugs are discussed below whilst side-effects characteristic of a particular drug or class of drugs (e.g. neurotoxicity with vinca alkaloids) are mentioned in the appropriate sections. Manufacturers’ product literature, hospital-trust protocols, and cancer-network protocols should be consulted for full details of side-effects associated with individual drugs and specific chemotherapy regimens. Many side-effects of cytotoxic drugs often do not occur at the time of administration, but days or weeks later. It is therefore important that patients and healthcare professionals can identify symptoms that cause concern and can contact an expert for advice. Toxicities should be accurately recorded using a recognised scoring system such as the Common Toxicity Criteria for Adverse Events (CTCAE) developed by the National Cancer Institute.

Extravasation of intravenous drugs
A number of cytotoxic drugs will cause severe local tissue necrosis if leakage into the extravascular compartment occurs. To reduce the risk of extravasation injury it is recommended that cytotoxic drugs are administered by appropriately trained staff. For information on the prevention and management of extravasation injury, see section 10.3.

Oral mucositis
A sore mouth is a common complication of cancer chemotherapy; it is most often associated with fluorouracil, methotrexate, and the anthracyclines. It is best to prevent the complication. Good oral hygiene (rinsing the mouth frequently and effective brushing of the teeth with a soft brush 2–3 times daily) is probably beneficial. For fluorouracil, sucking ice chips during short infusions of the drug is also helpful.

Once a sore mouth has developed, treatment is much less effective. Saline mouthwashes should be used but there is no good evidence to support the use of anti-septic or anti-inflammatory mouthwashes. In general, mucositis is self-limiting but with poor oral hygiene it can be a focus for blood-borne infection.
Tumour lysis syndrome  Tumour lysis syndrome occurs secondary to spontaneous or treatment-related rapid destruction of malignant cells. Patients at risk of tumour lysis syndrome include those with non-Hodgkin’s lymphoma (especially if high grade and bulky disease), Burkitt’s lymphoma, acute lymphoblastic leukaemia and acute myeloid leukaemia (particularly if high white blood cell counts or bulky disease), and occasionally those with solid tumours. Pre-existing hyperuricaemia, dehydration, and renal impairment are also predisposing factors. Features include hyperkalaemia, hyperuricaemia (see below), and hyperphosphataemia with hypocalcaemia; renal damage and arrhythmias can follow. Early identification of patients at risk, and initiation of prophylaxis or therapy for tumour lysis syndrome, is essential.

Hyperuricaemia  Hyperuricaemia, which may be present in high-grade lymphoma and leukemia, can be markedly worsened by chemotherapy and is associated with acute renal failure. Allopurinol (section 10.1.4) should be started 24 hours before treating such tumours and patients should be adequately hydrated. The dose of mercaptopurine or azathioprine should be reduced if allopurinol needs to be given concomitantly (see Appendix 1). Rasburicase (section 10.1.4), a recombinant urate oxidase, is licensed for hyperuricaemia in patients with haematological malignancy, for details, see p. 730. It rapidly reduces plasma-uric acid concentration and may be of particular value in preventing complications following treatment of leukemias or bulky lymphomas.

Nausea and vomiting  Nausea and vomiting cause considerable distress to many patients who receive chemotherapy and to a lesser extent abdominal radiotherapy, and may lead to refusal of further treatment; prophylaxis of nausea and vomiting is therefore extremely important. Symptoms may be acute (occurring within 24 hours of treatment), delayed (first occurring more than 24 hours after treatment), or anticipatory (occurring prior to subsequent doses). Delayed and anticipatory symptoms are more difficult to control than acute symptoms and require different management.

Patients vary in their susceptibility to drug-induced nausea and vomiting; those affected more often include women, patients under 50 years of age, anxious patients, and those who experience motion sickness. Susceptibility also increases with repeated exposure to the cytotoxic drug.

Drugs may be divided according to their emetogenic potential and some examples are given below, but the symptoms vary according to the dose, route of administration, and to individual susceptibility.

Mildly emetogenic treatment—fluorouracil, etoposide, methotrexate (less than 100 mg/m²), the vinca alkaloids, and abdominal radiotherapy.

Moderately emetogenic treatment—the taxanes, doxorubicin, intermediate and low doses of cyclophosphamide, mitoxantrone, and high doses of methotrexate (0.1–1.2 g/m²).

Highly emetogenic treatment—cisplatin, dacarbazine, and high doses of cyclophosphamide.

Prevention of acute symptoms  For patients at low risk of emesis, pretreatment with dexamethasone (6–10 mg by mouth) or lorazepam (1–2 mg by mouth) may be used. For patients at high risk of emesis, a 5HT₁-receptor antagonist (section 4.6), usually given by mouth in combination with dexamethasone and the neurokinin receptor antagonist aprepitant is effective.

Prevention of delayed symptoms  For delayed symptoms associated with moderately emetogenic chemotherapy, a combination of dexamethasone and 5HT₁-receptor antagonist is effective; for highly emetogenic chemotherapy, a combination of dexamethasone and aprepitant is effective. Metoclopramide is also licensed for delayed chemotherapy-induced nausea and vomiting.

Prevention of anticipatory symptoms  Good symptom control is the best way to prevent anticipatory symptoms. Lorazepam can be helpful for its amnesic, sedative, and anxiolytic effects.

Bone-marrow suppression  All cytotoxic drugs except vincristine and bleomycin cause bone-marrow suppression. This commonly occurs 7 to 10 days after administration, but is delayed for certain drugs, such as carmustine, lomustine, and melphalan. Peripheral blood counts must be checked before each treatment, and doses should be reduced or therapy delayed if bone-marrow has not recovered.

Cytotoxic drugs may be contra-indicated in patients with acute infection; any infection should be treated before, or when starting, cytotoxic drugs. Fever in a neutropenic patient (neutrophil count less than 1.0 × 10⁹/litre) requires immediate broad-spectrum antibacterial therapy. Appropriate bacteriological investigations should be conducted as soon as possible. Patients taking cytotoxic drugs who have signs or symptoms of infection should be advised to seek prompt medical attention. All patients should initially be investigated and treated under the supervision of the appropriate oncology or haematology specialist.

In selected patients, the duration and the severity of neutropenia can be reduced by the use of amifostine, p. 567 or recombinant human granulocyte-colony stimulating factors, section 9.1.6.

Symptomatic anaemia is usually treated with red blood cell transfusions. For guidance on the use of erythropoietins in patients with cancer, see MHRA/CHM advice (p. 653) and NICE guidance (p. 653).

For advice on the use of live vaccines in individuals with impaired immune response, see section 14.1.

Alopecia  Reversible hair loss is a common complication, although it varies in degree between drugs and individual patients. No pharmacological methods of preventing this are available.

Pregnancy and reproductive function  Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Exclude pregnancy before treatment with cytotoxic drugs. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.

Contraceptive advice should be given to men and women before cytotoxic therapy begins (and should cover the duration of contraception required after therapy has ended).

Regimens that do not contain an alkylating drug or procarbazine may have less effect on fertility, but those with an alkylating drug or procarbazine carry
the risk of causing permanent male sterility (there is no effect on potency). Pretreatment counselling and consideration of sperm storage may be appropriate. Women are less severely affected, though the span of reproductive life may be shortened by the onset of a premature menopause. No increase in fetal abnormalities or abortion rate has been recorded in patients who remain fertile after cytotoxic chemotherapy.

**Thromboembolism** Venous thromboembolism can be a complication of cancer itself, but chemotherapy increases the risk.

**Treatment for cytotoxic-induced side-effects**

**Anthracycline side-effects**

**Anthracycline-induced cardiotoxicity** The anthracycline cytotoxic drugs are associated with dose-related, cumulative, and potentially life-threatening cardiotoxic side-effects.

Dexrazoxane, an iron chelator, is licensed for the prevention of chronic cumulative cardiotoxicity caused by doxorubicin or epirubicin treatment in advanced or metastatic breast cancer patients who have received a prior cumulative dose of 300 mg/m² of doxorubicin or a prior cumulative dose of 540 mg/m² of epirubicin when further anthracycline treatment is required. Patients receiving dexrazoxane should still be monitored for cardiac toxicity. The myelosuppressive effects of dexrazoxane may be additive to those of chemotherapy. The use of dexrazoxane is restricted to adults with advanced or metastatic breast cancer. Dexrazoxane is contra-indicated in children.

**Anthracycline extravasation** Dexrazoxane is licensed for the treatment of anthracycline extravasation. The first dose should be given as soon as possible and within six hours after the injury. For further information on the prevention and management of extravasation injury, see section 10.3.

**Folinic acid** (given as calcium folinate) is used to counteract the folate-antagonist action of methotrexate and thus speed recovery from methotrexate-induced mucositis or myelosuppression (‘folinic acid rescue’). Folinic acid is also used in the management of methotrexate overdose, together with other measures to maintain fluid and electrolyte balance, and to manage possible renal failure. Folinic acid does not counteract the antibacterial activity of folate antagonists such as trimethoprim.

When folic acid and fluorouracil are used together in metastatic colorectal cancer the response-rate improves compared to that with fluorouracil alone.

The calcium salt of levofolinic acid, a single isomer of folic acid, is also used for rescue therapy following methotrexate administration, for cases of methotrexate overdose, and for use with fluorouracil for colorectal cancer. The dose of calcium levofolinate is generally half that of calcium folinate.

The disodium salts of folic acid and levofolinic acid are also used for rescue therapy following methotrexate therapy, and for use with fluorouracil for colorectal cancer.

Palifermin, a human keratinocyte growth factor, is licensed for the management of oral mucositis in patients with haematological malignancies receiving myeloablative radiochemotherapy with autologous haematopoietic stem-cell support.

**EXTRAVASATION INJURY**

**Anthracycline extravasation**

**Dexrazoxane** (Clinigen) for the treatment of anthracycline extravasation should be followed or specialist advice sought.

**Dose**

- See under preparations

**Cardioxane®** (Clinigen) for reconstitution, dexrazoxane (as hydrochloride), net price 500-mg vial = £156.57

**Dose** prevention of anthracycline-induced cardiotoxicity, ADULT over 18 years, by *intravenous infusion* (30 minutes before anthracycline administration), 10 times the doxorubicin-equivalent dose or 10 times the epirubicin-equivalent dose

**Savene®** (Norgine) for reconstitution, dexrazoxane (as hydrochloride), net price 10 x 500-mg vials (with diluent) = £8750.00

**Dose** anthracycline extravasation, ADULT over 18 years, by *intravenous infusion*, 1 g/m² (max. 2 g) daily for 2 days, then 500 mg/m² for 1 day

**Note** Local coolants such as ice packs should be removed at least 15 minutes before administration

**Chemotherapy-induced mucositis and myelosuppression**
8 Malignant disease and immunosuppression

**Calcium folinate**
(Calcium leucovorin)

**Calcium Folinate** (Non-proprietary) **(Pfizer)**

Tablets, scored, folinic acid (as calcium salt) 15 mg, net price 10-tab pack = £47.46, 30-tab pack = £85.74

**Brands include** Refolinon®

**Note** Not all strengths and pack sizes are available from all manufacturers

**Injection**, folinic acid (as calcium salt) 3 mg/mL, net price 1-mL amp = £4.00, 10-mL amp = £4.62; 7.5 mg/mL, net price 2-mL amp = £7.80; 10 mg/mL, net price 5-mL vial = £19.41, 10-mL vial = £34.94, 30-mL vial = £89.95, 35-mL vial = £90.98

**Brands include** Refolinon®

**Note** Not all strengths and pack sizes are available from all manufacturers

**Injection**, powder for reconstitution, folinic acid (as calcium salt), net price 15-mg vial = £4.46; 30-mg vial = £8.36

**Dose**

**Note** Doses expressed as folinic acid

Prevention of methotrexate-induced adverse effects, usually started 12–24 hours after start of methotrexate infusion, by intramuscular injection, or by intravenous injection, or by intravenous infusion, 15 mg, repeated every 6 hours for 24 hours (may be continued by mouth); consult local treatment protocol for further information

Suspected methotrexate overdosage, by intravenous injection or by intravenous infusion (at a max. rate of 160 mg/minute), initial dose at least 50% of the dose of methotrexate; consult poisons information service (p. 33) for advice on continuing management

Adjunct to fluorouracil in colorectal cancer, consult product literature

**Disodium levofolinate**

**Sodiofolin** (Medac) **(Pfizer)**

**Injection**, folinic acid (as disodium salt) 50 mg/mL, net price 2-mL vial = £35.09, 8-mL vial = £126.25

**Dose**

**Note** Doses expressed as levofolinic acid

As an antidote to methotrexate, by intravenous injection or infusion, consult product literature

Adjunct to fluorouracil in colorectal cancer, consult product literature

**Disubstitution**

**Levofolinic Acid**

**Dose**

**Note** Levofolinic acid is an isomer of folinic acid

**Indications** see notes above

**Cautions** see Folinic acid

**Contra-indications** see Folinic acid

**Pregnancy** see Folinic acid

**Breast-feeding** see Folinic acid

**Side-effects**

**Dose**

**Note** See under preparations

**Calcium levofolinate**

**Injection**, levofolinic acid (as calcium salt) 10 mg/mL, net price 17.5-mL vial = £84.63

**Isovorin** **(Pfizer)**

**Injection**, levofolinic acid (as calcium salt) 10 mg/mL, net price 2.5-mL vial = £11.62, 17.5-mL vial = £81.33

**Dose**

**Note** Doses expressed as levofolinic acid

Prevention of methotrexate-induced adverse effects, (usually started 12–24 hours after beginning of methotrexate infusion), by intramuscular injection, or by intravenous injection or by intravenous infusion, usually 7.5 mg every 6 hours for 10 doses

Suspected methotrexate overdosage, by intravenous injection or by intravenous infusion (at a max. rate of 160 mg/minute), initial dose at least 50% of the dose of methotrexate; consult poisons information service (p. 33) for advice on continuing management

Adjunct to fluorouracil in colorectal cancer, consult product literature

**PALIFERMIN**

**Indications** see notes above

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** oral paraesthesia, taste disturbance, thickening and discoloration of tongue; fever; oedema; arthralgia; rash, pruritus, erythema, skin hyperpigmentation

**Dose**

**Note** By intravenous injection, 60 micrograms/kg once daily for 3 doses (third dose given 24–48 hours before myeloablative therapy) then 3 further doses at least 24 hours after myeloablative therapy, and more than 4 days after most recent palifermin injection, starting on same day as (but after) stem-cell infusion; CHILD not recommended

**Kepivance®** **(Swedish Orphan)** **(Pfizer)**

**Injection**, powder for reconstitution, palifermin, net price 6.25-mg vial = £544.24

**Chemotherapy-induced neutropenic infection and nephrotoxicity**

**Amifostine** is licensed for the reduction of risk of infection associated with cisplatin- and cyclophosphamide-induced neutropenia in advanced ovarian carcinoma, and for the reduction of nephrotoxicity caused by cisplatin use in advanced solid tumours of non-germ-cell origin. Amifostine is also licensed for protection against xerostomia during radiotherapy for head and neck cancer.

Other drugs for the reduction of risk of infection associated with neutropenia include granulocyte-colony stimulating factors (section 9.1.6).
CONTRA-INDICATIONS
Hypersensitivity to thiol-containing compounds.

CAUTIONS
False positive urinary ketones; false positive or false negative urinary erythrocytes.

SIDE-EFFECTS
Nausea, vomiting, colic, diarrhoea, fatigue, headache, limb and joint pains, depression, irritability, rash, hypotension and tachycardia; rarely hypersensitivity reactions (more common in patients with auto-immune disorders).

DOSE
Calculated according to oxazaphosphorine (cyclophosphamide or ifosfamide) treatment—consult product literature.

MESNA

Indications
See notes above.

Cautions
Hypersensitivity to thiol-containing compounds.

Malignant disease and immunosuppression

AMIFOSTINE

Indications
See under Dose.

Cautions
Ensure adequate hydration before treatment; infuse with patient supine and monitor arterial blood pressure (interrupt infusion if blood pressure decreases significantly; consult product literature).

During chemotherapy interrupt antihypertensive therapy 24 hours before treatment with amifostine and monitor closely; during radiotherapy monitor closely if concomitant antihypertensive therapy; monitor serum-calcium concentration in patients at risk of hypocalcaemia; patients at risk of renal impairment, caution in handling—risk of cutaneous reactions.

Hepatic impairment
Avoid—no information available.

Renal impairment
Avoid—no information available.

Pregnancy
Toxicity in animal studies; avoid.

Breast-feeding
Avoid—no information available.

Side-effects
Nausea, vomiting, hiccup; hypotension (managed by infusion of sodium chloride 0.9% and postural management); hypertension, flushing, arthralgia, myalgia (including rarely atrial fibrillation, supraventricular tachycardia); sneezing; drowsiness, dizziness, syncope; hypocalcaemia; rarely chest pain, apnoea, seizures, serious skin reactions (including Stevens-Johnson syndrome, toxic epidermal necrolysis, and very rarely exfoliative and bullous dermatitis, toxicoderma), and renal failure; very rarely myocardial infarction, laryngeal oedema, and respiratory arrest.

Dose
Reduction of neutropenia-related risk of infection due to cyclophosphamide and cisplatin treatment in patients with advanced ovarian carcinoma, by intravenous infusion over 15 minutes, Adults under 70 years, 910 mg/m² started within 30 minutes before chemotherapy (reduced to 740 mg/m² for subsequent cycles if full dose could not be given first time due to hypotension lasting more than 5 minutes after interruption, consult product literature).

Reduction of nephrotoxicity associated with cisplatin in patients with advanced solid tumours of non-germ-cell origin, consult product literature.

Prevention of xerostomia during radiotherapy for head and neck cancer, consult product literature.

ETHYOL® (Genopharm)®
Intravenous infusion, powder for reconstitution, amifostine, net price 500-mg vial = £144.00.

UROTHELIAL TOXICITY
Haemorrhagic cystitis is a common manifestation of urothelial toxicity which occurs with the oxazaphosphorines, cyclophosphamide and ifosfamide; it is caused by the metabolite acrolein. Mesna reacts specifically with this metabolite in the urinary tract, preventing toxicity. Mesna is used routinely (preferably by mouth) in patients receiving ifosfamide, and in patients receiving cyclophosphamide by the intravenous route at a high dose (e.g. more than 2 g) or in those who experienced urothelial toxicity when given cyclophosphamide previously.

MESNA

Indications
See notes above.

Cautions
False positive urinary ketones; false positive or false negative urinary erythrocytes.

CONTRA-INDICATIONS
Hypersensitivity to thiol-containing compounds.

8.1.1 ALKYLATING DRUGS

Pregnancy
Not known to be harmful; see also Pregnancy and Reproductive Function, p. 564.

Side-effects
Nausea, vomiting, colic, diarrhoea, fatigue, headache, limb and joint pains, depression, irritability, rash, hypotension and tachycardia; rarely hypersensitivity reactions (more common in patients with auto-immune disorders).

Dose
Calculated according to oxazaphosphorine (cyclophosphamide or ifosfamide) treatment—consult product literature.

MESNA (Baxter)®
Tablets, f/c, mesna 400 mg, net price 10-tab pack = £42.90; 600 mg, 10-tab pack = £61.10.
Injection, mesna 100 mg/mL, net price 4-mL amp = £3.95; 10-mL amp = £9.77.

Note
For oral administration contents of ampoule are taken in a flavoured drink such as orange juice or cola which may be stored in a refrigerator for up to 24 hours in a sealed container.

8.1.1 ALKYLATING DRUGS

Extensive experience is available with these drugs, which are among the most widely used in cancer chemotherapy. They act by damaging DNA, thus interfering with cell replication. In addition to the side-effects common to many cytotoxic drugs (section 8.1), there are two problems associated with prolonged usage. Firstly, gametogenesis is often severely affected (section 8.1). Secondly, prolonged use of these drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

Cyclophosphamide is used mainly in combination with other agents for treating a wide range of malignancies, including some leukaemias, lymphomas, and solid tumours. It is given by mouth or intravenously; it is inactive until metabolised by the liver. A urinary metabolite of cyclophosphamide, acrolein, can cause haemorrhagic cystitis; this is a rare but serious complication; increased fluid intake for 24–48 hours after intravenous injection, can prevent this complication. When high-dose therapy (e.g. more than 2 g intravenously) is used or when the patient is considered to be at high risk of cystitis (e.g. because of pelvic irradiation), mesna (given intravenously then by mouth) can also help prevent cystitis—see under Urothelial Toxicity (section 8.1).

Ifosfamide is related to cyclophosphamide and is given intravenously; mesna (section 8.1) is routinely given with it to reduce urothelial toxicity.

Chlorambucil is used either alone or in combination therapy for some lymphomas and chronic leukaemias. It is given by mouth. Side-effects, apart from bone-marrow suppression, are uncommon. However, patients occasionally develop severe widespread rashes which can progress to Stevens-Johnson syndrome or to toxic epidermal necrolysis. If a rash occurs further chlorambucil is contra-indicated and cyclophosphamide is substituted.

Melphalan is licensed for the treatment of multiple myeloma, polycythaemia vera, childhood neuroblastoma, advanced ovarian adenocarcinoma, and advanced breast cancer. However, in practice, melphalan is rarely used for ovarian adenocarcinoma; it is no longer used for advanced breast cancer. Melphalan is also licensed
for regional arterial perfusion in localised malignant melanoma of the extremities and localised soft-tissue sarcoma of the extremities. Interstitial pneumonitis and life-threatening pulmonary fibrosis are rarely associated with melphalan.

**Busulfan** is given by mouth to treat chronic myeloid leukaemia. Busulfan given by mouth or intravenously, followed by cyclophosphamide, is also licensed as conditioning treatment before haematopoietic stem-cell transplantation in adults and children. Frequent blood tests are necessary because excessive myelosuppression may result in irreversible bone-marrow aplasia. Rarely, progressive pulmonary fibrosis is associated with busulfan. Skin hyperpigmentation is a common side-effect of oral therapy.

**Lomustine** is a lipid-soluble nitrosourea and is given by mouth. It is used mainly to treat Hodgkin’s disease resistant to conventional therapy, malignant melanoma and certain solid tumours. Bone-marrow toxicity is delayed, and the drug is therefore given at intervals of 4 to 6 weeks. Permanent bone-marrow damage can occur with prolonged use. Nausea and vomiting are common and moderately severe.

**Bendamustine** given intravenously is licensed for the treatment of chronic lymphocytic leukaemia, non-Hodgkin’s lymphoma, and for the treatment of multiple myeloma.

The Scottish Medicines Consortium (p. 4) has advised (March 2011) that bendamustine (Levact\textsuperscript{®}) is accepted for restricted use within NHS Scotland for the treatment of chronic lymphocytic leukaemia in patients for whom fludarabine combination chemotherapy is not appropriate.

**NICE guidance**

**Bendamustine for the first-line treatment of chronic lymphocytic leukaemia (February 2011)**

Bendamustine is recommended as an option for the treatment of chronic lymphocytic leukaemia in patients for whom fludarabine combination chemotherapy is not appropriate.

www.nice.org.uk/TA216

**Cautions**

See section 8.1; cardiac disorders—monitor serum potassium and ECG; avoid in acute porphyria (but see section 9.8.2); interactions: see Appendix 1 (bendamustine).

**Contra-indications** jaundice; severe bone marrow suppression, low leucocyte or platelet count; major surgery less than 30 days before start of treatment

**Hepatic impairment** consider a 30% dose reduction in moderate impairment; avoid in severe impairment

**Renal impairment** no information available on use in patients with creatinine clearance less than 10 mL/minute

**Pregnancy** avoid (teratogenic and mutagenic in animal studies); effective contraception required during treatment in men or women, and for 6 months after treatment in men; see also Pregnancy and Reproductive function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1; also anorexia, diarrhoea, constipation, haemorrhage, hypotension, hypertension, palpitation, angina, arrhythmias, respiratory dysfunction, insomnia, pain, chills, malaise, infection, pyrexia, amenorrhoea, dehydration, electrolyte disturbances (including hypokalaemia); less commonly pericardial effusion; rarely acute circulatory failure, drowsiness, voice changes, sweating; very rarely taste disturbance, tachycardia, myocardial infarction, cardiac failure, pulmonary fibrosis, paraesthesia, peripheral neuropathy, neurological disorders, ataxia, anticholinergic syndrome, encephalitis, phlebitis, multiple organ failure, haemolysis; also reported secondary tumours, Stevens-Johnson syndrome, toxic epidermal necrolysis

**Dose**

- See Doses, p. 563

**Levact\textsuperscript{®} (Napp)**

Injection, powder for reconstitution, bendamustine hydrochloride, net price 25-mg vial = £69.45; 100-mg vial = £275.81

**BUSULFAN** (Busulphan)

**Indications** see notes above

**Cautions** see section 8.1 and notes above; monitor cardiac and liver function; ineffective once in blast crisis phase; high dose or history of seizures—anti-epileptic prophylaxis required; previous radiation therapy, three or more cycles of chemotherapy, or previous progenitor cell transplant—increased risk of hepatic veno-occlusive disease; discontinue if lung toxicity develops; risk of second malignancy; avoid in ovarian cancer. Skin pigmentation is a common side-effect and allergic alveolitis, pulmonary fibrosis and haemorrhagic cystitis occur rarely.

**Thiotepa** is licensed in combination with other chemotherapy as conditioning treatment in adults and children with haematological disease or solid tumours before haematopoietic stem cell transplantation.

**Mitobronitol** is occasionally used to treat chronic myeloid leukaemia; it is available on a named-patient basis from specialist importing companies, see p. 1104.

### BENDAMUSTINE HYDROCHLORIDE

**Indications** see notes above

**Cautions** see section 8.1; cardiac disorders—monitor serum potassium and ECG; avoid in acute porphyria (but see section 9.8.2); interactions: see Appendix 1 (bendamustine).

**Contra-indications** jaundice; severe bone marrow suppression, low leucocyte or platelet count; major surgery less than 30 days before start of treatment

**Hepatic impairment** consider a 30% dose reduction in moderate impairment; avoid in severe impairment

**Renal impairment** no information available on use in patients with creatinine clearance less than 10 mL/minute

**Pregnancy** avoid (teratogenic and mutagenic in animal studies); effective contraception required during treatment in men or women, and for 6 months after treatment in men; see also Pregnancy and Reproductive function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1; also anorexia, diarrhoea, constipation, haemorrhage, hypotension, hypertension, palpitation, angina, arrhythmias, respiratory dysfunction, insomnia, pain, chills, malaise, infection, pyrexia, amenorrhoea, dehydration, electrolyte disturbances (including hypokalaemia); less commonly pericardial effusion; rarely acute circulatory failure, drowsiness, voice changes, sweating; very rarely taste disturbance, tachycardia, myocardial infarction, cardiac failure, pulmonary fibrosis, paraesthesia, peripheral neuropathy, neurological disorders, ataxia, anticholinergic syndrome, encephalitis, phlebitis, multiple organ failure, haemolysis; also reported secondary tumours, Stevens-Johnson syndrome, toxic epidermal necrolysis

**Dose**

- See Doses, p. 563

**Levact\textsuperscript{®} (Napp)**

Injection, powder for reconstitution, bendamustine hydrochloride, net price 25-mg vial = £69.45; 100-mg vial = £275.81

**BUSULFAN** (Busulphan)

**Indications** see notes above

**Cautions** see section 8.1 and notes above; monitor cardiac and liver function; ineffective once in blast crisis phase; high dose or history of seizures—anti-epileptic prophylaxis required; previous radiation therapy, three or more cycles of chemotherapy, or previous progenitor cell transplant—increased risk of hepatic veno-occlusive disease; discontinue if lung toxicity develops; risk of second malignancy; avoid in ovarian cancer. Skin pigmentation is a common side-effect and allergic alveolitis, pulmonary fibrosis and haemorrhagic cystitis occur rarely.

**Thiotepa** is licensed in combination with other chemotherapy as conditioning treatment in adults and children with haematological disease or solid tumours before haematopoietic stem cell transplantation.

**Mitobronitol** is occasionally used to treat chronic myeloid leukaemia; it is available on a named-patient basis from specialist importing companies, see p. 1104.
Conditioning treatment before haematopoietic stem-cell transplantation, by mouth; maintenance, usually 0.5–2 mg daily

Dose may need to be calculated based on body surface area or adjusted ideal body weight in obese patients—consult product literature

- Chronic myeloid leukaemia, induction of remission, by mouth, 60 micrograms/kg daily (max. 4 mg): maintenance, usually 0.5–2 mg daily
- Conditioning treatment before haematopoietic stem-cell transplantation, by mouth or by intravenous infusion, consult product literature

Myleran® (Alkopharma) Tablets, f/c, busulfan 2 mg, net price 25-tab pack = £65.22

Busilvex® (Fabre) Concentrate for intravenous infusion, busulfan 6 mg/mL, net price 10-mL vial = £201.25

CARMUSTINE

Indications see notes above

Cautions see section 8.1 and notes above; avoid in acute porphyria (but see section 9.8.2); interactions: Appendix 1 (carmustine)

Pregnancy avoid (teratogenic in animals); manufacturer advises effective contraception during treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above; also: carcinogenicity, embolism, myocardial infarction, oedema (rarely angioedema) impotence, gynaecomastia; altered liver function, altered endocrine function

Dose

- See Doses, p. 563

Gladel® (Archimedes) Implant, carmustine 7.7 mg, net price = £650.38

CHLORAMBUCIL

Indications see notes above

Cautions see section 8.1 and notes above; history of epilepsy and children with nephrotic syndrome (increased risk of seizures); avoid in acute porphyria (but see section 9.8.2)

Hepatic impairment manufacturer advises consider dose reduction in severe impairment—limited information available

Pregnancy avoid; manufacturer advises effective contraception during treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above

Dose

- See Doses, p. 563

Leukeran® (Alkopharma) Tablets, f/c, brown, chlorambucil 2 mg, net price 25-tab pack = £40.51

CYCLOPHOSPHAMIDE

Indications see notes above; rheumatoid arthritis (section 10.1.3)

Cautions see section 8.1 and notes above; previous or concurrent mediastinal irradiation—risk of cardiotoxicity; diabetes mellitus; avoid in acute porphyria (but see section 9.8.2); interactions: Appendix 1 (cyclophosphamide)

Contra-indications haemorrhagic cystitis

Hepatic impairment reduce dose—consult local treatment protocol for details

Renal impairment reduce dose if serum creatinine concentration greater than 120 micromol/litre

Pregnancy avoid (manufacturer advises effective contraception during and for at least 3 months after treatment in men or women); see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding during and for 36 hours after stopping treatment

Side-effects see section 8.1 and notes above; also: anorexia; pancreatitis; cardiotoxicity at high doses; interstitial pulmonary fibrosis; inappropriate secretion of anti-diuretic hormone; disturbances of carbohydrate metabolism; urothelial toxicity; pigmentation of palms, nails, and soles; rarely hepatotoxicity and renal dysfunction

Dose

- See Doses, p. 563

Cyclophosphamide (Non-proprietary) Tablets, s/c, cyclophosphamide (anhydrous) 50 mg, net price 100 = £70.70. Label: 25, 27

Injection, powder for reconstitution, cyclophosphamide, net price 500-mg vial = £9.20; 1-g vial = £17.06

ESTRAMUSTINE PHOSPHATE

Indications prostate cancer

Cautions see section 8.1; cerebrovascular or cardiovascular disease; diabetes; hypertension; hypercalcaemia; congestive heart failure, epilepsy, migraine or other conditions which might be aggravated by fluid retention; avoid in acute porphyria (but see section 9.8.2); interactions: Appendix 1 (estramustine)

Contra-indications peptic ulceration, severe cardiovascular disease, thrombembolic disorders

Hepatic impairment manufacturer advises caution and regular liver function tests; avoid in severe impairment

Renal impairment manufacturer advises caution

Pregnancy men should use effective contraceptive methods during treatment

Side-effects see section 8.1; also: diarrhea, congestive heart failure, ischaemic heart disease, myocardial infarction, oedema (rarely angioedema) impotence, gynaecomastia; altered liver function, altered endocrine function
Dose
- 0.14–1.4 g daily in divided doses (usual initial dose 560–840 mg daily)

Counselling Each dose should be taken not less than 1 hour before or 2 hours after meals and should not be taken with products containing calcium, magnesium or aluminium, including dairy products and antacid medication

 Estracyt® (Pharmacia) Capsules, estramustine phosphate 140 mg (as disodium salt), net price 100-cap pack = £171.28. Label: 5, 23, counselling, see above

**IFOSFAMIDE**

*Indications* see notes above

*Cautions* see section 8.1 and notes above; ensure satisfactory electrolyte balance and renal function before each course (risk of tubular dysfunction, Fanconi’s syndrome and diabetes insipidus if renal toxicity not treated promptly); diabetes mellitus; avoid in acute porphyria (but see section 9.8.2); *interactions*: Appendix 1 (ifosfamide)

*Contra-indications* urinary-tract obstruction; acute infection (including urinary-tract infection); urothelial damage

*Hepatic impairment* avoid

*Renal impairment* avoid if serum creatinine concentration greater than 120 micromol/litre

*Pregnancy* avoid (teratogenic and carcinogenic in animals); manufacturer advises adequate contraception during and for at least 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

*Breast-feeding* discontinue breast-feeding

*Side-effects* see section 8.1 and notes above

**LOMUSTINE**

*Indications* see notes above

*Cautions* see section 8.1 and notes above; avoid in acute porphyria (but see section 9.8.2); *interactions*: Appendix 1 (lomustine)

*Contra-indications* coeliac disease

*Renal impairment* avoid in severe impairment

*Pregnancy* avoid (manufacturer advises effective contraception during and for at least 6 months after treatment in men or women); see also Pregnancy and Reproductive Function, p. 564

*Breast-feeding* discontinue breast-feeding

*Side-effects* see section 8.1 and notes above

**MELPHALAN**

*Indications* see notes above

*Cautions* see section 8.1 and notes above; avoid in acute porphyria (but see section 9.8.2); *interactions*: Appendix 1 (melphalan)

*Renal impairment* reduce dose initially (consult product literature)

*Pregnancy* avoid (manufacturer advises adequate contraception during treatment in men or women); see also Pregnancy and Reproductive Function, p. 564

*Breast-feeding* discontinue breast-feeding

*Side-effects* see section 8.1 and notes above

**THIOTEPA**

*Indications* see notes above

*Cautions* see section 8.1; avoid in acute porphyria (but see section 9.8.2); *interactions*: Appendix 1 (thiotepa)

*Pregnancy* avoid (teratogenic and embryotoxic in animals); see also Pregnancy and Reproductive Function, p. 564

*Breast-feeding* discontinue breast-feeding

*Side-effects* see section 8.1

**TREOSULFAN**

*Indications* see notes above

*Cautions* see section 8.1; avoid in acute porphyria (but see section 9.8.2)

*Pregnancy* avoid; see also Pregnancy and Reproductive Function, p. 564

*Breast-feeding* discontinue breast-feeding

*Side-effects* see section 8.1 and notes above
8.1.2 Anthracyclines and other cytotoxic antibiotics

Drugs in this group are widely used. Many cytotoxic antibiotics act as radiomimetics and simultaneous use of radiotherapy should be avoided because it may markedly increase toxicity.

Daunorubicin, doxorubicin, epirubicin and idarubicin are anthracycline antibiotics. Mitoxantrone is an anthracine derivative.

Doxorubicin is used to treat the acute leukemias, Hodgkin’s and non-Hodgkin’s lymphomas, paediatric malignancies, and some solid tumours including breast cancer. It is given by injection into a fast-running infusion, commonly at 21-day intervals. Extravasation can cause severe tissue necrosis. Doxorubicin is largely excreted in the bile and an elevated bilirubin concentration is an indication for reducing the dose. Diarrhoea, dehydration, and red coloration of the urine can commonly occur, and renal damage has been reported. Supraventricular tachycardia related to drug administration is an uncommon complication. Higher cumulative doses are associated with cardiomyopathy and it is usual to limit total cumulative doses to 450 mg/m^2 because symptomatic and potentially fatal heart failure is common above this dose. Patients should be assessed before treatment by echocardiography; the elderly, and those with cardiac disease, hypertension, or who have received myocardial irradiation, should be treated cautiously. Cardiac monitoring may assist in determining safe dosage. Caution is necessary with concomitant use of cardotoxic drugs, or drugs that reduce cardiac contractility. Some evidence suggests that weekly low-dose administration may be less cardiotoxic. Doxorubicin is also given by bladder instillation for the treatment of transitional cell carcinoma, papillary bladder tumours and carcinoma in-situ.

Liposomal formulations of doxorubicin for intravenous use are also available. They may reduce the incidence of cardiotoxicity and lower the potential for local necrosis, but infusion reactions, sometimes severe, may occur. Hand-foot syndrome (painful, macular reddening skin erosion) occurs commonly with liposomal doxorubicin and may be dose limiting. It can occur after 2–3 treatment cycles and may be prevented by cooling hands and feet and avoiding socks, gloves, or tight-fitting footwear for 4–7 days after treatment.

Epirubicin is structurally related to doxorubicin and clinical trials suggest that it is as effective in the treatment of breast cancer. A maximum cumulative dose of 0.9–1 g/m^2 is recommended to help avoid cardiotoxicity. Like doxorubicin it is given intravenously and by bladder instillation. Hyperpigmentation of skin, nails, and oral mucosa, and red coloration of the urine, may occur.

Idarubicin has general properties similar to those of doxorubicin; it is mostly used in the treatment of haematological malignancies. Diarrhoea, abdominal pain, haemorrhage, cardiac disorders, rash, and red pigmentation of the urine are commonly reported. Skin and nail hyperpigmentation have been reported less frequently. Idarubicin is given intravenously and it may also be given by mouth.

Daunorubicin also has general properties similar to those of doxorubicin. It should be given by intravenous infusion and is indicated for acute leukemias. A liposomal formulation for intravenous use is licensed for advanced AIDS-related Kaposi’s sarcoma.

Mitoxantrone is structurally related to doxorubicin; it is used for metastatic breast cancer. Mitoxantrone is also licensed for treatment of non-Hodgkin’s lymphoma, adult acute non-lymphocytic leukaemia, and non-resectable primary hepatocellular carcinoma. It is given intravenously and is well tolerated, but myelosuppression and dose-related cardiotoxicity occur; cardiac examinations are recommended after a cumulative dose of 160 mg/m^2.

Pixantrone is licensed as monotherapy for the treatment of refractory or multiply relapsed aggressive non-Hodgkin B-cell lymphomas, although the benefits of using it as a fifth-line or greater chemotherapy in refractory patients has not been established. Baseline investigations should include a full blood count, assessment of cardiac function measured by left ventricular ejection fraction, and measurement of serum concentrations of total bilirubin and total creatinine. Severe myelosuppression is a common side-effect, and cardiotoxicity may occur during or following treatment; full blood count and cardiac function should be monitored throughout treatment. Patients with cardiac risk factors should have the risks and benefits of treatment carefully assessed. Photosensitivity is a theoretical risk and patients should be advised to follow sun protection strategies.

**NICE guidance**

Pixantrone monotherapy for treating multiply relapsed or refractory aggressive non-Hodgkin’s B-cell lymphoma (February 2014)

Pixantrone monotherapy is recommended as an option for treating adults with multiply relapsed or refractory aggressive non-Hodgkin’s B-cell lymphoma in patients:

- who have previously been treated with rituximab and
- who are receiving third- or fourth-line treatment and
- if the manufacturer provides pixantrone with the discount agreed in the patient access scheme

See p. 594

Bleomycin is given intravenously or intramuscularly to treat metastatic germ cell cancer and, in some regimens, via breast biopsy and systemic chemotherapy.
non-Hodgkin’s lymphoma. It causes little bone-marrow suppression but dermatological toxicity is common and increased pigmentation particularly affecting the flexures and subcutaneous sclerotic plaques may occur. Mucositis is also relatively common and an association with Raynaud’s phenomenon is reported. Hypersensitivity reactions manifest by chills and fevers commonly occur a few hours after drug administration and may be prevented by simultaneous administration of a corticosteroid, for example hydrocortisone intravenously. The principal problem associated with the use of bleomycin is progressive pulmonary fibrosis. This is dose-related, occurring more commonly at cumulative doses greater than 300 000 units (see Bleomycin, below) and in the elderly. Basal lung crepitations or suspicious chest X-ray changes are an indication to stop therapy with this drug. Patients who have received extensive treatment with bleomycin (e.g. cumulative dose more than 100 000 units—see Bleomycin, below) may be at risk of developing respiratory failure if a general anaesthetic is given with high inspired oxygen concentrations. Anaesthetists should be warned of this.

Dactinomycin is principally used to treat paediatric cancers; it is given intravenously. Its side-effects are similar to those of doxorubicin, except that cardiac toxicity is not a problem.

Mitomycin is given intravenously to treat upper gastrointestinal and breast cancers and by bladder instillation for superficial bladder tumours. It causes delayed bone-marrow toxicity and therefore it is usually administered at 6-weekly intervals. Prolonged use may result in permanent bone-marrow damage. It may also cause lung fibrosis and renal damage.

**BLEOMYCIN**

**Indications** squamous cell carcinoma; see also notes above

**Cautions** see section 8.1 and notes above; caution in handling—irritant to tissues; cardiac monitoring essential

**Renal impairment** reduce dose by half if serum-creatinine 177–354 micromol/litre; reduce dose further if serum-creatinine greater than 354 micromol/litre

**Pregnancy** avoid (teratogenic in animal studies); see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Dose**

- See Doses, p. 563

**Bleomycin (Non-proprietary) (HY)

Injection, powder for reconstitution, bleomycin (as sulphate), net price 15 000-unit vial = £15.56

Note To conform to the European Pharmacopoeia vials previously labelled as containing ‘15 units’ of bleomycin are now labelled as containing 15 000 units. The amount of bleomycin in the vial has not changed. Brands include Bleo-Kyowa®

**DACTINOMYCIN** (Actinomycin D)

**Indications** see notes above

**Cautions** see section 8.1 and notes above; caution in handling—irritant to tissues

**Pregnancy** avoid (teratogenic in animal studies); see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Dose**

- See Doses, p. 563

**Dactinomycin (Non-proprietary) (HY)

Injection, powder for reconstitution, dactinomycin (as hydrochloride), net price 20-mg vial = £55.00

Note The brand name Cerubin® was formerly used.

**Lipid formulation**

DaunoXome® (Galien) (HY)

Concentrate for intravenous infusion, daunorubicin encapsulated in liposomes. For dilution before use, net price 50-mg vial = £131.75

For advanced AIDS-related Kaposi’s sarcoma

**DOXORUBICIN HYDROCHLORIDE**

**Indications** see notes above and section 7.4.4

**Cautions** see section 8.1 and notes above; caution in handling—irritant to tissues; interactions: Appendix 1 (doxorubicin)

**Contra-indications** see notes above; severe myocardial insufficiency, recent myocardial infarction, severe arrhythmia; previous treatment with maximum cumulative doses of doxorubicin or other anthracycline

**Hepatic impairment** reduce dose according to serum bilirubin concentration—consult local protocol for details; avoid in severe impairment

**Renal impairment** reduce dose by 25% if serum creatinine 105–265 micromol/litre and by 50% if serum creatinine greater than 265 micromol/litre; avoid in severe impairment

**Pregnancy** avoid (teratogenic and carcinogenic in animal studies); see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Dose**

- See Doses, p. 563

**Daunorubicin (Non-proprietary) (HY)

Injection, powder for reconstitution, daunorubicin (as hydrochloride), net price 20-mg vial = £55.00

Note The brand name Cerubin® was formerly used.

**Lipid formulation**

DaunoXome® (Galien) (HY)

Concentrate for intravenous infusion, daunorubicin encapsulated in liposomes. For dilution before use, net price 50-mg vial = £131.75

For advanced AIDS-related Kaposi’s sarcoma

**DOXORUBICIN HYDROCHLORIDE**

**Indications** see notes above and section 7.4.4

**Cautions** see section 8.1 and notes above; caution in handling—irritant to tissues; interactions: Appendix 1 (doxorubicin)

**Contra-indications** see notes above; severe myocardial insufficiency, recent myocardial infarction, severe arrhythmia; previous treatment with maximum cumulative doses of doxorubicin or other anthracycline; intravesical use in urinary tract infections, bladder inflammation, and in urethral stenosis with catheterisation difficulties

**Hepatic impairment** reduce dose according to bilirubin concentration; avoid in severe impairment

**Pregnancy** avoid (teratogenic and toxic in animal studies); manufacturer of liposomal product advises effective contraception during and for at least 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 564
Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above

Dose
- See Doses, p. 563

Doxorubicin (Non-proprietary) \( ^{®} \)
- Injection, powder for reconstitution, doxorubicin hydrochloride, net price 10-mg vial = £18.72; 50-mg vial = £100.12
- Injection, doxorubicin hydrochloride 2 mg/mL, net price 5-mL vial = £18.54, 25-mL vial = £92.70, 100-ml vial = £370.80

Lipid formulation

Caelyx\(^{®}\) (Janssen) \( ^{®} \)
- Concentrate for intravenous infusion, pegylated doxorubicin hydrochloride 2 mg/mL encapsulated in liposomes. For dilution before use, net price 10-mL vial = £360.23, 25-mL vial = £712.49
- For AIDS-related Kaposi’s sarcoma in patients with low CD4 count and extensive mucocutaneous or visceral disease, for advanced ovarian cancer when platinum-based chemotherapy has failed, for progressive multiple myeloma (in combination with bortezomib) in patients who have received at least one prior therapy and who have undergone or are unsuitable for bone-marrow transplantation, and as monotherapy for metastatic breast cancer in patients with increased cardiac risk

Myocet\(^{®}\) (TEVA UK) \( ^{®} \)
- Injection, powder for reconstitution, doxorubicin hydrochloride (as doxorubicin–citrate complex) encapsulated in liposomes, net price 50-mg vial (with vials of liposomes and buffer) = £456.13
- Electrolytes Contains approx. 4.7 mmol Na+/vial
- For use with cyclophosphamide for metastatic breast cancer

Pharmorubicin\(^{®}\) Solution for Injection \( ^{®} \)
- Injection, epirubicin hydrochloride 2 mg/mL, net price 5-mL vial = £21.24, 25-mL vial = £106.19, 100-mL vial = £386.16

IDARUBICIN HYDROCHLORIDE

Indications acute leukaemias (see notes above); advanced breast cancer after failure of first-line chemotherapy (not including anthracyclines)

Cautions see section 8.1 and notes above; caution in handling—irritant to tissues; interactions: Appendix 1 (idarubicin)

Contra-indications severe myocardial insufficiency; recent myocardial infarction; severe arrhythmias; previous treatment with maximum cumulative dose of idarubicin or other anthracycline

Hepatic impairment reduce dose according to bilirubin concentration; avoid in severe impairment

Renal impairment reduce dose; avoid in severe impairment

Pregnancy avoid (teratogenic and toxic in animal studies); see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above

Dose
- By mouth, acute non-lymphocytic leukaemia, monotherapy, 30 mg/m² daily for 3 days or in combination therapy, 15–30 mg/m² daily for 3 days
- Advanced breast cancer, monotherapy, 45 mg/m² as a single dose or 15 mg/m² daily for 3 consecutive days; repeat every 3–4 weeks
- Note Max, cumulative dose by mouth (for all indications) 400 mg/m²
- By intravenous administration, consult product literature

Zavedos\(^{®}\) (Pharmacia) \( ^{®} \)
- Capsules, idarubicin hydrochloride, 5 mg (red), net price 1-cap pack = £41.47; 10 mg (red/white), 1-cap pack = £69.12. Label: 25
- Injection, powder for reconstitution, idarubicin hydrochloride, net price 5-mg vial = £87.36; 10-mg vial = £174.72

MITOMYCIN

Indications see notes above and section 7.4.4

Cautions see section 8.1 and notes above; caution in handling—irritant to tissues

Pregnancy avoid (teratogenic in animal studies); see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above

Dose
- See Doses, p. 563

Mitomycin C Kyowa\(^{®}\) (ProStrakan) \( ^{®} \)
- Injection, powder for reconstitution, mitomycin, net price 2-mg vial = £5.88; 10-mg vial = £21.37; 20-mg vial = £39.94; 40-mg vial = £79.88 (hosp. only)
**Malignant disease and immunosuppression**

**MITOXANTRONE**
(Mitozantrone)

**Indications** see notes above

**Cautions** see section 8.1 and notes above; intrathecal administration not recommended; **interactions**: Appendix 1 (mitoxantrone)

**Hepatic impairment** use with caution—consult local treatment protocol

**Pregnancy** avoid; manufacturer advises effective contraception during and for at least 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above, anorexia, diarrhoea, abdominal pain, gastro-intestinal bleeding, constipation, dyspnoea, drowsiness, confusion, paraesthesia, anxiety, amenorrhoea, and transient blue-green discoloration of urine and blue discolouration of skin and nails also reported

**Dose**
- See Doses, p. 563

**Mitoxantrone (Non-proprietary)**

Concentrate for intravenous infusion, mitoxantrone (as hydrochloride) 2 mg/mL, net price 10-mL vial = £100.00

Onkotrone® (Baxter) (93B)

Concentrate for intravenous infusion, mitoxantrone (as hydrochloride) 2 mg/mL, net price 10-mL vial = £121.85, 12.5-mL vial = £152.33, 15-mL vial = £203.04

**PIXANTRONE**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; history of, or active cardiovascular disease, previous therapy with anthracyclines or anthracenediones, previous or concurrent radiotherapy to the mediastinal area, or concurrent use of cardiotoxic drugs—increased risk of cardiotoxicity; **interactions**: Appendix 1 (pixantrone)

**Contra-indications** immunisation with live virus vaccines; active severe infection or risk factors for severe infection

**Hepatic impairment** no information available—manufacturer advises caution in mild to moderate impairment; avoid in severe impairment

**Renal impairment** no information available—manufacturer advises caution

**Pregnancy** manufacturer advises avoid—toxicity in animal studies; ensure effective contraception during and for at least 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** see section 8.1 and notes above; loss of appetite, weight loss, taste disturbances, diarrhoea, constipation, abdominal pain, dyspepsia, dry mouth, abnormal liver function tests, cardiac toxicity and disorders, tachycardia, hypotension, pallor, vein discoloration, oedema, dyspnoea, cough, drowsiness, malaise, headache, paraesthesia, infection, pyrexia, biochemical and electrolyte disturbances, chroma-
turia, proteinuria, haematuria, bone pain, conjunctivitis, skin discoloration, pruritus, nail disorder; less commonly oesophagitis, rectal haemorrhage, arrhythmia, vein disorder, pleural effusion, pneumonitis, rhinorrhoea, anxiety, sleep disorder, dizziness, vertigo, spontaneous erection, tumour progression, oliguria, arthralgia, arthritis, musculoskeletal pain and weakness, dry eye, keratitis, night sweats, petechiae, skin ulcer, rash

**Dose**
- See Doses, p. 563

Pixuvri® (CTI) ▼ P93B

Injection, powder for reconstitution, pixantrone (as dimaleate), net price 29-mg vial = £553.50

**Electrolytes** Na⁺ 1.70 mmol/vial

**8.1.3 Antimetabolites**

Antimetabolites are incorporated into new nuclear material or combine irreversibly with cellular enzymes, preventing normal cellular division.

**Methotrexate** inhibits the enzyme dihydrofolate reductase, essential for the synthesis of purines and pyrimidines. It is given by mouth, intravenously, intramuscularly, or intrathecally. Methotrexate is used as maintenance therapy for childhood acute lymphoblastic leukaemia. Other uses include choriocarcinoma, non-Hodgkin’s lymphoma, and a number of solid tumours. Intrathecal methotrexate is used in the CNS prophylaxis of childhood acute lymphoblastic leukaemia, and as a therapy for established meningeal cancer or lymphoma. Methotrexate causes myelosuppression, mucositis, and rarely pneumonitis. It is contra-indicated in significant renal impairment because it is excreted primarily by the kidney. It is also contra-indicated in patients with severe hepatic impairment. It should also be avoided in the presence of significant pleural effusion or ascites because it can accumulate in these fluids, and its subsequent return to the circulation may cause myelosuppression. Systemic toxicity may follow intrathecal administration and blood counts should be carefully monitored.

Folinic acid (section 8.1) following methotrexate administration helps to prevent methotrexate-induced mucositis or myelosuppression.

**Capecitabine**, which is metabolised to fluorouracil, is given by mouth. It is licensed as monotherapy or combination therapy for adjuvant treatment of advanced colon cancer following surgery, for monotherapy or combination therapy of metastatic colorectal cancer, and for first-line treatment of advanced gastric cancer in combination with a platinum-based regimen. Capecitabine is also licensed for second-line treatment of locally advanced or metastatic breast cancer either in combination with docetaxel (where previous therapy included an anthracycline) or alone (after failure of a taxane and anthracycine regimen or where further anthracycine treatment is not indicated). For the role of capecitabine in the treatment of breast cancer, see section 8.3.4.1.
Cytarabine acts by interfering with pyrimidine synthesis. It is given subcutaneously, intravenously, or intrathecally. Its predominant use is in the induction of remission of acute myeloblastic leukaemia. It is a potent myelosuppressant and requires careful haematological monitoring. A liposomal formulation of cytarabine for intrathecal use is licensed for lymphomatous meningitis.

Fludarabine is licensed for the initial treatment of advanced B-cell chronic lymphocytic leukaemia (CLL) or after first-line treatment in patients with sufficient bone-marrow reserves; it is usually given by mouth, but can be given by intravenous injection or infusion. Fludarabine is well tolerated but it does cause myelosuppression, which may be cumulative. Immunosuppression is also common (see panel on cladribine and fludarabine below), and co-trimoxazole is used to prevent pneumocystis infection. Immune-mediated haemolytic anaemia, thrombocytopenia, and neutropenia are less common side-effects.

The Scottish Medicines Consortium (p. 4) has advised that fludarabine is accepted for restricted use for the treatment of B-cell chronic lymphocytic leukaemia (CLL) in patients with sufficient bone marrow reserves. First-line treatment should only be initiated in patients with advanced disease, Rai stages III/IV (Binet stage C), or Rai stages I/II (Binet stage A/B) where the patient has disease-related symptoms or evidence of progressive disease.

NICE guidance

**Fludarabine for the treatment of B-cell chronic lymphocytic leukaemia (September 2001)**

Oral fludarabine is recommended for the second-line treatment of B-cell chronic lymphocytic leukaemia in patients who either failed, or are intolerant of, first-line chemotherapy, and who would otherwise have received combination chemotherapy of either:
- cyclophosphamide, doxorubicin, vincristine and prednisolone (CHOP)
- cyclophosphamide, doxorubicin and prednisolone (CAP)
- cyclophosphamide, vincristine and prednisolone (CVP)

Intravenous fludarabine should only be used when oral fludarabine is contra-indicated. www.nice.org.uk/TA29

**Fludarabine and fludarabine have a potent and prolonged immunosuppressive effect. Patients treated with cladribine or fludarabine are more prone to serious bacterial, opportunistic fungal, and viral infections, and prophylactic therapy is recommended in those at risk. To prevent potentially fatal transfusion-related graft-versus-host reaction, only irradiated blood products should be administered. Prescribers should consult specialist literature when using highly immunosuppressive drugs.**

Cladribine is given by intravenous infusion for the treatment of hairy cell leukaemia. It is also given for chronic lymphocytic leukaemia in patients who have failed to respond to standard regimens containing an alkylating agent. Cladribine produces severe myelosuppression, with neutropenia, anaemia, and thrombocytopenia; haemolytic anaemia has also been reported. High doses of cladribine have been associated with acute renal failure and severe neurotoxicity.

Ciofarabine is licensed for the treatment of acute lymphoblastic leukaemia in patients aged 1 to 21 years who have relapsed or are refractory after receiving at least two previous regimens. It is given by intravenous infusion.

Nelarabine is licensed for the treatment of T-cell acute lymphoblastic leukaemia and T-cell lymphoblastic lymphoma in patients who have relapsed or who are refractory after receiving at least two previous regimens. It is given by intravenous infusion. Neurotoxicity is common with nelarabine and close monitoring for neurological adverse events is strongly recommended—discontinue if neurotoxicity occurs.

The Scottish Medicines Consortium (p. 4) has advised that the use of nelarabine (Atriance®) within NHS Scotland is restricted to bridging treatment before stem cell transplantation.
Gemcitabine is used intravenously; it is given alone for elderly patients or for palliative treatment, or with cisplatin as first-line treatment for locally advanced or metastatic non-small cell lung cancer. It is also used in the treatment of locally advanced or metastatic pancreatic cancer (see NICE guidance below). Combined with cisplatin, gemcitabine is also licensed for the treatment of advanced bladder cancer. Combined with carboplatin, gemcitabine is licensed for the treatment of locally advanced or metastatic epithelial ovarian cancer which has relapsed after a recurrence-free interval of at least 6 months following previous platinum-based therapy. Combined with paclitaxel, gemcitabine is also licensed for the treatment of metastatic breast cancer which has relapsed after previous chemotherapy including an anthracycline (see NICE guidance below). Gemcitabine is generally well tolerated but it can cause mild gastro-intestinal side-effects, musculoskeletal pain, influenza-like symptoms and rashes; renal impairment and pulmonary toxicity have also been reported. Haemolytic uraemic syndrome has been reported rarely and gemcitabine should be discontinued if signs of microangiopathic haemolytic anaemia occur.

The Scottish Medicines Consortium has advised (November 2006) that gemcitabine is accepted for restricted use for the treatment of metastatic breast cancer, which has relapsed following previous chemotherapy including an anthracycline (unless contra-indicated).

**NICE guidance**

**Gemcitabine for the treatment of metastatic breast cancer (January 2007)**

Gemcitabine, in combination with paclitaxel, is an option for the treatment of metastatic breast cancer only when docetaxel monotherapy or docetaxel plus capecitabine are also considered appropriate.

www.nice.org.uk/TA116

Fluorouracil is used to treat a number of solid tumours, including gastro-intestinal tract cancers and breast cancer. It is commonly used with folic acid in advanced colorectal cancer. It may also be used topically for certain malignant and pre-malignant skin lesions. Toxicity is unusual, but may include myelosuppression, mucositis, and rarely a cerebellar syndrome. On prolonged infusion, a desquamative hand–foot syndrome may occur.

**NICE guidance**

**Gemcitabine for the treatment of pancreatic cancer (May 2001)**

Gemcitabine is an option for first-line chemotherapy for patients with advanced or metastatic adenocarcinoma of the pancreas and a Karnofsky score of at least 50 [Karnofsky score is a measure of the ability to perform ordinary tasks].

Gemcitabine is not recommended for patients who can have potentially curative surgery. There is insufficient evidence about its use for second-line treatment of pancreatic adenocarcinoma.

www.nice.org.uk/TA25

Pemetrexed inhibits thymidylate transferase and other folate-dependent enzymes. It is licensed for use with cisplatin for the treatment of unresectable malignant pleural mesothelioma which has not previously been treated with chemotherapy (see NICE guidance, below).

Pemetrexed is also licensed for use with cisplatin for the first-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology (see NICE guidance, below), and as monotherapy for its second-line treatment (but see NICE guidance, below). It is also licensed as monotherapy for maintenance treatment in locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology that has not progressed immediately following platinum-based chemotherapy (but see NICE guidance, below). Pemetrexed is given by intravenous infusion.

The Scottish Medicines Consortium (p. 4) has advised (July 2005) that pemetrexed (Alimta<sup>®</sup>) in combination with cisplatin is accepted for restricted use within NHS Scotland for previously untreated patients with stage III/IV unresectable malignant pleural mesothelioma.

The Scottish Medicines Consortium (p. 4) has advised (January 2010) that pemetrexed (Alimta<sup>®</sup>) is accepted for restricted use within NHS Scotland in combination with cisplatin for the first-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology; it is restricted to patients in whom the histology of the tumour has been confirmed as adenocarcinoma or large cell carcinoma.

The Scottish Medicines Consortium (p. 4) has advised (August 2008) that pemetrexed (Alimta<sup>®</sup>) is accepted for restricted use within NHS Scotland as monotherapy for the second-line treatment of locally advanced or metastatic non-small cell lung cancer without predominantly squamous cell histology; it is restricted for use in patients with good performance status who would otherwise be eligible for docetaxel treatment.

**NICE guidance**

**Pemetrexed for the treatment of malignant pleural mesothelioma (January 2008)**

Pemetrexed is an option for the treatment of malignant pleural mesothelioma only in patients who have a WHO performance status of 0 or 1 [WHO performance status is a measure of the ability to perform ordinary tasks], who are considered to have advanced disease and for whom surgical resection is considered inappropriate.

www.nice.org.uk/TA135
Mercaptopurine is used as maintenance therapy for the acute leukaemias and in the management of ulcerative colitis and Crohn’s disease (section 1.5.3). Azathioprine, which is metabolised to mercaptopurine, is generally used as an immunosuppressant (section 8.2.1 and section 10.1.3). The dose of both drugs should be reduced if the patient is receiving allopurinol since it interferes with their metabolism.

Raltitrexed, a thymidylate synthase inhibitor, is given intravenously for palliation of advanced colorectal cancer when fluorouracil and folinic acid cannot be used. It is probably of similar efficacy to fluorouracil. Raltitrexed is generally well tolerated, but can cause marked myelosuppression and gastrointestinal side-effects.

Tegafur is a prodrug of fluorouracil. Tegafur in combination with gimeracil and oteracil is licensed for the treatment of advanced gastric cancer when used in combination with cisplatin.

Tioguanine is given by mouth for the treatment of acute leukaemias and chronic myeloid leukaemia. It can be given at various stages of treatment in short-term cycles. Tioguanine has a lower incidence of gastrointestinal side-effects than mercaptopurine. Long-term therapy is no longer recommended because of the high risk of liver toxicity; treatment with tioguanine should be discontinued if liver toxicity develops.

Azacitidine is a pyrimidine analogue that is given by subcutaneous injection. It is used in the treatment of intermediate-2 and high-risk myelodysplastic syndromes, chronic myelomonocytic leukaemia, and acute myeloid leukaemia, in adults who are not eligible for haemotopoietic stem cell transplantation.

Decitabine is a pyrimidine analogue and is licensed for the treatment of newly diagnosed acute myeloid leukaemia in patients over 65 years who are not candidates for standard induction chemotherapy.

**AZACITIDINE**

**Indications** see notes above

**Cautions** see section 8.1; history of severe congestive heart failure, unstable cardiac or pulmonary disease—consider cardiopulmonary assessment before and during treatment; monitor for bleeding; monitor liver function tests, serum creatinine, and serum bicarbonate before initiation of treatment and before each treatment cycle; monitor full blood count before initiation of treatment, before each treatment cycle, and as clinically indicated

**Contra-indications** advanced malignant hepatic tumour

**Hepatic impairment** caution in severe impairment

**Renal impairment** delay next treatment cycle if serum-creatinine or blood urea nitrogen greater than twice baseline value and above the upper level of normal until values return to normal or baseline, and then reduce dose by 50% on the next treatment cycle. Reduce dose by 50% on the next treatment cycle if serum-bicarbonate concentration less than 20 mmol/litre

**Pregnancy** avoid (toxicity in animal studies); manufacturer advises effective contraception during and for 3 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 564
Malignant disease and immunosuppression

Breast-feeding  
Discontinue breast-feeding

Side-effects  
See section 8.1; also gastrointestinal disturbances (including diarrhea, constipation, abdominal pain, and dyspepsia), anorexia; hypertension, hypotension; dyspnoea, pneumonia; anxiety, insomnia, dizziness, headache, drowsiness; haematuria; hypokalaemia; arthralgia, myalgia; injection-site reactions, rash, haematoma; haemorrhage (including cerebral haemorrhage); less commonly hypersensitivity reactions (including anaphylactic reactions); hepatic coma, hepatic failure and renal failure also reported

Dose  
See Doses, p. 563

Vidaza® (Celgene)  
Injection, powder for reconstitution, azacitidine, net price 100-mg vial = £21.00

CAPECITABINE

Indications  
See notes above

Cautions  
See section 8.1; history of significant cardiovascular disease, arrhythmias, angina pectoris; monitor plasma-calcium concentration; diabetes mellitus; electrolyte disturbances; nervous system disease; monitor for symptoms of severe skin reactions (including Stevens-Johnson syndrome and toxic epidermal necrolysis)—permanently discontinue treatment immediately if symptoms occur; monitor for symptoms of hand-foot syndrome—interrupt treatment if significant syndrome occurs and refer to product literature; diarrhoea or dehydration—consult product literature for guidance on dose modification and treatment interruption; monitor for eye disorders (including keratitis and corneal disorders); interactions: Appendix 1 (fluorouracil)

Contra-indications  
dihydropyrimidine dehydrogenase deficiency

Hepatic impairment  
Manufacturer advises monitor liver function in mild to moderate impairment—consult product literature for guidance on treatment interruption; avoid in severe impairment

Renal impairment  
Reduce starting dose of 1.25 g/m² to 75% if creatinine clearance 30–50 mL/minute; avoid if creatinine clearance less than 30 mL/minute

Pregnancy  
Avoid (teratogenic in animal studies); see also Pregnancy and Reproductive Function, p. 564

Breast-feeding  
Discontinue breast-feeding

Side-effects  
See section 8.1; also see product literature

Dose  
Stage III colon cancer, adjuvant following surgery, monotherapy, ADULT over 18 years 1.25 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval; recommended duration of treatment 6 months

Stage III colon cancer, adjuvant following surgery, in combination therapy, ADULT over 18 years 0.8–1 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval; recommended duration of treatment 6 months

Metastatic colorectal cancer, monotherapy, ADULT over 18 years 1.25 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval

Metastatic colorectal cancer, in combination therapy, ADULT over 18 years 0.8–1 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval

Advanced gastric cancer, in combination with a platinum-based regimen, ADULT over 18 years 0.8–1 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval or 625 mg/m² twice daily given continuously

Locally advanced or metastatic breast cancer, monotherapy or in combination with docetaxel, ADULT over 18 years 1.25 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval

Note  
Adjust dose according to tolerability—consult product literature

Capecitabine  
(Non-proprietary)  
Tablets, capcitabine 150 mg, net price 60-tab pack = £30.00; 500 mg, 120-tab pack = £240.00. Label: 21

Xeloda® (Roche)  
Tablets, f/c, peach, capcitabine 150 mg, net price 60-tab pack = £40.02; 500 mg, 120-tab pack = £265.55. Label: 21

CLADRIBINE

Indications  
See notes above and under preparations

Cautions  
See section 8.1 and notes above; use irradiated blood only; interactions: Appendix 1 (cladribine)

Hepatic impairment  
Regular monitoring recommended

Renal impairment  
Regular monitoring recommended

Pregnancy  
Avoid (teratogenic in animal studies); manufacturer advises that men should not father children during and for 6 months after treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding  
Discontinue breast-feeding

Side-effects  
See section 8.1 and notes above; also constipation, diarrhoea, abdominal pain, flatulence, oedema, tachycardia; cough, dyspnoea; dizziness, insomnia, anxiety, headache; chills, asthenia, malaise; myalgia, arthralgia; sweating, rash, pruritus, and purpura

Dose  
See Doses, p. 563

Leustat® (Janssen)  
Concentrate for intravenous infusion, cladribine 1 mg/mL, net price 10-mL vial = £159.70

For hairy cell leukaemia and for B-cell chronic lymphocytic leukaemia in patients who have failed to respond to standard regimens containing an alkylating agent

Litak® (Lipomed)  
Injection (for subcutaneous use only—no dilution required), cladribine 2 mg/mL, net price 5-mL vial = £165.00

For hairy cell leukaemia

CLOFARABINE

Indications  
See notes above

Cautions  
See section 8.1 and notes above; cardiac disease

Hepatic impairment  
Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment

Renal impairment  
Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment
Pregnancy: manufacturer advises avoid (teratogenic in animal studies); see also Pregnancy and Reproductive Function, p. 564

Breast-feeding: discontinue breast-feeding

Side-effects: see section 8.1; also diarrhoea, abdominal pain, jaundice; tachycardia, flushing, hypotension, pericardial effusion, oedema, haematomy; dyspnoea, cough; anxiety, agitation, dizziness, drowsiness, headache, paraesthesia, peripheral neuropathy, restlessness; haematuria; arthralgia, myalgia; rash, pruritus, hand-foot (desquamative) syndrome, sweating; pancreatitis also reported

Dose
- See Doses, p. 563

Evoltra® (Sanofi-Aventis) ▼ (Patent)
Concentrate for intravenous infusion, clofarabine 1 mg/mL, net price 20-mL vial = £336.18
Electrolytes Na⁺ 3.68 mmol/vial

CYTARABINE

Indications: see notes above
Cautions: see section 8.1 and notes above; interactions: Appendix 1 (cytarabine)

Hepatic impairment: reduce dose—consult product literature

Pregnancy: avoid (teratogenic in animal studies); see also Pregnancy and Reproductive Function, p. 564

Breast-feeding: discontinue breast-feeding

Side-effects: see section 8.1 and notes above
Dose
- See Doses, p. 563

Cytarabine (Non-proprietary) (Patent)
Injection (for intravenous, subcutaneous, or intrathecal use), cytarabine 20 mg/mL, net price 5-mL vial = £3.90
Injection (for intravenous or subcutaneous use), cytarabine 20 mg/mL, net price 5-mL vial = £6.00, 5-mL vial = £20.00, 10-mL vial = £39.00, 20-mL vial = £77.50

Lipid formulation for intrathecal use

DepoCyte® (Napp) (Patent)
Intrathecal injection, cytarabine encapsulated in liposomes, net price 50-mg vial = £1223.75
For lymphomatous meningitis
Note: The Scottish Medicines Consortium (p. 4) has advised (July 2007) that liposomal cytarabine suspension (DepoCyt®) is not recommended for use within NHS Scotland for the intrathecal treatment of lymphomatous meningitis

DECITABINE

Indications: see notes above
Cautions: see section 8.1; history of severe congestive heart failure or unstable cardiac disease; interactions: Appendix 1 (decitabine)

Hepatic impairment: manufacturer advises caution—no information available

Renal impairment: manufacturer advises caution if creatinine clearance less than 30 mL/minute—no information available

Pregnancy: avoid (teratogenic in animal studies); ensure effective contraception during treatment; men must avoid fathering a child during and for 3 months after treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding: discontinue breast-feeding

Side-effects: see section 8.1; also diarrhoea, headache, epistaxis; less commonly acute febrile neutrophilic dermatosis

Dose
- See Doses, p. 563

Dacogen® (Janssen) ▼ (Patent)
Injection, powder for reconstitution, decitabine, net price 50-mg vial = £970.86
Electrolytes Na⁺ 0.29 mmol/vial, K⁺ 0.5 mmol/vial

FLUDARABINE PHOSPHATE

Indications: see notes above
Cautions: see section 8.1 and notes above; monitor for signs of haemolysis; monitor for neurological toxicity; worsening of existing and increased susceptibility to skin cancer; patients over 65 years—assess creatinine clearance before treatment initiation; interactions: Appendix 1 (fludarabine)

Contra-indications: haemolytic anaemia

Renal impairment: reduce dose by up to 50% if creatinine clearance 30–70 mL/minute; avoid if creatinine clearance less than 30 mL/minute

Pregnancy: avoid (embryotoxic and teratogenic in animal studies); manufacturer advises effective contraception during and for at least 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding: discontinue breast-feeding

Side-effects: see section 8.1 and notes above; also diarrhoea, anorexia, oedema, pneumonia, cough, peripheral neuropathy, chills, fever, malaise, weakness, myelodysplastic syndrome, acute myeloid leukaemia, visual disturbances, rash; less commonly pulmonary toxicity (including pneumonitis and fibrosis), confusion, haemorrhage, autoimmune disorder; rarely heart failure, arrhythmia, coma, seizures, agitation, skin cancer, optic neuropathy, blindness, Stevens-Johnson syndrome, toxic epidermal necrolysis; also reported haemorrhagic cystitis

Dose
- By mouth, ADULT 40 mg/m² for 5 days every 28 days usually for 6 cycles
- By intravenous injection or infusion, consult product literature

Fludarabine phosphate (Non-proprietary) (Patent)
Injection, powder for reconstitution, fludarabine phosphate, net price 50-mg vial = £155.00
Concentrate for intravenous injection or infusion, fludarabine phosphate 25 mg/mL, net price 2-mL vial = £155.00
Note: Must be diluted before administration (consult product literature)

Fludara® (Sanofi-Aventis) (Patent)
Tablets, f/c, pink, fludarabine phosphate 10 mg, net price 15-tab pack = £302.48, 20-tab pack = £403.31
Injection, powder for reconstitution, fludarabine phosphate, net price 50-mg vial = £147.07

FLUOROURACIL

Indications: see notes above; pre-malignant and malignant skin lesions (section 13.8.1)
Cautions: see section 8.1 and notes above; caution in handling—irritant to tissues; interactions: Appendix 1 (fluorouracil)
8.1.3 Antimetabolites

**Malignant disease and immunosuppression**

- **8 Malignant disease and immunosuppression**
  - **See preparations below**
  - **Dose**
    - By intravenous injection or infusion or by intra-arterial infusion, consult product literature

**Fluorouracil**

(Non-proprietary) **Gemcitabine**

A (Non-proprietary) **Fluorouracil**

By intravenous injection.

- **Indications**
  - See section 8.1 and notes above; thiopurine

- **Cautions**
  - Manufacture advises caution

- **Renal impairment**
  - Hepatic impairment

- **Breast-feeding**
  - Discontinue breast-feeding

- **Pregnancy**
  - Avoid (teratogenic); see also Pregnancy

- **Reduced dose**

- **Hepatic impairment**

- **Side-effects**
  - See section 8.1 and notes above; local irritation with topical preparation

**Gemcitabine**

(Non-proprietary) **Gemcitabine**

A (Non-proprietary) **Gemcitabine**

By intravenous injection.

- **Indications**
  - See notes above

- **Cautions**
  - See section 8.1 and notes above; interactions: Appendix 1 (gemcitabine)

- **Renal impairment**
  - Manufacture advises caution

- **Pregnancy**
  - Avoid (teratogenic in animal studies)

- **Reduced dose**

- **Hepatic impairment**

- **Breast-feeding**
  - Discontinue breast-feeding

- **Side-effects**
  - See section 8.1 and notes above

**Methotrexate**

(Non-proprietary) **Methotrexate**

**Puri-Nethol**

(Alkopharma) **Puri-Nethol**

**Xaluprine**

(Lilly) **Xaluprine**

- **Indications**
  - See notes above and under Dose; Crohn’s disease [unlicensed indication] (section 1.5.3); rheumatoid arthritis (section 10.1.3); psoriasis (section 13.5.3)

- **Cautions**
  - See section 8.1, notes above and section 10.1.3; interactions: Appendix 1 (methotrexate)

- **Renal impairment**
  - Reduce dose; risk of nephrotoxicity at high doses; avoid in severe impairment

- **Pregnancy**
  - Avoid (teratogenic; fertility may be reduced during therapy but this may be reversible); manufacturer advises effective contraception during and for at least 3 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

- **Breast-feeding**
  - Discontinue breast-feeding—present in milk

- **Side-effects**
  - See section 8.1, notes above and section 10.1.3

- **Dose**
  - By mouth, leukaemia in children (maintenance), 15 mg/m² weekly in combination with other drugs

**Nelarabine**

(Non-proprietary) **Nelarabine**

- **Indications**
  - See notes above

- **Cautions**
  - See section 8.1 and notes above; previous or concurrent intrathecal chemotherapy or craniospinal irradiation (increased risk of neurotoxicity)

- **Driving**
  - May affect performance of skilled tasks (e.g. driving)

- **Pregnancy**
  - Avoid (toxicity in animal studies); manufacturer advises effective contraception during and for at least 3 months after treatment in men and women; see also Pregnancy and Reproductive Function, p. 564

- **Breast-feeding**
  - Discontinue breast-feeding
8.1.3 Antimetabolites

**TEGAFUR WITH GIMERACIL AND OTERACIL**

**Indications** see notes above

**Dose**
- See Doses, p. 563

**Tomudex®** (Hospira) *(fluorouracil)*

Intravenous injection, powder for reconstitution, raltitrexed, net price 2-mg vial = £175.00

**Indications** see notes above

**Cautions** see section 8.1; interactions: Appendix 1 (fluorouracil)

**Contra-indications** dihydropyrimidine dehydrogenase deficiency

**Renal impairment** reduce dose if creatinine clearance 30–50 mL/minute—consult product literature; manufacturer advises avoid if creatinine clearance less than 30 mL/minute

**Pregnancy** avoid; manufacturer advises effective contraception during and for up to 6 months after treatment; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1; also ocular toxicity and neuropathy

**Dose**
- See Doses, p. 563

**Teysono®** (Nordic) *(fluorouracil)*

Capsules, tegafur 15 mg, gimeracil 4.35 mg, oteracil (as potassium salt) 11.8 mg, net price 84-cap pack = £279.72; Label: 23

Capsules, tegafur 20 mg, gimeracil 5.8 mg, oteracil (as potassium salt) 15.8 mg, net price 84-cap pack = £248.40; Label: 23

**Note** The Scottish Medicines Consortium (p. 4) has advised (August 2012) that tegafur with gimeracil and oteracil (Teysono®) is accepted for restricted use within NHS Scotland for the treatment of advanced gastric cancer, when given in combination with cisplatin, in patients who are unsuitable for an anthracycline, fluorouracil and platinum triplet first-line regimen.

**RALTITREXED**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; thiopurine metabolism and interactions: Appendix 1 (raltitrexed)

**Hepatic impairment** caution in mild to moderate impairment; avoid if severe

**Renal impairment** reduce dose if creatinine clearance less than 30 mL/minute—consult product literature; avoid if creatinine clearance less than 25 mL/minute

**Pregnancy** avoid; manufacturer advises effective contraception during treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1; also stomatitis and oral ulceration

**Dose**
- See Doses, p. 563

**Alimta®** *(Lilly)*

Injection, powder for reconstitution, pemetrexed (as disodium), net price 500-mg vial = £222.00

Electrolytes Na⁺ 3.75 mmol/vial

**PEMETREXED**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; history of cardiovascular disease; diabetes; prophylactic folic acid and vitamin B₁₂ supplementation required (consult product literature); concomitant nephrotoxic drugs including non-steroidal anti-inflammatory drugs (consult product literature); interactions: Appendix 1 (pemetrexed)

**Renal impairment** manufacturer advises avoid if creatinine clearance less than 45 mL/minute—no information available

**Pregnancy** avoid (toxicity in animal studies); manufacturer advises effective contraception during treatment; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1; also stomatitis and ocular toxicity

**Dose**
- See Doses, p. 563

**Atriance®** *(GSK)* *(fluorouracil)*

50-mL vial = £222.00

Intravenous infusion, nelaarabine 5 mg/mL, net price 50-mL vial = £222.00

Electrolytes Na⁺ 3.75 mmol/vial

**RALTITREXED**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; history of cardiovascular disease; diabetes; prophylactic folic acid and vitamin B₁₂ supplementation required (consult product literature); concomitant nephrotoxic drugs including non-steroidal anti-inflammatory drugs (consult product literature); interactions: Appendix 1 (raltitrexed)

**Hepatic impairment** caution in mild to moderate impairment; avoid if severe

**Renal impairment** reduce dose and increase dosing interval if creatinine clearance less than 65 mL/min-ute (consult product literature); avoid if creatinine clearance less than 25 mL/min-ute

**Pregnancy** pregnancy must be excluded before treatment; ensure effective contraception during and for at least 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1; also stomatitis and intestinal necrosis and perforation

**Dose**
- 100–200 mg/m² daily

**Lanvis®** *(Alkopharma)* *(fluorouracil)*

Tablets, yellow, scored, tioguanine 40 mg, net price 25-tab pack = £103.54
8.1.4 Vinca alkaloids and etoposide

The vinca alkaloids, vinblastine, vincristine, and vindesine, are used to treat a variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer). Vinorelbine is a semi-synthetic vinca alkaloid; it is given intravenously or orally for the treatment of advanced breast cancer and for advanced non-small cell lung cancer. For the role of vinorelbine in the treatment of breast cancer, see section 8.3.4.1. Vinflunine is licensed as monotherapy for the treatment of advanced or metastatic transitional cell carcinoma of the urothelial tract after failure of a platinum-containing regimen.

**NICE guidance**

Vinflunine for the treatment of advanced or metastatic transitional cell carcinoma of the urothelial tract (January 2013)

Vinflunine is not recommended for the treatment of advanced or metastatic transitional cell carcinoma of the urothelial tract that has progressed after treatment with platinum-based chemotherapy.

www.nice.org.uk/TA272

Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids and is a limiting side-effect of vincristine; it occurs less often with vindesine, vinblastine, vinorelbine, and vinflunine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; otoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced. Motor weakness can also occur, and increasing motor weakness calls for dose reduction or discontinuation of these drugs. Recovery from neurotoxic effects is usually slow but complete.

Myelosuppression is a dose-limiting side-effect of vinblastine, vindesine, vinorelbine, and vinflunine; vincristine causes negligible myelosuppression. The vinca alkaloids cause severe local irritation and care must be taken to avoid extravasation. Severe bronchospasm has been reported following administration of the vinca alkaloids (more commonly when used in combination with mitomycin-C).

### ETOPOSIDE

#### Indications

- see notes above

#### Cautions

- see section 8.1 and notes above; interactions: Appendix 1 (etoposide)

#### Contra-indications

- see section 8.1 and notes above

#### Hepatic impairment

- avoid in severe impairment

#### Renal impairment

- consider dose reduction—consult local treatment protocol for details

#### Pregnancy

- avoid (teratogenic in animal studies); see also NICE and Reproductive Function, p. 564

#### Breast-feeding

- discontinue breast-feeding

#### Side-effects

- see section 8.1; irritant to tissues

- **Dose**
  - By mouth, 120–240 mg/m² daily for 5 days
  - By intravenous infusion, consult product literature

- **Etoposide** (Non-proprietary)

  **Concentrate for intravenous infusion**, etoposide 20 mg/mL, net price 5-mL vial = £12.15, 10-mL vial = £29.00, 25-mL vial = £60.75

  **Brands include** Eposin®

  **Etopophos®** (Bristol-Myers Squibb)

  **Injection**, powder for reconstitution, etoposide (as phosphate), net price 100-mg vial = £26.17 (hosp. only)

  **Vepesid®** (Bristol-Myers Squibb)

  **Capsules**, both pink, etoposide 50 mg, net price 20 = £99.82, 100 mg, 10-cap pack = £87.23 (hosp. only), Label: 23

### VINBLASTINE SULFATE

#### Indications

- see notes above

#### Cautions

- see section 8.1 and notes above; caution in handling; interactions: Appendix 1 (vinblastine)

#### Contra-indications

- see section 8.1 and notes above

#### Important

Intrathecal injection contra-indicated

#### Hepatic impairment

- dose reduction may be necessary

#### Pregnancy

- avoid (limited experience suggests fetal harm; teratogenic in animal studies); see also Pregnancy and Reproductive Function, p. 564

#### Breast-feeding

- discontinue breast-feeding

#### Side-effects

- see section 8.1 and notes above; irritant to tissues

- **Dose**
  - See Doses, p. 563

#### Vinblastine (Non-proprietary)

**Injection**, vinblastine sulfate 1 mg/mL, net price 10-mL vial = £13.09

**Velbe® (Genus)**

**Injection**, powder for reconstitution, vinblastine sulfate, net price 10-mg amp = £14.15

### VINCRISTINE SULFATE

#### Indications

- see notes above

#### Cautions

- see section 8.1 and notes above; neuromuscular disease; caution in handling; interactions: Appendix 1 (vincristine)

#### Contra-indications

- see section 8.1 and notes above

#### Important

Intrathecal injection contra-indicated

in small cell carcinoma of the bronchus, the lymphomas, and testicular cancer.
**Side-effects** see section 8.1 and notes above; also rarely inappropriate secretion of antidiuretic hormone; diarrhoea, intestinal necrosis, paralytic ileus, seizures, urinary retention, muscle wasting, and eye disorders also reported; irritant to tissues

**Dose**
- See Doses, p. 563

**Vincristine (Non-proprietary)**

**Injection**, vincristine sulfate 1 mg/mL, net price 1-mL vial = £10.92; 2-mL vial = £21.17; 5-mL vial = £44.16

**Oncovin** (Genus)

**Injection**, vincristine sulfate 1 mg/mL, net price 1-mL vial = £14.18; 2-mL vial = £28.05

**VINDESINE SULFATE**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; neuro-muscular disease; see handling; **interactions**: Appendix 1 (vineside)

**Contra-indications** see section 8.1 and notes above

**Hepatic impairment** dose reduction may be necessary

**Pregnancy** avoid (teratogenic in animal studies); see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; irritant to tissues

**Dose**
- See Doses, p. 563

**Eldisine** (Genus)

**Injection**, powder for reconstitution, vineside sulfate, net price 5-mg vial = £78.30 (hosp. only)

**VINFLUNINE**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; cardiovascular disease; QT-interval prolongation (avoid hypokalaemia or concomitant use of drugs that prolong QT-interval); **interactions**: Appendix 1 (vinflunine)

**Contra-indications** see notes above

**Hepatic impairment** reduce dose—consult product literature

**Pregnancy** avoid unless essential—teratogenicity in animal studies; manufacturer advises effective contraception during and for up to 6 months after treatment; men must avoid fathering a child during treatment and for at least 3 months after treatment; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; also anorexia, diarrhoea, dyspepsia; tachycardia, hypertension, hypotension, thrombosis; oedema; insomnia; fatigue; dehydration; cutaneous reactions, sweating; less commonly increased weight, myocardial infarction, renal failure; also reported QT-interval prolongation, inappropriate anti-diuretic hormone secretion, blurred vision

**Dose**
- See Doses, p. 563

**Javoid** (Fabre)

Concentrate for intravenous infusion, vinflunine (as ditratrate) 25 mg/mL, net price 2-mL vial = £122.50, 10-mL vial = £1062.50

**VINORELBINE**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; ischaemic heart disease; see handling; **interactions**: Appendix 1 (vinorelbine)

**Contra-indications** see section 8.1 and notes above; with capsules previous significant surgical resection of stomach or small bowel, long-term oxygen therapy, concurrent radiotherapy if treating the liver

**Hepatic impairment** reduce oral dose in moderate impairment, avoid oral use in severe impairment; reduce intravenous dose in severe impairment; consult product literature

**Pregnancy** avoid unless essential (teratogenicity, and fetal loss in animal studies); manufacturer advises effective contraception during and for 3 months after treatment; men must avoid fathering a child during treatment and for at least 3 months after treatment; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; also rarely pancreatitis; hyponatraemia and inappropriate secretion of antidiuretic hormone also reported; irritant to tissues

**Dose**
- **By mouth**, 60 mg/m² once weekly for 3 weeks, increased if tolerated to 80 mg/m² once weekly; max. 160 mg once weekly
- **By intravenous injection or infusion**, consult product literature

**Vinorelbine** (Non-proprietary)

Concentrate for intravenous infusion, vinorelbine (as tartrate) 10 mg/mL, net price 1-mL vial = £29.00, 5-mL vial = £139.00

**Navelbine** (Fabre)

Concentrate for intravenous infusion, vinorelbine (as tartrate) 10 mg/mL, net price 1-mL vial = £29.75; 5-mL vial = £139.98

Capsules, vinorelbine (as tartrate) 20 mg (brown), net price 1-cap pack = £43.98; 30 mg (pink), 1-cap pack = £65.98; 80 mg (yellow), 1-cap pack = £175.92. Label: 21, 25

**8.1.5 Other antineoplastic drugs**

**Afibercept**

Afibercept is a recombinant fusion protein that acts as a soluble decoy receptor and binds to vascular endothelial growth factors A and B (VEGF-A, VEGF-B) and placental growth factor (PIGF). Afibercept inhibits the activation of VEGF receptors and the proliferation of endothelial cells, thereby inhibiting the growth of new vessels.
that supply tumours with oxygen and nutrients. It is licensed in combination with irinotecan, fluorouracil and folinic acid (FOLFIRI) chemotherapy, in adults with metastatic colorectal cancer that is resistant to, or has progressed after, an oxaliplatin-containing regimen. An intravitreal preparation is available for the treatment of neovascular age-related macular degeneration, see section 11.8.2.

NICE guidance
Aflibercept in combination with irinotecan and fluorouracil-based therapy for treating metastatic colorectal cancer that has progressed following prior oxaliplatin-based chemotherapy (March 2014)
Aflibercept in combination with irinotecan and fluorouracil-based therapy is not recommended within its marketing authorisation for treating metastatic colorectal cancer that is resistant to or has progressed after an oxaliplatin-containing regimen.

www.nice.org.uk/TA307

Arsenic trioxide
Arsenic trioxide is licensed for acute promyelocytic leukaemia in patients who have relapsed or failed to respond to previous treatment with a retinoid and chemotherapy.

Side-effects diarrhea, stomatitis, abdominal pain, decreased appetite, weight loss, fistula, aphthous stomatitis, haemorrhoids, proctalgia, toothache, hypertension, haemorrhage (including nasal, rectal and gastro-intestinal), thromboembolic events (arterial and venous), dyspnoea, opharyngeal pain, rhinorrhoea, nasopharyngitis, dysphonia, headache, malaise, infection, sepsis, urinary tract infection, leucopenia, neutropenia (including febrile neutropenia), thrombocytopenia, dehydration, proteinuria, hand-foot syndrome, skin hyperpigmentation; less commonly gastrointestinal perforation, posterior reversible encephalopathy syndrome, nephrotic syndrome, thrombotic microangiopathy, impaired wound healing

Dose
- See Doses, p. 563

Zaltrap® (Sanofi-Aventis) ▼ (FR)
Concentrate for intravenous infusion, aflibercept 25 mg/mL, net price 4-mL (100-mg) vial = £295.65, 8-mL (200-mg) vial = £591.30
**Bevacizumab**

**Bevacizumab** is a monoclonal antibody that inhibits vascular endothelial growth factor. It is licensed for the treatment of metastatic colorectal cancer in combination with fluoropyrimidine-based chemotherapy (but see NICE guidance below). It is also licensed for first-line treatment of metastatic breast cancer in combination with paclitaxel, or with capecitabine when treatment with other chemotherapy, including taxanes or anthracyclines is not appropriate; patients who have received adjuvant taxane or anthracycline-containing regimens in the previous 12 months should not be treated with bevacizumab in combination with capecitabine. Bevacizumab is also licensed for advanced or metastatic renal cell carcinoma in combination with interferon alfa-2a (but see NICE Guidance, p. 599). Bevacizumab, in combination with platinum-based chemotherapy, is licensed for first-line treatment of unsectable advanced, metastatic or recurrent non-small cell lung cancer other than predominantly squamous cell histology. It is also licensed, in combination with carboplatin and paclitaxel, for the first-line treatment of advanced (FIGO stages IIIB, IIIC and IV) epithelial ovarian, fallopian tube, or primary peritoneal cancer and, in combination with carboplatin and gemcitabine, for first recurrence of platinum-sensitive epithelial ovarian, fallopian tube, or primary peritoneal cancer in patients who have not been treated previously with bevacizumab or other drugs that target vascular endothelial growth factor. Bevacizumab is given by intravenous infusion.

**MHRA/CHM advice**

**Bevacizumab and sunitinib: risk of osteonecrosis of the jaw (January 2011)**

Treatment with bevacizumab or sunitinib may be a risk factor for the development of osteonecrosis of the jaw.

Patients treated with bevacizumab or sunitinib, who have previously received bisphosphonates, or are treated concurrently with bisphosphonates, may be particularly at risk.

Dental examination and appropriate preventive dentistry should be considered before treatment with bevacizumab or sunitinib.

If possible, invasive dental procedures should be avoided in patients treated with bevacizumab or sunitinib who have previously received, or who are currently receiving, intravenous bisphosphonates.

The Scottish Medicines Consortium (p. 4) has advised (April 2012) that bevacizumab (Avastin®) is not recommended for use within NHS Scotland for the first-line treatment of patients with metastatic breast cancer in whom treatment with other chemotherapy options including taxanes or anthracyclines is not considered appropriate, or (September 2012), in combination with carboplatin and paclitaxel, for the first-line treatment of advanced (FIGO stages IIIB, IIIC and IV) epithelial ovarian, fallopian tube, or primary peritoneal cancer.

**NICE guidance**

**Bevacizumab in combination with cetuximab for the treatment of metastatic colorectal cancer (January 2007)**

Bevacizumab in combination with fluorouracil plus folinic acid, with or without irinotecan, is not recommended for the first-line treatment of metastatic colorectal cancer; see also NICE guidance Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy, p. 589.

[www.nice.org.uk/TA218](www.nice.org.uk/TA218)

**NICE guidance**

**Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine for the treatment of metastatic colorectal cancer (December 2010)**

Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine is not recommended for the treatment of metastatic colorectal cancer.

[www.nice.org.uk/TA212](www.nice.org.uk/TA212)

**NICE guidance**

**Bevacizumab in combination with a taxane for the first-line treatment of metastatic breast cancer (February 2011)**

Bevacizumab in combination with a taxane is not recommended for the first-line treatment of metastatic breast cancer.

[www.nice.org.uk/TA214](www.nice.org.uk/TA214)

**NICE guidance**

**Bevacizumab in combination with capecitabine for the first-line treatment of metastatic breast cancer (August 2012)**

Bevacizumab in combinations with capecitabine is not recommended within its marketing authorisation for the first-line treatment of metastatic breast cancer, that is, when treatment with other chemotherapy options including taxanes or anthracyclines is not considered appropriate, or when taxanes or anthracyclines have been used as part of adjuvant treatment in the previous 12 months.

[www.nice.org.uk/TA263](www.nice.org.uk/TA263)

**NICE guidance**

**Bevacizumab in combination with paclitaxel and carboplatin for the first-line treatment of advanced ovarian cancer (May 2013)**

Bevacizumab in combination with paclitaxel and carboplatin is not recommended for the first-line treatment of advanced ovarian cancer (including fallopian tube and primary peritoneal cancer).

[www.nice.org.uk/TA284](www.nice.org.uk/TA284)
BEVACIZUMAB

Indications  see notes above

Cautions  see section 8.1; intra-abdominal inflammation (risk of gastro-intestinal perforation and gall bladder perforation); increased risk of fistulas (discontinue permanently if tracheo-oesophageal or grade 4 fistula develops); withhold treatment for elective surgery and avoid for at least 28 days after major surgery or until wound fully healed; monitor for necrotising fasciitis (usually secondary to wound healing complications, gastro-intestinal perforation or fistula formation)—discontinue and initiate treatment promptly; history of hypertension (increased risk of proteinuria—discontinue if nephrotic syndrome); uncontrolled hypertension; monitor blood pressure; history of arterial thromboembolism; history of cardiovascular disease (increased risk of cardiovascular events especially in the elderly): monitor for congestive heart failure; increased risk of haemorrhage (especially tumour-associated haemorrhage); monitor for posterior reversible encephalopathy syndrome (presenting as seizures, headache, altered mental status, visual disturbance or cortical blindness, with or without hypertension); untreated CNS metastases; consider dental check-up before initiating treatment (risk of osteonecrosis of the jaw, see MHRA/CHM advice, above); interactions: Appendix 1 (bevacizumab)

Pregnancy  avoid—toxicity in animal studies; effective contraception required during and for at least 6 months after treatment in women; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding  manufacturer advises avoid breast-feeding during and for at least 6 months after treatment

Side-effects  see section 8.1; gastro-intestinal perforation, gall bladder perforation, intestinal obstruction, abdominal pain, diarrhoea, constipation, taste disturbances; mucocutaneous bleeding, haemorrhage, hypoxia, arterial thromboembolism, congestive heart failure, syncope, supraventricular tachycardia, hypertension (see also Cautions); dyspnoea, rhinitis; anorexia, drowsiness, headache, peripheral neuropathy, asthenia, lethargy, dysarthria, posterior reversible encephalopathy syndrome; pyrexia; infection; proteinuria; dehydration, neutropenia, thrombocytopenia, anaemia; eye disorders; fistulas, pulmonary hypertension, impaired wound healing, necrotising fasciitis (see Cautions) osteonecrosis of the jaw (see MHRA/CHM advice, above), hand-foot syndrome, exfoliative dermatitis, dry skin, skin discoloration, and hypersensitivity reactions (including flushing, rash, hypotension, chest pain, and rigors) also reported

Dose  ● See Doses, p. 563

Avastin® (Roche) ▼ (P30)

Concentrate for intravenous infusion, bevacizumab 25 mg/mL, net price 4-ml (100-mg) vial = £242.66, 16-ml (400-mg) vial = £924.40

BEXAROTENE

Indications  skin manifestations of cutaneous T-cell lymphoma refractory to previous systemic treatment

Cautions  see section 8.1 and notes above; hyperlipidaemia (avoid if uncontrolled), hypothyroidism (avoid if uncontrolled); hypersensitivity to retinoids; avoid in acute porphyria (section 9.8.2); interactions: Appendix 1 (bexarotene)

Contra-indications  see section 8.1 and notes above; history of pancreatitis, hypervitaminosis A

Hepatic impairment  avoid

Pregnancy  avoid; manufacturer advises effective contraception during and for at least 1 month after treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding  discontinue breast-feeding

Side-effects  see section 8.1 and notes above

Dose  ● Initially 300 mg/m² daily as a single dose with a meal; adjust dose according to response

Targetin® (TEVA UK) ▼ (P21)

Capsules, bexarotene 75 mg in a liquid suspension, net price 100-cap pack = £937.50

Bortezomib

Bortezomib, a proteasome inhibitor, is licensed as monotherapy, or in combination with pegylated liposomal doxorubicin or dexamethasone, for the treatment of multiple myeloma that has progressed despite the use of at least one therapy, and where the patient has already had, or is unable to have, haematopoietic stem cell transplantation. It is also licensed for use in combination with melphalan and prednisolone for the treatment of previously untreated multiple myeloma in patients who are not eligible for high-dose chemotherapy with haematopoietic stem cell transplantation. Bortezomib is also licensed in combination with dexamethasone, or with dexamethasone and thalidomide, for the induction treatment of previously untreated multiple myeloma in patients who are eligible for high-dose chemotherapy.
with haematopoietic stem cell transplantation. Bortezomib is given by intravenous or subcutaneous injection.

Important
Bortezomib injection is for intravenous or subcutaneous administration only. Inadvertent intrathecal administration with fatal outcome has been reported.

The Scottish Medicines Consortium, p. 4 has advised (December 2013) that bortezomib (Velcade®) is accepted for restricted use within NHS Scotland in combination with dexamethasone and thalidomide for the induction treatment of adults with previously untreated multiple myeloma who are eligible for high-dose chemotherapy with haematopoietic stem cell transplantation.

NICE guidance
Bortezomib monotherapy for relapsed multiple myeloma (October 2007)
Bortezomib monotherapy is an option for the treatment of progressive multiple myeloma in patients who are at first relapse having received one prior therapy and who have undergone, or are unsuitable for, bone-marrow transplantation, under the following circumstances:

- the response to bortezomib is measured using serum M protein after a maximum of four cycles of treatment, and treatment is continued only in patients who have a reduction in serum M protein of 50% or more (where serum M protein is not measurable, an appropriate alternative biochemical measure of response should be used) and
- the manufacturer rebates the full cost of bortezomib if there is an inadequate response (as defined above) after four cycles of treatment.

www.nice.org.uk/TA129

NICE guidance
Bortezomib and thalidomide for the first-line treatment of multiple myeloma (July 2011)
Bortezomib in combination with an alkylating drug and a corticosteroid is recommended as an option for the first-line treatment of multiple myeloma if:

- high-dose chemotherapy with stem cell transplantation is considered inappropriate and
- the person is unable to tolerate or has contra-indications to thalidomide.

For thalidomide see under Lenalidomide and thalidomide, p. 631

www.nice.org.uk/TA228

NICE guidance
Bortezomib for induction therapy in multiple myeloma before high-dose chemotherapy and autologous stem cell transplantation (April 2014)
Bortezomib is recommended as an option within its marketing authorisation, in combination with dexamethasone, or with dexamethasone and thalidomide, for the induction treatment of adults with previously untreated multiple myeloma, who are eligible for high-dose chemotherapy with haematopoietic stem cell transplantation.

www.nice.org.uk/TA311

8.1.5 Other antineoplastic drugs 587

BORTEZOMIB

Indications see notes above
Cautions see section 8.1; cardiovascular disease; pulmonary disease (chest x-ray recommended before treatment—discontinue if interstitial lung disease develops); consider antiviral prophylaxis for herpes zoster infection; risk factors for seizures; amyloidosis; history of syncope and concurrent use of medication which may cause hypotension; dehydration; risk of neuropathy—consult product literature; monitor blood-glucose concentration in patients on oral anti-diabetics; monitor for symptoms of progressive multifocal leucoencephalopathy (presenting as new or worsening neurological signs or symptoms)—discontinue treatment if diagnosed; interactions: Appendix 1 (bortezomib)

Contra-indications acute diffuse infiltrative pulmonary disease; pericardial disease

Hepatic impairment reduce dose in moderate to severe impairment—consult product literature

Renal impairment no information available for creatinine clearance less than 20 mL/minute/1.73 m²

Pregnancy manufacturer advises effective contra-ception during and for 3 months after treatment in men or women—toxicity in animal studies; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; also diarrhoea, constipation (cases of ileus reported), hypotension, dyspnœa, fatigue, pyrexia, peripheral neuropathy (including sensory), headache, paraesthesia, decreased appetite, herpes zoster (including reaction-vation), myalgia, rash; less commonly heart failure, pulmonary hypertension, acute diffuse infiltrative pulmonary disorders, seizures, posterior reversible encephalopathy syndrome (discontinue treatment); rarely autonomic neuropathy; very rarely progressive multifocal leucoencephalopathy; also consult product literature

Dose
- See Doses, p. 563

Velcade® (Janssen) Injection, powder for reconstitution, bortezomib (as mannitol boronic ester), net price 3.5-mg vial = £762.38

Brentuximab vedotin

Brentuximab vedotin is licensed for the treatment of relapsed or refractory CD-30 positive Hodgkin’s disease following autologous stem cell transplant or following at least two prior therapies, when autologous stem cell transplant or multi-agent chemotherapy is not a treatment option. It is also licensed for relapsed or refractory systemic anaplastic large cell lymphoma.

BRENTUXIMAB VEDOTIN

Indications see notes above
Cautions see section 8.1; rapidly proliferating tumours and high tumour burden—risk of tumour lysis syndrome; elevated BMI—risk of hyperglycaemia; monitor for symptoms of progressive multifocal leucoencephalopathy (presenting as new or worsening neurological, cognitive or behavioural signs or symptoms); monitor for new or worsening abdominal pain—investigate and withhold treatment if acute
pancreatitis suspected and discontinue if confirmed (fatal cases reported); monitor for pulmonary toxicity—treat symptoms promptly; routinely monitor hepatic function; monitor for infusion-related (including anaphylactic) reactions; monitor for signs of peripheral neuropathy—consult product literature for treatment adjustment; interactions: Appendix 1
(brentuximab vedotin)

Pregnancy  avoid unless potential benefit outweighs risk (toxicity in animal studies); effective contraception required during treatment and for 6 months after treatment in men and women
Breast-feeding  avoid—no information available
Side-effects see section 8.1; diarrhoea, constipation, cough, dyspnoea, fatigue, infusion-related reactions (including anaphylaxis), pyrexia, dizziness, peripheral neuropathy, demyelinating polyneuropathy, hyperglycaemia, myalgia, arthralgia, back pain, pruritus, rash; less commonly acute pancreatitis, Stevens-Johnson syndrome, also reported progressive multifocal leucoencephalopathy

Dose

- See Doses, p. 563

Adcetris® (Takeda) ▼ 766
Injection, powder for reconstitution, brentuximab vedotin, net price 50-mg vial = £2500.00
Electrolytes Na+ 0.57 mmol/vial

Catumaxomab

Catumaxomab is licensed for the treatment of malignant ascites in patients with epithelial cell adhesion molecule (EpCAM) positive carcinomas, where standard therapy is not available or no longer feasible. Catumaxomab is given by intraperitoneal infusion. Infusion related side-effects have been reported with catumaxomab; premedication with analgesics, antipyretics, or NSAIDs is recommended by the manufacturer.

Indications  see notes above
Cautions  see section 8.1 and notes above; haemodynamic insufficiency, oedema, hypoproteinaemia
Pregnancy  avoid—limited information available
Breast-feeding  avoid—no information available
Side-effects  see section 8.1 and notes above; also abdominal pain, diarrhoea, constipation, dyspepsia, flatulence, ileus, anorexia, dehydration, cholangitis, tachycardia, hypotension, hypertension, flushing, dyspnoea, pleural effusion, cough, hypoxia, insomnia, anxiety, headache, dizziness, infection, hyperglycaemia, electrolyte disturbances, proteinuria, haematuria, leucocyturia, myalgia, arthralgia, vertigo, rash, sweating, skin reactions, less commonly gastro-intestinal haemorrhage, intestinal obstruction, seizures, acute renal failure
Dose

- Consult product literature

Removab® (Fresenius Biotech) ▼ 766
Concentrate for intraperitoneal infusion, catumaxomab 100 micrograms/mL, net price 10-microgram prefilled syringe = £510.00; 50-microgram prefilled syringe = £2550.00

Cetuximab

Cetuximab is licensed for the treatment of wild-type RAS metastatic colorectal cancer in patients with tumours expressing epidermal growth factor receptor, as combination therapy, or as monotherapy if oxaliplatin- and irinotecan-based therapy has failed or if irinotecan is not tolerated (but see NICE guidance below). Evidence of non-mutated (wild-type) RAS status (at exons 2, 3 and 4 of KRAS and NRAS) is required before cetuximab is initiated for the treatment of metastatic colorectal cancer, and should be determined by an experienced laboratory using a validated test method. The combination of cetuximab with oxaliplatin-containing chemotherapy is contra-indicated in patients with metastatic colorectal cancer who have mutant or unknown RAS status. Cetuximab is also licensed, in combination with radiotherapy, for the treatment of locally advanced squamous cell cancer of the head and neck and in combination with platinum-based chemotherapy for recurrent or metastatic squamous cell cancer of the head and neck (but see NICE guidance below).

Cetuximab is given by intravenous infusion. Patients must receive an antihistamine and a corticosteroid at least one hour before infusion. Resuscitation facilities should be available and treatment should be initiated by a specialist.

Indications see notes above
Cautions  see section 8.1 and notes above; haemodynamic insufficiency, oedema, hypoproteinaemia
Pregnancy  avoid unless potential benefit outweighs risk (toxicity in animal studies); effective contraception required during treatment and for 6 months after treatment in men and women
Breast-feeding  avoid unless potential benefit outweighs risk (toxicity in animal studies); effective contraception required during treatment and for 6 months after treatment in men and women
Side-effects  see section 8.1; diarrhoea, constipation, cough, dyspnoea, fatigue, infusion-related reactions (including anaphylaxis), pyrexia, dizziness, peripheral neuropathy, demyelinating polyneuropathy, hyperglycaemia, myalgia, arthralgia, back pain, pruritus, rash; less commonly acute pancreatitis, Stevens-Johnson syndrome, also reported progressive multifocal leucoencephalopathy

Dose

- See Doses, p. 563

Adcetris® (Takeda) ▼ 766
Injection, powder for reconstitution, brentuximab vedotin, net price 50-mg vial = £2500.00
Electrolytes Na+ 0.57 mmol/vial

MHRA/CHM advice

Epidermal growth factor receptor (EGFR) inhibitors: serious cases of keratitis and ulcerative keratitis (May 2012)

Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness. Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative keratitis is diagnosed.

The Scottish Medicines Consortium (p. 4) has advised (January 2010) that cetuximab (Erbitux®) is accepted for restricted use within NHS Scotland, in combination with chemotherapy, for metastatic colorectal cancer in patients with tumours expressing epidermal growth factor; it is restricted to patients with non-resectable metastases confined to the liver, who have not previously received chemotherapy.

NICE guidance

Cetuximab for the treatment of locally advanced squamous cell cancer of the head and neck (June 2008)

Cetuximab in combination with radiotherapy is an option for the treatment of locally advanced squamous cell cancer of the head and neck in patients who have a Karnofsky performance status of 90% or greater and when all forms of platinum-based chemoradiotherapy treatment are contra-indicated.

www.nice.org.uk/TA145
NICE guidance
Cetuximab for the treatment of recurrent or metastatic squamous cell cancer of the head and neck (June 2009)
Cetuximab in combination with platinum-based chemotherapy is not recommended for the treatment of recurrent or metastatic squamous cell cancer of the head and neck.
www.nice.org.uk/TA172

NICE guidance
Cetuximab for the first-line treatment of metastatic colorectal cancer (August 2009)
Cetuximab in combination with fluorouracil, folinic acid and oxaliplatin is an option for the first-line treatment of metastatic colorectal cancer under the following circumstances:

- the primary tumour has been resected or is potentially operable;
- the metastatic disease is confined to the liver and is resectable; and
- the patient is fit to undergo surgery to resect the primary colorectal tumour and to undergo liver surgery if the metastases become resectable after treatment with cetuximab.

In patients unable to tolerate oxaliplatin, or in whom oxaliplatin is contra-indicated, cetuximab in combination with fluorouracil, folinic acid and irinotecan can be used as an alternative.

In addition, the manufacturer is required to rebate 16% of the amount of cetuximab used per patient when used in combination with fluorouracil, folinic acid, and oxaliplatin.

Patients who meet the above criteria should receive cetuximab for no more than 16 weeks. At 16 weeks, cetuximab should be stopped and the patient should be assessed for resection of liver metastases.

www.nice.org.uk/TA176

NICE guidance
Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy (January 2012)
Cetuximab monotherapy or combination chemotherapy is not recommended for the treatment of patients with metastatic colorectal cancer that has progressed after first-line chemotherapy.

Bevacizumab in combination with non-oxaliplatin (fluoropyrimidine-based) chemotherapy is not recommended for the treatment of patients with metastatic colorectal cancer that has progressed after first-line chemotherapy; see also NICE guidance Bevacizumab and cetuximab for the treatment of metastatic colorectal cancer (January 2007), p. 585

Panitumumab monotherapy is not recommended for the treatment of patients with metastatic colorectal cancer that has progressed after first-line chemotherapy.

www.nice.org.uk/TA242

CETUXIMAB
Indications see notes above and product literature
Cautions cardiovascular disease, cardiopulmonary disease, pulmonary disease—discontinue if interstitial lung disease; history of, or risk factors for keratitis, ulcerative keratitis (including contact lens use), or severe dry eye (see also MHRA/CHM advice above)
Contra-indications RAS mutated colorectal tumours (or if RAS tumour status unknown)
Pregnancy use only if potential benefit outweighs risk—no information available; see also Pregnancy and Reproductive Function, p. 564
Breast-feeding avoid breast-feeding during and for 2 months after treatment—no information available
Side-effects infusion-related reactions including dyspnoea, dizziness, chills, fever, and severe (sometimes fatal) hypersensitivity reactions (possibly delayed onset) such as rash, urticaria, bronchospasm, hypotension, hypertension, and shock; nausea, vomiting, diarrhoea, headache, aseptic meningitis, hypomagnesaemia, hypocalcaemia, conjunctivitis, blepharitis, keratitis, skin reactions including acne, pruritus, dry skin, desquamation, hypertrichosis, nail disorders; very rarely Stevens-Johnson syndrome, toxic epidermal necrolysis
Dose
- See Doses, p. 563

Erbitux® (Merck Serono) Intravenous infusion, cetuximab 5 mg/mL, net price 20-mL vial = £178.10, 100-mL vial = £890.50

Crisantaspase
Crisantaspase is the enzyme asparaginase produced by Erwinia chrysanthemi. It is given intramuscularly, intravenously, or subcutaneously almost exclusively in acute lymphoblastic leukaemia. Facilities for the management of anaphylaxis should be available.

CRISANTASPASE
Indications see notes above
Cautions see notes above
Contra-indications history of pancreatitis related to asparaginase therapy
Pregnancy avoid; see also Pregnancy and Reproductive Function, p. 564
Breast-feeding discontinue breast-feeding
Side-effects see section 8.1; also liver dysfunction, pancreatitis, diarrhoea; coagulation disorders; lethargy, drowsiness, confusion, dizziness, neurotoxicity, convulsions, headache; less commonly changes in blood lipids, anaphylaxis, hyperglycaemia; rarely CNS depression; very rarely myalgia; abdominal pain and hypertension also reported
Dose
- See Doses, p. 563

Erwinase® (EUSA Pharma) Injection, powder for reconstitution, crisantaspase, net price 10 000-unit vial = £613.00

Dacarbazine and temozolomide
Dacarbazine is used to treat metastatic melanoma and, in combination therapy, soft tissue sarcomas. It is also a component of a commonly used combination for
Hodgkin’s disease (ABVD—doxorubicin [previously Adria-myocin®], bleomycin, vinblastine, and dacarbazine). It is given intravenously. The predominant side-effects are myelosuppression and severe nausea and vomiting.

**Temozolomide** is structurally related to dacarbazine. It is given by mouth and is licensed for the treatment of newly diagnosed glioblastoma multiforme in adults (in combination with radiotherapy) and subsequently as monotherapy. It is also licensed for second-line treatment of malignant glioma in adults and children over 3 years.

**NICE guidance**

*Temozolomide for the treatment of recurrent malignant glioma (brain cancer)* (April 2001)

Temozolomide may be considered for the treatment of recurrent glioma, which has not responded to first-line chemotherapy.

www.nice.org.uk/TA23

**NICE guidance**

Carmustine implants and temozolomide for the treatment of newly diagnosed high-grade glioma (June 2007)

Temozolomide is an option for the treatment of newly diagnosed glioblastoma multiforme in patients with a WHO performance status of 0 or 1. Carmustine implants are an option for the treatment of newly diagnosed high-grade (Grade 3 or 4) glioma only for patients in whom at least 90% of the tumour has been resected. Carmustine implants should only be used within specialist centres.

www.nice.org.uk/TA121

**DECARBAZINE**

**Indications** see notes above

**Cautions** see section 8.1; caution in handling; **interactions**: Appendix 1 (dacarbazine)

**Hepatic impairment** dose reduction may be required in combined renal and hepatic impairment; avoid in severe impairment

**Renal impairment** dose reduction may be required in combined renal and hepatic impairment; avoid in severe impairment

**Pregnancy** avoid (carcinogenic and teratogenic in animal studies); ensure effective contraception during treatment; men should avoid fathering a child during and for at least 6 months after treatment; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and consult product literature

**Dose**

- See Doses, p. 563

**Dacarbazine** (Non-proprietary) (Non-proprietary)

Injection, powder for reconstitution, dacarbazine (as citrate), net price 100-mg vial = £5.05; 200-mg vial = £7.50; 500-mg vial = £16.50; 600-mg vial = £22.50; 1-g vial = £31.80

**Eribulin**

Eribulin is licensed for the treatment of locally advanced or metastatic breast cancer when the disease has progressed after treatment with at least 2 chemotherapy regimens. Previous therapy should have included an anthracycline and a taxane unless patients were unsuitable for these treatments. It is given intravenously on day 1 and day 8 of a 21-day cycle. It can cause myelosuppression, peripheral neuropathy, and QT-interval prolongation.

**NICE guidance**

**Eribulin for the treatment of locally advanced or metastatic breast cancer** (April 2012)

Eribulin is not recommended for the treatment of locally advanced or metastatic breast cancer that has progressed after at least two chemotherapy regimens for advanced disease.

www.nice.org.uk/TA250
**ERIBULIN**

**Indications** see notes above

**Cautions** see section 8.1 and notes above—susceptibility to QT-interval prolongation (including electrolyte disturbances, concomitant use of drugs that prolong QT-interval); **interactions:** Appendix 1 (eribulin)

**Hepatic impairment** reduce dose

**Renal impairment** consider dose reduction if creatinine clearance less than 40 mL/minute

**Pregnancy** avoid unless essential (teratogenic in animal studies); ensure effective contraception during and for up to 3 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Dose**

- See Doses, p. 563

**Halaven** (Eisai) ▼ (p. 561)

Injection, eribulin (as mesilate) 440 micrograms/mL, net price 2-mL vial = £361.00

**Note** Contains ethanol

---

**HYDROXYCARBAMIDE**

*(Hydroxyurea)*

**Indications** see notes above; sickle-cell disease (section 9.1.3)

**Cautions** see section 8.1 and notes above; **interactions:** Appendix 1 (hydroxy carbamide)

**Hepatic impairment** use with caution

**Renal impairment** use with caution

**Pregnancy** avoid (teratogenic in animal studies); manufacturer advises effective contraception before and during treatment; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Dose**

- 20–30 mg/kg daily or 80 mg/kg every third day

**Hydroxy carbamide** (Non-proprietary) ▼

Capsules, hydroxy carbamide 500 mg, net price 100-cap pack = £10.55

**Hydrea** (Squibb) ▼

Capsules, pink/green, hydroxy carbamide 500 mg, net price 100-cap pack = £10.47

---

**IPILIMUMAB**

**Indications** see notes above

**Cautions** see notes above—for full details consult product literature; **interactions:** Appendix 1 (ipilimumab)

**Hepatic impairment** use with caution if plasma-bilirubin concentration greater than 3 times upper limit of normal range or if plasma-transaminase concentration 5 times or greater than the upper limit of normal range

**Pregnancy** avoid unless potential benefit outweighs risk (toxicity in animal studies); use effective contraception

**Breast-feeding** discontinue breast-feeding—no information available

**Side-effects** see notes above—for full details (including monitoring and management of side-effects) consult product literature

**Dose**

- Consult product literature

**Yervoy** (Bristol-Myers Squibb) ▼

Concentrate for intravenous infusion, ipilimumab 5 mg/mL, net price 10-mL vial = £3750.00, 40-mL vial = £15000.00

**Electrolytes** Contains approx. 0.1 mmol Na⁺mL

---

**Mitotane**

**Mitotane** is licensed for the symptomatic treatment of advanced or inoperable adrenocortical carcinoma. It selectively inhibits the activity of the adrenal cortex, necessitating corticosteroid replacement therapy (section 6.3.1); the dose of glucocorticoid should be increased in case of shock, trauma, or infection.

Gastro-intestinal side-effects such as anorexia, nausea, and vomiting, and endocrine side-effects, such as hypogonadism and thyroid disorders, are very common with mitotane; neurotoxicity occurs in many patients.
Malignant disease and immunosuppression

**MITOTANE**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; risk of accumulation in overweight patients; monitor plasma-mitotane concentration—consult product literature; avoid in acute porphyria (section 9.8.2);

**Interactions**: Appendix 1 (mitotane)

**Driving** CNS effects may affect performance of skilled tasks (e.g. driving)

**Counselling** Warn patient to contact doctor immediately if injury, infection, or illness occurs (because of risk of acute adrenal insufficiency)

**Hepatic impairment** manufacturer advises caution in mild to moderate impairment—monitoring of plasma-mitotane concentration recommended; avoid in severe impairment

**Renal impairment** manufacturer advises caution in mild to moderate impairment—monitoring of plasma-mitotane concentration recommended; avoid in severe impairment

**Pregnancy** manufacturer advises avoid—women of childbearing age should use effective contraception during and after treatment; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; also gastrointestinal disturbances (including nausea, vomiting, diarrhoea, epigastric discomfort), anorexia, liver disorders; hypercholesterolaemia, hypertriglyceridaemia; ataxia, confusion, asthenia, myasthenia, paraesthesia, drowsiness, neuropathy, cognitive impairment, movement disorder, dizziness, headache; gynaecomastia; prolonged bleeding time, leucopenia, thrombocytopenia, anaemia; rash; rarely hypersalivation, hypertension, postural hypotension, flushing, pyrexia, haematuria, proteinuria, haemorrhagic cystitis, hypouricaemia, visual disturbances, and ocular disorders

**Dose**

- **ADULT** over 18 years, initially 2–3 g daily, (up to 6 g daily in severe illness) in 2–3 divided doses, adjusted according to plasma-mitotane concentration; reduce dose or interrupt treatment if signs of toxicity; discontinue if inadequate response after 3 months

- **Note** Plasma-mitotane concentration for optimum response 14–20 mg/litre

**Lysodren® (HRA Pharma)**

- **Tablets**, scored, mitotane 500 mg, net price 100-tab pack = £590.97. Label: 2, 10, 21, counselling, driving, adrenal suppression

**PANITUMUMAB**

**Indications** see notes above

**Cautions** monitor for dermatological reactions (see Severe Skin Reactions above and consult product literature); pulmonary disease—discontinue if interstitial lung disease develops; monitor for hypomagnesaemia and hypocalcaemia; history of, or risk factors for keratitis, ulcerative keratitis (including contact lens use), or severe dry eye (see also MHRA/CHM advice Epidermal Growth Factor Receptor (EGFR) Inhibitors: Serious Cases of Keratitis and Ulcerative Keratitis, p. 588)

**Contra-indications** see notes above; interstitial pulmonary disease

**Pregnancy** avoid (toxicity in animal studies); manufacturer advises effective contraception during and for 6 months after treatment; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** manufacturer advises avoid breast-feeding during and for 2 months after treatment

**Side-effects** see section 8.1; also infusion-related reactions including hypertension, hypotension, tachycardia, and severe hypersensitivity reactions (possibly delayed onset); diarrhoea, abdominal pain, constipation, dry mouth and nose; dyspnoea, cough, embolism; fatigue, dizziness, headache; hypomagnesaemia, hypocalcaemia, hypokalaemia, dehydration; ocular disorders (including conjunctivitis, increased lacrimation, dry eyes, ocular hyperaemia and keratitis); skin reactions (including rash, erythema, pruritus, dry skin, acne, hand-foot syndrome and exfoliation), mucosal inflammation, hypertrichosis, and nail disorders

**Dose**

- **See** Doses, p. 563

**Vectibix® (Amgen)**

- **Concentrate for intravenous infusion**, panitumumab 20 mg/mL, net price 5-mL vial = £379.29, 20-mL vial = £1517.16

**Electrolytes**

- **Na+ 0.75 mmol/vial**

**Pentostatin**

**Pentostatin** is active in hairy cell leukaemia. It is given intravenously on alternate weeks and can induce prolonged complete remission. It can cause myelosuppres-
sion, immunosuppression, and a number of other side-effects that may be severe. Treatment should be withheld in patients who develop a severe rash, and withheld or discontinued in patients showing signs of neurotoxicity. Its use should be confined to specialist centres.

**PENTOSTATIN**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; interacions: Appendix 1 (pentostatin)

**Hepatic impairment** manufacturer advises caution—limited information available

**Renal impairment** avoid if creatinine clearance less than 60 mL/minute

**Pregnancy** avoid (teratogenic in animal studies); manufacturer advises that men should not father children during and for 6 months after treatment; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Dose**

- See Doses, p. 563

**Nipent** (Hospira)

Injection, powder for reconstitution, pentostatin, net price 10-mg vial = £863.78

---

**Pertuzumab**

Pertuzumab is a recombinant humanised monoclonal antibody, and acts by inhibiting human epidermal growth factor receptor 2 protein (HER2) dimerisation. It is indicated for the treatment of HER2-positive metastatic or locally recurrent unresectable breast cancer in combination with trastuzumab and docetaxel, in patients who have not received previous anti-HER2 therapy or chemotherapy. Pertuzumab is given by intravenous infusion; reuscrification facilities should be available and treatment should be initiated by a specialist.

**PERTUZUMAB**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; history of congestive heart failure, impaired left ventricular function or conditions that could impair left ventricular function (including uncontrolled hypertension, recent myocardial infarction, serious cardiac arrhythmia, prior anthracycline exposure, or radiotherapy to the chest area); assess for signs and symptoms of congestive heart failure (including left ventricular ejection fraction) before and during treatment—consult product literature, and withhold treatment if necessary; monitor for febrile neutropenia

**Hepatic impairment** caution—no information available

**Renal impairment** caution in severe impairment—no information available

**Pregnancy** avoid (toxicity in animal studies); ensure effective contraception during and for six months after treatment in women of childbearing potential; see also Pregnancy and Reproductive Function

**Breast-feeding** avoid—no information available

**Side-effects** see section 8.1; also (when used in combination with trastuzumab and docetaxel) decreased appetite, diarrhoea, constipation, dyspepsia, left ventricular dysfunction, oedema, dyspnoea, cough, pleural effusion, nasopharyngitis, insomnia, peripheral neuropathy, headache, dizziness, taste disturbance, pain, malaise, pyrexia, chills, upper respiratory-tract infection, paronychia, neutropenia (including febrile neutropenia), leucopenia, anaemia, myalgia, arthralgia, increased lacrimation, rash, nail disorder, pruritus, dry skin; infusion-related reactions including severe hypersensitivity reactions; less commonly interstitial lung disease

**Dose**

- See Doses, p. 563

**Perjeta** (Roche)

Concentrate for intravenous infusion, pertuzumab 30 mg/mL, net price 14-mL vial = £2395.00

---

**Platinum compounds**

Carboplatin is widely used in the treatment of advanced ovarian cancer and lung cancer (particularly the small cell type). It is given intravenously. The dose of carboplatin is determined according to renal function rather than body surface area. Carboplatin can be given on an outpatient basis and is better tolerated than cisplatin; nausea and vomiting are reduced in severity and nephrotoxicity, neurotoxicity, and ototoxicity are much less of a problem than with cisplatin. It is, however, more myelosuppressive than cisplatin.

Cisplatin is used alone or in combination for the treatment of testicular, lung, cervical, bladder, head and neck, and ovarian cancer (but carboplatin is preferred for ovarian cancer). It is given intravenously. Cisplatin requires intensive intravenous hydration and treatment may be complicated by severe nausea and vomiting. Cisplatin is toxic, causing nephrotoxicity (monitoring of renal function is essential), ototoxicity, peripheral neuropathy, hypomagnesaemia and myelosuppression. It is, however, increasingly given in a day-care setting.

Oxaliplatin is licensed in combination with fluorouracil and folic acid, for the treatment of metastatic colorectal cancer and as adjuvant treatment of colon cancer after resection of the primary tumour; it is given intravenously. Neurotoxic side-effects (including sensory peripheral neuropathy) are dose limiting. Other side-effects include gastrointestinal disturbances, ototoxicity, myelosuppression and transient vision loss (reversible on discontinuation). If unexplained respiratory symptoms occur, oxaliplatin should be discontinued until investigations exclude interstitial lung disease and pulmonary fibrosis. Posterior reversible encephalopathy syndrome has also been reported in patients receiving oxaliplatin combination chemotherapy.

---

**NICE guidance**

Irinotecan, oxaliplatin, and raltitrexed for advanced colorectal cancer (August 2005)

A combination of fluorouracil and folic acid with either irinotecan or oxaliplatin are options for first-line treatment for advanced colorectal cancer. Irinotecan alone or fluorouracil and folic acid with oxaliplatin are options for patients who require further treatment subsequently.

Raltitrexed is not recommended for the treatment of advanced colorectal cancer. Its use should be confined to clinical studies.

www.nice.org.uk/TA93
CARBOPLATIN

**Indications** see notes above

**Cautions** see section 8.1 and notes above; interactions: Appendix 1 (platinum compounds)

**Renal impairment** reduce dose and monitor haematological parameters and renal function; avoid if creatinine clearance less than 20 ml/minute

**Pregnancy** avoid (teratogenic and embryotoxic in animal studies); see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Dose**
- See Doses, p. 563

**Carboplatin (Non-proprietary)**

**Injection**
- carboplatin 10 mg/mL, net price 5-mL vial = £20.00, 15-mL vial = £50.00, 45-mL vial = £160.00, 60-mL vial = £260.00

Porfimer sodium and temoporfin

Porfimer sodium and temoporfin are used in the photodynamic treatment of various tumours. The drugs accumulate in malignant tissue and are activated by laser light to produce a cytotoxic effect.

Porfimer sodium is licensed for photodynamic therapy of non-small cell lung cancer and obstructing oesophageal cancer. Temoporfin is licensed for photodynamic therapy of advanced head and neck cancer.

PORFIMER SODIUM

**Indications** non-small cell lung cancer; oesophageal cancer; see notes above

**Cautions** see section 8.1; avoid exposure of skin and eyes to direct sunlight or bright indoor light for at least 30 days
Contra-indications see section 8.1; tracheo-oesophageal or broncho-oesophageal fistula; acute porphyria (section 9.8.2)

Hepatic impairment avoid in severe impairment

Pregnancy manufacturer advises avoid unless essential

Breast-feeding no information available—manufacturer advises avoid

Side-effects see section 8.1; photosensitivity (see Cautions above—sunscreens offer no protection), constipation

Dose
  • See Doses, p. 563

Photofrin® (pinnacle) ▼ (PM) Injection, powder for reconstitution, porfimer sodium, net price 15-mg vial = £154.00; 75-mg vial = £770.00

TEMOPORFIN

Indications advanced head and neck squamous cell carcinoma refractory to, or unsuitable for, other treatments

Cautions see section 8.1; avoid exposure of skin and eyes to direct sunlight or bright indoor light for at least 15 days after administration; avoid prolonged exposure of injection site arm to direct sunlight for 6 months after administration, if extravasation occurs protect area from light for at least 3 months; interactions: Appendix 1 (temoporfin)

Contra-indications see section 8.1; acute porphyria (section 9.8.2) or other diseases exacerbated by light; elective surgery or ophthalmic slit-lamp examination for 30 days after administration; concomitant photosensitising treatment

Pregnancy toxicity in animal studies—manufacturer advises avoid pregnancy for at least 3 months after treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding manufacturer advises avoid breast-feeding for at least 1 month after treatment—no information available

Side-effects see section 8.1; also constipation, dysphagia; haemorrhage, oedema; giddiness, trismus, facial pain; injection site pain, blistering, scarring, erythema, skin necrosis, hyperpigmentation, photosensitivity (see Cautions above; sunscreens ineffective)

Dose
  • See Doses, p. 563

Foscan® (Biolitec) ▼ (PM) Injection, temoporfin 1 mg/mL, net price 3-mL vial = £1800.00, 6-mL vial = £3400.00

Procarbazine

Procarbazine is most often used in Hodgkin’s disease. It is given by mouth. Toxic effects include nausea, myelosuppression, and a hypersensitivity rash preventing further use of this drug. It is a mild monoamineoxidase inhibitor and dietary restriction is rarely considered necessary. Alcohol ingestion may cause a disulfiram-like reaction.

8.1.5 Other antineoplastic drugs

PROCARBAZINE

Indications see notes above

Cautions see section 8.1 and notes above; cardiovascular or cerebrovascular disease; phaeochromocytoma; epilepsy; interactions: Appendix 1 (procarbazine)

Contra-indications pre-existing severe leucopenia or thrombocytopenia

Hepatic impairment caution in mild to moderate impairment; avoid in severe impairment

Renal impairment caution in mild to moderate impairment; avoid in severe impairment

Pregnancy avoid (teratogenic in animal studies and isolated reports in humans); see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above; loss of appetite; also reported jaundice, hypersensitivity rash (discontinue treatment)

Dose
  • See Doses, p. 563

Procarbazine (Non-proprietary) (PM) Capsules, procarbazine (as hydrochloride) 50 mg, net price 50-cap pack = £249.50. Label: 4

Protein kinase inhibitors

Afatinib is a protein kinase inhibitor licensed for the treatment of locally advanced or metastatic non-small cell lung cancer with activating epidermal growth factor receptor (EGFR) mutations, in patients who have not previously been treated with an EGFR tyrosine kinase inhibitor.

NICE guidance

Afatinib for treating epidermal growth factor receptor mutation-positive locally advanced or metastatic non-small-cell lung cancer (April 2014)

Afatinib is recommended as an option, within its marketing authorisation, for treating locally advanced or metastatic non-small-cell lung cancer in adults:

  • whose tumour tests positive for the epidermal growth factor receptor tyrosine kinase (EGFR-TK) mutation, and
  • who have not previously had an EGFR-TK inhibitor, and
  • if the manufacturer provides afatinib with the discount agreed in the patient access scheme.

www.nice.org.uk/TA310

Axitinib, a tyrosine kinase inhibitor, is licensed for the treatment of advanced renal cell carcinoma following failure of previous treatment with sunitinib or a cytokine (aldesleukin or interferon alfa).

Bosutinib is licensed for the treatment of chronic, accelerated and blast phase Philadelphia chromosome-positive chronic myeloid leukaemia, in those previously treated with one or more tyrosine kinase inhibitors, and for whom imatinib, nilotinib and dasatinib are not clinically appropriate.
Crizotinib, a tyrosine kinase inhibitor, is licensed for previously treated anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer.

Dasatinib, a tyrosine kinase inhibitor, is licensed for the treatment of chronic myeloid leukaemia in those who have resistance to or intolerance of previous therapy. It is also licensed for newly diagnosed Philadelphia chromosome-positive chronic myeloid leukaemia in the chronic phase and for acute lymphoblastic leukaemia (Philadelphia chromosome positive) in those who have resistance to or intolerance of previous therapy.

The Scottish Medicines Consortium (p. 4) has advised (April 2007) that the use of dasatinib (Sprycel®) in NHS Scotland is restricted to patients in the chronic phase of chronic myeloid leukaemia.

Dasatinib, nilotinib and standard-dose imatinib for the first-line treatment of chronic myeloid leukaemia (April 2012)

Standard-dose imatinib is recommended as an option for the first-line treatment of adults with chronic phase Philadelphia-chromosome-positive chronic myeloid leukaemia (CML); see also NICE guidance Imatinib for chronic myeloid leukaemia (April 2012), p. 598.

Nilotinib is recommended as an option for the first-line treatment of adults with chronic phase Philadelphia-chromosome-positive CML if the manufacturer makes nilotinib available with the discount agreed as part of the patient access scheme.

Dasatinib is not recommended for the first-line treatment of chronic phase Philadelphia-chromosome-positive CML.

www.nice.org.uk/TA251

NICE guidance
Dasatinib, high-dose imatinib and nilotinib for the treatment of imatinib-resistant chronic myeloid leukaemia (CML), and dasatinib and nilotinib for people with CML for whom treatment with imatinib has failed because of intolerance (January 2012)

Nilotinib is recommended for the treatment of chronic or accelerated phase Philadelphia-chromosome-positive chronic myeloid leukaemia (CML) in adults:

- whose CML is resistant to treatment with standard-dose imatinib, or
- who have imatinib intolerance, and
- if the manufacturer makes nilotinib available with the discount agreed as part of the patient access scheme.

Dasatinib is not recommended for the treatment of chronic, accelerated or blast-crisis phase CML in adults with imatinib intolerance or whose CML is resistant to treatment with standard-dose imatinib.

High-dose imatinib is not recommended for the treatment of chronic, accelerated or blast-crisis phase Philadelphia-chromosome-positive CML that is resistant to standard-dose imatinib.

www.nice.org.uk/TA241

Erlotinib, a tyrosine kinase inhibitor, is licensed in combination with gemcitabine for the treatment of metastatic pancreatic cancer. It is also licensed for the treatment of locally advanced or metastatic non-small cell lung cancer after failure of previous chemotherapy and as monotherapy for maintenance treatment of locally advanced or metastatic non-small cell lung cancer with stable disease after four cycles of platinum-based chemotherapy.

The Scottish Medicines Consortium (p. 4) has advised (May 2006) that erlotinib (Tarceva®) is accepted for use within NHS Scotland for the treatment of locally advanced or metastatic non-small cell lung cancer, after failure of at least one chemotherapy regimen. Erlotinib is restricted to use in patients who would otherwise be eligible for treatment with docetaxel monotherapy. The Scottish Medicines Consortium (p. 4) has also advised (December 2011) that erlotinib (Tarceva®) is accepted for use within NHS Scotland for the first-line treatment of patients with locally advanced or metastatic non-small cell lung cancer (NSCLC) with epidermal growth factor receptor (EGFR) activating mutations.

Erlotinib for non-small-cell lung cancer (November 2008)

Erlotinib is recommended, as an alternative to docetaxel, as second-line treatment for locally advanced or metastatic non-small-cell lung cancer after failure of previous chemotherapy, on the basis that it is provided by the manufacturer at an overall treatment cost equal to that of docetaxel. Erlotinib is not recommended in patients for whom docetaxel is unsuitable or as third-line treatment after docetaxel.

www.nice.org.uk/TA162
Everolimus, a protein kinase inhibitor, is licensed for the treatment of advanced renal cell carcinoma when the disease has progressed despite treatment with vascular endothelial growth factor-targeted therapy (see NICE guidance below), and for the treatment of unresectable or metastatic, well- or moderately-differentiated neuroendocrine tumours of pancreatic origin. It is licensed for the treatment of subependymal giant cell astrocytoma associated with tuberous sclerosis complex in patients who require therapeutic intervention but are not amenable to surgery, and for renal angiomyolipoma associated with tuberous sclerosis complex in patients at risk of complications, but who do not require immediate surgery. Everolimus is also licensed for the treatment of hormone-receptor-positive, human epidermal growth factor receptor-2 (HER-2) negative advanced breast cancer, in combination with exemestane, in postmenopausal women without symptomatic visceral disease after recurrence or progression following a non-steroidal aromatase inhibitor.

Everolimus is not recommended for the second-line treatment of advanced renal cell carcinoma.

Gefitinib, a tyrosine kinase inhibitor, is licensed for the treatment of locally advanced or metastatic non-small cell lung cancer with activating mutations of epidermal growth factor receptor.

Imatinib, a tyrosine kinase inhibitor, is licensed for the treatment of newly diagnosed chronic myeloid leukaemia where bone marrow transplantation is not considered first-line treatment, and for chronic myeloid leukaemia in chronic phase after failure of interferon alfa, or in accelerated phase, or in blast crisis (see NICE guidance below). It is also licensed for the treatment of c-kit (CD117)-positive unresectable or metastatic malignant gastro-intestinal stromal tumours (GIST), and as adjuvant treatment following resection of c-kit (CD117)-positive GIST, in patients at significant risk of relapse. Imatinib is licensed for the treatment of newly diagnosed acute lymphoblastic leukaemia in combination with other chemotherapy, and as monotherapy for relapsed or refractory acute lymphoblastic leukaemia.

NICE guidance

Everolimus in combination with exemestane for treating advanced HER2-negative hormone-receptor-positive breast cancer after endocrine therapy (August 2013)

Everolimus, in combination with exemestane, is not recommended within its marketing authorisation for treating postmenopausal women with advanced human epidermal growth factor receptor 2 (HER2) negative hormone-receptor-positive breast cancer that has recurred or progressed following treatment with a non-steroidal aromatase inhibitor.

www.nice.org.uk/TA295

Gefitinib for the first-line treatment of locally advanced or metastatic non-small cell lung cancer (July 2010)

Gefitinib is recommended as an option for the first-line treatment of locally advanced or metastatic non-small-cell lung cancer if the patient tests positive for the epidermal growth receptor tyrosine kinase (EGFR-TK) mutation and the manufacturer provides gefitinib at the fixed price agreed under the patient access scheme.

www.nice.org.uk/TA192

Imatinib for maintenance treatment of non-small-cell lung cancer (June 2011)

Erlotinib monotherapy is not recommended for maintenance treatment in people with locally advanced or metastatic non-small-cell lung cancer who have stable disease after platinum-based first-line chemotherapy.

www.nice.org.uk/TA227

Erlotinib for the first-line treatment of locally advanced or metastatic EGFR-TK mutation-positive non-small-cell lung cancer (June 2012)

Erlotinib is recommended as an option for the first-line treatment of locally advanced or metastatic non-small-cell lung cancer if:
- they test positive for the epidermal growth factor tyrosine kinase (EGFR-TK) mutation and
- the manufacturer provides erlotinib at the discounted price agreed under the patient access scheme (as revised in 2012).

www.nice.org.uk/TA258

Erlotinib monotherapy for maintenance treatment of non-small-cell lung cancer

Erlotinib monotherapy is not recommended for maintenance treatment in people with locally advanced or metastatic non-small-cell lung cancer who have stable disease after platinum-based first-line chemotherapy.

www.nice.org.uk/TA227
stromal tumour (GIST) and who are at high risk of recurrence following complete resection (according to the Armed Forces Institute of Pathology (AFIP) risk criteria).

**NICE guidance**

**Imatinib for chronic myeloid leukaemia (October 2003)**

Imatinib is recommended as first-line treatment for Philadelphia-chromosome-positive chronic myeloid leukaemia in the chronic phase and as an option for patients presenting in the accelerated phase or with blast crisis, provided that imatinib has not been used previously.

See also NICE guidance Dasatinib, nilotinib and standard-dose imatinib for the first-line treatment of chronic myeloid leukaemia (April 2012), p. 596 and NICE guidance Dasatinib, high-dose imatinib and nilotinib for the treatment of imatinib-resistant chronic myeloid leukaemia, and dasatinib and nilotinib for people with CML for whom treatment of imatinib has failed because of intolerance (January 2012), p. 596

www.nice.org.uk/TA70

**NICE guidance**

**Imatinib for the adjuvant treatment of gastro-intestinal stromal tumours (August 2010)**

Imatinib is **not** recommended for the adjuvant treatment of gastro-intestinal stromal tumours after surgery.

www.nice.org.uk/TA196

**NICE guidance**

**Imatinib for the treatment of unresectable and/or metastatic gastro-intestinal stromal tumours (October 2004)**

Imatinib 400 mg daily is recommended as first-line management of KIT (CD117)-positive unresectable or metastatic, or both, gastro-intestinal stromal tumours. Continued therapy is recommended only if a response to initial treatment [as defined by Southwest Oncology Group criteria available at www.nice.org.uk/TA86] is achieved within 12 weeks. Patients who have responded should be assessed at 12-week intervals. Discontinue if tumour ceases to respond.

www.nice.org.uk/TA86

**NICE guidance**

**Imatinib for the treatment of unresectable and/or metastatic gastro-intestinal stromal tumours (November 2010)**

Imatinib 600 mg daily or 800 mg daily is **not** recommended for unresectable or metastatic, or both, gastro-intestinal stromal tumours whose disease has progressed after treatment with imatinib 400 mg daily.

www.nice.org.uk/TA209

Lapatinib, a tyrosine kinase inhibitor, is licensed for the treatment of advanced or metastatic breast cancer in patients with tumours that overexpress human epidermal growth factor receptor-2 (HER2). It is indicated, in combination with capecitabine, for patients who have had previous treatment with an anthracycline, a taxane, and trastuzumab, or for postmenopausal women in combination with an aromatase inhibitor section 8.3.4.1.

**NICE guidance**

**Lapatinib or trastuzumab in combination with an aromatase inhibitor for the first-line treatment of metastatic hormone-receptor-positive breast cancer that overexpresses HER2 (June 2012)**

Lapatinib or trastuzumab in combination with an aromatase inhibitor is **not** recommended for first-line treatment in postmenopausal women of metastatic hormone-receptor-positive breast cancer that overexpresses human epidermal growth factor receptor 2 (HER2).

Postmenopausal women currently receiving lapatinib or trastuzumab in combination with an aromatase inhibitor for this indication should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA257

Nilotinib, a tyrosine kinase inhibitor, is licensed for the treatment of newly diagnosed chronic myeloid leukaemia in the chronic phase, and also for patients with chronic or accelerated phase chronic myeloid leukaemia who have resistance to or intolerance of previous therapy, including imatinib.

The Scottish Medicines Consortium (p. 4) has advised (February 2008) that nilotinib (Tasigna®) is accepted for restricted use within NHS Scotland for the treatment of chronic-phase chronic myeloid leukaemia in adults resistant to or intolerant of at least one previous therapy, including imatinib, and (July 2011) for the treatment of adults with newly diagnosed chronic myeloid leukaemia in the chronic phase.

**NICE guidance**

**Dasatinib, nilotinib and standard-dose imatinib for the first-line treatment of chronic myeloid leukaemia (April 2012)**

See p. 596

**NICE guidance**

**Dasatinib, high-dose imatinib and nilotinib for the treatment of imatinib-resistant chronic myeloid leukaemia (CML), and dasatinib and nilotinib for people with CML for whom treatment with imatinib has failed because of intolerance (January 2012)**

See p. 596

Pazopanib, a tyrosine kinase inhibitor, is licensed for advanced renal cell carcinoma, as first-line treatment and for patients who have had previous treatment with cytokine therapy for advanced disease. It is also licensed for the treatment of selective subtypes of advanced soft tissue sarcoma (consult product literature for details).

The Scottish Medicines Consortium (p. 4) has advised (February 2011) that pazopanib (Votrient®) is accepted for restricted use within NHS Scotland for the first-line treatment of advanced renal cell carcinoma and (December 2012) is **not** recommended for use within NHS Scotland for the treatment of selective subtypes of advanced soft tissue sarcoma in patients who have...
received prior chemotherapy for metastatic disease, or who have progressed within 12 months after neoadjuvant therapy.

**NICE guidance**

**Pazopanib for the first-line treatment of advanced renal cell carcinoma (updated August 2013)**

Pazopanib is recommended as a first-line treatment option for people with advanced renal cell carcinoma:

- who have not received prior cytokine therapy and have an Eastern Cooperative Oncology Group performance status of 0 or 1.
- if the manufacturer provides pazopanib at the discounted price agreed under the patient access scheme.

www.nice.org.uk/TA215

**NICE guidance**

**Sorafenib for the treatment of advanced hepatocellular carcinoma (May 2010)**

Sorafenib is not recommended for the treatment of advanced hepatocellular carcinoma in patients for whom surgical or locoregional therapies have failed or are unsuitable.

www.nice.org.uk/TA189

**Sunitinib**, a tyrosine kinase inhibitor, is licensed for the treatment of advanced or metastatic renal cell carcinoma (but see NICE Guidance, below). It is also licensed for the treatment of unresectable or metastatic malignant gastro-intestinal stromal tumours, after failure of imatinib, and for the treatment of unresectable or metastatic pancreatic neuroendocrine tumours.

The [Scottish Medicines Consortium](www.nice.org.uk/TA169) (p. 4) has advised (October 2009 and April 2011) that sunitinib (Sutent®) is accepted for restricted use within NHS Scotland for the treatment of unresectable or metastatic malignant gastro-intestinal stromal tumours after failure of imatinib and for unresectable or metastatic pancreatic neuroendocrine tumours.

**Ruxolitinib** is a selective inhibitor of the Janus-associated tyrosine kinases JAK1 and JAK2 and is licensed for the treatment of disease-related splenomegaly or symptoms in patients with primary myelofibrosis, post-polycythæmia vera myelofibrosis, or post-essential thrombocytæmia myelofibrosis.

**NICE guidance**

**Ruxolitinib for disease-related splenomegaly or symptoms in adults with myelofibrosis (June 2013)**

Ruxolitinib is not recommended for the treatment of disease-related splenomegaly or symptoms in adult patients with primary myelofibrosis (also known as chronic idiopathic myelofibrosis), post-polycythæmia vera myelofibrosis, or post-essential thrombocytæmia myelofibrosis.

www.nice.org.uk/TA289

**NICE guidance**

**Sunitinib for advanced or metastatic renal cell carcinoma (March 2009)**

Sunitinib is recommended as first-line treatment for advanced or metastatic renal cell carcinoma in patients who are suitable for immunotherapy and have an Eastern Cooperative Oncology Group performance status of 0 or 1.

www.nice.org.uk/TA179

**NICE guidance**

**Sunitinib for the treatment of gastro-intestinal stromal tumours (September 2009)**

Sunitinib is recommended as an option for treatment in patients with unresectable or metastatic gastro-intestinal tumours if imatinib treatment has failed because of resistance or intolerance, and the cost of sunitinib for the first treatment cycle is met by the manufacturer.

www.nice.org.uk/TA178

**Tensirolimus** is a protein kinase inhibitor licensed for the first-line treatment of advanced renal cell carcinoma (see NICE Guidance above), and for the treatment of relapsed or refractory mantle cell lymphoma. Hypersensitivity reactions, including some life-threatening

**Temsirolimus** is a protein kinase inhibitor licensed for the first-line treatment of advanced renal cell carcinoma (see NICE Guidance above), and for the treatment of relapsed or refractory mantle cell lymphoma. Hypersensitivity reactions, including some life-threatening
and rare fatal reactions, are associated with temsirolimus therapy, usually during administration of the first dose. Symptoms include flushing, chest pain, dyspnoea, apnoea, hypotension, loss of consciousness, and anaphylaxis. Where possible, patients should receive an intravenous dose of antihistamine 30 minutes before starting the temsirolimus infusion. The infusion may have to be stopped temporarily for the treatment of infusion-related effects—consult product literature for appropriate management. If adverse reactions are not managed with dose delays, a dose reduction should be considered—consult product literature.

Vandetanib, a tyrosine kinase inhibitor, is licensed for the treatment of aggressive and symptomatic medullary thyroid cancer in patients with unresectable locally advanced or metastatic disease.

Vemurafenib, a BRAF kinase inhibitor, is licensed as a monotherapy for the treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma. The Scottish Medicines Consortium (p. 4) has advised (November 2013) that vemurafenib (Zelboraf®) is accepted for restricted use within NHS Scotland as monotherapy for the first-line treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma. The manufacturer advises avoid unless potent; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding manufacturer advises avoid—present in milk in animal studies

Side-effects see section 8.1; also diarrhoea, dehydration, weight loss, decreased appetite, dyspepsia, dysgeusia, pyrexia, paronychia, cystitis, renal failure, hypokalaemia, muscle spasms, dry eyes, conjunctivitis, epistaxis, rhinorrhoea, rash (see Cautions), acne, pruritus, dry skin, hand-foot syndrome; less commonly interstitial lung disease, keratitis

Dose

ADULT over 18 years, 40 mg once daily; if tolerated may be increased after 3 weeks to 50 mg once daily (but consult product literature); for dose adjustment due to side-effects, consult product literature

Giotrif® (Boehringer Ingelheim) Tablets, 10 mg (white), 20 mg (white-yellow), net price 28-tab pack = £2023.28; 30 mg (dark blue), 28-tab pack = £2023.28; 40 mg (light blue), 28-tab pack = £2023.28; 50 mg (dark blue), 28-tab pack = £2023.28. Label: 25, Counselling, administration (see below), driving, see Cautions above

Counselling Tablets should be taken whole on an empty stomach. Food should not be consumed for at least 3 hours before and at least 1 hour after each dose

Note Gastro® tablets may be dispersed in approximately 100 mL of noncarbonated water by stirring occasionally for up to 15 minutes (must not be crushed). The dispersion should be swallowed immediately, and the glass rinsed with the same volume of water which should also be swallowed. The dispersion can also be administered via a gastric tube

AFATINIB

Indications see notes above

Cautions see section 8.1; hypertension (blood pressure should be well-controlled before starting and monitored during treatment); monitor for thyroid dysfunction; monitor haemoglobin or haematocrit before and during treatment; monitor for symptoms of gastro-intestinal perforation or fistula; monitor for proteinuria before and during treatment; monitor liver function before and during treatment; interactions: Appendix 1 (afatinib)

Contra-indications untreated brain metastases; recent active gastro-intestinal bleeding

Hepatic impairment reduce starting dose in moderate impairment; avoid in severe impairment; no information available

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk (toxicity in animal studies)—effective contraception required during and for up to 1 week after treatment; see also Pregnancy and Reproductive Function, p. 564

Side-effects see section 8.1; also diarrhoea, constipation, abdominal pain, dyspepsia, flatulence, haemorrhoids, gastro-intestinal perforation, anal fistula, hypertension, haemorrhage (including gastrointestinal, cerebral and haemoptysis), dysphonia, dyspnœa, cough, dysgeusia, headache, dizziness, fatique, asthenia, decreased appetite, weight loss, hypothyroidism, hyperthyroidism, dehydration, proteinuria, hypokalaemia, hypercalcaemia, renal failure, myalgia, arthralgia, tinnitus, hand-foot syndrome, rash, dry skin, pruritus, erythema; less commonly hypertensive crisis, postural reversible encephalopathy syndrome, polycythaemia
8.1.5 Other antineoplastic drugs

**Hepatic impairment** manufacturer advises caution in mild to moderate impairment; avoid in severe impairment

**Pregnancy** avoid (toxicity in animal studies); ensure effective contraception during and for at least 90 days after treatment; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** avoid—no information available

**Indications** see notes above

**Cautions** history or risk factors for QT prolongation (including recent cardiac event or concomitant use of drugs that prolong the QT interval)—monitor ECG and correct hypokalaemia and hypomagnesaemia before and during treatment; cardiac disease; significant gastrointestinal disorder; history of pancreatitis—hold treatment if lipase elevated and abdominal symptoms occur; monitor liver function before treatment initiation, then monthly for the first 3 months and thereafter as clinically indicated—consult product literature for management of raised transaminases; monitor full blood count weekly for the first month and then monthly thereafter or as clinically indicated; monitor for signs and symptoms of fluid retention (including pericardial effusion, pleural effusion and pulmonary oedema); interactions: Appendix 1 (bosutinib)

**Hepatic impairment** caution—no information available

**Pregnancy** avoid—toxicity in animal studies; effective contraception required during treatment in women; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** see section 8.1; also decreased appetite, dyspepsia, bradycardia, QT-interval prolongation, oedema, pneumonitis, fatigue, neuropathy, dizziness, taste disturbance, decreased appetite, hypophosphataemia, vision disorder; less commonly renal cyst; hepatotoxicity also reported

**Dose**

- **ADULT** over 18 years, 250 mg twice daily; for dose adjustment due to side effects, consult product literature

**Xalkori**

- **Capsules** crizotinib 200 mg (white/pink), net price 60-cap pack = £4689.00; 250 mg (pink), 60-cap pack = £4689.00. Label: 25

---

**BOSUTINIB**

**Indications** see notes above

**Cautions** history or risk factors for QT prolongation (including recent cardiac event or concomitant use of drugs that prolong the QT interval)—monitor ECG and correct hypokalaemia and hypomagnesaemia before and during treatment; cardiac disease; significant gastrointestinal disorder; history of pancreatitis—hold treatment if lipase elevated and abdominal symptoms occur; monitor liver function before treatment initiation, then monthly for the first 3 months and thereafter as clinically indicated—consult product literature for management of raised transaminases; monitor full blood count weekly for the first month and then monthly thereafter or as clinically indicated; monitor for signs and symptoms of fluid retention (including pericardial effusion, pleural effusion and pulmonary oedema); interactions: Appendix 1 (bosutinib)

**Hepatic impairment** caution—no information available

**Pregnancy** avoid—toxicity in animal studies; effective contraception required during treatment in women; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** see section 8.1; also decreased appetite, dyspepsia, bradycardia, QT-interval prolongation, oedema, pneumonitis, fatigue, neuropathy, dizziness, taste disturbance, decreased appetite, hypophosphataemia, vision disorder; less commonly renal cyst; hepatotoxicity also reported

**Dose**

- **ADULT** over 18 years, 250 mg twice daily; for dose adjustment due to side effects, consult product literature

---

**CRIZOTINIB**

**Indications** see notes above

**Cautions** susceptibility to QT-prolongation (including concomitant use of drugs that prolong QT interval and electrolyte disturbances); monitor liver function twice a month for the first 2 months of treatment, then at least monthly thereafter; pneumonitis reported (monitor patients with pulmonary symptoms and permanently discontinue treatment if treatment-related pneumonitis diagnosed); interactions: Appendix 1 (crizotinib)

**Hepatic impairment** manufacturer advises caution in moderate to severe impairment; avoid in severe impairment

**Pregnancy** avoid (toxicity in animal studies); ensure effective contraception during and for at least 90 days after treatment; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** avoid—no information available

**Indications** see notes above

**Cautions** pyrexia (interrupt treatment if > 38.5°C and assess for signs and symptoms of infection—consult product literature); assess for cutaneous squamous cell carcinoma and new primary melanoma before treatment, monthly during treatment, and for 6 months after discontinuation or until initiation of alternative treatment; assess and monitor for non-cutaneous secondary or recurrent malignancy before, during, and for 6 months after discontinuation or until initiation of alternative treatment—consult product literature; monitor serum creatinine and other signs of renal failure—consult product literature and interrupt dose as appropriate; monitor for ophthalmologic reactions including uveitis and iritis; promptly investigate signs and symptoms of pancreatitis—consult product literature; monitor ECG and electrolytes (including magnesium) before and one month after treatment initiation and after each dose modification—consult product literature if abnormalities occur; interactions: Appendix 1 (dabrafenib)

**Driving** Ocular adverse reactions and fatigue may affect performance of skilled tasks e.g. driving

**Contra-indications** BRAF wild-type melanoma; uncorrectable electrolyte abnormalities (including magnesium); long QT syndrome, or concomitant use of drugs that prolong the QT interval

**Hepatic impairment** manufacturer advises caution in moderate to severe impairment; additional monitoring of ECG and electrolytes required—consult product literature

**Renal impairment** manufacturer advises caution in severe impairment—no information available

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk (toxicity in animal studies)—effective non-hormonal contraception required during and for one month after treatment in women of childbearing potential; see also Pregnancy and Reproductive Function, p. 564

---

**DABRAFENIB**

**Indications** see notes above

**Cautions** pyrexia (interrupt treatment if > 38.5°C and assess for signs and symptoms of infection—consult product literature); assess for cutaneous squamous cell carcinoma and new primary melanoma before treatment, monthly during treatment, and for 6 months after discontinuation or until initiation of alternative treatment; assess and monitor for non-cutaneous secondary or recurrent malignancy before, during, and for 6 months after discontinuation or until initiation of alternative treatment—consult product literature; monitor serum creatinine and other signs of renal failure—consult product literature and interrupt dose as appropriate; monitor for ophthalmologic reactions including uveitis and iritis; promptly investigate signs and symptoms of pancreatitis—consult product literature; monitor ECG and electrolytes (including magnesium) before and one month after treatment initiation and after each dose modification—consult product literature if abnormalities occur; interactions: Appendix 1 (dabrafenib)

**Driving** Ocular adverse reactions and fatigue may affect performance of skilled tasks e.g. driving

**Contra-indications** BRAF wild-type melanoma; uncorrectable electrolyte abnormalities (including magnesium); long QT syndrome, or concomitant use of drugs that prolong the QT interval

**Hepatic impairment** manufacturer advises caution in moderate to severe impairment; additional monitoring of ECG and electrolytes required—consult product literature

**Renal impairment** manufacturer advises caution in severe impairment—no information available

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk (toxicity in animal studies)—effective non-hormonal contraception required during and for one month after treatment in women of childbearing potential; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** manufacturer advises avoid

**Side-effects** see section 8.1; also decreased appetite, diarrhoea, constipation, decrease in left ventricular
Dose
- **ADULT** over 18 years, 150 mg every 12 hours; for dose adjustment due to side-effects, consult product literature

**Tafinlar**

**Indications**
see section 8.1; susceptibility to QT-interval prolongation (correct hypokalaemia or hypomagnesaemia before starting treatment); risk of cardiac dysfunction (monitor closely);

**Cautions**
see section 8.1 and notes above; also

**Side-effects**
 discontinued if unexplained symptoms such as fever, rigor; conjunctivitis; pruritus, dry skin; rarely corneal perforation or ulceration, Stevens-Johnson syndrome, and toxic epidermal necrolysis

**Dose**
- Chronic phase chronic myeloid leukaemia, **ADULT** over 18 years 100 mg once daily, increased if necessary to max. 140 mg once daily
- Accelerated and blast phase chronic myeloid leukaemia, acute lymphoblastic leukaemia, **ADULT** over 18 years 140 mg once daily, increased if necessary to max. 180 mg once daily

**Sprycel** (Bristol-Myers Squibb)

**Indications**
see notes above

**Cautions**
see section 8.1; pre-existing liver disease or concomitant use with hepatotoxic drugs—monitor liver function; dose adjustment may be necessary if smoking started or stopped during treatment; see MHRA/CHM advice Epidermal Growth Factor Receptor (EGFR) Inhibitors: Serious Cases of Keratitis and Ulcerative Keratitis, p. 588; **interactions**: Appendix 1 (erlotinib)

**Hepatic impairment**
manufacturer advises caution in mild to moderate impairment; avoid in severe impairment

**Renal impairment**
manufacturer advises avoid in severe impairment

**Pregnancy**
manufacturer advises avoid—no data available; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding**
manufacturer advises avoid—no data available

**Side-effects**
see section 8.1 and notes above; also diarrhoea, abdominal pain, taste disturbance, constipation, dyspepsia, colitis, gastritis; arthralgias, congestive heart failure, hypertension, chest pain, flushing, haemorrhage (including gastro-intestinal and CNS haemorrhage), palpitation; dyspnoea, pulmonary hypertension, cough, oedema (more common in patients over 65 years old), pleural effusion; depression, dizziness, headache, insomnia, neuropathy; influenza-like symptoms; musculoskeletal pain; visual disturbances; tinnitus; acne, dry skin, sweating, pruritus, dermatitis, urticaria; less commonly gastrointestinal perforation, interstitial lung disease—discontinue if unexplained symptoms such as dyspnoea, cough or fever occur; eyelash changes; rarely hepatic failure; very rarely corneal perforation or ulceration, Stevens-Johnson syndrome, and toxic epidermal necrolysis

**Dose**
- Non-small cell lung cancer, 150 mg once daily
- Pancreatic cancer, 100 mg once daily in combination with gemcitabine

**Tarceva** (Roche)

**Indications**
see notes above

**Cautions**
see section 8.1; monitor blood-glucose concentration, serum-triglycerides and serum-cholesterol before treatment and periodically thereafter; concomitant use of drugs that increase risk of bleeding; history of bleeding disorders; monitor renal function before treatment and periodically thereafter; reduce dose or discontinue if severe side-effects
occur—consult product literature; interactions: Appendix 1 (everolimus)

Pneumonitis Non-infectious pneumonitis reported. Patients should be advised to seek urgent medical advice if new or worsening respiratory symptoms occur.

Hepatic impairment consult product literature

Pregnancy manufacturer advises avoid (toxicity in animal studies); effective contraception must be used during and for up to 8 weeks after treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding manufacturer advises avoid

Side-effects see section 8.1; also diarrhoea, dry mouth, abdominal pain, dysphagia, anorexia, taste disturbance, chest pain, hypertension, hyperlipidaemia, hypercholesterolaemia, peripheral oedema, pneumonitis (including interstitial lung disease), asthenia, fatigue, headache, insomnia, convulsions, irritability, increased susceptibility to infections (including pneumonia, aspergillosis, and candidiasis), hyperglycaemia, hypoglycaemia, dehydration, renal failure, electrolyte disturbance, arthralgia, eyelid oedema, epistaxis, skin and nail disorders (including hand-foot syndrome), less commonly congestive heart failure, flushing, agitation, aggression, rhabdomyolysis and impaired wound healing; hepatitis B reactivation and haemorrhage also reported.

Dose

○ See under preparations

Afinitor® (Novartis) Tablets, white-yellow, everolimus, 5 mg, net price 30-tab pack = £2250.00; 10 mg, 30-tab pack = £2970.00. Label: 25, counselling, pneumonitis

Dose renal cell carcinoma, neuroendocrine tumours of pancreatic origin, hormone-receptor-positive breast cancer, ADULT over 18 years, 10 mg once daily.

The Scottish Medicines Consortium (p. 4) has advised (April 2012) that everolimus (Afinitor®) is accepted for restricted use within NHS Scotland for the treatment of unresectable or metastatic, well- or moderately-differentiated neuroendocrine tumours of pancreatic origin (pNET) in adults with progressive disease.

Votubia® (Novartis) Tablets, white-yellow, everolimus, 2.5 mg, net price 30-tab pack = £1200.00; 5 mg, 30-tab pack = £2250.00; 10 mg, 30-tab pack = £2970.00. Label: 25, counselling, pneumonitis

Dose subependymal giant cell astrocytoma or renal angiomyolipoma associated with tuberous sclerosis complex, consult product literature

Note Votubia® tablets may be dispersed in approximately 30 mL of water by gently stirring, immediately before drinking. After solution has been swallowed, any residue must be re-dispersed in the same volume of water and swallowed

Gefitinib

Indications see notes above

Cautions monitor liver function—consider discontinuing if severe changes in liver function occur; monitor for worsening of dyspnoea, cough and fever—discontinue if interstitial lung disease confirmed; see MHRA/CHM advice Epidermal Growth Factor Receptor (EGFR) Inhibitors: Serious Cases of Keratitis and Ulcerative Keratitis, p. 588; interactions: Appendix 1 (gefitinib)

Hepatic impairment manufacturer advises caution in moderate to severe impairment due to cirrhosis

Renal impairment manufacturer advises caution if creatinine clearance less than 20 mL/minute

Pregnancy manufacturer advises avoid unless essential—toxicity in animal studies; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; also anorexia, diarrhoea, dry mouth, epistaxis, interstitial lung disease—discontinue if confirmed; asthenia, pyrexia; haematuria, proteinuria; dry eye, conjunctivitis, blepharitis; nail disorder, skin reactions (including dry skin, rash, acne, and pruritus); less commonly pancreatitis, corneal erosion; rarely hepatitis, toxic epidermal necrolysis

Dose

○ ADULT over 18 years, 250 mg once daily

Iressa® (AstraZeneca) Tablets, f/c, brown, gefitinib 250 mg, net price 30-tab pack = £2167.71

Imatinib

Indications see notes above

Cautions see section 8.1; cardiac disease; risk factors for heart failure; history of renal failure; monitor for fluid retention; monitor liver function (see also Hepatic Impairment, below); monitor growth in children (may cause growth retardation); interactions: Appendix 1 (imatinib)

Hepatic impairment max. 400 mg daily; reduce dose further if not tolerated

Renal impairment max. starting dose 400 mg daily if creatinine clearance less than 80 mL/minute; reduce dose further if not tolerated

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk; effective contraception required during treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; also abdominal pain, appetite changes, constipation, diarrhoea, flatulence, gastro-oesophageal reflux, taste disturbance, weight changes, dry mouth; oedema (including pulmonary oedema, pleural effusion, and ascites), flushing, haemorrhage; cough, dyspnoea; dizziness, headache, insomnia, hypoaesthesia, paraesthesia, fatigue; influenza-like symptoms; cramps, arthralgia; visual disturbances, increased lacrimation, conjunctivitis, dry eyes; epistaxis; dry skin, sweating, rash, pruritus, photosensitivity; less commonly gastric ulceration, pancreatitis, hepatic dysfunction (rarely hepatic failure, hepatic necrosis), dysphagia, heart failure, tachycardia, palpitation, syncope, haematomata, hypertension, hypotension, cold extremities, cough, acute respiratory failure, depression, drowsiness, anxiety, peripheral neuropathy, tremor, migraine, impaired memory, vertigo, gynaecomastia, menorrhagia, irregular menstruation, sexual dysfunction, electrolyte disturbances, renal failure, urinary frequency, gout, tinnitus, hearing loss; skin hyperpigmentation; rarely intestinal obstruction, gastro-intestinal perforation, inflammatory bowel disease, arrhythmia, atrial fibrillation, myocardial infarction, angina, pulmonary fibrosis, pulmonary hypertension, increased intracranial pressure, convulsions, confusion, haemolytic anaemia, rhabdomyolysis, myopathy, aseptic necrosis of bone, cataract, glaucoma, angioedema, exfoliative dermatitis, and Stevens-Johnson syndrome; also reported drug rash with eosinophilia and systemic symptoms (DRESS), growth retardation in children.

8.1.5 Other antineoplastic drugs

Pregnancy manufacturer advises avoid unless essential—toxicity in animal studies; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; also anorexia, diarrhoea, dry mouth; epistaxis, interstitial lung disease—discontinue if confirmed; asthenia, pyrexia; haematuria, proteinuria; dry eye, conjunctivitis, blepharitis; nail disorder, skin reactions (including dry skin, rash, acne, and pruritus); less commonly pancreatitis, corneal erosion; rarely hepatitis, toxic epidermal necrolysis

Dose

○ ADULT over 18 years, 250 mg once daily
Malignant disease and immunosuppression

8.1.5 Other antineoplastic drugs

Dose
- Chronic phase chronic myeloid leukaemia, ADULT 400 mg once daily, increased if necessary to max. 800 mg daily (in 2 divided doses); CHILD consult product literature
- Accelerated phase and blast crisis chronic myeloid leukaemia, ADULT 600 mg once daily, increased if necessary to max. 800 mg daily (in 2 divided doses); CHILD consult product literature
- Acute lymphoblastic leukaemia, ADULT 600 mg once daily; CHILD consult product literature
- Gastro-intestinal stromal tumours, ADULT 400 mg once daily
- Alveolar soft part sarcoma, ADULT 800 mg daily in 2 divided doses
- Myelodysplastic/myeloproliferative diseases, ADULT 400 mg once daily
- Advanced hypereosinophilic syndrome and chronic eosinophilic leukaemia, ADULT 100–400 mg once daily

Lapatinib

Indications see notes above

Caution see section 8.1; low gastric pH (reduced absorption); susceptibility to QT-interval prolongation (including concomitant use of drugs that prolong QT-interval and electrolyte disturbances); monitor left ventricular function; monitor for pulmonary toxicity; monitor liver function before treatment and at monthly intervals; interactions: Appendix 1 (lapatinib)

Hepatic impairment caution in moderate to severe impairment—metabolism reduced

Renal impairment caution in severe impairment—no information available

Pregnancy avoid unless potential benefit outweighs risk—毒性 in animal studies; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; anorexia, diarrhoea, flatulence, anxiety, tremor, influenza-like symptoms, headache, fatigue, malaise, nausea, vomiting, constipation, diarrhoea, dyspepsia, flatulence, fatigue, anorexia, weight changes, palpitation, QT-interval prolongation, hypertension, oedema, flushing; dyspnoea, cough, dysphonia; headache, fatigue, asthenia, dizziness, paraesthesia, insomnia, vertigo; hypomagnesaemia, hyperkalaemia, blood glucose changes; bone pain, arthralgia, muscle spasm; urticaria, erythema, hypoproteinaemia, dry mouth, chest pain, cardiac failure, arrhythmias, pericardial effusion, coronary artery disease, cardiomegaly, cardiac murmur, bradycardia, hypertension crisis, haemorrhage, melena, haematoma, pleural effusion, intestinal lung disease, migraine, hypoesthesia, hyperaesthesia, depression, anxiety, tremor, influenza-like symptoms, hyperthyroidism, breast pain, gynaecomastia, erectile dysfunction, dysuria, urinary frequency, hypokalaemia, hypercalcaemia, hypernatraemia, hypocalcaemia, hypophosphataemia, dehydration, decreased visual acuity, conjunctivitis, dry eyes, epistaxis, and ecchymosis

Dose
- Newly diagnosed chronic myeloid leukaemia, chronic phase, ADULT over 18 years, 300 mg twice daily
- Chronic and accelerated phase chronic myeloid leukaemia (see notes above), ADULT over 18 years, 400 mg twice daily

Tasigna® (Novartis) dose: nilotinib (as hydrochloride monohydrate) 150 mg (red), net price 112-cap pack = £2432.85; 200 mg (yellow), 112-cap pack = £2432.85. Label: 23, 25, 27

Pazopanib

Indications see notes above

Caution see section 8.1; monitor liver function before treatment and at weeks 3, 5, 7, and 9, then at months 3 and 4, and periodically thereafter as clinically indicated—consult product literature if elevated liver enzymes observed; control blood pressure before initiating and monitor blood pressure within 1 week of treatment initiation, then frequently throughout treatment (consider dose reduction or interruption if hypertension uncontrolled despite anti-hypertensive therapy; discontinue if blood pressure persistently elevated despite anti-hypertensive therapy and pazopanib dose reduction—consult product literature); susceptibility to QT-interval prolongation (including electrolyte disturbances, concomitant use of drugs that prolong QT-interval); patients at risk of
thrombotic events including myocardial infarction, ischaemic stroke or transient ischaemic attack; cardiac disease (monitor for signs or symptoms of congestive heart failure—monitor left ventricular ejection fraction in patients at risk of heart failure before and during treatment); patients at increased risk of haemorrhage; patients at increased risk of gastrointestinal perforation or fistulas; discontinue treatment 7 days before elective surgery and restart only if adequate wound healing; monitor thyroid function; monitor for proteinuria; increased risk of thrombotic microangiopathy—permanently discontinue if symptoms develop; monitor for signs and symptoms of posterior reversible encephalopathy syndrome (including headache, hypertension, seizure, lethargy, confusion, visual and neurological disturbances)—permanently discontinue treatment if symptoms occur.

**Contra-indications**

- Renal impairment: use with caution if creatinine clearance less than 30 mL/minute.
- Hepatic impairment: no information available—manufacturer advises caution.

**Pregnancy**

- Avoid toxicity in animal studies; effective contraception advised during treatment; see also Pregnancy and Reproductive Function, p. 564.

**Breast-feeding**

- Manufacturer advises avoid—no information available.

**Indications**

- See notes above.

**Cautions**

- History of pancreatitis, alcohol abuse or current severe hypertriglyceridaemia—increased risk of pancreatitis; monitor serum lipase every 2 weeks for the first 2 months and periodically thereafter for all patients—withdraw treatment if lipase elevated and abdominal symptoms occur; monitor full blood count every 2 weeks for the first 3 months and then monthly thereafter or as clinically indicated; monitor liver function periodically; history of myocardial infarction or stroke—do not use unless potential benefit outweighs potential risk; assess cardiovascular status before treatment—manage risk factors before and during treatment; hypertension—medically control during treatment and interrupt treatment if uncontrolled; monitor for vascular occlusion or thromboembolism—interrupt treatment immediately if this occurs; interactions: Appendix 1 (ponatinib).

**Side-effects**

- See section 8.1; also abdominal discomfort, gastro-oesophageal reflux disease, constipation, diarrhoea, pancreatitis, dyspepsia, dry mouth, dehydration, decreased appetite, weight loss, hyper- tension, cardiac disorders, cardiac events, cerebrovascular events, vascular occlusion, thromboembolic events, intermittent claudication, atrial fibrillation, pericardial effusion, oedema, flushing, dyspnoea, cough, pleural effusion, dysphonia, malaise, head- ache, insomnia, dizziness, peripheral neuropathy, altered sensations, pyrexia, infection, biochemistry and electrolyte disturbances, erectile dysfunction, arthralgia, muscle spasm, myalgia, blurred vision, sweating, skin reactions, dry skin, hair and skin discoloration, nail disorders; less commonly hepatic failure, gastro-intestinal perforation, peritonitis, pancreatitis, fistula, cardiac dysfunction, transient ischaemic attack, stroke, myocardial infarction, myocardial ischaemia, brady- cardia, haemorrhage, hypertensive crisis, QT-interval prolongation, pulmonary embolism, peripheral neuropathy, menstrual disturbances, hypomagnesaemia, arthralgia, oropharyngeal pain, photosensitivity reactions; rarely thrombotic microangiopathy

**Dose**

- **ADULT** over 18 years, 45 mg once daily; for dose adjustment due to side-effects, consult product literature.

**Iclusig® (ARIAD)**

- Tablets, ponatinib 15 mg, net price 60-tab pack = £5050.00; 45 mg, 30-tab pack = £5050.00. Label: 3.25

**Indications**

- See notes above.

**Cautions**

- Predisposition to bleeding or concomitant treatment with drugs that may increase the risk of bleeding (increased risk of haemorrhagic events)—monitor blood count and coagulation parameters and consider permanent discontinuation in event of severe bleeding; history of ischaemic heart disease—
monitor for signs and symptoms of myocardial ischaemia and interrupt treatment if signs of ischaemia or infarction develop; may impair wound healing—withdraw treatment for major surgical procedures; hypertension—control blood pressure before treatment initiation and monitor as clinically indicated during treatment (review dose and consider treatment interruption if severe or persistent hypertension develops; discontinue treatment if hypertensive crisis occurs); Gilbert’s syndrome—risk of hyperbilirubinaemia; monitor hepatic function before treatment, then at least every two weeks for the first 2 months, then at least monthly thereafter and as clinically indicated—consult product literature if changes in liver function observed; monitor for signs and symptoms of posterior reversible encephalopathy syndrome (including seizure, headache, altered mental status, visual disturbances or cortical blindness, with or without hypertension)—discontinue treatment if symptoms occur; monitor biochemical, electrolyte and metabolic parameters during treatment; ensure measures to prevent hand-foot skin reaction—consult product literature if signs or symptoms develop; interactions: Appendix 1 (regorafenib)

**Hepatic impairment** manufacturer advises caution in moderate impairment; avoid in severe impairment

**Renal impairment** caution in severe impairment—no information available

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies; women of childbearing potential and men must use effective contraception during treatment and up to 8 weeks after the last dose; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** avoid—present in milk in animal studies

**Side-effects** see section 8.1; also decreased appetite, flatulence, hyperglycaemia, increased transaminases, hepatitis; susceptibility to QT-interval prolongation; expected; unlikely—toxicity in animal studies; rarely—progressive multifocal leukoencephalopathy

**Dose**
- **ADULT** over 18 years, 160 mg once daily for 21 consecutive days of repeated 28-day cycles; for dose adjustment due to side-effects, consult product literature

---

**Stivarga** (Bayer)

**Tablets**
- **I/c, pink** regorafenib 40 mg, net price 84-tab pack = £3744.00. Label: 21, counselling, administration

**Counselling** Tablets should be taken at the same time each day, swallowed whole with water after a light meal that contains less than 30% fat

**Electrolytes** Na⁺ 0.607 mmol/40 mg tablet

---

**RUXOLITINIB**

**Indications** see notes above

**Cautions** see section 8.1; monitor full blood count (including differential white cell count) before treatment, then every 2–4 weeks until dose stabilised, then as clinically indicated; assess risk of developing infection before treatment—do not initiate until active serious infections are resolved (see also under Tuberculosis below); monitor for infection during treatment; monitor for symptoms of progressive multifocal leukoencephalopathy (presenting as new or worsening neurological, cognitive or psychiatric signs or symptoms)—withhold treatment if suspected; interactions: Appendix 1 (ruxolitinib)

**Tuberculosis** Patients should be evaluated for latent and active tuberculosis before starting treatment and monitored for signs and symptoms of tuberculosis during treatment

**Hepatic impairment** reduce dose (consult product literature)

**Renal impairment** reduce dose in severe impairment (consult product literature)

**Pregnancy** avoid—toxicity in animal studies

**Breast-feeding** avoid—present in milk in animal studies

**Side-effects** see section 8.1; also flatulence, hypercholesterolaemia, dizziness, headache, weight gain; less commonly tuberculosis; also reported progressive multifocal leukoencephalopathy

**Dose**
- See Doses, p. 563

**Jakavi** (Novartis)

**Tablets**
- ruxolitinib (as phosphate) 5 mg, net price 56-tab pack = £1680.00; 15 mg, 56-tab pack = £3360.00; 20 mg, 56-tab pack = £3360.00

---

**SORAFENIB**

**Indications** see notes above

**Cautions** major surgical procedures; cardiac ischaemia; susceptibility to QT-interval prolongation; interactions: Appendix 1 (sorafenib)

**Hepatic impairment** manufacturer advises caution in severe impairment—no information available

**Pregnancy** manufacturer advises avoid unless essential—toxicity in animal studies; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1; also diarrhoea, constipation, dyspepsia, dysphagia, anorexia, hypertension, haemorrhage, flushing, hoarseness, fatigue, anaemia, bleeding, peripheral neuropathy, fever, erectile dysfunction, renal failure, hypophosphataemia, arterioalgalgia, myalgia, tinnitus, rash, pruritus, erythema, dry skin, desquamation, acne, hand-foot skin reaction; less commonly gastrointestinal perforations, myocardial infarction, congestive heart failure, hypertensive crisis, interstitial lung disease-like events, posterior reversible encephalopathy syndrome, keratoacanthoma, squamous cell carcinoma of the skin, Stevens-Johnson syndrome, toxic epidermal necrolysis

**Dose**
- **ADULT** over 18 years, 400 mg twice daily

**Nexavar** (Bayer)

**Tablets**
- **I/c, red** sorafenib (as tosylate) 200 mg, net price 112-tab pack = £2980.47 Label: 23
SUNITINIB

Indications see notes above

Cautions see section 8.1; cardiovascular disease—discontinue if congestive heart failure develops; susceptibility to QT-interval prolongation; hypertension; increased risk of bleeding; monitor for thyroid dysfunction; consider dental check-up before initiating treatment (risk of osteonecrosis of the jaw, see MHRA/CHM advice, p. 585); interactions: Appendix 1 (sunitinib)

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk—ritoximab in animal studies; effective contraception required during treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; also abdominal pain, diarrhoea, constipation, anorexia, taste disturbance, dehydration; hypertension, oedema; dyspnoea, cough; fatigue, dizziness, headache, insomnia, peripheral neuropathy, paraesthesia, hypothyroidism; arthralgia, myalgia; increased lacrimation; epistaxis; skin, hair, and urine discoloration, hand-foot syndrome, dry skin, and rash; gastro-intestinal perforation; fistula formation (interrupt treatment if occurs) pancreatitis, osteonecrosis of the jaw (see MHRA/CHM advice, p. 585), hepatic failure, proteinuria (rarely nephrotic syndrome) and seizures reported

Dose

- Gastro-intestinal stromal tumours and metastatic renal cell carcinoma, 50 mg once daily for 4 weeks, followed by a 2-week treatment-free period to complete 6-week cycle; adjust dose in steps of 12.5 mg according to tolerability; dose range 25–75 mg daily
- Pancreatic neuroendocrine tumours, 37.5 mg once daily, without a treatment-free period; adjust dose in steps of 12.5 mg according to tolerability; max. dose 50 mg daily

Sutent® (Pfizer) Capsules, sunitinib (as malate) 12.5 mg (orange), net price 28-cap pack = £784.70; 25 mg (caramel), 28-cap pack = £1569.40; 50 mg (caramel), 28-cap pack = £3138.80. Label: 14

TEMSIROLIMUS

Indications see notes above

Cautions see notes above; monitor respiratory function; monitor blood lipids; interactions: Appendix 1 (temsirolimus)

Hepatic impairment use with caution; in renal cell carcinoma, reduce dose in severe impairment (consult product literature); in mantle cell lymphoma, avoid in moderate or severe impairment

Renal impairment manufacturer advises caution in severe impairment—no information available

Pregnancy manufacturer advises avoid (toxicity in animal studies); ensure effective contraception during treatment in men and women; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding manufacturer advises discontinue breast-feeding

Side-effects see section 8.1; also abdominal pain, diarrhoea, anorexia, taste disturbance, gastro-intestinal haemorrhage, bowel perforation, dysphagia; hypertension, oedema, thrombosis, thrombophlebitis; cough, dyspnoea, chest pain, interstitial lung disease, hypersensitivity reactions (see notes above); insomnia, anxiety, depression, drowsiness, paraesthesia, dizziness, asthenia; increased susceptibility to infection (including urinary-tract infection and pneumonia), pyrexia; hyperglycaemia; renal failure; hypophosphataemia, hypokaemia, hypercholesterolaemia, hyperlipidaemia; myalgia, arthralgia; eye disorders; rhinitis, epistaxis; skin disorders (including rash and acne), folliculitis, impaired wound healing; less commonly intracerebral bleeding

Dose

- See Doses, p. 563

Torisel® (Pfizer) Infusion, temsirolimus 30 mg concentrate (25 mg/mL), net price 1.2-mL amp (with diluent) = £620.00

Excipients include propylene glycol and ethanol

VANDETANIB

Indications see notes above

Cautions see section 8.1; susceptibility to QT-prolongation (including concomitant use of drugs that prolong QT interval and electrolyte disturbances)—monitor ECG, serum potassium, calcium, magnesium and thyroid stimulating hormone before treatment, then 1, 3, 6 and 12 weeks after starting treatment and following dose adjustment or interruption, then every 3 months for at least 1 year; history of torsades de pointes; phototoxicity reactions reported (wear protective clothing and/or sunscreen); brain metastases (intracranial haemorrhage reported); hypertension; interactions: Appendix 1 (vandetanib)

Contra-indications congenital long QT syndrome; QT interval greater than 480 milliseconds

Hepatic impairment manufacturer advises avoid in severe impairment (serum bilirubin greater than 1.5 times the upper limit of normal)

Renal impairment reduce dose to 200 mg if creatinine clearance 30–49 mL/minute; avoid if creatinine clearance less than 30 mL/minute

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk—effective contraception required during and for at least 4 months after treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding avoid—no information available

Side-effects see section 8.1; also abdominal pain, diarrhoea, constipation, dyspepsia, colitis, dry mouth, dysphagia, gastritis, gastrointestinal haemorrhage, cholelithiasis, QT-interval prolongation, hypertension, ischaemic cerebrovascular conditions, oedema, epistaxis, haemoptysis, pnuemonitis, headache, paraesthesia, dysaesthesia, dizziness, tremor, lethargy, asthenia, pain, pyrexia, loss of consciousness, balance disorders, taste disturbance, insomnia, depression, anxiety, hypothyroidism, decreased appetite, hyperglycaemia, dehydration, electrolyte disturbances, proteinuria, nephrolithiasis, dysuria, haematuria, pollakiuria, micturition urgency, blurred vision, corneal changes (including corneal deposits and opacity), halo vision, photopsia, glaucoma, conjunctivitis, dry eye, keratopathy, photosensitivity reactions, hand-foot syndrome, alopecia, less commonly panreatitis, peritonitis, ileus, intestinal perforation, faecal incontinence, heart failure, cardiac conduction, rate and rhythm disorders, ventricular arrhythmia, cardiac arrest, respiratory failure, aspiration pneumonia, interstitial lung disease (sometimes
8.1.5 Other antineoplastic drugs

Malignant disease and immunosuppression

fatal), convulsions, clonus, brain oedema, posterior reversible encephalopathy syndrome, impaired healing, increased haemoglobin, chromatura, anuria, cataract, accommodation disorders, bulous dermatitis, erythema multiforme and Stevens-Johnson syndrome

Dose

- **ADULT, 300 mg** once daily; for dose adjustment due to side effects, consult product literature

Caprelsa® (AstraZeneca) ▼ (PVI)

Tablets, I/c, vandetanib 100 mg, net price 30-tab pack = £2500.00; 300 mg, 30-tab pack = £5000.00. Alert card

Note Caprelsa® tablets may be dispersed in half a glass of water by stirring until dispersed (approximately 10 minutes), immediately before drinking (do not crush). After solution has been swallowed, any residue must be re-dispersed in the same volume of water and swallowed. The solution can also be administered via nasogastric or gastrostomy tubes

VEMURAFENIB

Indications see notes above

Cautions see section 8.1; susceptibility to QT-prolongation (including concomitant use of drugs that prolong QT interval and electrolyte disturbances)—monitor ECG and electrolytes before treatment, after one month and following dose adjustment (treatment not recommended if QT interval greater than 500 milliseconds at baseline); monitor for cutaneous and non-cutaneous squamous cell carcinoma and new primary melanoma before, during and for up to 6 months after treatment—consult product literature; monitor liver function before treatment and periodically thereafter; monitor for uveitis, iritis and retinal vein occlusion; prior or concurrent cancer associated with RAS mutation—increased risk of tumour progression; interactions: Appendix 1 (vemurafenib)

Contra-indications wild-type BRAF malignant melanoma

Hepatic impairment manufacturer advises more frequent monitoring in moderate to severe impairment (including monthly ECG monitoring during first 3 months of treatment)

Renal impairment manufacturer advises caution in severe impairment

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk—effective contraception required during and for at least 6 months after treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding avoid—no information available

Side-effects see section 8.1; also diarrhoea, constipation, decreased appetite, cough, peripheral oedema, QT-interval prolongation, fatigue, anaesthesia, pyrexia, headache, dizziness, taste disturbance, Bell’s palsy, new primary melanoma, arthralgia, myalgia, pain in extremities, musculoskeletal pain, arthritis, uveitis, seborrhoeic keratosis, actinic keratosis, keratosis pilaris, skin papilloma, cutaneous squamous cell carcinoma, basal cell carcinoma, photosensitivity reactions, hyperkeratosis, erythema, alopecia, folliculitis, dry skin, hand-foot syndrome, erythema nodosum; less commonly vasculitis, peripheral neuropathy, non-cutaneous squamous cell carcinoma, retinal vein occlusion, toxic epidermal necrolysis, Stevens-Johnson syndrome; rarely progression of pre-existing NRAS mutated chronic myelomonocytic leukaemia; also reported hypersensitivity reactions

Drug rash with eosinophilia and systemic symptoms (DRESS syndrome)

DRESS syndrome has been reported in patients taking vemurafenib. DRESS syndrome starts with rash, fever, swollen glands, and increased white cell count, and it can affect the liver, kidneys and lungs; DRESS can also be fatal. Patients should be advised to stop taking vemurafenib and consult their doctor immediately if skin rash develops. Treatment with vemurafenib should not be restarted.

Dose

- **ADULT over 18 years, 960 mg** twice daily; for dose adjustment due to side effects, consult product literature

Zelboraf® (Roche) ▼ (PVI)

Tablets, I/c, vemurafenib (as co-precipitate of vemurafenib and hypromellose acetate succinate) 240 mg, net price 56-tab pack = £1750.00. Label: 25, counselling

Counselling Food may affect absorption (take at the same time with respect to food)

Taxanes

Paclitaxel is a member of the taxane group of drugs. It is given by intravenous infusion, and is available as both conventional and albumin-bound formulations. The different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are not interchangeable. Conventional paclitaxel given with carboplatin or cisplatin is used for the treatment of ovarian cancer (see NICE guidance p. 594); the combination is also considered appropriate for women whose ovarian cancer is initially considered inoperable; it is also licensed for the secondary treatment of metastatic breast cancer. There is limited evidence to support its use in non-small cell lung cancer. Routine premedication with a corticosteroid, an antihistamine and a histamine H 2-receptor antagonist is recommended to prevent severe hypersensitivity reactions; hypersensitivity reactions may occur rarely despite premedication, although more commonly only bradycardia or asymptomatic hypotension occur.

Other side-effects of conventional paclitaxel include myelosuppression, peripheral neuropathy, and cardiac conduction defects with arrhythmias (which are nearly always asymptomatic). It also causes alopecia and muscle pain; nausea and vomiting is mild to moderate. Albumin-bound paclitaxel is licensed for monotherapy of metastatic breast cancer following failed first-line treatment for metastatic disease and when standard, anthra-cycline-containing therapy is not indicated. It is also licensed in combination with gemcitabine for the first-line treatment of metastatic adenocarcinoma of the pancreas. It causes myelosuppression (primarily neutropenia) and commonly febrile neutropenia. Other common side-effects include peripheral neuropathy, pancytopenia, myalgia, arthralgia and gastro-intestinal disorders; bradycardia, cardiac arrest, congestive heart failure, and left ventricular dysfunction are rare but cardiac monitoring should be undertaken, particularly if patients have underlying cardiac disease or...
previous exposure to anthracyclines. Patients aged over 75 years with metastatic adenocarcinoma of the pancreas should be treated with caution. Patients should also be monitored for signs and symptoms of pneumonitis and sepsis. Stevens-Johnson syndrome and toxic epidermal necrolysis have also been reported.

**NICE guidance**

**Paclitaxel for the adjuvant treatment of early node-positive breast cancer**

Paclitaxel, within its licensed indication, is **not** recommended for the adjuvant treatment of women with early node-positive breast cancer.

www.nice.org.uk/TA108

Docetaxel is licensed for use in locally advanced or metastatic breast cancer and non-small cell lung cancer resistant to other cytotoxic drugs or for initial chemotherapy in combination with other cytotoxic drugs. It is also licensed for hormone-resistant prostate cancer, for use with other cytotoxic drugs for gastric adenocarcinoma and head and neck cancer, and for adjuvant treatment of operable node-positive and operable node-negative breast cancer. Its side-effects are similar to those of paclitaxel but persistent fluid retention (commonly as leg oedema that worsens during treatment) can be resistant to treatment; hypersensitivity reactions also occur. Pretreatment with dexamethasone by mouth is recommended for reducing fluid retention and hypersensitivity reactions.

For the role of taxanes in the treatment of breast cancer, see section 8.3.4.1.

The *Scottish Medicines Consortium* (p. 4) has advised that docetaxel *(Taxotere®)* in combination with cisplatin and fluorouracil is accepted for restricted use within NHS Scotland for the induction treatment of patients with locally advanced squamous cell carcinoma of the head and neck.

**NICE guidance**

**Docetaxel for the treatment of hormone-refractory metastatic prostate cancer**

Docetaxel is an option for hormone-refractory metastatic prostate cancer and a Karnofsky score of at least 60% [Karnofsky score is a measure of the ability to perform ordinary tasks].

www.nice.org.uk/TA101

**NICE guidance**

**Docetaxel for the adjuvant treatment of early node-positive breast cancer**

Docetaxel, when given concurrently with doxorubicin and cyclophosphamide (TAC regimen), is recommended as an option for the adjuvant treatment of women with early node-positive breast cancer.

www.nice.org.uk/TA109

**Cabazitaxel**

Cabazitaxel, in combination with prednisone or prednisolone, is licensed for the treatment of hormone refractory metastatic prostate cancer in patients who have previously been treated with a docetaxel-containing regimen. Routine premedication with a corticosteroid, an antihistamine, and a histamine H₂-receptor antagonist is recommended to prevent severe hypersensitivity reactions. Hypersensitivity reactions are common.

Other side-effects of cabazitaxel include weight changes, diarrhoea, constipation, abdominal pain, dyspepsia, gastroesophageal reflux, haemorrhoids, rectal haemorrhage, taste disturbance, dry mouth, chest pain, atrial fibrillation, tachycardia, hypertension, hypotension, flushing, oedema, dyspnoea, cough, peripheral neuropathy, paraesthesia, hypoaesthesia, anxiety, confusion, dizziness, headache, malaise, vertigo, chills, hyperglycaemia, urinary retention, urinary incontinence, renal disorders (fatal cases of renal failure reported), dehydration, electrolyte disturbances, sciatia, arthralgia, muscle spasm, myalgia, increased lacrimation, tinnitus, dry skin, erythema.

**NICE guidance**

**Cabazitaxel for hormone-refractory metastatic prostate cancer previously treated with a docetaxel-containing regimen**

Cabazitaxel in combination with prednisone or prednisolone is **not** recommended for the treatment of hormone-refractory metastatic prostate cancer previously treated with a docetaxel-containing regimen.

Patients currently receiving cabazitaxel in combination with prednisone or prednisolone for the treatment of hormone-refractory metastatic prostate cancer previously treated with a docetaxel-containing regimen should have the option to continue treatment until they and their clinicians consider it appropriate to stop.

www.nice.org.uk/TA255

**CABAZITAXEL**

**Indications** see notes above

**Cautions** see section 8.1; monitor electrolytes—correct dehydration; avoid in acute porphyria (but see section 9.8.2); interactions: Appendix 1 (cabazitaxel)

**Hepatic impairment** avoid

**Renal impairment** use with caution if creatinine clearance less than 50 mL/minute

**Pregnancy** ensure effective contraception during treatment (women) and for up to 6 months after treatment (men); see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Dose**

- See Doses, p. 563

**Jevtana®** (Sanofi-Aventis)

Concentrate for intravenous infusion, cabazitaxel 40 mg/mL, net price 1.5-mL vial (and solvent) = £3696.00

**Note** Incompatible with PVC. Solvent contains ethanol
**Malignant disease and immunosuppression**

**DOCETAXEL**

**Indications**  
Adjuvant treatment of operable node-positive and operable node-negative breast cancer, in combination with docetaxel and cyclophosphamide; with doxorubicin for initial chemotherapy of locally advanced or metastatic breast cancer; monotherapy for locally advanced or metastatic breast cancer where cytotoxic chemotherapy with an anthracycline or an alkylating drug has failed; with capecitabine for locally advanced or metastatic breast cancer where cytotoxic chemotherapy with an anthracycline has failed; with trastuzumab for initial chemotherapy of metastatic breast cancer which overexpresses human epidermal growth factor-2; locally advanced or metastatic non-small cell lung cancer where first-line chemotherapy has failed; with cisplatin for unresectable, locally advanced or metastatic non-small cell lung cancer; with prednisolone for hormone-refractory metastatic prostate cancer; with cisplatin and fluorouracil for initial treatment of metastatic gastric adenocarcinoma, including adeno-carcinoma of the gastro-oesophageal junction; with cisplatin and fluorouracil for induction treatment of locally advanced squamous cell carcinoma of the head and neck.

**Cautions**  
See section 8.1 and notes above; avoid in acute porphyria (but see section 9.8.2); interactions: Appendix 1 (docetaxel).

**Hepatic impairment**  
Monitor liver function—reduce dose according to liver enzymes; avoid in severe impairment.

**Pregnancy**  
Avoid (toxicity and reduced fertility in animal studies); manufacturer advises effective contraception during and for at least 3 months after treatment; see also Pregnancy and Reproductive Function, p. 564.

**Breast-feeding**  
Discontinue breast-feeding.

**Side-effects**  
See section 8.1, notes above, and consult product literature.

**Dose**  
See Doses, p. 563.

**Note**  
Different preparations of intravenous paclitaxel vary in their licensed indications, pharmacodynamics, pharmacokinetics, dosage, and administration; these preparations should not be considered interchangeable. To avoid confusion, prescribers should specify the brand to be dispensed.

**Paclitaxel** (Non-proprietary)  
**Infusion**, paclitaxel 6 mg/mL, net price 5-mL vial = £66.85, 16.7-mL vial = £200.35, 25-mL vial = £300.52, 50-mL vial = £601.03.

**Excipients**  
Include polyoxyl castor oil (risk of anaphylaxis, see Excipients, p. 2).

**Albumin-bound formulation**

**Abraxane** (Celgene)  
**Infusion**, paclitaxel as albumin bound nanoparticles, net price 100-mg vial = £246.00.

**Electrolytes**  
Contains approx. 3.7 mmol Na+/vial.

**Topoisomerase I inhibitors**

**Irinotecan** and **topotecan** inhibit topoisomerase I, an enzyme involved in DNA replication.

**Irinotecan** is licensed for metastatic colorectal cancer in combination with fluorouracil and folinic acid or as monotherapy when treatment containing fluorouracil has failed. It is also licensed in combination with cetuximab for the treatment of epidermal growth factor receptor-expressing metastatic colorectal cancer after failure of chemotherapy that has included irinotecan. Irinotecan is also licensed in combination with fluorouracil, folinic acid and bevacizumab for the first-line treatment of metastatic carcinoma of the colon or rectum. Irinotecan is also licensed in combination with capecitabine with or without bevacizumab for the first-line treatment of metastatic colorectal carcinoma. Irinotecan is given by intravenous infusion.

**NICE guidance**

Irinotecan, oxaliplatin and raltitrexed for advanced colorectal cancer (August 2005)  
See p. 593.
**Topotecan** is given by intravenous infusion or orally in relapsed small-cell lung cancer when retreatment with the first-line regimen is considered inappropriate. Topotecan injection is also licensed for metastatic ovarian cancer when first-line or subsequent treatment has failed. Topotecan injection is licensed in combination with cisplatin for treatment of recurrent carcinoma of the cervix, after radiotherapy, and for patients with stage IVB disease.

In addition to dose-limiting myelosuppression, side-effects of irinotecan and topotecan include gastrointestinal effects (delayed diarrhoea requiring prompt treatment). The effects of irinotecan and topotecan include gastrointestinal effects (delayed diarrhoea requiring prompt treatment), asthenia, alopecia, anorexia, and anorexia.

The Scottish Medicines Consortium (p. 4) has advised (November 2007) that topotecan (Hycamtin®) is accepted for restricted use in combination with cisplatin for treatment of recurrent carcinoma of the cervix after radiotherapy and for stage IVB disease; it is restricted to patients who have not previously received cisplatin treatment.

The Scottish Medicines Consortium (p. 4) has advised (March 2009) that use of topotecan capsules within NHS Scotland is restricted to patients in whom standard intravenous chemotherapy is inappropriate and who would otherwise receive best supportive care.

**Topotecan**

Topotecan for the treatment of recurrent and stage IVB cervical cancer (October 2009)

Topotecan in combination with cisplatin is recommended as a treatment option for recurrent or stage IVB cervical cancer in patients who have not previously received cisplatin.

www.nice.org.uk/TA183

**Topotecan**

Topotecan for the treatment of relapsed small-cell lung cancer (November 2009)

Oral topotecan is recommended as an option for treatment in patients with relapsed small-cell lung cancer only if re-treatment with the first-line regimen is not considered appropriate, and the combination of cyclophosphamide, doxorubicin and vincristine is contra-indicated. Intravenous topotecan is not recommended for people with relapsed small-cell lung cancer.

www.nice.org.uk/TA184

**Topotecan (paclitaxel, pegylated liposomal doxorubicin and topotecan for second-line or subsequent treatment of advanced ovarian cancer)**

See p. 594

---

**IRINOTECAN HYDROCHLORIDE**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; raised plasma-bilirubin concentration (see under Hepatic impairment); risk factors for cardiac disease; monitor respiratory function; interactions Appendix 1 (irinotecan)

**Contra-indications** see section 8.1 and notes above; also chronic inflammatory bowel disease, bowel obstruction

**Hepatic impairment** monitor closely for neutropenia if plasma-bilirubin concentration 1.5–3 times upper limit of normal range (consult product literature); avoid if plasma-bilirubin concentration greater than 3 times upper limit of normal range

**Renal impairment** manufacturer advises avoid—no information available

**Pregnancy** avoid (teratogenic and toxic in animal studies); manufacturer advises effective contraception during and for up to 1 month after treatment in women and up to 3 months after treatment in men; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; also acute cholinergic syndrome (with early diarrhoea) and delayed diarrhoea (consult product literature); less commonly interstitial pulmonary disease

**Dose**

- See Doses, p. 563

**Irinotecan (Non-proprietary)**

Infusion, irinotecan hydrochloride 20 mg/mL, net price 2-mL vial = £46.50, 5-mL vial = £114.00, 15-mL vial = £370.50, 25-mL vial = £601.25

**Campto® (Pfizer)**

Infusion, irinotecan hydrochloride 20 mg/mL, net price 2-mL vial = £53.00; 5-mL vial = £130.00; 15-mL vial = £390.00

---

**TOPOTECAN**

**Indications** see notes above

**Cautions** see section 8.1 and notes above

**Contra-indications** see section 8.1 and notes above

**Hepatic impairment** avoid in severe impairment

**Renal impairment** reduce dose; avoid infusion if creatinine clearance less than 20 mL/minute; avoid oral route if creatinine clearance less than 60 mL/minute

**Pregnancy** avoid (teratogenicity and fetal loss in animal studies); see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Dose**

- See Doses, p. 563

**Topotecan (Non-proprietary)**

Concentrate for intravenous infusion, topotecan (as hydrochloride) 1 mg/mL, net price 1-mL vial = £87.88, 4-mL vial = £261.55

Intravenous infusion, powder for reconstitution, topotecan (as hydrochloride), net price 1-mg vial = £97.00, 4-mg vial = £290.00

---
Trabectedin

Trabectedin is licensed for the treatment of advanced soft tissue sarcoma when treatment with anthracyclines and ifosfamide has failed or is contra-indicated and in combination with pegylated liposomal doxorubicin for the treatment of relapsed platinum-sensitive ovarian cancer.

Trabectedin is given by intravenous infusion. A corticosteroid, such as dexamethasone by intravenous infusion, should be given 30 minutes before therapy for its antiemetic and hepatoprotective effects.

NICE guidance

Trabectedin for the treatment of advanced soft tissue sarcoma (February 2010)

Trabectedin is an option for advanced soft tissue sarcoma when treatment with anthracyclines and ifosfamide has failed, is inappropriate or is not tolerated. The cost of trabectedin for treatment after the fifth cycle is met by the manufacturer.

www.nice.org.uk/TA185

Trabectedin for the treatment of relapsed ovarian cancer (April 2011)

Trabectedin in combination with pegylated liposomal doxorubicin is not recommended for the treatment of relapsed platinum-sensitive ovarian cancer.

www.nice.org.uk/TA222

Breast-feeding

manufacturer advises avoid breast-feeding during and for 3 months after treatment

Side-effects

see section 8.1; also abdominal pain, constipation, diarrhoea, dyspepsia, taste disturbance, hepatobiliary disorders; hypotension, oedema, flushing; dyspnoea, cough; headache, insomnia, peripheral neuropathy, paraesthesia, dizziness, anorexia, asthenia, fatigue; pyrexia; hypokalaemia, dehydration, increased blood creatine kinase; myalgia, arthralgia, back pain

Dose

- See Doses, p. 563

Trastuzumab

Trastuzumab is licensed for the treatment of early breast cancer which overexpresses human epidermal growth factor receptor-2 (HER2).

Trastuzumab is also licensed, in combination with paclitaxel or docetaxel, for metastatic breast cancer in patients with HER2-positive tumours who have not received chemotherapy for metastatic breast cancer and in whom anthracycline treatment is inappropriate.

Trastuzumab is also licensed, in combination with an aromatase inhibitor, for metastatic breast cancer in postmenopausal patients with hormone-receptor positive HER2-positive tumours not previously treated with trastuzumab.

Trastuzumab is also licensed as monotherapy for metastatic breast cancer in patients with tumours that overexpress HER2 who have received at least 2 chemotherapy regimens including, where appropriate, an anthracycline and a taxane; women with oestrogen-receptor-positive breast cancer should also have received hormonal therapy.

Trastuzumab is also licensed (by intravenous infusion only), in combination with capecitabine or fluorouracil and cisplatin, for metastatic gastric cancer in patients with HER2-positive tumours who have not received treatment for metastatic gastric cancer.

Resuscitation facilities should be available during administration of trastuzumab and treatment should be initiated by a specialist. Trastuzumab is not interchangeable with trastuzumab emtansine. See section 8.3.4.1 for the role of trastuzumab in the treatment of breast cancer.

Use with anthracyclines

Concomitant use of trastuzumab with anthracyclines (section 8.1.2) is associated with cardiotoxicity. The use of anthracyclines even after stopping trastuzumab can increase the risk of cardiotoxicity and if possible should be avoided for up to 24 weeks. If an anthracycline needs to be used, cardiac function should be monitored closely.
NICE guidance

Guidance on the use of trastuzumab for the treatment of advanced breast cancer (March 2002)

Trastuzumab in combination with paclitaxel is recommended as an option for patients with tumours expressing human epidermal growth factor receptor 2 (HER2) scored at levels of 3+ who have not received chemotherapy for metastatic breast cancer, and in whom anthracycline treatment is inappropriate.

Trastuzumab monotherapy is recommended as an option for patients with tumours expressing HER2 scored at levels of 3+ who have received at least two chemotherapy regimens for metastatic breast cancer. Prior chemotherapy must have included at least an anthracycline and a taxane where these treatments are appropriate. It should also have included hormonal therapy in suitable oestrogen-receptor-positive patients.

www.nice.org.uk/TA34

NICE guidance

Trastuzumab for the adjuvant treatment of early-stage HER2-positive breast cancer (August 2006)

Trastuzumab, given at 3-week intervals for 1 year or until disease recurrence (whichever is the shorter period), is recommended as an option for women with early-stage HER2-positive breast cancer following surgery, chemotherapy (neoadjuvant or adjuvant) and radiotherapy (if applicable).

www.nice.org.uk/TA107

NICE guidance

Trastuzumab for the treatment of HER2-positive metastatic gastric cancer (November 2010)

Trastuzumab in combination with cisplatin and capecitabine or fluorouracil is recommended for human epidermal growth factor receptor-2-positive metastatic adenocarcinoma of the stomach or gastro-oesophageal junction in patients who:

- have not received treatment for metastatic disease and
- have tumours expressing high levels of HER2 as defined by a positive immunohistochemistry score of 3.

www.nice.org.uk/TA208

NICE guidance (lapatinib or trastuzumab in combination with an aromatase inhibitor for the first-line treatment of metastatic hormone-receptor-positive breast cancer that overexpresses HER2)

See p. 598

8.1.5 Other antineoplastic drugs

Contra-indications see section 8.1 and notes above; severe dyspnoea at rest

Pregnancy  manufacturer advises avoid—oligohydramnios reported; effective contraception must be used during treatment and for 6 months after stopping; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding  avoid breast-feeding during treatment and for 7 months afterwards

Side-effects see section 8.1; also infusion-related side-effects (possibly delayed onset, including chills, fever, hypersensitivity reactions such as anaphylaxis, urticaria, and angioedema), gastro-intestinal symptoms, hepatitis, cardiotoxicity (see also above), chest pain, hypertension, hypotension, pulmonary events (possibly delayed onset), headache, taste disturbance, anxiety, malaise, depression, insomnia, drowsiness, dizziness, paraesthesia, tremor, asthma, peripheral neuropathy, hypertension, paresis, mastitis, infection, ecchymosis, oedema, weight loss, arthralgia, myalgia, arthritis, bone pain, leg cramps, dry eye, increased lacrimation, rash, pruritus, sweating, dry skin, alopecia, acne, nail disorders

Dose

- See Doses, p. 563
- Herceptin® (Roche)  Intravenous infusion, powder for reconstitution, trastuzumab, net price 150-mg vial = £407.40
- Injection (for subcutaneous use), trastuzumab 120-mg/ml, net price 5-mL vial = £1222.20
- Note Subcutaneous preparation not licensed for use in metastatic gastric cancer
- Note When prescribing, dispensing or administering, check that this is the correct preparation—trastuzumab and trastuzumab emtansine are not interchangeable
- Note The Scottish Medicines Consortium p. 4 has advised (December 2013) that subcutaneous trastuzumab injection (Herceptin®) is accepted for restricted use within NHS Scotland for the treatment of adults with HER2 positive metastatic breast cancer and early breast cancer, when used within licensed indications excluding use in combination with an aromatase inhibitor for the treatment of postmenopausal patients with hormone-receptor positive metastatic breast cancer, not previously treated with trastuzumab

Trastuzumab emtansine

Trastuzumab emtansine is an antibody-drug conjugate that contains trastuzumab covalently linked to DM1, a cytotoxic microtubule inhibitor. Trastuzumab emtansine and trastuzumab are not interchangeable; trastuzumab emtansine is indicated as monotherapy for the treatment of HER2-positive, unresectable, locally advanced or metastatic breast cancer, in adult patients who have previously received trastuzumab and a taxane separately or in combination, or who have developed disease recurrence during or within 6 months of completing adjuvant therapy. Resuscitation facilities should be available during administration of trastuzumab emtansine and treatment should be initiated by a specialist. See section 8.3.4.1 for the role of trastuzumab emtansine in the treatment of breast cancer.

TRASTUZUMAB EMTANSINE

Indications see notes above

Cautions see section 8.1; patients over 75 years; dyspnoea at rest—increased risk of pulmonary events; monitor for dyspnoea, cough, fatigue and pulmonary infiltrates—discontinue if interstitial lung
Tretinoin is the acid form of vitamin A. It is used in previously untreated patients as well as in those who have relapsed after standard chemotherapy or who are refractory to it.

Note: Tretinoin is the acid form of vitamin A.

Indications see notes above; acne (section 13.6.1); photodamage (section 13.8.1).

Cautions exclude pregnancy before starting treatment; monitor haematological and coagulation profile, liver function, serum calcium and plasma lipids before and during treatment; increased risk of thromboembolism during first month of treatment; interactions: Appendix 1 (retinoids).

Hepatic impairment reduce dose to 25 mg/m².

Renal impairment reduce dose to 25 mg/m².

Pregnancy teratogenic; effective contraception must be used for at least 1 month before oral treatment, during treatment and for at least 1 month after stopping (oral prostogestogen-only contraceptives not considered effective); see also Pregnancy and Reproductive Function, p. 564.

Breast-feeding avoid

Side-effects retinoic acid syndrome (fever, dyspnoea, acute respiratory distress, pulmonary infiltrates, pleural effusion, hyperleucocytosis, hypotension, oedema, weight gain, hepatic, renal and multi-organ failure) requires immediate treatment—consult product literature; gastro-intestinal disturbances, pancreatitis; arthralgias, flushing, oedema, headache, benign intracranial hypertension (mainly in children—consider dose reduction if intractable headache in children), shivering, dizziness, confusion, anxiety, depression, insomnia, paraesthesia, visual and hearing disturbances; raised liver enzymes, serum creatinine and lipids; bone and chest pain, alopecia, erythema, rash, pruritus, sweating, dry skin and mucous membranes, cheilitis; thromboembolism, hypercalcaemia, and genital ulceration reported.

Dose

ADULT and CHILD 45 mg/m² daily in 2 divided doses, max. duration of treatment 90 days (consult product literature for details of concomitant chemotherapy).

Vesanoid® (intrapharm) (Roche) Capsules, yellow/brown, tretinoin 10 mg, net price 100-cap pack = £160.63. Label: 21, 25

Vismodegib Vismodegib is a hedgehog pathway inhibitor used in the treatment of basal cell carcinoma. Vismodegib may cause severe birth defects and embryo-fetal death. For women of child-bearing potential, pregnancy must be excluded before initiation of treatment, and monthly during treatment. Women must use two contraceptive methods (including one highly effective method and one barrier method) during treatment and for 24 months after the final dose of vismodegib; men must use a condom during treatment and for 2 months after the final dose. Prescribers and pharmacists must comply with prescribing and dispensing restrictions as specified in the manufacturer’s Pregnancy Prevention Programme, and ensure that the patient fully acknowledges the programme’s pregnancy prevention measures—consult product literature for further information.

VISMODEGIB

Indications symptomatic metastatic basal cell carcinoma; locally advanced basal cell carcinoma not appropriate for surgery or radiotherapy.

Cautions see notes above; interactions: Appendix 1 (vismodegib).

Hepatic impairment no information available—manufacturer advises caution in moderate to severe impairment.

8.1.5 Other antineoplastic drugs
Renal impairment  no information available—manufacturer advises caution in severe impairment

Pregnancy  important: teratogenic risk; see also notes above

Breast-feeding  avoid during treatment and for 24 months after final dose

Side-effects  nausea, vomiting, diarrhoea, constipation, abdominal pain, decreased appetite, weight loss, dehydrogenase, dyspepsia, taste disturbances, malaise, amenorrhoea, hyponatraemia, arthralgia, musculoskeletal pain, muscle spasms, alopecia, abnormal hair growth, pruritus, rash

Dose
- ADULT over 18 years, 150 mg once daily

Erivedge® (Roche) ▼ Patient, prescriber, and supplying pharmacy must comply with the manufacturer’s pregnancy prevention programme

Capsules, pink/grey, vismodegib 150 mg, net price 28-cap pack = £6285.00. Label: 25, counselling, pregnancy and contraception

Note  Patient, prescriber, and supplying pharmacy must comply with the manufacturer’s pregnancy prevention programme

Immunosuppressant therapy

Immunosuppressants are used to suppress rejection in organ transplant recipients and to treat a variety of chronic inflammatory and autoimmune diseases. Solid organ transplant patients are maintained on drug regimens, which may include antiproliferative drugs (azathioprine or mycophenolate mofetil), calcineurin inhibitors (ciclosporin or tacrolimus), corticosteroids, or thiopurine. Choice is dependent on the type of organ, time after transplantation, and clinical condition of the patient. Specialist management is required and other immunomodulators may be used to initiate treatment or to treat rejection.

Impaired immune responsiveness  Modification of tissue reactions caused by corticosteroids and other immunosuppressants may result in the rapid spread of infection. Corticosteroids may suppress clinical signs of infection and allow diseases such as septicaemia or tuberculosis to reach an advanced stage before being recognised—important: for advice on measles exposure, see section 14.5.1, and chickenpox (varicella) exposure, see section 14.5.2. For advice on the use of live vaccines in individuals with impaired immune response, see section 14.1. For general comments and warnings relating to corticosteroids and immunosuppressants, see section 6.3.2.

Pregnancy  Transplant patients immunosuppressed with azathioprine should not discontinue it on becoming pregnant. However, there have been reports of premature birth and low birth-weight following exposure to azathioprine, particularly in combination with corticosteroids. Spontaneous abortion has been reported following maternal or paternal exposure. Azathioprine is teratogenic in animal studies.

There is less experience of ciclosporin in pregnancy but it does not appear to be any more harmful than azathioprine. The use of these drugs during pregnancy needs to be supervised in specialist units.

8.2.1 Antiproliferative immunosuppressants

Azathioprine is widely used for transplant recipients and it is also used to treat a number of auto-immune conditions, usually when corticosteroid therapy alone provides inadequate control. It is metabolised to mercaptopurine, and doses should be reduced when allopurinol is given concurrently. Blood tests and monitoring for signs of myelosuppression are essential in long-term treatment with azathioprine.

Thiopurine methyltransferase

The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Consider measuring TPMT activity before starting azathioprine, mercaptopurine, or tioguanine therapy. Patients with absent TPMT activity should not receive thiouric drugs; those with reduced TPMT activity may be treated under specialist supervision.

Mycophenolate mofetil is metabolised to mycophenolic acid which has a more selective mode of action than azathioprine. It is licensed for the prophylaxis of acute rejection in renal, hepatic or cardiac transplantation when used in combination with ciclosporin and corticosteroids. There is evidence that compared with similar regimens incorporating azathioprine, mycophenolate mofetil reduces the risk of acute rejection episodes; the risk of opportunistic infections (particularly due to tissue-invasive cytomegalovirus) and the occurrence of blood disorders such as leucopenia may be higher.

Cases of pure red cell aplasia have been reported with azathioprine and with mycophenolate mofetil; dose reduction or discontinuation should be consider under specialist supervision.

Cyclophosphamide (section 8.1.1) is less commonly prescribed as an immunosuppressant.

AZATHIOPRINE

Indications  see notes above; inflammatory bowel disease (section 1.5.3); rheumatoid arthritis (section 10.1.3); severe refractory eczema [unlicensed indication] (section 13.5.3)

Cautions  reduced thiopurine methyltransferase activity (see notes above); monitor for toxicity throughout treatment; monitor full blood count weekly (more frequently with higher doses or if severe hepatic or renal impairment) for first 4 weeks (manufacturer advises weekly monitoring for 8 weeks but evidence of practical value unsatisfactory), thereafter reduce
frequency of monitoring to at least every 3 months; reduce dose in elderly; interactions: Appendix 1 (azathioprine)

**Bone marrow suppression** Patients should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. inexplicable bruising or bleeding, infection

**Contra-indications** see notes above; hypersensitivity to mercaptopurine

**Hepatic impairment** reduce dose; monitor liver function; see also Cautions

**Renal impairment** reduce dose; see also Cautions

**Pregnancy** treatment should not generally be initiated during pregnancy; see also p. 615

**Breast-feeding** present in milk in low concentration; treatment should not generally be initiated

**Bone marrow suppression** see notes above; hypersensitivity to mercaptopurine

**Contra-indications** see notes above; hypersensitivity to mercaptopurine

**Hepatic impairment** reduce dose; monitor liver function; see also Cautions

**Renal impairment** reduce dose; see also Cautions

**Pregnancy** treatment should not generally be initiated during pregnancy; see also p. 615

**Breast-feeding** present in milk in low concentration; no evidence of harm in small studies—use if potential benefit outweighs risk

**Side-effects** hypersensitivity reactions (including malaise, dizziness, vomiting, diarrhoea, fever, rigors, myalgia, arthralgia, rash, hypotension and interstitial nephritis—calling for immediate withdrawal); dose-related bone marrow suppression (see also Cautions); liver impairment, cholestatic jaundice, hair loss and increased susceptibility to infections and colitis in patients also receiving corticosteroids; nausea; rarely pancreatitis, pneumonitis, hepatic veno-occlusive disease, lymphoma, red cell aplasia—see notes above

**Dose**

- **By mouth**, or (if oral administration not possible—intravenous solution very irritant, see below) by intravenous injection over at least 1 minute (followed by 50 mL sodium chloride intravenous infusion), or by intravenous infusion

  **Autoimmune conditions**, 1–3 mg/kg daily, adjusted according to response (consider withdrawal if no improvement within 3 months)

  **Suppression of transplant rejection**, 1–2.5 mg/kg daily adjusted according to response

  **Note** Azathioprine doses in BNF may differ from those in product literature

  **Note** Intravenous injection is alkaline and very irritant, intravenous route should therefore be used only if oral route not feasible, see also Appendix 4

**Azathioprine (Non-proprietary)**

- **Tablets**, azathioprine 25 mg, net price 28-tab pack = £3.66; 50 mg, 56-tab pack = £3.42. Label: 21

  **Brands include** Azasem**®

**Imuran® (Aspen)**

- **Tablets**, both ¼ c, azathioprine 25 mg (orange), net price 100-tab pack = £10.99; 50 mg (yellow), 100-tab pack = £7.99. Label: 21

  **Injection**, powder for reconstitution, azathioprine (as sodium salt), net price 50-mg vial = £15.38

---

**MYCOPHENOLATE MOFETIL**

**Indications** prophylaxis of acute renal, cardiac, or hepatic transplant rejection (in combination with ciclosporin and corticosteroids) under specialist supervision

**Cautions** monitor full blood count every week for 4 weeks then twice a month for 2 months then every month in the first year (consider interrupting treatment if neutropenia develops); exclude pregnancy before starting treatment; elderly (increased risk of infection, gastro-intestinal haemorrhage and pulmonary oedema); children (higher incidence of side-effects may call for temporary reduction of dose or interruption); active serious gastro-intestinal disease (risk of haemorrhage, ulceration and perforation); delayed graft function; increased susceptibility to skin cancer (avoid exposure to strong sunlight); interactions: Appendix 1 (mycophenolate)

**Bone marrow suppression** Patients should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. infection or inexplicable bruising or bleeding

**Contra-indications** see notes above; hypersensitivity to mercaptopurine

**Hepatic impairment** reduce dose; monitor liver function; see also Cautions

**Renal impairment** no data available in cardiac or hepatic transplant patients with renal impairment

**Pregnancy** avoid—congenital malformations reported; effective contraception required before treatment, during treatment, and for 6 weeks after discontinuation of treatment; manufacturer of Myfortic® also advise that men should use condoms during treatment and for 13 weeks after last dose

**Breast-feeding** avoid—present in milk in animal studies

**Side-effects** taste disturbance, gingival hyperplasia, nausea, constipation, flatulence, anorexia, weight loss, vomiting, abdominal pain, gastro-intestinal inflammation, ulceration, and bleeding, hepatitis, jaundice, pancreatitis, stomatitis, oedema, tachycardia, hypertension, hypotension, vasodilatation, cough, dysphonia, insomnia, agitation, confusion, depression, anxiety, convulsions, paraesthesia, myasthenic syndrome, tremor, dizziness, headache, influenza-like syndrome, infections, hyperglycaemia, renal impairment, malignancy (particularly of the skin), blood disorders (including leucopenia, anaemia, thrombocytopenia, pancytopenia, and red cell aplasia—see notes above), disturbances of electrolytes and blood lipids, arthralgia, alopecia, acne, skin hypertrophy, and rash; also reported: intestinal villous atrophy, progressive multifocal leucoencephalopathy, interstitial lung disease, pulmonary fibrosis

**Dose**

- **Renal transplantation**, by mouth, 1 g twice daily starting within 72 hours of transplantation or by intravenous infusion, 1 g twice daily starting within 24 hours of transplantation for max. 14 days (then transfer to oral therapy); **CHILD** and **adolescent** 2–18 years, by mouth 600 mg/m² twice daily (max. 2 g daily)

  **Note** Tablets and capsules not appropriate for dose titration in children with body surface area less than 1.25 m²

- **Cardiac transplantation**, by mouth, **ADULT** over 18 years, 1.5 g twice daily starting within 5 days of transplantation

- **Hepatic transplantation**, by intravenous infusion, **ADULT** over 18 years, 1 g twice daily starting within 24 hours of transplantation for 4 days (up to max. 14 days), then by mouth, 1.5 g twice daily as soon as is tolerated

**Mycophenolate Mofetil (Non-proprietary)**

- **Capsules**, mycophenolate mofetil 250 mg, net price 100-cap pack = £82.26

  **Tablets**, mycophenolate mofetil 500 mg, net price 50-tab pack = £11.82

  **Brands include** Arza**®

**CellCept® (Roche)**

- **Capsules**, blue/brown, mycophenolate mofetil 250 mg, net price 100-cap pack = £82.26

  **Tablets**, lavender, mycophenolate mofetil 500 mg, net price 50-tab pack = £82.26
Oral suspension, mycophenolate mofetil 1 g/5 mL when reconstituted with water, net price 175 mL = £115.16.

Excipients include aspartame (section 9.4.1)

Intravenous infusion, powder for reconstitution, mycophenolate mofetil (as hydrochloride), net price 500-mg vial = £9.12

**Mycophenolic acid**

Myfortic® (Novartis) (Pf) Tablets, e/c, mycophenolic acid (as mycophenolate sodium) 180 mg (green), net price 120-tab pack = £96.72; 360 mg (orange), 120-tab pack = £193.43. Label: 25

Dose renal transplantation, 720 mg twice daily starting within 72 hours of transplantation

**Equivalence to mycophenolate mofetil** Mycophenolic acid 720 mg is approximately equivalent to mycophenolate mofetil 1 g but avoid unnecessary switching because of pharmacokinetic differences

### 8.2.2 Corticosteroids and other immunosuppressants

Prednisolone (section 6.3.2) is widely used in oncology. It has a marked antitumour effect in acute lymphoblastic leukaemia, Hodgkin’s disease, and the non-Hodgkin lymphomas. It has a role in the palliation of symptomatic end-stage malignant disease when it may enhance appetite and produce a sense of well-being (see also Prescribing in Palliative Care, p. 21).

The corticosteroids are also powerful immunosuppressants. They are used to prevent organ transplant rejection, and in high dose to treat rejection episodes.

Ciclosporin is a calcineurin inhibitor, is a potent immunosuppressant which is virtually non-myelotoxic but markedly nephrotoxic. It has an important role in organ and tissue transplantation, for prevention of graft rejection following bone marrow, kidney, liver, pancreas, heart, lung, and heart-lung transplantation, and for prophylaxis and treatment of graft-versus-host disease.

Tacrolimus is also a calcineurin inhibitor. Although not chemically related to ciclosporin it has a similar mode of action and side-effects, but the incidence of neurotoxicity appears to be greater; cardiomyopathy has also been reported. Disturbance of glucose metabolism also appears to be significant.

Sirolimus is a non-calcineurin inhibiting immunosuppressant licensed for renal transplantation.

Basiliximab is a monoclonal antibody that acts as an interleukin-2 receptor antagonist and prevents T-lymphocyte proliferation; it is used for prophylaxis of acute rejection in allogeneic renal transplantation. It is given with ciclosporin and corticosteroid immunosuppression regimens; its use should be confined to specialist centres.

Belatacept is a fusion protein and co-stimulation blocker that prevents T-cell activation; it is licensed for prophylaxis of graft rejection in adults undergoing renal transplantation who are seropositive for the Epstein-Barr virus. It is used with interleukin-2 receptor antagonist induction, in combination with corticosteroids and a mycophenolic acid.

Antithymocyte immunoglobulin (rabbit) is licensed for the prophylaxis of organ rejection in renal and heart allograft recipients and for the treatment of corticosteroid-resistant allograft rejection in renal transplantation. Tolerability is increased by pretreatment with an intravenous corticosteroid and antihistamine; an antipyretic drug such as paracetamol may also be beneficial.

**NICE guidance**

**Immunosuppressive therapy for renal transplantation in adults (September 2004)**

**Immunosuppressive therapy for renal transplantation in children and adolescents (April 2006)**

For induction therapy in the prophylaxis of organ rejection, either basiliximab or daclizumab [discontinued] are options for combining with a calcineurin inhibitor. For each individual, ciclosporin or tacrolimus is chosen as the calcineurin inhibitor on the basis of side-effects.

Mycophenolate mofetil [mycophenolic acid also available but not licensed for use in children, see above] is recommended as part of an immunosuppressive regimen only if:

- the calcineurin inhibitor is not tolerated, particularly if nephrotoxicity endangers the transplanted kidney, or
- there is very high risk of nephrotoxicity from the calcineurin inhibitor, requiring a reduction in the dose of the calcineurin inhibitor or its avoidance.

Sirolimus is recommended as a component of immunosuppressive regimen only if intolerance necessitates the withdrawal of a calcineurin inhibitor.

These recommendations may not be consistent with the marketing authorisation of some of the products.

www.nice.org.uk/TA85

**Malignant disease and immunosuppression**

**ANTITHYMOCYTE IMMUNOGLOBULIN (RABBIT)**

**Indications** see notes above

**Cautions** see notes above; monitor blood count

**Contra-indications** infection

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—no information available

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects**

- nausea, vomiting, dysphagia, diarrhoea;
- hypotension; infusion-related reactions (including cytokine release syndrome and anaphylaxis, see notes above);
- serum sickness; fever, shivering;
- increased susceptibility to infection; increased susceptibility to malignancy; lymphopenia, neutropenia, thrombocytopenia; myalgia; pruritus, rash

**Dose**

- Heart transplantation, by intravenous infusion over at least 6 hours, 1–2.5 mg/kg daily for 3–5 days
- Renal transplantation, by intravenous infusion over at least 6 hours, 1–1.5 mg/kg daily for 3–9 days
- Corticosteroid-resistant renal graft rejection, by intravenous infusion over at least 6 hours, 1.5 mg/kg daily for 7–14 days

**Note** To avoid excessive dosage in obese patients, calculate dose on the basis of ideal body weight

Thymoglobulin® (Sanofi-Aventis) (Pf) Intravenous infusion, powder for reconstitution, rabbit anti-human thymocyte immunoglobulin, net price 25-mg vial = £158.77
BASILIXIMAB

**Indications** see notes above

**Pregnancy** avoid—no information available; adequate contraception must be used during treatment and for 16 weeks after last dose.

**Breast-feeding** avoid—no information available

**Side-effects** severe hypersensitivity reactions and cytokine release syndrome have been reported

**Dose**
- By intravenous injection or by intravenous infusion, 20 mg within 2 hours before transplant surgery and 20 mg 4 days after surgery; withhold second dose if severe hypersensitivity or graft loss occurs; **CHILD** and **ADOLESCENT** 1–17 years, body-weight under 35 kg, 10 mg within 2 hours before transplant surgery and 10 mg 4 days after surgery; body-weight over 35 kg, adult dose.

Simulect® (Novartis) Full injection, powder for reconstitution, basiliximab, net price 10-mg vial = £758.69, 20-mg vial = £842.38 (both with water for injections). For intravenous infusion

BELATACEPT

**Indications** see notes above

**Cautions** increased risk of infection; risk factors for post-transplant lymphoproliferative disorder; avoid excessive exposure to UV light including sunlight; tapering of corticosteroid, particularly in patients with high immunologic risk—increased risk of acute graft rejection

**Tuberculosis** Patients should be evaluated for latent and active tuberculosis before starting treatment, and monitored for signs and symptoms of tuberculosis during and after treatment

**Pregnancy** use only if essential; adequate contraception must be used during treatment and for up to 8 weeks after last dose

**Breast-feeding** avoid—no information available

**Side-effects** (reported when used in combination with basiliximab, mycophenolate mofetil and corti-costeroids) diarrhea, constipation, nausea, vomiting, hypertension, peripheral oedema, cough, headache, pyrexia, infection, malignancy, anaemia, leucopenia, dehydration, hypophosphataemia; less commonly infusion related reactions, progressive multifocal leucoencephalopathy

**Dose**
- Consult product literature

Nulojix® (Bristol-Myers Squibb) Full Intravenous infusion, powder for reconstitution, belatacept, net price 250-mg vial = £354.52

CICLOSPORIN (Cyclosporin)

**Indications** see notes above, and under Dose; severe acute ulcerative colitis [unlicensed indication] (section 1.5.3); rheumatoid arthritis (section 10.1.3); atopic dermatitis and psoriasis (section 13.5.3)

**Cautions** monitor kidney function—dose dependent increase in serum creatinine and urea during first few weeks may necessitate dose reduction in transplant patients (exclude rejection if kidney transplant) or discontinuation in non-transplant patients; monitor liver function (see Hepatic Impairment below); monitor blood pressure—discontinue if hypertension develops that cannot be controlled by antihypertensives; hyperuricaemia; monitor serum potassium especially in renal dysfunction (risk of hyperkalaemia); monitor serum magnesium; measure blood lipids before treatment and after the first month of treatment; use with tacrolimus specifically contraindicated; for patients other than transplant recipients, preferably avoid other immunosuppressants (increased risk of infection and malignancies, including lymphoma and skin cancer); avoid excessive exposure to UV light, including sunlight; interactions: Appendix 1 (ciclosporin)

**Additional cautions** Atopic Dermatitis and Psoriasis, section 13.5.3; Rheumatoid Arthritis, section 10.1.3

**Hepatic impairment** dosage adjustment based on bilirubin and liver enzymes may be needed

**Renal impairment** dose as in normal renal function but see Cautions above; in nephrotic syndrome reduce dose by 25–50% if serum creatinine more than 30% above baseline on more than one measurement; in patients with nephrotic syndrome and renal impairment initially 2.5 mg/kg daily

**Pregnancy** crosses placenta; see Immunosuppressant Therapy, p. 615

**Breast-feeding** present in milk—manufacturer advises avoid

**Side-effects** anorexia, nausea, vomiting, abdominal pain, diarrhoea, gingival hyperplasia, hepatic dysfunction, hypertension, tremor, headache, paraesthesia, fatigue, renal dysfunction (renal structural changes on long-term administration, see also under Cautions), hyperuricaemia, hyperkalaemia, hypomagnesaemia, hyperlipidaemia, hypercholesterolaemia, muscle cramps, myalgia, hypertrichosis; less commonly oedema, weight gain, signs of encephalopathy, anaemia, thrombocytopenia; rarely pancreatitis, motor polyneuropathy, menstrual disturbances, gynaecomastia, microangiopathic haemolytic anaemia, haemolytic uraemic syndrome, hyperglycaemia, muscle weakness, myopathy, visual disturbances secondary to benign intracranial hypertension (discontinue; also reported with infusion anaphylaxis

**Dose**
- Organ transplantation, used alone, **ADULT** and **CHILD** over 3 months 10–15 mg/kg by mouth 4–12 hours before transplantation followed by 10–15 mg/kg daily for 1–2 weeks postoperatively then reduced gradually to 2–6 mg/kg daily for maintenance (dose should be adjusted according to blood-ciclosporin concentration and renal function); dose lower if given concurrently with other immunosuppressant therapy (e.g. corticosteroids); if necessary one-third corresponding oral dose can be given by intravenous infusion over 2–6 hours

- Bone-marrow transplantation, prevention and treatment of graft-versus-host disease, **ADULT** and **CHILD** over 3 months 3–5 mg/kg daily by intravenous infusion over 2–6 hours from day before transplantation to 2 weeks postoperatively (or 12.5–15 mg/kg daily by mouth) then 12.5 mg/kg daily by mouth for 3–6 months then tailed off (may take up to a year after transplantation)

- Nephrotic syndrome, by mouth, 5 mg/kg daily in 2 divided doses; **CHILD** 6 mg/kg daily in 2 divided doses;
maintenance treatment reduce to lowest effective dose according to proteinuria and serum creatinine measurements; discontinue after 3 months if no improvement in glomerulonephritis or glomerulonephritis (after 6 months in membranous glomerulonephritis)

### Important

Patients should be stabilised on a particular brand of oral ciclosporin because switching between formulations without close monitoring may lead to clinically important changes in blood-ciclosporin concentration. Prescribing and dispensing of ciclosporin should be by brand name to avoid inadvertent switching. If it is necessary to switch to a different brand of ciclosporin, the patient should be monitored closely for changes in blood-ciclosporin concentration, serum creatinine, blood pressure, and transplant function.

**Capsimune®** (Mylan)®

**Capsules**, ciclosporin 25 mg (grey), net price 30-cap pack = £13.50; 50 mg (white), 30-cap pack = £26.80; 100 mg (grey), 30-cap pack = £51.30. Counselling, administration

Excipients include propylene glycol (see Excipients, p. 2)

Note Contains ethanol

Counselling Total daily dose should be taken in 2 divided doses

**Capsorin**® (Morningside)®

**Capsules**, ciclosporin 25 mg (grey), net price 30-cap pack = £13.11; 50 mg (white), 30-cap pack = £25.65; 100 mg (grey), 30-cap pack = £48.93. Counselling, administration

Note Contains ethanol

Counselling Total daily dose should be taken in 2 divided doses

**Deximune®** (Dexcel)®

**Capsules**, grey, ciclosporin 25 mg, net price 30-cap pack = £15.06; 50 mg 30-cap pack = £25.80; 100 mg 30-cap pack = £48.90. Counselling, administration

Note Contains ethyl lactate which is metabolised to ethanol

Counselling Total daily dose should be taken in 2 divided doses

**Neoral®** (Novartis)®

**Capsules**, ciclosporin 10 mg (yellow/white), net price 60-cap pack = £19.40; 25 mg (blue/grey), 30-cap pack = £19.52; 50 mg (yellow/white), 30-cap pack = £38.23; 100 mg (blue/grey), 30-cap pack = £72.57. Counselling, administration

Excipients include propylene glycol (see Excipients, p. 2)

Note Contains ethanol

Oral solution, yellow, sugar-free, ciclosporin 100 mg/mL, net price 50 mL = £108.73. Counselling, administration

Excipients include propylene glycol (see Excipients, p. 2)

Note Contains ethanol

Counselling Total daily dose should be taken in 2 divided doses

### Sandimmun® (Novartis)®

**Concentrate for intravenous infusion** (oily), ciclosporin 50 mg/mL. To be diluted before use, net price 1-mL amp = £1.94; 5-mL amp = £9.17

Excipients include polyoxyl castor oil (risk of anaphylaxis, see Excipients, p. 2)

Note Contains ethanol

Note Observe patients for signs of anaphylaxis for at least 30 minutes after starting infusion and at frequent intervals thereafter

Note Sandimmun® capsules and oral solution are available direct from Novartis for patients who cannot be transferred to a different oral preparation

### SIROLIMUS

#### Indications

Prophylaxis of organ rejection in kidney allograft recipients (initially in combination with ciclosporin and corticosteroid, then with corticosteroid only); see also under **Dose**

#### Cautions

Monitor kidney function when given with ciclosporin; monitor whole blood-sirolimus trough concentration (Afro-Caribbean patients may require higher doses); hyperlipidaemia (monitor lipids); monitor urine proteins; increased susceptibility to infection (especially urinary-tract infection); increased susceptibility to lymphoma and other malignancies, particularly of the skin (limit exposure to UV light)

#### Interactions

Appendix 1 (sirolimus)

#### Hepatic impairment

Monitor whole blood-sirolimus level closely and consult local treatment protocol; clearance reduced in mild to moderate impairment; in severe impairment decrease dose by 50% and monitor whole blood-sirolimus trough concentration every 5–7 days until 3 consecutive measurements have shown stable blood-sirolimus concentration

#### Pregnancy

Avoid unless essential—(toxicity in animal studies); effective contraception must be used during treatment and for 12 weeks after stopping

#### Breast-feeding

Discontinue breast-feeding

#### Side-effects

Abdominal pain, constipation, nausea, diarrhoea, ascites, stomatitis; oedema, tachycardia, hypertension, hypercholesterolaemia, hypertriglyceridaemia; venous thromboembolism; pleural effusion, pneumonitis; headache; pyrexia; proteinuria, haemolytic uraemic syndrome; anaemia, thrombocytopenia, thrombotic thrombocytopenic purpura, leucopenia, neutropenia, hypokalaemia, hypophosphataemia, hyperglycaemia, lymphocele, arthralgia, osteonecrosis; epistaxis; acne, rash, impaired healing; less commonly pancreatitis, pulmonary embolism, pulmonary haemorrhage, pericardial effusion, nephrotic syndrome, pancytopenia; rarely interstitial lung disease, alveolar proteinosis, hepatic necrosis, lymphoedema, and hypersensitivity reactions including anaphylactic reactions, angioedema, exfoliative dermatitis, and hypersensitivity vasculitis; focal segmental glomerulosclerosis and reversible impairment of male fertility also reported

#### Dose

- Initially 6 mg, after surgery (once wound has healed), then 2 mg once daily (dose adjusted according to whole blood-sirolimus trough concentration) in combination with ciclosporin and corticosteroid for 2–3 months (sirolimus given 4 hours after ciclosporin); ciclosporin should then be withdrawn over 4–8 weeks (if not possible, sirolimus should be discontinued and an alternate immunosuppressive regimen used)

**Note**

Manufacturer advises pre-dose (‘trough’) whole blood-sirolimus concentration (using chromatographic
assay) when used with ciclosporin should be 4–12 micrograms/litre (local treatment protocols may differ); after withdrawal of ciclosporin pre-dose whole blood sirolimus concentration should be 12–20 micrograms/litre (local treatment protocols may differ); close monitoring of whole blood-sirolimus concentration required if concomitant treatment with potent inducers or inhibitors of metabolism and after discontinuing them, or if ciclosporin dose reduced significantly or stopped; see also Hepatic Impairment above When changing between oral solution and tablets, measurement of whole blood ‘rough’ sirolimus concentration after 1–2 weeks is recommended Therapeutic drug monitoring assays Sirolimus whole-blood concentration is measured using high performance liquid chromatography (HPLC) or immunoassay. Switching between different immunoassays or between an immunoassay and HPLC can lead to clinically significant differences in results and therefore incorrect dose adjustments. Adjustment to the target therapeutic dose range should be made with knowledge of the assay used and corresponding reference range Rapamune® (Pfizer) Tablets, coated, sirolimus 500 micrograms (tan), net price 30-tab pack = £69.00; 1 mg (white), 30-tab pack = £86.49; 2 mg (yellow), 30-tab pack = £172.98. Counselling, administration Important The 500-microgram tablet is not bioequivalent to the 1-mg and 2-mg tablets. Multiples of 500 microgram tablets should not be used as a substitute for other tablet strengths Oral solution, sirolimus 1 mg/mL, net price 60 mL = £162.41. Counselling, administration Note Contains ethanol Counselling Food may affect absorption (take at the same time with respect to food). Mix solution with at least 60 mL water or orange juice in a glass or plastic container immediately before taking; refill container with at least 120 mL of water or orange juice and drink immediately (to ensure total dose). Do not mix with any other liquids TACROLIMUS Indications prophylaxis of organ rejection in liver, kidney, and heart allograft recipients and allograft rejection resistant to conventional immunosuppressive regimens, see also notes above; moderate to severe atopic eczema (section 13.5.3) Cautions monitor blood pressure, ECG (important: see Cardiomyopathy below), fasting blood-glucose concentration, haematological and neurological (including visual) parameters, electrolytes, hepatic and renal function; monitor whole blood-tacrolimus trough concentration (especially during episodes of diarrhoea)—consult local treatment protocol for details; QT-interval prolongation; neurotoxicity; increased risk of infections, malignancies, and lymphoproliferative disorders; avoid excessive exposure to UV light including sunlight; Interactions: Appendix 3 (tacrolimus) Driving May affect performance of skilled tasks (e.g. driving) Contra-indications hypersensitivity to macrolides; avoid concurrent administration with ciclosporin (care if patient has previously received ciclosporin) Hepatic impairment dose reduction may be necessary in severe impairment Pregnancy exclude before treatment; avoid unless potential benefit outweighs risk—risk of premature delivery, intra-uterine growth restriction, and hyperkalaemia Breast-feeding avoid—present in breast milk Side-effects nausea, vomiting, diarrhoea, constipation, dyspepsia, flatulence, bloating, weight changes, anorexia, gastro-intestinal inflammation, ulceration, and perforation, hepatic dysfunction, jaundice, cholestasis, ascites, bile-duct abnormalities, oedema, tachycardia, hypertension, haemorrhage, thromboembolic and ischaemic events, dyspnoea, pleural effusion, parenchymal lung disorders, sleep disturbances, tremor, headache, peripheral neuropathy, mood changes, depression, confusion, anxiety, psychosis, seizures, paraesthesia, dizziness, renal impairment, renal failure, renal tubular necrosis, urinary abnormalities, hyperglycaemia, electrolyte disturbances (including hyperkalaemia, hypokalaemia, and hyperuricaemia), blood disorders (including anaemia, leucopenia, pancytopenia, and thrombocytopenia), arthralgia, muscle cramp, visual disturbances, photophobia, tinnitus, impaired hearing, alopecia, sweating, acne; less commonly paralytic ileus, gastro-intestinal reflux disease, peritonitis, pancreatitis, heart failure, arrhythmia, cardiac arrest, cerebrovascular accident, cardiomyopathy (important: see Cardiomyopathy below), palpitation, respiratory failure, coma, speech disorder, amnesia, paralysis, influenza-like symptoms, encephalopathy, coagulation disorders, photosensitivity, cataract, hypoglycaemia, dysmenorrhea, hypertension, dermatitis; rarely peri-cardial effusion, respiratory distress syndrome, posterior reversible encephalopathy syndrome, dehydration, thrombotic thrombocytopenic purpura, blindness, toxic epidermal necrolysis, hirsutism; very rarely myasthenia, haemorrhagic cystitis, Stevens-Johnson syndrome; also reported pure red cell aplasia, agranulocytosis, haemolytic anaemia Cardiomyopathy Cardiomyopathy has been reported in children. Patients should be monitored by echocardiography for hypertrophic changes—consider dose reduction or discontinuation if these occur Dose See under preparations MHRA/CHM advice Oral tacrolimus products: prescribe and dispense by brand name only, to minimise the risk of inadvertent switching between products, which has been associated with reports of toxicity and graft rejection (June 2012) Inadvertent switching between oral tacrolimus products has been associated with reports of toxicity and graft rejection. To ensure maintenance of therapeutic response when a patient is stabilised on a particular brand, oral tacrolimus products should be prescribed and dispensed by brand name only. Adoport® (Pfizer), Prograf®, Capexion®, Tacni®, and Vivadex® are immediate-release capsules that are taken twice daily, once in the morning and once in the evening; Modigraf® granules are used to prepare an immediate-release oral suspension which is taken twice daily, once in the morning and once in the evening; Advagraf® is a prolonged-release capsule that is taken once daily in the morning. Switching between tacrolimus brands requires careful supervision and therapeutic monitoring by an appropriate specialist. Adoport® (Sandz) Capsules, tacrolimus (as monohydrate) 500 micrograms (white/ivory), net price 50-cap pack = £42.92; 1 mg (white/brown), 50-cap pack = £55.69,
100-cap pack = £111.36; 5 mg (white/orange), 50-cap pack = £205.74. Label: 23, counselling, driving

**Note** Tacrolimus is incompatible with PVC

**Dose** Liver transplantation, starting 12 hours after transplantation, by mouth, 100–200 micrograms/kg daily in 2 divided doses; CHILD 300 micrograms/kg daily in 2 divided doses

Renal transplantation, starting within 24 hours of transplantation, by mouth, 200–300 micrograms/kg daily in 2 divided doses; CHILD 300 micrograms/kg daily in 2 divided doses

Heart transplantation with antibody induction (starting within 5 days of transplantation) or without antibody induction (starting within 12 hours of transplantation), by mouth, 75 micrograms/kg daily in 2 divided doses; CHILD, with antibody induction (starting within 5 days of transplantation), 100–300 micrograms/kg daily in 2 divided doses, without antibody induction (starting within 12 hours of transplantation), 300 micrograms/kg daily in 2 divided doses as soon as clinically possible (8–12 hours after discontinuing intravenous infusion)

**Maintenance treatment, dose adjusted according to response and whole blood concentration**

**Rejection therapy, seek specialist advice**

**Capexion**® (Generics)\(\text{®}\)

**Capsules**, tacrolimus 500 micrograms, (ivory), net price 50-cap pack = £52.50; 1 mg (white), 50-cap pack = £88.20, 100-cap pack = £136.20; 5 mg (red), 50-cap pack = £252.00. Label: 23, counselling, driving

**Note** Tacrolimus is incompatible with PVC

**Dose** Liver transplantation, starting 12 hours after transplantation, by mouth, 100–200 micrograms/kg daily in 2 divided doses; CHILD 300 micrograms/kg daily in 2 divided doses

Renal transplantation, starting within 24 hours of transplantation, by mouth, 200–300 micrograms/kg daily in 2 divided doses; CHILD 300 micrograms/kg daily in 2 divided doses

Heart transplantation with antibody induction (starting within 5 days of transplantation) or without antibody induction (starting within 12 hours of transplantation), by mouth, 75 micrograms/kg daily in 2 divided doses; CHILD, with antibody induction (starting within 5 days of transplantation), 100–300 micrograms/kg daily in 2 divided doses, without antibody induction (starting within 12 hours of transplantation), 300 micrograms/kg daily in 2 divided doses as soon as clinically possible (8–12 hours after discontinuing intravenous infusion)

**Maintenance treatment, dose adjusted according to response and whole blood concentration**

**Rejection therapy, seek specialist advice**

**Modigraf**® (Astellas)\(\text{®}\)

**Granules**, tacrolimus (as monohydrate), 200 micrograms, net price 50-sachet pack = £71.30; 1 mg, 50-sachet pack = £356.65. Label: 13, 23, counselling, driving

**Note** Tacrolimus is incompatible with PVC

**Dose** Liver transplantation, starting 12 hours after transplantation, by mouth, 100–200 micrograms/kg daily in 2 divided doses; CHILD 300 micrograms/kg daily in 2 divided doses

Renal transplantation, starting within 24 hours of transplantation, by mouth, 200–300 micrograms/kg daily in 2 divided doses; CHILD 300 micrograms/kg daily in 2 divided doses

Heart transplantation with antibody induction (starting within 5 days of transplantation) or without antibody induction (starting within 12 hours of transplantation), by mouth, 75 micrograms/kg daily in 2 divided doses; CHILD, with antibody induction (starting within 5 days of transplantation), 100–300 micrograms/kg daily in 2 divided doses, without antibody induction (starting within 12 hours of transplantation), 300 micrograms/kg daily in 2 divided doses as soon as clinically possible (8–12 hours after discontinuing intravenous infusion)

**Maintenance treatment, dose adjusted according to response and whole blood concentration**

**Rejection therapy, seek specialist advice**

**Prograf**® (Astellas)\(\text{®}\)

**Capsules**, tacrolimus (as monohydrate) 500 micrograms (yellow), net price 50-cap pack = £61.88; 1 mg (white), 50-cap pack = £80.28, 100-cap pack = £160.54; 5 mg (greyish-red), 50-cap pack = £286.58. Label: 23, counselling, driving

**Note** Tacrolimus is incompatible with PVC

**Concentrate for intravenous infusion**, tacrolimus 5 mg/mL. To be diluted before use. Net price 1-mL amp = £58.45

**Excipients** include polyoxyl castor oil (risk of anaphylaxis, see Excipients, p. 2)

**Note** Tacrolimus is incompatible with PVC

**Dose** Liver transplantation, starting 12 hours after transplantation, by mouth, 100–200 micrograms/kg daily in 2 divided doses or by intravenous infusion over 24 hours, 10–50 micrograms/kg daily for up to 7 days (then transfer to oral therapy), CHILD by mouth, 300 micrograms/kg daily in 2 divided doses or by intravenous infusion over 24 hours, 50 micrograms/kg daily for up to 7 days (then transfer to oral therapy)

Renal transplantation, starting within 24 hours of transplantation, by mouth, 200–300 micrograms/kg daily in 2 divided doses or by intravenous infusion over 24 hours, 50–100 micrograms/kg daily for up to 7 days (then transfer to oral therapy)

Heart transplantation with antibody induction (starting within 5 days of transplantation) or without antibody induction (starting within 12 hours of transplantation), by mouth, 75 micrograms/kg daily in 2 divided doses or by intravenous infusion over 24 hours, 10–20 micrograms/kg daily for up to 7 days (then transfer to oral therapy), CHILD, with antibody induction (starting within 5 days of transplantation), by mouth, 100–300 micrograms/kg daily in 2 divided doses; without antibody induction (starting within 12 hours of transplantation), initially by intravenous infusion over 24 hours, 30–50 micrograms/kg daily, then, by mouth, 300 micrograms/kg daily in 2 divided doses as soon as clinically possible (8–12 hours after discontinuing intravenous infusion)

**Maintenance treatment, dose adjusted according to response and whole blood concentration**

**Rejection therapy, seek specialist advice**

**Tacni**® (TEVA UK)\(\text{®}\)

**Capsules**, tacrolimus 500 micrograms (ivory), net price 50-cap pack = £50.48; 1 mg (white), 50-cap pack = £65.49, 100-cap pack = £130.99; 5 mg (red), 50-cap pack = £242.01. Label: 23, counselling, driving

**Note** Tacrolimus is incompatible with PVC

**Dose** Liver transplantation, starting 12 hours after transplantation, by mouth, 100–200 micrograms/kg daily in 2 divided doses or by intravenous infusion over 24 hours, 10–50 micrograms/kg daily for up to 7 days (then transfer to oral therapy)

Renal transplantation, starting within 24 hours of transplantation, by mouth, 200–300 micrograms/kg daily in 2 divided doses or by intravenous infusion over 24 hours, 50–100 micrograms/kg daily for up to 7 days (then transfer to oral therapy)

Heart transplantation with antibody induction (starting within 5 days of transplantation) or without antibody induction (starting within 12 hours of transplantation), by mouth, 75 micrograms/kg daily in 2 divided doses or by intravenous infusion over 24 hours, 10–20 micrograms/kg daily for up to 7 days (then transfer to oral therapy), CHILD, with antibody induction (starting within 5 days of transplantation), by mouth, 100–300 micrograms/kg daily in 2 divided doses; without antibody induction (starting within 12 hours of transplantation), initially by intravenous infusion over 24 hours, 30–50 micrograms/kg daily, then, by mouth, 300 micrograms/kg daily in 2 divided doses as soon as clinically possible (8–12 hours after discontinuing intravenous infusion)

**Maintenance treatment, dose adjusted according to response and whole blood concentration**

**Rejection therapy, seek specialist advice**
induction (starting within 12 hours of transplantation), by mouth, 75 micrograms/kg daily in 2 divided doses; CHILD with antibody induction (starting within 12 hours of transplantation), 100–300 micrograms/kg daily in 2 divided doses; without antibody induction (starting within 12 hours of transplantation), 300 micrograms/kg daily in 2 divided doses as soon as clinically possible (8–12 hours after discontinuing intravenous infusion)

Maintenance treatment, dose adjusted according to response and whole blood concentration

**Modified release**

**Advagraf**® (Astellas) (Twr)

Capsules, m/r, tacrolimus (as monohydrate) 500 micrograms (yellow/orange), net price 50-cap pack = £35.79; 1 mg (white/orange), 50-cap pack = £71.59, 100-cap pack = £143.17; 3 mg (orange), 50-cap pack = £214.76; 5 mg (red/orange), 50-cap pack = £266.92. Label: 23, 25, counselling, driving

**Note** Tacrolimus is incompatible with PVC

**Dose** liver transplantation, starting 12–18 hours after transplantation, by mouth, 100–200 micrograms/kg once daily in the morning

Renal transplantation, starting within 24 hours of transplantation, by mouth, 200–300 micrograms/kg once daily in the morning

Rejection therapy, seek specialist advice

CHILD not recommended

### 8.2.3 Anti-lymphocyte monoclonal antibodies

The anti-lymphocyte monoclonal antibodies cause lysis of B lymphocytes. Infusion-related side-effects (including cytokine release syndrome) are reported commonly with anti-lymphocyte monoclonal antibodies and occur predominantly during the first infusion; they include fever and chills, nausea and vomiting, allergic reactions (such as rash, pruritus, angioedema, bronchospasm and dyspnoea), flushing and tumour pain. Patients should receive premedication before administration of anti-lymphocyte monoclonal antibodies to reduce these effects—consult product literature for details of individual regimens. The infusion may have to be stopped temporarily and the infusion-related effects treated—consult product literature for appropriate management. Evidence of pulmonary infiltration and features of tumour lysis syndrome should be sought if infusion-related effects occur.

Fatalities following severe cytokine release syndrome (characterised by severe dyspnoea) and associated with features of tumour lysis syndrome have occurred after infusions of anti-lymphocyte monoclonal antibodies. Patients with a high tumour burden as well as those with pulmonary insufficiency or infiltration are at increased risk and should be monitored very closely (and a slower rate of infusion considered).

Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking **ofatumumab** and **rituximab**. All patients should be screened before treatment. Patients with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).

**Alemtuzumab** is licensed for the treatment of adults with relapsing-remitting multiple sclerosis with active disease defined by clinical or imaging features. It is not recommended for inactive or stable disease. Pretreatment before administration is required (consult product literature) and all patients should receive oral prophylaxis for herpes infection starting on the first day of treatment and continuing for at least a month following each treatment course. Screening patients at high risk of hepatitis B or C is recommended before treatment—patients who are carriers should be treated with caution. HPpV screening should be carried out annually in female patients. In patients with active infection, a delay in initiation of alemtuzumab treatment should be considered until the infection is fully controlled, and all patients should be evaluated for active or latent tuberculosis before starting alemtuzumab treatment. The risk of autoimmune mediated conditions may increase during treatment, including immune thrombocytopenic purpura, thyroid disorders, nephropathies, and cytopenias, and should be monitored for throughout the course of treatment (consult product literature). Patients with previous autoimmune conditions other than multiple sclerosis should be treated with caution. Alemtuzumab should be given under the care of a specialist with facilities for the management of hypersensitivity and anaphylactic reactions. Although no longer licensed for oncological and transplant indications, alemtuzumab is also available through a patient access programme for these indications.

**NICE guidance**

**Alemtuzumab for treating relapsing-remitting multiple sclerosis (May 2014)**

Alemtuzumab is recommended as an option, within its marketing authorisation, for treating adults with active relapsing-remitting multiple sclerosis www.nice.org.uk/TA312

**Rituximab** is licensed for the treatment of chemotherapy-resistant or relapsed stage III–IV follicular non-Hodgkin’s lymphoma and, in combination with other
chemotherapy, for previously untreated stage III–IV follicular lymphoma, and for previously untreated or relapsed chronic lymphocytic leukaemia (see NICE guidance below). Rituximab is also licensed for maintenance therapy in patients with follicular non-Hodgkin’s lymphoma that has responded to induction therapy (see NICE guidance below). It is also licensed for use in combination with other chemotherapy for the treatment of diffuse large B-cell non-Hodgkin’s lymphoma (see NICE guidance below). Rituximab, in combination with glucocorticoids, is also licensed for the induction of remission in patients with severe, active granulomatosis with polyangiitis (Wegener’s) and microscopic polyangiitis (see SMC guidance and NICE guidance below). Full resuscitation facilities should be at hand and as with other cytotoxics, treatment should be undertaken under the close supervision of a specialist.

Rituximab should be used with caution in patients receiving cardiotoxic chemotherapy or with a history of cardiovascular disease because exacerbation of angina, arrhythmia, and heart failure have been reported. The use of rituximab for the treatment of granulomatosis with polyangiitis or microscopic polyangiitis is contra-indicated in patients with severe heart failure or severe, uncontrolled heart disease. Transient hypotension occurs frequently during infusion and antihypertensives may need to be withheld for 12 hours before infusion. Progressive multifocal leucoencephalopathy (which is usually fatal or causes severe disability) has been reported in association with rituximab; patients should be monitored for cognitive, neurological, or psychiatric signs and symptoms. If progressive multifocal leucoencephalopathy is suspected, suspend treatment until it has been excluded. Severe (including fatal) skin reactions, including toxic epidermal necrolysis and Stevens-Johnson syndrome have been reported—permanently discontinue treatment if severe skin reactions occur.

The Scottish Medicines Consortium (p. 4) has advised (August 2013) that Rituximab (MabThera®) is accepted for restricted use within NHS Scotland, in combination with glucocorticoids for the induction of remission in adult patients with severe, active granulomatosis with polyangiitis (Wegener’s) and microscopic polyangiitis. It is restricted to use in patients who have relapsed following treatment with cyclophosphamide or who are intolerant to or unable to receive cyclophosphamide.

**NICE guidance**

**Rituximab in combination with glucocorticoids for treating anti-neutrophil cytoplasmic antibody-associated vasculitis (March 2014)**

Rituximab, in combination with glucocorticoids, is recommended as an option for inducing remission in adults with anti-neutrophil cytoplasmic antibody (ANCA)-associated vasculitis (severely active granulomatosis with polyangiitis [Wegener’s] and microscopic polyangiitis), only if:

- further cyclophosphamide treatment would exceed the maximum cumulative cyclophosphamide dose, or
- cyclophosphamide is contraindicated or not tolerated, or
- the patient has not completed their family, and treatment with cyclophosphamide may materially affect their fertility, or
- the disease has remained active or progressed despite a course of cyclophosphamide lasting 3–6 months, or
- the patient has had uroepithelial malignancy.

www.nice.org.uk/TA308

**NICE guidance**

**Rituximab for the first-line treatment of stage III–IV follicular lymphoma (January 2012)**

Rituximab, in combination with:

- cyclophosphamide, vincristine and prednisolone (CHOP);
- cyclophosphamide, doxorubicin, vincristine and prednisolone (CHOP);
- mitoxantrone, chlorambucil and prednisolone (MCP);
- cyclophosphamide, doxorubicin, etoposide, prednisolone and interferon-alfa (CHVPi); or
- chlorambucil

is recommended as an option for the treatment of symptomatic stage III and IV follicular lymphoma in previously untreated patients.

www.nice.org.uk/TA243

**NICE guidance**

**Rituximab for the treatment of relapsed or refractory stage III or IV follicular non-Hodgkin’s lymphoma (February 2008)**

Rituximab, in combination with chemotherapy, is an option for the induction of remission in patients with relapsed stage III or IV follicular non-Hodgkin’s lymphoma.

Rituximab monotherapy as maintenance therapy is an option for the treatment of patients with relapsed stage III or IV follicular non-Hodgkin’s lymphoma in remission induced with chemotherapy (with or without rituximab).

Rituximab monotherapy is an option for the treatment of patients with relapsed or refractory stage III or IV follicular non-Hodgkin’s lymphoma, when all alternative treatment options have been exhausted (that is, if there is resistance to or intolerance of chemotherapy).

www.nice.org.uk/TA137
Malignant disease and immunosuppression

**8.2.3 Anti-lymphocyte monoclonal antibodies**

**NICE guidance**  
**Rituximab for the treatment of relapsed or refractory chronic lymphocytic leukaemia**  
(July 2010)  
Rituximab in combination with fludarabine and cyclophosphamide is recommended as a treatment option for people with relapsed or refractory chronic lymphocytic leukaemia except when the condition:  
- is refractory to fludarabine (that is, it has not responded to fludarabine, or has relapsed within 6 months of treatment), or  
- has previously been treated with rituximab, unless it was in the context of a clinical trial, at a dose lower than the dose currently licensed for chronic lymphocytic leukaemia or with chemotherapy other than fludarabine and cyclophosphamide.

Rituximab in combination with fludarabine and cyclophosphamide is recommended only in the context of research for patients with relapsed or refractory chronic lymphocytic leukaemia that has previously been treated with rituximab, unless rituximab has been given as specified above.  
www.nice.org.uk/TA193

**NICE guidance**  
**Rituximab for the first-line maintenance treatment of follicular non-Hodgkin’s lymphoma**  
(June 2011)  
Rituximab maintenance therapy is recommended as an option for the treatment of patients with follicular non-Hodgkin’s lymphoma that has responded to first-line induction therapy with rituximab in combination with chemotherapy.  
www.nice.org.uk/TA226

**NICE guidance**  
**Rituximab for the first-line treatment of chronic lymphocytic leukaemia**  
(July 2009)  
Rituximab, in combination with fludarabine and cyclophosphamide, is recommended as an option for the first-line treatment of chronic lymphocytic leukaemia.  
www.nice.org.uk/TA174

**NICE guidance**  
**Rituximab for aggressive non-Hodgkin’s lymphoma**  
(September 2003)  
Rituximab, in combination with cyclophosphamide, doxorubicin, vincristine, and prednisolone, is recommended for first-line treatment of CD20-positive diffuse large-B-cell lymphoma at clinical stage II, III or IV.  
The use of rituximab for localised (stage I) disease should be limited to clinical trials.  
www.nice.org.uk/TA65

**NICE guidance**  
**Ofatumumab for the treatment of chronic lymphocytic leukaemia refractory to fludarabine and alemtuzumab**  
(October 2010)  
Ofatumumab is not recommended for the treatment of chronic lymphocytic leukaemia that is refractory to fludarabine and alemtuzumab.  
Patients currently receiving ofatumumab for this condition should have the option to continue treatment until they and their clinician consider it appropriate to stop.  
www.nice.org.uk/TA202

**ALEMTUZUMAB**

**Indications** see notes above  
**Cautions** see notes above—for full details consult product literature; **interactions:** Appendix 1 (alemtuzumab)  
**Alert card** Patients should be provided with a Patient Alert Card and Patient Guide  
**Contra-indications** human immunodeficiency virus  
**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies.  
Autoimmune thyroid disease during treatment may affect fetus (consult product literature); women of childbearing potential should use effective contraception during and for 4 months after treatment  
**Breast-feeding** manufacturer advises avoid during and for 4 months after each treatment course unless potential benefit outweighs risk  
**Side-effects** see notes above—for full details (including monitoring and management of side-effects) consult product literature  
**Dose**  
- Consult product literature  
- Important Patients should receive premedication before administration (consult product literature for details)  
**Lemtrada®** (Genzyme)  
Concentrate for intravenous infusion, alemtuzumab 10 mg/mL, net price 1.2-mL vial = £7045.00

**OFATUMUMAB**

**Indications** see notes above  
**Cautions** see notes above—for full details consult product literature  
**Contra-indications** consult product literature  
**Renal impairment** no information available for creatinine clearance less than 30 mL/minute  
**Pregnancy** avoid unless potential benefit outweighs risk; use effective contraception during and for 12 months after treatment  
**Breast-feeding** discontinue breast-feeding during and for 12 months after treatment—no information available  
**Side-effects** see notes above—for full details (including monitoring and management of side-effects) consult product literature  
**Dose**  
- See Doses, p. 563  
- Important Patients should receive premedication before each dose (consult product literature for details)
Interferon alfa

Interferon alfa has shown some antitumour effect in certain lymphomas and solid tumours. Interferon alfa preparations are also used in the treatment of chronic hepatitis B, and chronic hepatitis C ideally in combination with ribavirin (section 5.3.3). Side-effects are dose-related, but commonly include anorexia, nausea, diarrhoea, influenza-like symptoms, and lethargy. Ocular side-effects and depression (including suicidal behaviour) have also been reported. Myelosuppression may occur, particularly affecting granulocyte counts. Cardiovascular problems (hypotension, hypertension, palpitation, and arrhythmias), nephrotoxicity and hepatotoxicity have been reported. Hypertriglyceridaemia, sometimes severe, has been observed; monitoring of lipid concentration is recommended. Other side-effects include hypersensitivity reactions, thyroid abnormalities, hyperglycaemia, alopecia, psoriasisiform rash, confusion, coma and seizures (usually with high doses in the elderly).

Polyethylene glycol-conjugated (‘pegylated’) derivatives of interferon alfa (peginterferon alfa-2a and peginterferon alfa-2b) are available; pegylation increases the persistence of the interferon in the blood. The peginterferons are licensed for the treatment of chronic hepatitis C, ideally in combination with ribavirin (see section 5.3.3.2). Peginterferon alfa-2a is also licensed for the treatment of chronic hepatitis B. For use of interferon alfa and peginterferon alfa in children see BNF for Children.

NICE guidance (peginterferon alfa, interferon alfa, and ribavirin for chronic hepatitis C)
See p. 429

Ron-interferon alfa

Indications see under preparations
Cautions consult product literature; interactions: Appendix 1 (interferons)
Contra-indications consult product literature; avoid injections containing benzyl alcohol (see under preparations below)
Hepatic impairment close monitoring in mild to moderate impairment; avoid if severe
Renal impairment close monitoring required; avoid in severe impairment
Pregnancy avoid unless potential benefit outweighs risk (toxicity in animal studies); effective contraception required during treatment—consult product literature
Breast-feeding unlikely to be harmful
Side-effects see notes above and consult product literature
Dose consult product literature

PEGINTERFERON ALFA

Indications see under preparations
Cautions consult product literature; interactions: Appendix 1 (interferons)
Contra-indications consult product literature

PEGINTERFERON ALFA

Indications see under preparations
Cautions consult product literature; interactions: Appendix 1 (interferons)
Contra-indications consult product literature
Hepatic impairment avoid in severe impairment
Renal impairment close monitoring required—reduce dose in moderate to severe impairment; consult product literature
Pregnancy manufacturers recommend avoid unless potential benefit outweighs risk (toxicity in animal studies); effective contraception required during treatment—consult product literature
Breast-feeding manufacturers advise avoid—no information available
Side-effects see notes above and consult product literature
Dose • Consult product literature

**Pegasys**® (Roche) 
Injection, peginterferon alfa-2a (rbe), net price 90-microgram prefilled syringe = £76.51, 135-microgram prefilled syringe = £107.17, 180-microgram prefilled syringe = £124.40; 135-microgram prefilled pen = £107.17, 180-microgram prefilled pen = £124.40. For subcutaneous injection

Exipients • include benzyl alcohol (avoid in neonates, see Exipients, p)
Combined with ribavirin for chronic hepatitis C, as monotherapy for chronic hepatitis C if ribavirin not tolerated or contra-indicated (see section 5.3.3.2), as monotherapy for chronic hepatitis B

**ViraferonPeg**® (MSD) 
Injection, prefilled pen, powder for reconstitution, peginterferon alfa-2b (rbe), net price 50-microgram pen = £66.46, 80-microgram pen = £106.34, 100-microgram pen = £132.92, 120-microgram pen = £159.51, 150-microgram pen = £199.38 (all with needles and swabs). For subcutaneous injection

Exipients • include benzyl alcohol (avoid in neonates, see Exipients, p)
Combined with ribavirin for chronic hepatitis C, as monotherapy for chronic hepatitis C if ribavirin not tolerated or contra-indicated (see section 5.3.3.2), as monotherapy for chronic hepatitis B

**Note** For intramuscular injection

Potential side-effects include:
- Fatigue, nervousness, restlessness
- Irritation at injection site (including inflammation, hypersensitivity, necrosis) and influenza-like symptoms (fever, chills, myalgia, or malaise) but these decrease over time; nausea and vomiting occur occasionally. Other side-effects include hypersensitivity reactions (including anaphylaxis and urticaria), blood disorders, menstrual disorders, mood and personality changes, suicide attempts, confusion and convulsions; alopecia, hepatitis, nephrotic syndrome, and thyroid dysfunction have been reported rarely with interferon beta-1b.

**NICE guidance**

**Interferon beta and glatiramer for multiple sclerosis (January 2002)**
Interferon beta and glatiramer acetate are **not** recommended for the treatment of multiple sclerosis in the NHS in England and Wales. Patients who are currently receiving interferon beta or glatiramer acetate for multiple sclerosis, whether as routine therapy or as part of a clinical trial, should have the option to continue treatment until they and their consultant consider it appropriate to stop, having regard to the established criteria for withdrawal from treatment.

**Provision of disease-modifying therapies for multiple sclerosis**

The Department of Health, the National Assembly for Wales, the Scottish Executive, the Northern Ireland Department of Health, Social Services & Public Safety, and the manufacturers have reached agreement on a risk-sharing scheme for the NHS supply of interferon beta and glatiramer acetate for multiple sclerosis. Health Service Circular (HSC 2002/004) explains how patients can participate in the scheme. It is available on the Department of Health website (www.dh.gov.uk).
Injection, powder for reconstitution, interferon beta-1a, net price 30-microgram (6 million-unit) vial with diluent = £163.50
Note For intramuscular injection
Dose for relapsing, remitting multiple sclerosis or for a single demyelinating event with an active inflammatory process (if it is severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis), consult product literature

Rebif® (Merck Serono) (Novartis)
Injection, interferon beta-1a, net price 22-microgram (6 million-unit) prefilled syringe = £48.16; 44-microgram (12 million-unit) prefilled syringe = £67.77; starter pack of 6 × 8.8-microgram (2.4 million-unit) prefilled syringes with 6 × 22-microgram (6 million-unit) prefilled syringes = £552.19
Note For subcutaneous injection
Excipients include benzyl alcohol (avoid in neonates, see Excipients, p. 2)
Injection, interferon beta-1a, 44 micrograms (12 million-units/mL), net price 1.5 mL (66-microgram, 18 million-unit) cartridge = £203.30; 88-micrograms (24 million-units/mL) cartridge = £203.30; 1.5 mL (132-microgram, 36 million-unit) cartridge = £171.97; starter pack of 2 × 1.5 mL (132-microgram, 36 million-unit) cartridge = £406.61
Note Cartridges for use with RebiSmart® auto-injector device. For subcutaneous injection
Excipients include benzyl alcohol (avoid in neonates, see Excipients, p. 2)
Injection (RebiDose®), interferon beta-1a, net price 22-microgram (6 million-unit) prefilled pen = £51.13; 44-microgram (12 million-unit) prefilled pen = £67.77; starter pack of 6 × 8.8-microgram (2.4 million-unit) prefilled pens with 6 × 22-microgram (6 million-unit) prefilled pens = £552.19
Note For subcutaneous injection
Excipients include benzyl alcohol (avoid in neonates, see Excipients, p. 2)
Dose for relapsing, remitting multiple sclerosis or for a single demyelinating event with an active inflammatory process (if alternative diagnoses have been excluded, and patient at high risk of developing multiple sclerosis), consult product literature

Interferon beta-1b
Betaferon® (Bayer) (Boehringer Ingelheim)
Injection, powder for reconstitution, interferon beta-1b, net price 300-microgram (9.6 million-unit) vial with diluent = £39.78
Note For subcutaneous injection
Note An autoinjector device (Beneject® Light) is available from Bayer Schering
Dose for relapsing, remitting multiple sclerosis, for secondary progressive multiple sclerosis with active disease, or for a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis), consult product literature

Extavia® (Novartis)
Injection, powder for reconstitution, interferon beta-1b. Net price 300-microgram (9.6 million-unit) vial with diluent = £39.78
Note For subcutaneous injection
Dose for relapsing, remitting multiple sclerosis, for secondary progressive multiple sclerosis with active disease, or for a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis), consult product literature

Interferon gamma
Interferon gamma-1b is licensed to reduce the frequency of serious infection in chronic granulomatous disease and in severe malignant osteopetrosis.

INTERFERON GAMMA-1b
(Immune interferon)
Indications see notes above
Cautions seizure disorders (including seizures associated with fever); cardiac disease (including ischaemia, congestive heart failure, and arrhythmias); monitor before and during treatment: haematological tests (including full blood count, differential white cell count, and platelet count), blood chemistry tests (including renal and liver function tests) and urinalysis; avoid simultaneous administration of foreign proteins including immunological products (risk of exaggerated immune response); Interactions: Appendix 1 (interferons)
Hepatic impairment manufacturer advises caution in severe impairment—risk of accumulation
Renal impairment manufacturer advises caution in severe impairment—risk of accumulation
Pregnancy manufacturers recommend avoid unless potential benefit outweighs risk (toxicity in animal studies); effective contraception required during treatment—consult product literature
Breast-feeding manufacturers advise avoid—no information available
Side-effects nausea, vomiting, diarrhoea, abdominal pain; headache, fatigue, fever, chills, depression; myalgia, arthralgia; rash, injection-site reactions; rarely confusion and systemic lupus erythematosus; also reported, neutropenia, thrombocytopenia, proteinuria and raised liver enzymes
Dose ● See under preparation

ImmuKIN® (Boehringer Ingelheim)
Injection, recombinant human interferon gamma-1b 200 micrograms/mL, net price 0.5-mL vial = £75.00
Dose By subcutaneous injection, 50 micrograms/m² 3 times a week; patients with body surface area of 0.5 m² or less, 1.5 micrograms/kg 3 times a week; not yet recommended for children under 6 months with chronic granulomatous disease

Aldesleukin
Aldesleukin (recombinant interleukin-2) is licensed for metastatic renal cell carcinoma excluding patients in whom all three of the following prognostic factors are present: performance status of Eastern Co-operative Oncology Group of 1 or greater, more than one organ with metastatic disease sites, and a period of less than 24 months between initial diagnosis of primary tumour and date of evaluation of treatment. It is usually given by subcutaneous injection. It is now rarely given by intravenous infusion because of an increased risk of capillary leak syndrome, which can cause pulmonary oedema and hypotension. Aldesleukin produces tumour shrinkage in a small proportion of patients, but it has not been shown to increase survival. Bone-marrow, hepatic, renal, thyroid, and CNS toxicity is common. It is for use in specialist units only.
8.2.4 Other immunomodulating drugs

ALDESLUEKIN

**Indications**  see notes above

**Cautions** consult product literature; **Interactions: Appendix 1 (aldesleukin)

**Contra-indications** consult product literature

**Pregnancy** use only if potential benefit outweighs risk (toxicity in animal studies); ensure effective contraception during treatment in men and women; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1, notes above, and consult product literature

**Dose**
- Consult product literature

Proleukin® (Novartis)  

*Injection,* powder for reconstitution, aldesleukin. Net price 18-million unit vial = £12.00. For subcutaneous injection or intravenous infusion (but see notes above)

BCG bladder instillation

BCG (Bacillus Calmette-Guérin) is a live attenuated strain derived from Mycobacterium bovis. It is licensed as a bladder instillation for the treatment of primary or recurrent bladder carcinoma and for the prevention of recurrence following transurethral resection.

Bacillus Calmette-Guérin

**Indications**  see notes above; BCG immunisation (section 14.4)

**Cautions** screen for active tuberculosis (contra-indicated if tuberculosis confirmed); traumatic catheterisation or urethral or bladder injury (delay administration until mucosal damage healed)

**Contra-indications** impaired immune response, HIV infection, urinary-tract infection, severe haematuria, tuberculosis, fever of unknown origin

**Pregnancy**  avoid

**Breast-feeding**  avoid

**Side-effects** cystitis, dysuria, urinary frequency, haematuria, malaise, fever, influenza-like syndrome; also systemic BCG infection (with fatalities)—consult product literature; rarely hypersensitivity reactions (such as arthralgia and rash), orchitis, transient urethral obstruction, bladder contracture, renal abscess; ocular symptoms reported

**Dose**
- Consult product literature

ImmuCyst® (Alliance)  

*Bladder instillation,* freeze-dried powder containing attenuated Mycobacterium bovis prepared from the Connaught strain of bacillus of Calmette and Guérin, net price 81-mg vial = £9927.80

OncoTICE® (MSD)  

*Bladder instillation,* freeze-dried powder containing attenuated Mycobacterium bovis prepared from the TICE strain of bacillus of Calmette and Guérin, net price 12.5-mg vial = £71.61

Canakinumab

Canakinumab is a recombinant human monoclonal antibody that selectively inhibits interleukin-1 beta receptor binding. It is licensed for the treatment of cryopyrin-associated periodic syndrome, including severe forms of familial cold auto-inflammatory syndrome (or familial cold urticaria), Muckle-Wells syndrome, and neonatal-onset multisystem inflammatory disease (also known as chronic infantile neurological cutaneous and articular syndrome). These are rare inherited auto-inflammatory disorders.

**Indications**  see notes above; acute gout (section 10.1.4)

**Cautions** history of recurrent infection or predisposition to infection; monitor full blood count including neutrophil count before starting treatment, 1–2 months after starting treatment, and periodically thereafter; patients should receive all recommended vaccinations (including pneumococcal and inactivated influenza vaccine) before starting treatment; avoid live vaccines unless potential benefit outweighs risk—consult product literature and section 14.1 (p. 828) for further information

**Tuberculosis** Patients should be evaluated for latent and active tuberculosis before starting treatment and monitored for signs and symptoms of tuberculosis during and after treatment

**Contra-indications** active infection (see also Cautions); leucopenia; neutropenia; concomitant use with tumour necrosis factor inhibitors (possible increased risk of infections)

**Hepatic impairment** no information available

**Renal impairment** limited information available but manufacturer advises no dose adjustment required

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk; effective contraception required during treatment and for up to 3 months after last dose

**Breast-feeding** consider if benefit outweighs risk—not known if present in human milk

**Side-effects** vertigo, malaise, increased susceptibility to infection (including serious infection), injection-site reactions, neutropenia, back pain; less commonly gastro-oesophageal reflux; also reported vomiting, malignancy

**Dose**
- See Doses, p. 563

**Ilaris®** (Novartis)  

*Injection,* powder for reconstitution, canakinumab, net price 150-mg vial = £9027.80

Dimethyl fumarate

Dimethyl fumarate has immunomodulatory and anti-inflammatory properties, and is licensed for the treatment of adults with relapsing-remitting multiple sclerosis. Treatment should be initiated by a physician experienced in the treatment of multiple sclerosis.
**DIMETHYL FUMARATE**

**Indications**  
see notes above

**Cautions**  
reduced lymphocyte count; severe active gastro-intestinal disease; serious infection—do not start treatment until resolved and consider suspend- ing treatment if infection develops during treatment; monitor full blood count before treatment (within 6 months before initiation), after 6 months of treatment, then every 6 to 12 months thereafter, and as clinically indicated; monitor renal and hepatic function before treatment, after 3 and 6 months of treatment, then every 6 to 12 months thereafter, and as clinically indicated

**Hepatic impairment**  
manufacturer advises caution in severe impairment

**Renal impairment**  
manufacturer advises caution in severe impairment

**Pregnancy**  
manufacturer advises avoid unless essential and potential benefit outweighs risk—totoxicity in animal studies; contraception required in women of child-bearing potential (consider non-hormonal methods)

**Breast-feeding**  
manufacturer advises avoid

**Side-effects**  
nausea, vomiting, diarrhoea, abdominal pain, dyspepsia, gastritis, gastroenteritis, flushing (may be severe and indicate hypersensitivity); burning sensation, lymphopenia, leucopenia, pruritus, rash, erythema

**Dose**

- **ADULT** over 18 years, 120 mg twice daily; increased to 240 mg twice daily after 7 days; for dose adjustment due to side-effects, consult product literature

**Tecfidera® (Biogen)**  
Capsules, e/c, dimethyl fumarate 120 mg (green/ white), net price 14-cap pack = £343.00; 240 mg (green), 56-cap pack = £1373.00. Label: 21, 25

---

**Fingolimod**

Fingolimod is an immunomodulating drug licensed for use in patients with highly active relapsing-remitting multiple sclerosis despite treatment with interferon beta or in those with rapidly evolving severe relapsing-remitting multiple sclerosis. Treatment with fingoli- mod should be initiated and supervised by a specialist.

**MHRA/CHM advice**

**Fingolimod: not recommended for patients at known risk of cardiovascular events.**

Advice for extended monitoring for those with significant bradycardia or heart block after the first dose and following treatment interruption (January 2013)

Fingolimod is known to cause transient bradycardias and heart block after the first dose. Fingolimod is not recommended in the following patient groups who are at high risk of cardiovascular events unless the anticipated benefits outweigh the potential risks, and advice from a cardiologist is sought before initiation:

**Patients with the following medical conditions:**

- 2nd degree Mobitz Type II or higher degree atrioventricular block, sick sinus syndrome, or sino-atrial heart block
- significant QT prolongation (QT-interval greater than 470 milliseconds in women, or greater than 450 milliseconds in men)
- history of symptomatic bradycardia or recurrent syncope, known ischaemic heart disease, cerebrovascular disease, history of myocardial infarction, congestive heart failure, history of cardiac arrest, uncontrolled hypertension, or severe sleep apnoea

**Patients receiving the following antiarrhythmic or heart-rate lowering drugs:**

- class la or class III arrhythmics
- beta blockers
- heart-rate lowering calcium channel blockers
- other substances which may decrease heart rate (e.g. digoxin, anticholinesteratic drugs or pilocarpine)

**All patients receiving fingolimod should be monitored at treatment initiation, (first dose monitoring), and after treatment interruption (see note below); monitoring should include:**

- **Pre-treatment**

  - a 12-lead ECG and blood pressure measurement before starting

- **During the first 6 hours of treatment**

  - continuous ECG monitoring for 6 hours
  - blood pressure and heart rate measurement every hour

- **After 6 hours of treatment**

  - a further 12-lead ECG and blood pressure measurement

If heart rate at the end of the 6 hour period is at its lowest since fingolimod was first administered, monitoring should be extended by at least 2 hours and until heart rate increases.

Extended monitoring, (at least overnight), should be performed in patients with evidence of clinically important cardiac effects during first dose monitoring. Monitoring in patients requiring pharmacological intervention for bradyarrhythmia-related symptoms during first dose monitoring should be extended at least overnight, and first dose monitoring should be repeated after the second dose.

**Note**

First dose monitoring as above should be repeated in all patients whose treatment is interrupted for:

- 1 day or more during the first 2 weeks of treatment
- more than 7 days during weeks 3 and 4 of treatment
- more than 2 weeks after one month of treatment

If the treatment interruption is of shorter duration than the above, repeated monitoring is not required and treatment should be continued with the next dose as planned.
The Scottish Medicines Consortium (p. 4) has advised (August 2012) that fingolimod (Gilenya®) is accepted for restricted use within NHS Scotland as single disease modifying therapy in highly active relapsing-remitting multiple sclerosis despite treatment with interferon beta, with an unchanged or increased relapse rate or ongoing severe relapses, as compared to the previous year.

**NICE guidance**

**Fingolimod for the treatment of highly active relapsing-remitting multiple sclerosis (April 2012)**

- Fingolimod is recommended as an option for the treatment of highly active relapsing-remitting multiple sclerosis in adults, only if:
  - they have an unchanged or increased relapse rate or ongoing severe relapses compared with the previous year despite treatment with interferon beta, and
  - the manufacturer provides fingolimod with the discount agreed as part of the patient access scheme.

Patients currently receiving fingolimod whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA254

---

**Side-effects**

- diarrhoea, weight loss, AV block, bradycardia, hypertension, cough, dyspnoea, depression, malaise, headache, migraine, dizziness, paraesthesia, influenza, herpes, bronchitis, sinusitis, gastrointestinal, tinea, lymphopenia, leucopenia, back pain, blurred vision, eye pain, eczema, alopecia, pruritus; less commonly pneumonia, neutropenia, macular oedema; also reported haemophagocytic syndrome (see Cautions above), lymphoma

**Dose**

- ADULT over 18 years, 500 micrograms once daily

Gilenya® (Novartis)® (trade)

Capsules, fingolimod (as hydrochloride), 500 micrograms (yellow/white), net price 7-cap pack = £367.50, 28-cap pack = £1470.00

---

**Glatiramer acetate**

Glatiramer is an immunomodulating drug comprising synthetic polypeptides. It is licensed for treating initial symptoms in patients at high risk of developing multiple sclerosis, and also for reducing the frequency of relapses in ambulatory patients with relapsing-remitting multiple sclerosis who have had at least 2 clinical relapses in the past 2 years. Initiation of treatment with glatiramer should be supervised by a specialist.

**NICE guidance (interferon beta and glatiramer for multiple sclerosis)**

See p. 626

---

**Provision of disease-modifying therapies for multiple sclerosis**

See p. 626

---

**GLATIRAMER ACETATE**

**Indications**

See notes above

**Cautions**

- cardiac disorders

**Renal impairment**

- no information available—manufacturer advises caution

**Pregnancy**

- manufacturer advises avoid—no information available

**Breast-feeding**

- manufacturer advises caution—no information available

**Side-effects**

- hypersensitivity reactions; flushing, chest pain, palpitation, tachycardia, and dyspnoea may occur within minutes of injection; nausea, constipation, dyspepsia; syncope, anxiety, asthenia, depression, headache, tremor, sweating; oedema, lymphadenopathy; hypertension, back pain, arthralgia, influenza-like symptoms; injection-site reactions, rash; rarely seizures

**Dose**

- By subcutaneous injection, ADULT over 18 years, 20 mg daily

Copaxone® (Teva)® (trade)

Injection, glatiramer acetate 20 mg/mL, net price 1-ml prefilled syringe = £18.36

---

**Histamine**

Histamine is licensed for maintenance therapy, in combination with aldesleukin, in patients with acute myeloid leukaemia in first remission.
The Scottish Medicines Consortium (p. 4) has advised (December 2010) that histamine dihydrochloride (Ceplene®) is not recommended for use within NHS Scotland.

**HISTAMINE DIHYDROCHLORIDE**

**Indications** see notes above  
**Cautions** consult product literature; **interactions:** Appendix 1 (histamine)  
**Contra-indications** consult product literature  
**Hepatic impairment** increased risk of tachycardia and hypotension in moderate to severe impairment  
**Renal impairment** increased risk of hypotension in severe impairment  
**Pregnancy** manufacturer advises avoid—no information available; ensure effective contraception during treatment in men and women  
**Breast-feeding** manufacturer advises avoid—no information available  
**Side-effects** consult product literature  
**Dose**  
- See Doses, p. 563  
**Ceplene® (Meda) ▼ ( POW) Injection, histamine dihydrochloride 1 mg/mL, net price 0.5-mL vial = £84.38

---

**Lenalidomide, pomalidomide, and thalidomide**

Lenalidomide is an immunomodulating drug with anti-neoplastic, anti-angiogenic, and pro-erythropoietic properties. It is licensed for the treatment of transfusion-dependent anaemia due to low- or intermediate-1-risk myelodysplastic syndromes (MDS) associated with an isolated deletion 5q cytogenetic abnormality when other treatment options are insufficient or inadequate; it is also licensed in combination with dexamethasone, for the treatment of multiple myeloma in patients who have received at least one previous therapy.

The most serious side-effects of lenalidomide are venous thromboembolism, severe neutropenia, thrombocytopenia, and potentially fatal liver injuries. Lenalidomide is structurally related to thalidomide and there is a risk of peripheral neuropathy and teratogenesis.

The Scottish Medicines Consortium (p. 4) that lenalidomide, in combination with dexamethasone, is accepted for restricted use within NHS Scotland for patients with multiple myeloma who have received at least two prior therapies.

---

**NICE guidance**

**Lenalidomide for the treatment of multiple myeloma (June 2009)**

Lenalidomide in combination with dexamethasone is an option for the treatment of multiple myeloma in patients who have received two or more prior therapies. The drug cost of lenalidomide will be met by the manufacturer for patients who remain on treatment for more than 26 cycles.  
[www.nice.org.uk/TA171](www.nice.org.uk/TA171)

Pomalidomide is structurally related to thalidomide and has immunomodulatory properties and direct anti-myeloma tumoricidal activity. It is licensed for use in combination with dexamethasone for the treatment of relapsed and refractory multiple myeloma in patients who have received at least two prior treatment regimens, including both lenalidomide and bortezomib, and who have had disease progression during the last treatment.

Thalidomide is used in combination with melphalan and prednisolone as first-line treatment for untreated multiple myeloma, in patients aged 65 years and over, or for those not eligible for high-dose chemotherapy (for example, patients with significant co-morbidity such as cardiac risk factors). It has immunomodulatory and anti-inflammatory activity. Thalidomide can cause drowsiness, neutropenia, thrombocytopenia, hepatic disorders, and thromboembolism. Patients should also be monitored for signs and symptoms of peripheral neuropathy.

**NICE guidance**

**Bortezomib and thalidomide for the first-line treatment of multiple myeloma (July 2011)**

Thalidomide in combination with an alkylating drug and a corticosteroid is recommended as an option for the first-line treatment of multiple myeloma in people for whom high-dose chemotherapy with stem cell transplantation is considered inappropriate.

For bortezomib, see p. 587  
[www.nice.org.uk/TA228](www.nice.org.uk/TA228)

**Pregnancy** For women of child-bearing potential, pregnancy must be excluded before starting treatment with lenalidomide, pomalidomide, or thalidomide (perform pregnancy test on initiation or within 3 days prior to initiation). Women must practise effective contraception at least 1 month before, during, and for at least 1 month after treatment, including during dose interruptions (oral combined hormonal contraceptives and copper-releasing intrauterine devices not recommended) and men should use condoms during treatment, during dose interruption, and for at least 1 week after stopping if their partner is pregnant or is of child-bearing potential and not using effective contraception. Patients, prescribers and pharmacists must comply with pregnancy prevention measures as specified in the manufacturer’s Pregnancy Prevention Programme.

---

**LENALIDOMIDE**

**Indications** see notes above  
**Cautions** see notes above; monitor full blood count (including differential white cell count, platelet count, haemoglobin, and haematocrit) and liver function before treatment, then every week for the first 8 weeks, then monthly thereafter (reduce dose or interrupt treatment if neutropenia, thrombocytopenia or impaired liver function develop—consult product literature); monitor for arterial or venous thromboembolism (if thromboembolic event occurs, discontinue lenalidomide and treat with standard antiocoagulation therapy; lenalidomide may be restarted with continued antiocoagulation therapy once thromboembolic event resolved—consult product literature); use caution with concomitant drugs that increase the risk of thromboembolism—see also thromboembolism below; high tumour burden—risk
of tumour lysis syndrome, see p. 564; monitor thyroid function; monitor for signs and symptoms of peripher- nal neuropathy; caution in patients with risk factors for myocardial infarction; discontinue permanently if angioedema, exfoliative or bullous rash, or if Stevens- Johnson syndrome or toxic epidermal necrosis is suspected; interactions: Appendix 1 (lenalidomide) Thromboembolism Risk factors for thromboembolism (such as smoking, hypertension, hyperlipidaemia) should be minimised and thromboprophylaxis should be considered in patients with multiple risk factors. Patients and their carers should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness, chest pain, or swelling of a limb Neutropenia and thrombocytopenia Patients and their carers should be made aware of the symptoms of neutropenia and advised to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat) or of thrombocytopenia (such as bleeding) develop. Second primary malignancy Patients should be carefully evaluated before and during treatment with lenalidomide using routine cancer screening for occurrence of second primary malignancy and treatment should be instituted as indicated Hepatic disorders Liver function should be monitored (see Cautions above), particularly when there is history of, or concurrent viral liver infection, or when lenalidomide is combined with drugs known to be associated with liver dysfunction (e.g. paracetamol) Renal impairment reduce dose in renal impairment—consult product literature Pregnancy important: teratogenic risk see also notes above Breast-feeding discontinue breast-feeding—no information available Side-effects constipation, nausea, vomiting, diarrhoea, abdominal pain, dry mouth, dysphagia, dyspepsia, decreased appetite, stomatitis, cerebrovascular events, arthralgias, myalgias, myositis, tendinopathy, peripheral neuropathy; deep vein thrombosis, pulmonary embolism, deep vein thrombosis, pneumonia, dyspnoea, respiratory tract infections, respiratory distress, tension, malaise, mood changes, dizziness, syncope, falls, pyrexia, headache, ataxia, taste disturbance, peripheral neuropathy, sinusitis, sepsis, flu-like illness, hyperglycaemia, hypothyroidism, renal failure, urinary retention, urinary incontinence, haematological, sexual dysfunction, haematoma, haemorrhage, thrombocytopenia, anaemia, leucopenia, dehydration, electrolyte disturbances, musculoskeletal disorders, visual disturbances, cataract, hearing disturbances, skin disorders, rash [if rash occurs, treatment should be discontinued and only restarted following appropriate clinical evaluation, see also Cautions above], hyperhidrosis, pruritus; less commonly heaptic failure, secondary malignancies; rarely Stevens-Johnson syndrome, toxic epidermal necrosis, tumour lysis syndrome; also reported toxic hepatitis, cystoidic hepatitis, cholestatic hepatitis, pancreaticitis, interstitial pneumonitis; also consult product literature Dose Multiple myeloma, ADULT over 18 years, 25 mg once daily for 21 consecutive days of repeated 28-day cycles; for doses of dexamethasone, and dose adjustments due to side-effects, consult product literature Myelodysplastic syndromes, ADULT over 18 years, 10 mg once daily for 21 consecutive days of repeated 28-day cycles; for dose adjustments due to side-effects, consult product literature

Revlimid® (Celgene) (Pom)
Capsules, lenalidomide, 5 mg (white), net price 21-cap pack = £3570.00; 10 mg (blue/yellow), 21-cap pack = £3780.00; 15 mg (blue/white), 21-cap pack = £3969.00; 25 mg (white), 21-cap pack = £4368.00.
Label: 25, counselling, pregnancy and contraception, symptoms of thromboembolism, neutropenia, and thrombocytopenia
Note Patient, prescriber, and supplying pharmacy must comply with a pregnancy prevention programme. Every prescription must be accompanied by a completed Prescription Authorisation Form

POMALIDOMIDE
Indications see notes above
Cautions monitor full blood count before treatment, then every week for the first 8 weeks, then monthly thereafter (reduce dose or interrupt treatment if neutropenia or thrombocytopenia develop—consult product literature); monitor for arterial or venous thromboembolism; use caution with concomitant drugs that increase the risk of bleeding or thromboembolism; peripheral neuropathy; significant cardiac dysfunction; high tumour burden—risk of tumour lysis syndrome, see p. 564; interactions: Appendix 1 (pomalidomide) Thromboembolism Risk factors for thromboembolism (such as smoking, hypertension, hyperlipidaemia) should be minimised. Thromboprophylaxis should be considered, particularly in patients with additional risk factors. Patients and their carers should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness, chest pain, or swelling of a limb Neutropenia and thrombocytopenia Patients and their carers should be made aware of the symptoms of neutropenia and advised to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat) or of thrombocytopenia (such as bleeding) develop
Second primary malignancy Patients should be carefully evaluated before and during treatment with pomalidomide using routine cancer screening for occurrence of second primary malignancy and treatment should be instituted as indicated Hepatic impairment manufacturer advises caution—no information available Renal impairment manufacturer advises caution—no information available Pregnancy important: teratogenic risk see also notes above Breast-feeding avoid—present in milk in animal studies Side-effects decreased appetite, diarrhoea, nausea, vomiting, constipation, thromboembolic events, peripheral oedema, nasopharyngitis, dyspnoea, cough, impaired consciousness, malaise, confusion, peripheral neuropathy, dizziness, vertigo, tremor, pyrexia, pneumonia, respiratory tract infection, pelvic pain, urinary retention, renal failure, leucopenia, neutropenia (including febrile neutropenia and neutropenic sepsis), thrombocytopenia, anaemia, hyperkalaemia, hyponatraemia, bone pain, muscle spasms, rash, pruritus
Dose ADULT over 18 years, 4 mg once daily for 21 consecutive days of repeated 28-day cycles; for doses of dexamethasone, and dose adjustments due to side-effects, consult product literature
Imnovid® (Celgene) ▼ FHw
Capsules, pomalidomide, 1 mg (blue/yellow), net price 21-cap pack = £888.00; 2 mg (blue/orange), 21-cap pack = £888.00; 3 mg (blue/green), 21-cap pack = £888.00; 4 mg (blue), 21-cap pack = £888.00.Label: 3, 25, counselling, pregnancy and contraction, symptoms of thromboembolism, neutropenia, and thrombocytopenia

Note Patient, prescriber, and supplying pharmacy must comply with a pregnancy prevention programme. Every prescription must be accompanied by a completed Prescription Authorisation Form

Excipients include propylene glycol (see Excipients, p. 2)

**THALIDOMIDE**

**Indications** see notes above

**Cautions** see notes above; monitor white blood cell count (including differential count) and platelet count (reduce dose or interrupt treatment if neutropenia or thrombocytopenia develop - consult product literature); monitor liver function; high tumour burden - risk of tumour lysis syndrome, see p. 564; monitor for arterial or venous thromboembolism and use caution with concomitant drugs that increase the risk of peripheral neuropathy or thromboembolism — see also Thromboembolism, below

**Thromboembolism** Risk factors for thromboembolism (such as smoking, hypertension, hyperlipidaemia) should be minimised. Thromboprophylaxis is recommended for at least the first 5 months of treatment, especially in patients with additional thrombosis risk factors.

Patients and their carers should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness, chest pain, or swelling of a limb

**Neuropathy and thrombocytopenia** Patients and their carers should be made aware of the symptoms of neutropenia and advised to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat) or of thrombocytopenia (such as bleeding) develop

**Second primary malignancy** Patients should be carefully evaluated before and during treatment with thalidomide using routine cancer screening for occurrence of second primary malignancy and treatment should be instituted as indicated

**Hepatic disorder** Liver function should be monitored, particularly when there is history of, or concurrent viral liver infection, or when thalidomide is combined with drugs known to be associated with liver dysfunction (e.g. paracetamol)

**Peripheral neuropathy** Monitor patients for signs and symptoms of peripheral neuropathy; patients and their carers should be advised to seek medical advice if symptoms such as paraesthesia, abnormal coordination, or weakness develop. Dose reduction, dose interruption, or treatment discontinuation may be necessary - consult product literature. Patients with pre-existing peripheral neuropathy should not be treated with thalidomide unless the potential clinical benefits outweigh the risk

**Hepatic impairment** caution in severe impairment — no information available

**Renal impairment** caution in severe impairment — no information available

**Pregnancy** important: teratogenic risk; see also notes above

**Breast-feeding** avoid — present in milk in animal studies

**Side-effects** vomiting, dry mouth, dyspepsia, constipation; bradycardia, cardiac failure, deep vein thrombosis; dyspnoea, interstitial lung disease, pulmonary embolism, peripheral oedema; asthenia, confusion, depression, dizziness, drowsiness, peripheral neuropathy, dysaesthesia, paraesthesia, syncope, tremor; pyrexia; pneumonia; anaemia, leucopenia, neutropenia, lymphopenia, thrombocytopenia; skin reactions including Stevens-Johnson syndrome (if rash occurs, treatment should be discontinued and only restarted following appropriate clinical evaluation); also reported atrial fibrillation, atrioventricular block, toxic epidermal necrolysis, intestinal obstruction, gastro-intestinal perforation and haemorrhage, worsening of Parkinson’s disease symptoms, convulsions, hypothroidism, sexual dysfunction, menstrual disorders, second primary malignancy, hepatic disorders, renal failure, hearing loss, myocardial infarction, cerebrovascular events

**Dose**

- **ADULT** over 18 years, 200 mg once daily at bedtime for 6-week cycle; max. 12 cycles

**Thalidomide Celgene® (Celgene) ▼ FHw**

Capsules, thalidomide 50 mg, net price 28-cap pack = £298.48. Label: 2, counselling, pregnancy and contraction, symptoms of peripheral neuropathy, thromboembolism, neutropenia, and thrombocytopenia

Note Patient, prescriber, and supplying pharmacy must comply with a pregnancy prevention programme. Every prescription must be accompanied by a complete Prescription Authorisation Form.

**Mifamurtide**

Mifamurtide is licensed for high-grade, resectable, non-metastatic osteosarcoma after complete surgical resection, in patients 2 to 30 years of age at initial diagnosis. It is used in combination with chemotherapy.

**NICE guidance**

*Mifamurtide for the treatment of osteosarcoma (October 2011)*

Mifamurtide in combination with postoperative multi-agent chemotherapy is recommended (within its licensed indication), as an option for the treatment of high-grade resectable non-metastatic osteosarcoma after macroscopically complete surgical resection in children, adolescents and young adults and when mifamurtide is made available at a reduced cost to the NHS under the patient access scheme.

www.nice.org.uk/TA235

**MIFAMURTIDE**

**Indications** see notes above

**Cautions** asthma and chronic obstructive pulmonary disease—consider prophylactic bronchodilator therapy; history of autoimmune, inflammatory, or collagen disease; monitor renal function, hepatic function and clotting parameters; monitor patients with history of venous thrombosis, vasculitis, or unstable cardiovascular disorders for persistent or worsening symptoms during administration — consult product literature; interactions: Appendix 1 (mifamurtide)

**Hepatic impairment** use with caution — no information available

**Renal impairment** use with caution — no information available

**Pregnancy** avoid; effective contraception required

**Breast-feeding** avoid — no information available
**Side-effects**  
Gastro-intestinal disturbances (including anorexia, nausea, vomiting, diarrhoea, constipation, abdominal pain, dyspepsia); tachycardia, hypertension, palpitations, hypotension, phlebitis, flushing; oedema, respiratory disorders (including dyspnoea, epistaxis, cough, tachypnoea, haemoptysis, pleural effusion); confusion, depression, insomnia, headache, dizziness, paraesthesia, hypoaesthesia, tremor, drowsiness, anxiety; hypokalaemia, anaemia, leucopenia, thrombocytopenia, granulocytopenia; haematuria, dysuria, pollakiuria; musculoskeletal pain; blurred vision; vertigo, tinnitus, hearing loss; sweating, alopecia, rash, dry skin

**Dose**
- See Doses, p. 563

Natalizumab

**Natalizumab** is a monoclonal antibody that inhibits the migration of leukocytes into the central nervous system, hence reducing inflammation and demyelination. It is licensed for use in patients with highly active relapsing-remitting multiple sclerosis despite treatment with interferon beta or those with rapidly evolving severe relapsing-remitting multiple sclerosis. Treatment with natalizumab should be initiated and supervised by a specialist.

Natalizumab is associated with an increased risk of opportunistic infection and progressive multifocal leucoencephalopathy (PML). The risk of developing PML increases with previous immunosuppressant therapy and also after 2 years of therapy; the risk beyond 4 years is not known. A magnetic resonance image (MRI) scan is recommended before starting treatment with natalizumab, and annually thereafter. Patients should be monitored for new or worsening neurological symptoms, and for cognitive and psychiatric signs of PML. Treatment should be suspended until PML has been excluded. If a patient develops an opportunistic infection or PML, natalizumab should be permanently discontinued.

Infusion-related side-effects include nausea, vomiting, flushing, headache, dizziness, fatigue, rigor, pyrexia, arthralgia, urticaria, and pruritus. Patients should be observed for hypersensitivity reactions, including anaphylaxis, during the infusion and for 1 hour after completion of the infusion. Natalizumab should be discontinued permanently if hypersensitivity reaction occurs.

The **Scottish Medicines Consortium** (p. 4) has advised (August 2007) that natalizumab is accepted for restricted use as single disease-modifying therapy in highly active relapsing-remitting multiple sclerosis only in patients with rapidly evolving severe relapsing-remitting multiple sclerosis defined by 2 or more disabling relapses in 1 year and with 1 or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI.

**NICE guidance**  
**Natalizumab for the treatment of adults with highly active relapsing-remitting multiple sclerosis (August 2007)**

Natalizumab is an option for the treatment only of rapidly evolving severe relapsing-remitting multiple sclerosis (RES). RES is defined by 2 or more disabling relapses in 1 year, and 1 or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI.

www.nice.org.uk/TA127

**Teriflunomide**

**Teriflunomide** is a metabolite of leflunomide which has immunomodulating and anti-inflammatory properties. It is licensed for the treatment of adults with relapsing-remitting multiple sclerosis. Teriflunomide should be
initiated and supervised by a physician experienced in the management of multiple sclerosis.

**NICE guidance**

Teriflunomide for treating relapsing-remitting multiple sclerosis (January 2014)

Teriflunomide is recommended for the treatment of adults with active relapsing-remitting multiple sclerosis (normally defined as 2 clinically significant relapses in the previous 2 years), in adults who

- do not have highly active or rapidly evolving severe relapsing-remitting multiple sclerosis
- the manufacturer provides teriflunomide with the discount agreed in the patient access scheme

www.nice.org.uk/TA303

TERIFLUNOMIDE

**Note**

Teriflunomide is a metabolite of leflunomide

**Indications**

see notes above

**Cautions**

adult over 65 years; impaired bone-marrow function (avoid if severe) including anaemia, leucopenia or thrombocytopenia; significant alcohol consumption; latent tuberculosis; hypoproteinaemia (avoid if severe); switching between other immunomodulating drugs; persistent cough or dyspnoea; assess for interstitial lung disease and consider suspending treatment; severe infection—delay or suspend treatment until resolved; signs or symptoms of serious skin reactions (including ulcerative stomatitis, Stevens-Johnson syndrome, and toxic epidermal necrolysis)—discontinue treatment; monitor full blood count (including differential white cell count and platelet count) before treatment and as clinically indicated during treatment; monitor blood pressure and platelet count) before treatment and as clinically indicated thereafter; an accelerated elimination procedure is recommended following discontinuation due to serious adverse effects (consult product literature and see Accelerated Elimination Procedure below);

**Interactions:** Appendix 1 (teriflunomide)

**Hepatic monitoring**

Monitor liver function before treatment and every 2 weeks for 6 months then every 8 weeks thereafter or as clinically indicated (pre-existing liver disease may increase risk). Increase to weekly monitoring if alanine aminotransferase (ALT) is 2–3 times the upper limit of reference range; discontinue treatment if signs or symptoms of hepatic injury, or if liver enzymes exceed 3 times the upper limit of reference range; and a waiting period of one and a half months are 20 micrograms/litre (measured on 2 occasions at least 14 days apart) and a waiting period of one and a half months are present in milk in animal studies—manufacturer advises avoid

**Side-effects**

diarrhoea, nausea, vomiting, gastrointestinal, weight loss, hypertension, respiratory tract infection, laryngitis, anxiety, paraesthesia, peripheral neuropathy, sciatica, carpal tunnel syndrome, hyperaesthesia, neuralgia, menorrhagia, urinary tract infection, cystitis, neutropenia, leucopenia, polikaiuria, elevated liver enzymes, musculoskeletal pain, myalgia, oral infection, alopecia, rash, acne, tinea pedis; less commonly: anaemia, thrombocytopenia; very rarely: interstitial lung disease, pancreatitis; important: accelerated elimination procedure recommended following discontinuation due to serious adverse effects (consult product literature and see Accelerated Elimination Procedure above)

**Dose**

- **ADULT** over 18 years, 14 mg once daily

**Aubagio®** (Genzyme) f/c, pale blue, teriflunomide 14 mg, net price 28-tab pack = £1037.84.

**8.3 Sex hormones and hormone antagonists in malignant disease**

**8.3.1 Oestrogens**

**8.3.2 Progestogens**

**8.3.3 Androgens**

**8.3.4 Hormone antagonists**

Hormonal manipulation has an important role in the treatment of breast, prostate, and endometrial cancer, and a more marginal role in the treatment of hypernephroma. These treatments are not curative, but may provide excellent palliation of symptoms in selected patients, sometimes for a period of years. Tumour response, and treatment toxicity should be carefully monitored and treatment changed if progression occurs or side-effects exceed benefit.

**8.3.1 Oestrogens**

Diethylstilbestrol is sometimes used to treat prostate cancer, but it is not usually used first-line because of its side-effects. It is occasionally used in postmenopausal women with breast cancer. Toxicity is common and dose-related side-effects include nausea, fluid retention, and venous and arterial thrombosis. Impotence and gynaecomastia always occur in men, and withdrawal bleeding may be a problem in women. Hypercalcaemia and bone pain may also occur in breast cancer. Ethinylestradiol is the most potent oestrogen available; unlike other oestrogens it is only slowly metabolised in the liver. Ethinylestradiol is licensed for the palliative treatment of prostate cancer.

**DIETHYLSTILBESTROL**

(Stilboestrol)

**Indications**

see notes above

**Cautions**

cardiovascular disease

**Hepatic impairment**

avoid; see also Combined Hormonal Contraceptives (section 7.3.1)
8 Malignant disease and immunosuppression

- **Side-effects**: sodium retention with oedema, thromboembolism, jaundice, feminising effects in men; see also notes above.

- **Dose**
  - Breast cancer, 10–20 mg daily
  - Prostate cancer, 1–3 mg daily

- **Diethylstilbestrol** (Non-proprietary)
  - Tablets, diethylstilbestrol 1 mg, net price 28 = £101.32; 5 mg, 28 = £192.67

### ETHINYLESTRADIOL
(Ethinylestrodiol)

- **Indications** see notes above; other indications (section 6.4.1.1)

- **Cautions** see section 6.4.1.1; interactions: Appendix 1 (oestrogens)

- **Contra-indications** see section 6.4.1.1

- **Hepatic impairment** avoid; see also Combined Hormonal Contraceptives (section 7.3.1)

- **Side-effects** see section 6.4.1.1

- **Dose**
  - Prostate cancer (palliative), 0.15–1.5 mg daily

### Preparations
Section 6.4.1.1

#### 8.3.2 Progestogens

Progestogens have a role in the treatment of endometrial cancer; their use in breast cancer and renal cell cancer has declined. Progestogens are now rarely used to treat prostate cancer. Medroxyprogesterone or megestrol are usually chosen and can be given orally; high-dose or parenteral treatment cannot be recommended. Side-effects are mild but may include nausea, fluid retention, and weight gain.

#### MEGESTROL ACETATE

- **Indications** see notes above; other indications (section 7.3.2.2)

- **Cautions** see section 6.4.1.2; loss of vision during treatment (discontinue treatment if papilloedema or retinal vascular lesions); interactions: Appendix 1 (progestogens)

- **Contra-indications** see section 6.4.1.2 and notes above

- **Hepatic impairment** avoid; see also Combined Hormonal Contraceptives (section 7.3.1)

- **Side-effects** see section 6.4.1.2

- **Dose**
  - Breast cancer, 160 mg once daily

- **Preparations**
  - Megace® (Bristol-Myers Squibb)
    - Tablets, scored, megestrol acetate 160 mg (off-white), 30-tab pack = £19.52

#### NORLETHISTERONE

- **Indications** see notes above; other indications (section 6.4.1.2)

- **Cautions** see section 6.4.1.2 and notes above; interactions: Appendix 1 (progestogens)

- **Contra-indications** see section 6.4.1.2 and notes above

- **Hepatic impairment** avoid; see also oral Progestogen-only Contraceptives (section 7.3.2.1)

- **Pregnancy** masculinisation of female fetuses and other defects reported; see also oral Progestogen-only Contraceptives (section 7.3.2.1)

- **Breast-feeding** higher doses may suppress lactation and alter milk composition—use lowest effective dose; see also oral Progestogen-only Contraceptives (section 7.3.2.1)

- **Side-effects** see section 6.4.1.2

- **Dose**
  - Breast cancer, 40 mg daily, increased to 60 mg daily if required

- **Preparations**
  - Section 6.4.1.2
Early breast cancer

All women should be considered for younger women. Therapy for steroid hormone-receptor-negative tumours of hormone-receptor-positive breast cancer and chemotherapy for steroid hormone-receptor-negative tumours or for younger women.

For operable breast cancer, treatment before surgery (neoadjuvant therapy) reduces the size of the tumour and facilitates breast-conserving surgery, hormone antagonist therapy (e.g. letrozole) is chosen for steroid hormone-receptor-positive breast cancer and chemotherapy for steroid hormone-receptor-negative tumours.

Early breast cancer

All women should be considered for adjuvant therapy following surgical removal of the tumour. Adjuvant therapy is used to eradicate the micrometastases that cause relapses. Choice of adjuvant treatment is determined by the risk of recurrence, steroid hormone-receptor status of the primary tumour, and menopausal status.

Adjuvant therapy comprises cytotoxic chemotherapy and hormone-antagonist therapy. Women with steroid hormone-receptor-positive breast cancer are considered for hormone-antagonist therapy (preceded by cytotoxic chemotherapy if necessary) whilst women with steroid hormone-receptor-negative breast cancer should be considered for cytotoxic chemotherapy.

Aromatase inhibitors act predominantly by blocking the conversion of androgens to oestrogens in the peripheral tissues. They do not inhibit ovarian oestrogen synthesis and should not be used in premenopausal women. Anastrozole and letrozole are non-steroidal aromatase inhibitors; exemestane is a steroidal aromatase inhibitor. Aromatase inhibitors are usually prescribed as initial adjuvant therapy in postmenopausal women with oestrogen-receptor-positive tumours; tamoxifen, an oestrogen-receptor antagonist, is used if an aromatase inhibitor is not appropriate. Adjuvant hormone antagonist therapy should generally be continued for 5 years following removal of the tumour. In postmenopausal women considered for extended adjuvant therapy, 5 years of tamoxifen is followed by letrozole for a further 2–3 years.

Trastuzumab (section 8.1.5) is licensed for use in early breast cancer which overexpresses human epidermal growth factor-2 (HER2) in women who have received surgery, chemotherapy and radiotherapy (as appropriate).

Premenopausal women with oestrogen-receptor-positive breast cancer who decline chemotherapy may benefit from treatment with goserelin (section 8.3.4.2) or ovarian ablation.

Advanced breast cancer

Treatment of advanced breast cancer depends on the patient’s drug history and an assessment of disease severity. Aromatase inhibitors, such as anastrozole or letrozole, are the preferred treatment in postmenopausal women with oestrogen-receptor-positive advanced breast cancer, a long disease-free interval following treatment for early breast cancer, and disease limited to bone or soft tissues; tamoxifen can be used if aromatase inhibitors are not suitable. Progestogens, such as medroxyprogesterone acetate (section 8.3.2), may be used after aromatase inhibitors and tamoxifen in postmenopausal women.

Tamoxifen should be considered for pre- and perimenopausal women with oestrogen-receptor-positive breast cancer not previously treated with tamoxifen. Ovarian suppression is used in pre- and perimenopausal women who have had disease progression despite treatment with tamoxifen. The gonadorelin analogue goserelin (section 8.3.4.2) is licensed for advanced breast cancer in pre- and perimenopausal women suitable for hormone manipulation.

Trastuzumab emtansine can be used alone for treating HER2-positive, unresectable, locally advanced breast cancer previously treated with trastuzumab and a taxane, or when there is disease recurrence during or following adjuvant therapy (section 8.1.5).

Cytotoxic chemotherapy is indicated for advanced steroid hormone-receptor-negative tumours and for aggressive disease, particularly when metastases involve visceral sites (e.g. the liver) or if the disease-free interval following treatment for early breast cancer is short.

Cytotoxic drugs used in breast cancer

An anthracycline combined with fluorouracil (section 8.1.3) and cyclophosphamide (section 8.1.1), and sometimes also with methotrexate (section 8.1.3) is effective. Cyclophosphamide, methotrexate, and fluorouracil can be useful if an anthracycline is inappropriate (e.g. in cardiac disease).

Metastatic disease

The choice of chemotherapy regimen will be influenced by whether the patient has previously received adjuvant treatment and the presence of any co-morbidity.

For women who have not previously received chemotherapy, an anthracycline (such as doxorubicin or epirubicin) alone or in combination with another cytotoxic drug is the standard initial therapy for metastatic breast disease.

Patients with anthracycline-refractory or resistant disease should be considered for treatment with a taxane (section 8.1.5) either alone or in combination with trastuzumab if they have tumours that overexpress HER2. Other cytotoxic drugs with activity against breast cancer include capecitabine (section 8.1.5), mitoxantrone, mitomycin (both section 8.1.2), and vinorelbine (section 8.1.4). Trastuzumab alone (section 8.1.5) is an option for chemotherapy-resistant cancers that overexpress HER2. Trastuzumab emtansine can be used as monotherapy in HER2-positive metastatic breast cancer previously treated with trastuzumab and a taxane, or when there is disease recurrence during or following adjuvant therapy (section 8.1.5). Trastuzumab and trastuzumab emtansine are not interchangeable. The use of bisphosphonates (section 6.6.2) in patients with metastatic breast cancer may reduce pain and prevent skeletal complications of bone metastases.
**8 Malignant disease and immunosuppression**

**ANASTROZOLE**

**Indications** adjuvant treatment of oestrogen-receptor-positive early invasive breast cancer in postmenopausal women; adjuvant treatment of oestrogen-receptor-positive early breast cancer in postmenopausal women following 2–3 years of tamoxifen therapy; advanced breast cancer in postmenopausal women which is oestrogen-receptor-positive or responsive to tamoxifen

**Cautions** laboratory test for menopause if doubt; susceptibility to osteoporosis (assess bone mineral density before treatment and at regular intervals)

**Contra-indications** not for premenopausal women

**Hepatic impairment** avoid in moderate to severe impairment

**Renal impairment** avoid if creatinine clearance less than 20 mL/minute

**Pregnancy** avoid

**Breast-feeding** avoid

**Side-effects** hot flushes, vaginal dryness, vaginal bleeding, hair thinning, anorexia, nausea, vomiting, diarrhoea, headache, arthralgia, arthritis, bone fractures, bone pain, rash (including Stevens-Johnson syndrome), cutaneous vasculitis; asthenia and drowsiness—may initially affect ability to drive or operate machinery; slight increases in total cholesterol levels reported; very rarely allergic reactions including angioedema and anaphylaxis

**Dose**
- 1 mg daily

**Anastrozole (Non-proprietary)**

| Tablets, anastrozole 1 mg, net price 28-tab pack | £1.80
| Brands include | Nastrox®

**Arimidex® (AstraZeneca)**

| Tablets, f/c, anastrozole 1 mg, net price 28-tab pack | £68.56

- The Scottish Medicines Consortium (p. 4) has advised (August 2005 and October 2006) that anastrozole (Arimidex®) is accepted for restricted use within NHS Scotland as an adjuvant treatment in postmenopausal women with oestrogen-receptor-positive invasive early breast cancer, following 2–3 years of initial adjuvant tamoxifen therapy.

**FULVESTRANT**

**Indications** treatment of oestrogen-receptor-positive metastatic or locally advanced breast cancer in postmenopausal women in whom disease progresses or relapses while on, or after, other anti-oestrogen therapy

**Hepatic impairment** manufacturer advises caution in mild to moderate impairment; avoid in severe impairment

**Renal impairment** manufacturer advises caution if creatinine clearance less than 30 mL/minute—no information available

**Pregnancy** manufacturer advises avoid—increased incidence of fetal abnormalities and death in animal studies

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies

**Side-effects** nausea, vomiting, diarrhoea; venous thromboembolism; anorexia, headache, asthenia; urinary-tract infections; hot flushes; back pain; rash, injection-site reactions, hypersensitivity reactions; less commonly vaginal haemorrhage, vaginal candidiasis, and leucorrhoea

**Dose**
- By deep intramuscular injection into buttock, 500 mg every 2 weeks for the first 3 doses, then 500 mg every month

**Note** 500 mg dose should be administered as one 250-mg injection (slowly over 1–2 minutes) into each buttock

**Faslodex® (AstraZeneca)**

| Injection (oily), fulvestrant 50 mg/mL, net price 2 x 5-mL (250-mg) prefilled syringe | £522.41

**LETROZOLE**

**Indications** first-line treatment in postmenopausal women with hormone-dependent advanced breast cancer; adjuvant treatment of oestrogen-receptor-positive invasive early breast cancer in postmenopausal women; advanced breast cancer in postmenopausal women who have received standard adjuvant tamoxifen therapy in whom other anti-oestrogen therapy has failed; extended adjuvant treatment of hormone-dependent invasive breast cancer in postmenopausal women who have received standard adjuvant tamoxifen therapy for 5 years; neo-adjuvant treatment in postmenopausal women with localised hormone-receptor-positive, human epidermal growth factor-2 negative breast cancer where chemotherapy is not suitable and surgery not yet indicated

**Cautions** susceptibility to osteoporosis (assess bone mineral density before treatment and at regular intervals)

**Contra-indications** not indicated for premenopausal women

**Hepatic impairment** manufacturer advises caution in severe impairment

**Aromasin® (Pharmacia)**

| Tablets, s/c, exemestane 25 mg, net price 30-tab pack | £88.80, 90-tab pack = £266.40. Label: 21
| The Scottish Medicines Consortium (p. 4) has advised (October 2005) that exemestane (Aromasin®) is accepted for restricted use within NHS Scotland as an adjuvant treatment in postmenopausal women with oestrogen-receptor-positive invasive early breast cancer, following 2–3 years of initial adjuvant tamoxifen therapy.

**Exemestane (Non-proprietary)**

| Tablets, exemestane 1 mg, net price 28-tab pack | £1.80
| Brands include | Nastrox®

**LETROZOLE**

| Tablets, letrozole 2.5 mg, net price 28-tab pack | £70.66
| Brands include | Letrozex®

**LETROZOLE**

| Tablets, letrozole 2.5 mg, net price 28-tab pack | £70.66
| Brands include | Letrozex®

- The Scottish Medicines Consortium (p. 4) has advised (October 2005) that exemestane (Aromasin®) is accepted for restricted use within NHS Scotland as an adjuvant treatment in postmenopausal women with oestrogen-receptor-positive invasive early breast cancer, following 2–3 years of initial adjuvant tamoxifen therapy.

**Side-effects** nausea, vomiting, diarrhoea; venous thromboembolism; anorexia, headache, asthenia; urinary-tract infections; hot flushes; back pain; rash, injection-site reactions, hypersensitivity reactions; less commonly vaginal haemorrhage, vaginal candidiasis, and leucorrhoea

**Dose**
- 25 mg daily
**Renal impairment** manufacturer advises caution if creatinine clearance less than 10 mL/minute

**Pregnancy** avoid (isolated cases of birth defects reported); manufacturer advises effectiveness contra-

**Contraindications** treatment of infertility contra-

**Side-effects** nausea, vomiting, abdominal pain, hypotension, hot flushes, fatigue, dizziness, head-

**Cautions**

**Indications** see under Dose and notes above; effective contraception must be used during treatment and for 2 months after stopping

**Dose**
- 2.5 mg daily

**Tamoxifen (Non-proprietary)**
- Tablets, letrozole 2.5 mg, net price 14-tab pack = £1.63, 28-tab pack = £3.26
- Femara® (Novartis)
- Tablets, 1/2c, letrozole 2.5 mg. Net price 14-tab pack = £49.90, 28-tab pack = £84.86

**8.3.4 Hormone antagonists**

**Indications** hormone-dependent metastatic breast cancer in postmenopausal women

**Cautions** hypercalcaemia may occur (especially if bone metastases and usually at beginning of treat-

**Contra-indications** treatment of infertility contra-

**Pregnancy** avoid—possible effects on fetal develop-

**Breast-feeding** suppresses lactation; avoid unless potential benefit outweighs risk

**Side-effects** hot flushes, vaginal bleeding and vaginal discharge (important: see also Endometrial Changes under Cautions), suppression of menstruation in some premenopausal women, pruritus vulvae, gastro-

**Hepatic impairment** elimination decreased in hepatic impairment—avoid if severe

**Breast-feeding** avoid

**Side-effects** nausea, vomiting; oedema; depression, dizziness, fatigue; sweating, hot flushes, vaginal bleeding or discharge (important: see Cautions); rash; less commonly anorexia, constipation, increased weight, thromboembolic events; dyspnoea, insomnia, headache, endometrial hypertrophy; very rarely jaun-

**Dose**
- 60 mg daily

**Tamoxifen (Non-proprietary)**
- Tablets, tamoxifen (as citrate) 10 mg, net price 30-

**Toremifene**

**Indications**

**Cautions** hypercalcaemia may occur (especially if bone metastases and usually at beginning of treat-

**Contra-indications** endometrial hyperplasia, QT prolongation (avoid coadministration of drugs that prolong QT interval), electrolyte distur-

**Hepatic impairment** elimination decreased in hepatic impairment—avoid if severe

**Breast-feeding** avoid
Metastatic cancer of the prostate usually responds to hormonal treatment aimed at androgen depletion. Standard treatments include bilateral subcapsular orchidectomy or use of a gonadorelin analogue (buserelin, goserelin, histrelin, leuprolrelin, or triptorelin). The gonadotrophin-releasing hormone antagonist, degarelix, (p. 643) is also available. Response in most patients lasts for 12 to 18 months. No entirely satisfactory therapy exists for disease progression despite this treatment (hormone-refractory prostate cancer), but occasional patients respond to other hormone manipulation e.g. with an anti-androgen. Bone disease may be associated with progression of prostate cancer. In susceptible patients this tumour ‘flare’ may cause spinal cord compression, ureteric obstruction or increased bone pain. When such problems are anticipated, alternative treatments (e.g. orchidectomy) or concomitant use of an anti-androgen such as cyproterone acetate or flutamide (see below) are recommended; anti-androgen treatment should be started before the gonadorelin analogue. Gonadorelin analogues are also used in women for breast cancer (section 8.3.4.1) but are expensive and require parenteral administration, at least initially. They cause initial stimulation then depression of luteinising hormone release by the pituitary. During the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour ‘flare’ may cause spinal cord compression, ureteric obstruction or increased bone pain. When such problems are anticipated, alternative treatments (e.g. orchidectomy) or concomitant use of an anti-androgen such as cyproterone acetate or flutamide (see below) are recommended; anti-androgen treatment should be started before the gonadorelin analogue.

Gonadorelin analogues

Gonadorelin analogues are as effective as orchidectomy or diethylstilbestrol (section 8.3.1) but are expensive and require parenteral administration, at least initially. They cause initial stimulation then depression of luteinising hormone release by the pituitary. During the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour ‘flare’ may cause spinal cord compression, ureteric obstruction or increased bone pain. When such problems are anticipated, alternative treatments (e.g. orchidectomy) or concomitant use of an anti-androgen such as cyproterone acetate or flutamide (see below) are recommended; anti-androgen treatment should be started before the gonadorelin analogue. Gonadorelin analogues are also used in women for breast cancer (section 8.3.4.1) and other indications (section 6.7.2).

The Scottish Medicines Consortium (p. 4) has advised (June 2009) that histrelin (Vantana®) is accepted for restricted use within NHS Scotland for the palliative treatment of advanced prostate cancer in patients with an anticipated life expectancy of at least one year in whom annual administration will offer advantages.

Cautions

Men at risk of tumour ‘flare’ (see above) should be monitored closely during the first month of therapy. Caution is required in patients with metabolic bone disease because reduced bone mineral density can occur. The injection site should be rotated.

Side-effects

The gonadorelin analogues cause side-effects similar to the menopause in women and orchidectomy in men and include hot flushes and sweating, sexual dysfunction, vaginal dryness or bleeding, and gynaecomastia or changes in breast size. Signs and symptoms of prostate or breast cancer may worsen initially (managed in prostate cancer with anti-androgens, see above). Other side-effects include hypersensitivity reactions (rashes, pruritus, asthma, and rarely anaphylaxis), injection site reactions (see Cautions), headache (rarely migraine), visual disturbances, dizziness, arthralgia and possibly myalgia, hair loss, peripheral oedema, gastro-intestinal disturbances, weight changes, sleep disorders, and mood changes.

BUSERELIN

Indications

advanced prostate cancer; other indications (section 6.7.2)

Cautions

diabetes, hypertension, depression; see also notes above

Side-effects

see notes above; worsening hypertension, palpitation, glucose intolerance, altered blood lipids, thrombocytopenia, leucopenia, nervousness, fatigue, memory and concentration disturbances, anxiety, increased thirst, hearing disorders, musculoskeletal pain; nasal irritation, nose bleeds and altered sense of taste and smell (spray formulation only)

Dose

• By subcutaneous injection, 500 micrograms every 8 hours for 7 days, then intranasally, 1 spray into each nostril 6 times daily (see also notes above)

Counselling

Avoid use of nasal decongestants before and for at least 30 minutes after treatment.

Suprefact® (Sanofi-Aventis®) (Legal)

Injection, buserelin (as acetate) 1 mg/mL. Net price 2 × 5.5-mL vial = £28.64

Nasal spray, buserelin (as acetate) 100 micrograms/ metered spray. Net price treatment pack of 4 × 10- g bottle with spray pump = £101.87. Counselling, see above

GOSERELIN

Indications

locally advanced prostate cancer as an alternative to surgical castration; adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer; neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer; metastatic prostate cancer; advanced breast cancer; oestrogen-receptor-positive early breast cancer (section 8.3.4.1); endometriosis, endometrial thinning, uterine fibroids, assisted reproduction (section 6.7.2)

Cautions

see notes above; diabetes; hypertension; depression; risk of ureteric obstruction and spinal cord compression in men

Contra-indications

undiagnosed vaginal bleeding

Pregnancy

see Goserelin, section 6.7.2

Breast-feeding

see Goserelin, section 6.7.2

Side-effects

see notes above; also transient changes in blood pressure, heart failure, myocardial infarction; paraesthesia; rarely hypercalcaemia (in patients with metastatic breast cancer)

Dose

• See under preparations below

Zoladex® (AstraZeneca) (Legal)

Implant, goserelin (as acetate) 3.6 mg in SafeSystem® syringe applicator, net price each = £65.00

Dose

breast cancer and prostate cancer (see indications above) by subcutaneous injection into anterior abdominal wall, 3.6 mg every 28 days

Zoladex® LA (AstraZeneca) (Legal)

Implant, goserelin (as acetate) 10.8 mg in SafeSystem® syringe applicator, net price each = £235.00

Dose

prostate cancer (see indications above), by subcutaneous injection into anterior abdominal wall, 10.8 mg every 12 weeks
**HISTRELIN**

**Indications** advanced prostate cancer

**Cautions** see notes above; monitor patients at high risk of metabolic disease (e.g. bone disease, worsening diabetes) or cardiovascular disease before and during treatment; risk of ureteric obstruction and spinal cord compression

**Side-effects** see notes above; also hepatic disorder, dyspnoea, depression, asthenia, elevated blood glucose-concentration, increased urinary frequency, hypertrichosis; less commonly hypercholesterolaemia, palpitation, ventricular extrasystole, haematoma, tremor, anaemia, renal failure, nephrolithiasis, hypercalcaemia

**Dose**
- By subcutaneous implantation into upper arm, 1 implant (50 mg) every 12 months; remove after 12 months of treatment
- **Counselling** Avoid wetting arm containing implant for 24 hours and avoid lifting heavy objects or strenuous physical activity for 7 days after implantation

**Note** Each vial includes an overage to allow accurate administration of a 3-mg dose

**Injection** (powder for suspension), triptorelin (as acetate), net price 3.75-mg vial (with diluent) = £75.24

**Decapeptyl® SR (Ipsen)**

**Injection** (powder for suspension), triptorelin (as acetate), net price 11.25-mg vial (with diluent) = £207.00

**Dose** locally advanced non-metastatic prostate cancer as an alternative to surgical castration, metastatic prostate cancer, as an adjuvant treatment to radiotherapy in high-risk localised or locally advanced prostate cancer, as adjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer, as an adjuvant treatment to radical prostatectomy in patients with locally advanced prostate cancer at high risk of disease progression, by intramuscular injection, 3 mg every 4 weeks

**Note** Each vial includes an overage to allow accurate administration of an 11.25-mg dose

**Injection** (powder for suspension), triptorelin (as acetate), net price 22.5-mg vial (with diluent) = £414.00

**Dose** locally advanced non-metastatic prostate cancer as an alternative to surgical castration, metastatic prostate cancer, as an adjuvant treatment to radiotherapy in high-risk localised or locally advanced prostate cancer, as an adjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer, as an adjuvant treatment to radical prostatectomy in patients with locally advanced prostate cancer at high risk of disease progression, by intramuscular injection, 22.5 mg every 6 months (see also notes above)

**Note** Each vial includes an overage to allow accurate administration of a 22.5-mg dose

**Gonapeptyl Depot® (Ferring)**

**Injection** (powder for suspension), triptorelin (as acetate), net price 3.75-mg pre-filled syringe with prefilled syringe of vehicle = £81.69

**Dose** advanced prostate cancer, by subcutaneous or deep intramuscular injection, 3.75 mg every 4 weeks (see also notes above)

**Anti-androgens**

Cyproterone acetate, flutamide and bicalutamide are anti-androgens that inhibit the tumour ‘flare’ which may occur after commencing gonadorelin analogue administration. Cyproterone acetate and flutamide are also licensed for use alone in patients with metastatic prostate cancer refractory to gonadorelin analogue therapy. Bicalutamide is used for prostate cancer either alone or as an adjunct to other therapy, according to the clinical circumstances.

**Abiraterone** (in combination with prednisone or prednisolone) and enzalutamide are licensed for metastatic castration-resistant prostate cancer in patients whose disease has progressed during or after treatment with a docetaxel-containing chemotherapy regimen. Abirater-
one is also used to treat metastatic castration-resistant prostate cancer in patients who are asymptomatic or mildly symptomatic after failure of androgen deprivation therapy in whom chemotherapy is not yet clinically indicated. Medical castration with a luteinising hormone-releasing hormone analogue should be continued during treatment with abiraterone in patients not surgically castrated.

The Scottish Medicines Consortium (p. 4) has advised (July 2012) that abiraterone (Zytiga®), in combination with prednisone or prednisolone, is accepted for restricted use within NHS Scotland for the treatment of metastatic castration-resistant prostate cancer in patients whose disease has progressed during or after treatment with docetaxel-containing chemotherapy regimen, and have received only one prior chemotherapy regimen.

NICE guidance
Abiraterone for castration-resistant metastatic prostate cancer previously treated with a docetaxel-containing regimen (June 2012)
Abiraterone in combination with prednisone or prednisolone is recommended as an option for the treatment of castration-resistant metastatic prostate cancer only if:
- their disease has progressed on or after one docetaxel-containing chemotherapy regimen, and
- the manufacturer provides abiraterone with the discount agreed in the patient access scheme.

Patients currently receiving abiraterone in combination with prednisone or prednisolone whose disease does not meet the first criteria should be able to continue therapy until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA259

**ABIRATERONE ACETATE**

**Indications** see notes above

**Cautions** monitor blood pressure, serum potassium concentration, and fluid balance before treatment, and at least monthly during treatment—consult product literature for management of hypertension, hypokalaemia and oedema; history of cardiovascular disease—correct hypertension and hypokalaemia before treatment (if significant risk of congestive heart failure, such as history of cardiac failure, uncontrolled hypertension or cardiac events, consult product literature for management and increased monitoring); diabetes (increased risk of hyperglycaemia—monitor blood sugar frequently); concurrent chemotherapy—safety and efficacy not established; increased risk of myopathy and rhabdomyolysis with possible renal failure—caution with concomitant use of drugs known to be associated with myopathy or rhabdomyolysis; monitor liver function before treatment, then every 2 weeks for the first 3 months of treatment, then monthly thereafter—interrupt treatment if serum alanine aminotransferase or aspartate aminotransferase greater than 5 times the upper limit (consult product literature for details of restarting treatment at a lower dose) and discontinue permanently if 20 times the upper limit; interactions: Appendix 1 (abiraterone)

**Hepatic impairment** use with caution in moderate impairment and only if benefit clearly outweighs risk; avoid in severe impairment; see also Cautions

**Renal impairment** use with caution in severe impairment—no information available

**Pregnancy** men should use condoms if their partner is pregnant, and use condoms in combination with another effective contraceptive method if their partner is of child-bearing potential—toxicity in animal studies

**Side-effects** diarrhoea, dyspepsia, hepatotoxicity (see under Cautions, above), hypertension, hypertriglyceridaemia, heart failure, angina, arrhythmias, atrial fibrillation, tachycardia, peripheral oedema, urinary tract infection, haematuria, hypokalaemia, fractures, rash; less commonly adrenal insufficiency, myopathy, rhabdomyolysis

**Dose**
- 1 g once daily

**Note** Consult product literature for dose of concurrent prednisone or prednisolone

Zytiga® (Janssen) Tablets, abiraterone acetate 250 mg, net price 120-tab pack = £2930.00. Label: 23

**BICALUTAMIDE**

**Indications** locally advanced prostate cancer at high risk of disease progression, either alone or as adjuvant treatment to prostatectomy or radiotherapy; locally advanced, non-metastatic prostate cancer when surgical castration or other medical intervention inappropriate; advanced prostate cancer in combination with gonadorelin analogue or surgical castration

**Cautions** consider periodic liver function tests; interactions: Appendix 1 (bicalutamide)

**Hepatic impairment** increased accumulation possible in moderate to severe impairment

**Side-effects** nausea, diarrhoea, cholestasis, jaundice; asthenia, weight gain; gynaecomastia, breast tenderness, hot flushes, impotence, decreased libido; anaemia; alopecia, dry skin, hirsutism, pruritus; less commonly vomiting, abdominal pain, dyspepsia, interstitial lung disease, pulmonary fibrosis, depression, haematuria, thrombocytopenia, hypersensitivity reactions including angioneurotic oedema and urticaria; rarely cardiovascular disorders (including angina, heart failure, and arrhythmias), and hepatic failure

**Dose**
- Locally advanced prostate cancer at high risk of disease progression, 150 mg once daily
- Locally advanced, non-metastatic prostate cancer when surgical castration or other medical intervention inappropriate, 150 mg once daily
- Advanced prostate cancer, in combination with gonadorelin analogue or surgical castration, 50 mg once daily (started at the same time as surgical castration or at least 3 days before gonadorelin treatment, see also notes above)

Bicalutamide (Non-proprietary) Tablets, bicalutamide 50 mg, net price 28-tab pack = £2.31; 150 mg, 28-tab pack = £5.74

Casodex® (AstraZeneca) Tablets, 1/4 c, bicalutamide 50 mg, net price 28-tab pack = £119.79; 150 mg, 28-tab pack = £240.00
CYPROTERONE ACETATE

**Indications** prostate cancer, see under Dose and also notes above; other indications, see section 6.4.2

**Cautions** in prostate cancer, blood counts initially and throughout treatment; monitor hepatic function; liver function tests should be performed before treatment, see also under Side-effects below; monitor adrenocortical function regularly; risk of recurrence of thromboembolic disease; diabetes mellitus, sickle-cell anaemia, severe depression (in other indications some of these are contra-indicated, see section 6.4.2)

**Driving** Fatigue and lassitude may impair performance of skilled tasks (e.g. driving)

**Contra-indications** patients with meningioma or history of meningioma; for contra-indications relating to other indications see section 6.4.2

**Hepatic impairment** dose-related toxicity; see also under cautions (above) and side-effects (below)

**Side-effects** see section 6.4.2

**Hepatotoxicity** Direct hepatic toxicity including jaundice, hepatitis and hepatic failure have been reported (fatalities reported at dosages of 100 mg and above, usually in men treated for advanced prostate cancer). Liver function tests should be performed before and regularly during treatment and whenever symptoms suggestive of hepatotoxicity occur—if confirmed cyproterone should normally be withdrawn unless the hepatotoxicity can be explained by another cause such as metastatic disease (in which case cyproterone should be continued only if the perceived benefit exceeds the risk)

**Dose**
- Prevention of flare with initial gonadorelin analogue therapy, 200 mg daily in 2–3 divided doses for 5–7 days before initiation of gonadorelin analogue, followed by 200 mg daily in 2–3 divided doses for 3–4 weeks after initiation of gonadorelin analogue; max. 300 mg daily
- Long-term palliative therapy where gonadorelin analogues or orchidectomy contra-indicated, not tolerated, or where oral therapy preferred, 200–300 mg daily in 2–3 divided doses
- Hot flushes with gonadorelin analogue therapy or after orchidectomy, initially 50 mg daily, adjusted according to response to 50–150 mg daily in 1–3 divided doses

**Cyproterone Acetate (Non-proprietary) (Pat)**
- Tablets, cyproterone acetate 50 mg, net price 56-tab pack = £29.00; 100 mg, 84-tab pack = £55.19. Label: 21, counselling, driving
- Cyprostat® (Bayer) (Pat)
- Tablets, scored, cyproterone acetate 50 mg, net price 168-tab pack = £87.00; 100 mg, 84-tab pack = £87.00. Label: 21, counselling, driving

ENZALUTAMIDE

**Indications** metastatic castration-resistant prostate cancer in patients whose disease has progressed during or after docetaxel therapy

**Cautions** history or risk of seizure (including brain injury, stroke, brain tumours, brain metastases, alcoholism, concurrent use of medication which may lower seizure threshold); recent cardiovascular disease; bradycardia; uncontrolled hypertension; concurrent chemotherapy—safety and efficacy not established; interactions: Appendix 1 (enzalutamide)

**Hepatic impairment** manufacturer advises caution in moderate impairment, avoid in severe impairment

**Renal impairment** caution in severe impairment—no information available

**Pregnancy** men should use condoms during treatment and for 3 months after stopping treatment if their partner is pregnant, and use condoms in combination with another effective contraceptive method if their partner is of child-bearing potential—toxicity in animal studies

**Side-effects** hot flush, hypertension, headache, visual hallucinations, anxiety, cognitive disorder, memory impairment, falls, neutropenia, fractures, dry skin, pruritus; less commonly seizure, leucopenia

**Dose**
- 160 mg once daily

**Xtandi® (Astellas) (Pat)**
- Capsules, enzalutamide 40 mg, net price 112-cap pack = £2734.67. Label: 25

**FLUTAMIDE**

**Indications** advanced prostate cancer, see also notes above

**Cautions** cardiac disease (oedema reported); also liver function tests, monthly for first 4 months, periodically thereafter and at the first sign or symptom of liver disorder (e.g. pruritus, dark urine, persistent anaemia, jaundice, abdominal pain, unexplained influenza-like symptoms); avoid excessive alcohol consumption; avoid in acute porphyria (section 9.8.2); interactions: Appendix 1 (flutamide)

**Hepatic impairment** use with caution (hepatotoxic)

**Side-effects** gynaecomastia (sometimes with galactorrhoea); nausea, vomiting, diarrhoea, increased appetite, insomnia, tiredness; other side-effects reported include decreased libido, reduced sexual desire, palpitations, heart rate, increased saliva, sweating, tremor, dizziness, blurred vision, thirst, fatigue, irritability, depression, headache, dizziness, oedema, blurred vision, thirst, rash, pruritus, haemolytic anaemia, systemic lupus erythematosus-like syndrome, and lymphoedema; hepatic injury (with transaminase abnormalities, elevated bilirubin, jaundice, hepatic necrosis, hepatic encephalopathy and occasional fatality) reported

**Dose**
- 250 mg 3 times daily (see also notes above)

**Flutamide (Non-proprietary) (Pat)**
- Tablets, flutamide 250 mg. Net price 84-tab pack = £49.38

**Gonadotrophin-releasing hormone antagonists**

**Degarelix** is a gonadotrophin-releasing hormone antagonist used to treat advanced hormone-dependent prostate cancer. It does not induce a testosterone surge or tumour ‘flare’, therefore anti-androgen therapy is not required.

**DEGARELIX**

**Indications** see notes above

**Cautions** susceptibility to QT-interval prolongation (avoid concomitant use of drugs that prolong QT interval); monitor bone density; diabetes

**Hepatic impairment** manufacturer advises caution in severe impairment—no information available

**Renal impairment** manufacturer advises caution in severe impairment—no information available
Side-effects  nausea; dizziness, headache, drowsiness, insomia, asthenia; influenza-like symptoms; hot flushes, sweating (including night sweats), weight gain; injection-site reactions; less commonly diarrhoea, vomiting, abdominal discomfort, dry mouth, constipation, anorexia, atrio-ventricular block, QT-interval prolongation, fainting, hypertension, hypersensitivity reactions, depression, anxiety, oedema, gynaecomastia, micturition urgency, renal impairment, sexual dysfunction, pelvic pain, prostatitis, testicular pain, anaemia, musculoskeletal pain, tinnitus, urticaria, alopecia, and rash

Dose  
- By subcutaneous injection into the abdominal region, Adult over 18 years, initially 240 mg (administered as 2 injections of 120 mg), then 80 mg every 28 days

Firmagon® (Ferring) (PH) Injection, powder for reconstitution, degarelix (as acetate), net price 80-mg vial (with diluent) = £129.37; 2 × 120-mg vials (with diluent) = £260.00

8.3.4.3 Somatostatin analogues

Lanreotide, octreotide and pasireotide are analogues of the hypothalamic release-inhibiting hormone somatostatin. Lanreotide and octreotide are indicated for the relief of symptoms associated with neuroendocrine (particularly carcinoid) tumours and acromegaly. Additionally, lanreotide is licensed for the treatment of thyroid tumours and octreotide is also licensed for the prevention of complications following pancreatic surgery. Octreotide long-acting depot injection is licensed for treatment of advanced neuroendocrine tumours of the midgut, or treatment where primary origin is not known but non-midgut sites of origin have been excluded. Ocreotide may also be valuable in reducing vomiting in palliative care (see p. 23) and in stopping variceal bleeding (unlicensed indication)—see also vasopressin and terlipressin (section 6.5.2). Pasireotide is licensed for the treatment of Cushing’s disease when surgery has failed or is inappropriate.

Cautions  Growth hormone-secreting pituitary tumours can expand causing serious complications; during treatment with somatostatin analogues patients should be monitored for signs of tumour expansion (e.g. visual field defects). Ultrasound examination of the gallbladder is recommended before treatment and at intervals of 6–12 months during treatment (avoid abrupt withdrawal of short-acting ocreotide—see Side-effects below). In insulinoma an increase in the depth and duration of hypoglycaemia may occur (observe patients when initiating treatment and changing doses); in diabetes mellitus, insulin or oral antidiabetic requirements may be reduced. Patients with carcinoid tumours must only receive lanreotide after excluding the presence of an obstructive intestinal tumour.

Side-effects  Gastro-intestinal disturbances including anorexia, nausea, vomiting, abdominal pain and bloating, flatulence, diarrhoea, and steatorrhoea may occur (administering non-depot injections of octreotide between meals and at bedtime may reduce gastro-intestinal side-effects). Postprandial glucose tolerance may be impaired and rarely persistent hyperglycaemia occurs with chronic administration; hypoglycaemia has also been reported. Gallstones have been reported after long-term treatment (abrupt withdrawal of subcutaneous ocreotide is associated with biliary colic and pancreatitis). Pain and irritation may occur at the injection site and sites should be rotated. Rarely, pancreatitis has been reported shortly after administration.

LANREOTIDE

Indications  see notes above

Cautions  see notes above; cardiac disorders (including bradycardia); interactions: Appendix 1 (lanreotide)

Pregnancy  manufacturer advises use only if potential benefit outweighs risk

Breast-feeding  manufacturer advises caution—no information available

Side-effects  see notes above; also reported constipation, dyspepsia, bradycardia, asthenia, dizziness, fatigue, raised bilirubin, biliary dilatation, alopecia; less commonly skin nodule, hot flushes, leg pain, malaise, headache, insomnia, tenesmus, decreased libido, drowsiness, pruritus, increased sweating; rarely hypothyroidism (monitor as necessary)

Dose  
- See under preparations

Somatuline® LA (Ipsen) (PH) Injection, copolymer microparticles for aqueous suspen- sion, lanreotide (as acetate) 30-mg vial (with vehicle) = £232.00

Dose  by intramuscular injection, acromegaly and neuroendocrine (particularly carcinoid) tumours, initially 30 mg every 14 days, frequency increased to every 7–10 days according to response

Thyroid tumours, 30 mg every 14 days, frequency increased to every 10 days according to response

Somatuline Autogel® (Ipsen) (PH) Injection, prefilled syringe, lanreotide (as acetate) 60 mg = £551.00; 90 mg = £736.00; 120 mg = £937.00

Dose  by deep subcutaneous injection into the gluteal region, acromegaly (if somatostatin analogue not given previously), initially 60 mg every 28 days, adjusted according to response, for patients treated previously with somatostatin analogue, consult product literature for initial dose

Neuroendocrine (particularly carcinoid) tumours, initially 60–120 mg every 28 days, adjusted according to response

OCTREOTIDE

Indications  see under Dose

Cautions  see notes above; monitor thyroid function on long-term therapy; monitor liver function; interactions: Appendix 1 (octreotide)

Hepatic impairment  adjustment of maintenance dose of non-depot preparations may be necessary in patients with liver cirrhosis

Pregnancy  possible effect on fetal growth; manufacturer advises use only if potential benefit outweighs risk and effective contraception required during treatment

Breast-feeding  manufacturer advises avoid—present in milk in animal studies

Side-effects  see notes above; also arrhythmias, bradycardia, dyspnoea, headache, dizziness, dehydration, alopecia, rash; hepatitis also reported

Dose  
- Symptoms associated with carcinoid tumours with features of carcinoid syndrome, VIPomas, glucagonomas, by subcutaneous injection, initially 50 micrograms once or twice daily, gradually increased
according to response to 200 micrograms 3 times daily (higher doses required exceptionally); maintenance doses variable; in carcinoid tumours discontinue after 1 week if no effect; if rapid response required, initial dose by intravenous injection (with ECG monitoring and after dilution to a concentration of 10–50% with sodium chloride 0.9% injection).

- Acromegaly, short-term treatment before pituitary surgery or long-term treatment in those inadequately controlled by other treatment or until radiotherapy becomes fully effective by subcutaneous injection, 100–200 micrograms 3 times daily; discontinue if no improvement within 3 months.

- Prevention of complications following pancreatic surgery, consult product literature.

**Octreotide (Non-proprietary)** Injection, octreotide (as acetate) 50 micrograms/mL, net price 1-mL amp = £3.72; 100 micrograms/mL, 1-mL amp = £6.53; 200 micrograms/mL, 5-mL vial = £65.10; 500 micrograms/mL, 1-mL amp = £33.87.

**Sandostatin® (Novartis)** Injection, octreotide (as acetate) 50 micrograms/mL, net price 1-mL amp = £2.97; 100 micrograms/mL, 1-mL amp = £5.59; 200 micrograms/mL, 5-mL vial = £55.73; 500 micrograms/mL, 1-mL amp = £27.09.

**Depot preparation**

**Sandostatin Lar® (Novartis)** Injection (microsphere powder for aqueous suspension), octreotide (as acetate) 10-mg vial = £469.84; 20-mg vial = £776.05; 30-mg vial = £993.44 (all supplied with 2.5-mL diluent-filled syringe).

**Dose**
- For acromegaly, start depot octreotide 1 day after the last dose of subcutaneous octreotide (for pituitary surgery give last dose of depot octreotide at least 3 weeks before surgery). For neuroendocrine tumours, continue subcutaneous octreotide for 2 weeks after first dose of depot octreotide.
- Advanced neuroendocrine tumours of the midgut, or tumours of unknown primary origin where non-midgut sites of origin have been excluded, 30 mg every 4 weeks.

**PASIREOTIDE**

**Indications** see notes above.

**Cautions** see notes above; diabetes mellitus (assess glycaemic status before treatment, weekly for the first 2–3 months of treatment, periodically thereafter, and 3 months after treatment is complete); monitor liver function before treatment and after 1, 2, 4, 8, and 12 weeks of treatment; cardiac disorders (including bradycardia); susceptibility to QT-interval prolongation (including concomitant use of drugs that prolong QT interval and electrolyte disturbances)—monitor ECG and electrolytes before treatment, after one week, and periodically thereafter; **Interactions**: Appendix 1 (pasireotide).

**Hepatic impairment** reduce initial dose to 300 micrograms twice daily (increased if necessary after 2 months to max. 600 micrograms twice daily) in moderate impairment; avoid in severe impairment.

**Pregnancy** avoid—tOXicity in animal studies.

**Breast-feeding** avoid—present in milk in animal studies.

**Side-effects** see notes above; also bradycardia, QT-interval prolongation, hypotension, headache, fatigue, adrenal insufficiency, hyperglycaemia, decreased appetite, anaemia, alopecia, pruritus, myalgia, arthritis.

**Dose**
- By subcutaneous injection, ADULT over 18 years, initially 600 micrograms twice daily, increased if necessary after 2 months (according to response) to 900 micrograms twice daily; consider discontinuation if no response within 2 months; for dose adjustment due to side-effects, consult product literature.

**Signifor® (Novartis)** Injection, pasireotide (as diaspartate) 300 micrograms/mL, net price 1-mL amp = £46.67; 600 micrograms/mL, 1-mL amp = £54.00; 900 micrograms/mL, 1-mL amp = £54.00.

9.8.2 Acute porphyrias

Before initiating treatment for anaemia it is essential to determine which type is present. Iron salts may be harmful and result in iron overload if given alone to patients with anaemias other than those due to iron deficiency.

9.1.1.1 Oral iron

Iron salts should be given by mouth unless there are good reasons for using another route.

Ferrous salts show only marginal differences between one another in efficiency of absorption of iron. Haemoglobin regeneration rate is little affected by the type of salt used provided sufficient iron is given, and in most patients the speed of response is not critical. Choice of
preparation is thus usually decided by the incidence of side-effects and cost.

The oral dose of elemental iron for iron-deficiency anaemia should be 100 to 200 mg daily. It is customary to give this as dried ferrous sulfate, 200 mg (= 65 mg elemental iron) three times daily; for prophylaxis of iron-deficiency anaemia, a dose of ferrous sulfate 200 mg once or twice daily may be effective. For treatment of iron-deficiency anaemia in children and for prophylaxis of iron-deficiency anaemia in babies of low birth weight, see BNF for Children.

Some oral preparations contain ascorbic acid to aid absorption of the iron but the therapeutic advantage of such preparations is minimal and cost may be increased.

There is no justification for the inclusion of other ingredients, such as the B group of vitamins (except folic acid for pregnant women, see notes above and on p. 651).

**Modified-release preparations** Modified-release preparations of iron are licensed for once-daily dosage, but have no therapeutic advantage and should not be used. These preparations are formulated to release iron gradually; the low incidence of side-effects may reflect the small amounts of iron available for absorption as the iron is carried past the first part of the duodenum into an area of the gut where absorption may be poor.

### FERROUS SULFATE

**Indications** iron-deficiency anaemia

**Cautions** interactions: Appendix 1 (iron)

**Side-effects** see notes above

**Dose**
- See under preparations below and notes above

**Iron sulfur (Non-proprietary)**

- **Tablets**, coated, dried ferrous sulfate 200 mg (65 mg iron), net price 28-tab pack = 97p
- **Dose** prophylactic, 1 tablet daily; therapeutic, 1 tablet 2–3 times daily; **CHILD**, see BNF for Children

**Ironorm**

- **Oral Drops** (Wallace Mfg)
  - **Dose**
    - folic acid
      - tablets, f/c, 150 mg (47 mg iron), net price 15-tab pack = £28.00
      - **Dose** ADULT and **CHILD** over 6 years, prophylactic, 0.6 mL daily; **CHILD** under 6 years, see BNF for Children
  - **Modified-release preparations**
    - **Feospan** (Intrapharm)®
      - **Spansule** (= capsules m/r), clear/red, enclosing green and brown pellets, dried ferrous sulfate 150 mg (47 mg iron), net price 30-cap pack = £3.45.
      - **Label**: 25
      - **Dose** 1–2 capsules daily; **CHILD** over 1 year, 1 capsule daily can be opened and sprinkled on food
    - **Ferrograd** (Teofarma)®
      - **Tablets** in 3 strengths: 250 mg (75 mg iron), 375 mg (112.5 mg iron), 500 mg (150 mg iron), net price 30-tab pack = £3.23.
      - **Label**: 25
      - **Dose** ADULT and **CHILD** over 12 years, prophylactic and therapeutic, 1 tablet daily before food

**With folic acid**

For prescribing information on folic acid, see section 9.1.2

**Fefol** (Intrapharm)®

- **Spansule** (= capsules m/r), clear/green, enclosing brown, yellow, and white pellets, dried ferrous sulfate 150 mg (47 mg iron), folic acid 500 micrograms, net price 30-cap pack = £1.69.
  - **Label**: 25
  - **Dose** 1 capsule daily

- **Ferrograd Folic** (Teofarma)®
  - **Tablets** in 3 strengths: 250 mg (75 mg iron) for sustained release, folic acid 500 micrograms, net price 30-tab pack = £2.64.
    - **Label**: 25
    - **Dose** ADULT and **CHILD** over 12 years, 1 tablet daily before food
9.1.1 Iron-deficiency anaemias

### Ferrrous Fumarate

**Indications**: iron-deficiency anaemia

**Cautions**: interactions: Appendix 1 (iron)

**Side-effects**: see notes above

**Dose**

- See under preparations below and notes above

**Fersaday**

- Tablets, brown, f/c, ferrous fumarate 322 mg (100 mg iron), net price 28-tab pack = £9.20. Label: 25

- Dose **ADULT** and **CHILD** over 12 years, 1 tablet daily before food

**Galfer FA** (Thornton & Ross)

- Capsules, red/yellow, ferrous fumarate 305 mg (100 mg iron), folic acid 350 micrograms, net price 100 = £2.17

- Dose 1 capsule daily before food

**Pregaday** (RPH)

- Tablets, brown, f/c, ferrous fumarate equivalent to 100 mg iron, folic acid 350 micrograms, net price 28-tab pack = £1.25

- Dose 1 tablet daily

### Ferrous Gluconate

**Indications**: iron-deficiency anaemia

**Cautions**: interactions: Appendix 1 (iron)

**Side-effects**: see notes above

**Dose**

- See under preparation below and notes above

**Galfer Gluconate** (Non-proprietary)

- Tablets, red, coated, ferrous gluconate 300 mg (35 mg iron), net price 28 = £1.95

- **Dose**: prophylactic, 2 tablets daily before food; therapeutic, 4–6 tablets daily in divided doses before food; **CHILD** 6–12 years, prophylactic and therapeutic, 1–3 tablets daily

### Polysaccharide–Iron Complex

**Indications**: iron-deficiency anaemia

**Cautions**: interactions: Appendix 1 (iron)

**Side-effects**: see notes above

**Dose**

- See under preparation below and notes above

**Niferex** (Tillomed)

- **Elixir**: brown, sugar-free, polysaccharide–iron complex equivalent to 100 mg of iron/5 mL, net price 240-mL pack = £6.06; 1-30-mL dropper bottle for paediatric use = £2.16. Counselling, use of dropper

- **Dose**: prophylactic, 2.5 mL daily; therapeutic, 5 mL 1–2 times daily (once daily if required during second and third trimester of pregnancy); **PRETERM NEONATE** and **NEONATE**, and **INFANT** (from dropper bottle) 1 drop (approx. 500 micrograms iron) per 450 g body-weight 3 times daily; **CHILD** 2–6 years 2.5 mL daily, 6–12 years 5 mL daily

### SODIUM FEREDETATE

(Sodium ironedetate)

**Indications**: iron-deficiency anaemia

**Cautions**: interactions: Appendix 1 (iron)

**Side-effects**: see notes above

**Dose**

- See under preparation below and notes above

**Sytron** (Forum)

- **Elixir**: sugar-free, sodium feredetate 190 mg equivalent to 27.5 mg of iron/5 mL, net price 100 mL = £1.07

- **Dose**: therapeutic, 5 mL increasing gradually to 10 mL 3 times daily; **CHILD** under 1 year, see BNF for Children; **CHILD** 1–5 years, therapeutic, 2.5 mL 3 times daily, 6–12 years, therapeutic, 5 mL 3 times daily

### Parenteral iron

Iron can be administered parenterally as iron dextran, iron sucrose, ferric carboxymaltose, iron isomaltoside 1000, or ferumoxytol. Parenteral iron is generally reserved for use when oral therapy is unsuccessful because the patient cannot tolerate oral iron, or does not take it reliably, or if there is continuing blood loss, or in malabsorption. Parenteral iron may also have a role in the management of chemotherapy-induced anaemia, when given with erythropoietins, in specific patient groups (see NICE guidance, p. 653).

The **Scottish Medicines Consortium** (p. 4) has advised (January 2013) that ferumoxytol (Beno®) is accepted for restricted use within NHS Scotland for the treatment of iron deficiency anaemia in non-haemodialysis dependent adults with chronic kidney disease when oral iron preparations are ineffective or cannot be used.

Many patients with chronic renal failure who are receiving haemodialysis (and some who are receiving peritoneal dialysis) also require iron by the intravenous route.
on a regular basis (see also Erythropoietins, section 9.1.3).

With the exception of patients with severe renal failure receiving haemodialysis, parenteral iron does not produce a faster haemoglobin response than oral iron provided that the oral iron preparation is taken reliably and is absorbed adequately. If parenteral iron is necessary, the dose should be calculated according to the patient’s body-weight and total iron deficit. Depending on the preparation used, parenteral iron is given as a total dose or in divided doses. Further treatment should be guided by monitoring haemoglobin and serum iron concentrations.

Anaphylactic reactions can occur with parenteral administration of iron complexes and facilities for cardiopulmonary resuscitation must be available—see MHRA/CHM advice, below.

Anaphylactic reactions can occur during and for at least 30 minutes after every administration. In the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated.

The risk of hypersensitivity is increased in patients with known allergies, immune or inflammatory conditions, or those with a history of severe asthma, eczema, or other atopic allergy; in these patients, intravenous iron should only be used if the benefits outweigh the risks.

Intravenous iron should be avoided in the first trimester of pregnancy and used in the second or third trimesters only if the benefit outweighs the potential risks for both mother and fetus.

**FERRIC CARBOXYMALTOSE**

A ferric carboxymaltose complex containing 5% (50 mg/mL) of iron

**Indications** iron-deficiency anaemia, see notes above

**Cautions** hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available (see MHRA/CHM advice, p. 648); oral iron should not be given until 5 days after last injection; allergic or immune conditions; infection (discontinue if ongoing bacteraemia)

**Hepatic impairment** use with caution

**Pregnancy** avoid in first trimester; crosses the placenta in animal studies; may influence skeletal development

**Side-effects** gastro-intestinal disturbances; headache, dizziness; rash, injection-site reactions; less commonly hypertension, hypotension, flushing, chest pain, peripheral oedema, hypersensitivity reactions (including anaphylaxis), fatigue, paraesthesia, malaise, pyrexia, rigors, myalgia, arthralgia, back pain, pruritus, and urticaria; rarely dyspnoea

**Dose**

- By slow intravenous injection or by intravenous infusion, ADULT over 18 years, calculated according to body-weight and iron deficit, consult product literature

**Ferinject** (Takeda) 

**Injection** iron (as ferric carboxymaltose) 50 mg/mL, net price 2-mL vial = £19.10, 10-mL vial = £95.50, 20-mL vial = £181.45

**Electrolytes** Na⁺ 0.24 mmol/mL

---

**FERUMOXYTOL**

A complex of iron oxide with polyglucose sorbitol-carboxymethyl ether containing 3% (30 mg/mL) of iron

**Indications** iron-deficiency anaemia in chronic renal failure, see notes above

**Cautions** hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available (see MHRA/CHM advice, p. 648); oral iron should not be given until 5 days after last injection; allergic or immune conditions; infection (discontinue if ongoing bacteraemia)

**Hepatic impairment** use with caution

**Pregnancy** avoid—toxicity in animal studies

**Breast-feeding** avoid—present in milk in animal studies

**Side-effects** injection-site reactions; less commonly nausea, vomiting, constipation, diarrhoea, abdominal pain, appetite disorders, hypotension, hypertension, flushing, dyspnoea, dizziness, taste disturbances, headache, drowsiness, malaise, myalgia, arthralgia, back pain, pruritus, rash, hypersensitivity reactions (including anaphylaxis); rarely dry mouth, dyspepsia, epistaxis, blurred vision, paraesthesia, dehydration, hyperkalaemia, eosinophilia, gout; also reported arrhythmias, tachycardia, myocardial infarction, congestive heart failure, cough, syncope

**Dose**

- By intravenous injection, ADULT over 18 years, calculated according to body-weight and iron deficit, consult product literature

**Rienso** (Takeda)

**Injection** iron (as ferumoxytol) 30 mg/mL, net price 17-mL vial = £65.00

---

**IRON DEXTRAN**

A complex of ferric hydroxide with dextran containing 5% (50 mg/mL) of iron

**Indications** iron-deficiency anaemia, see notes above

**Cautions** hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available (see MHRA/CHM advice, p. 648); oral iron should not be given until 5 days after last injection
**Iron Sucrose**

A complex of ferric hydroxide with sucrose containing 2% (20 mg/mL) of iron

**Indications** iron-deficiency anaemia, see notes above

**Cautions** hypersensitivity reactions can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available (see MHRA/CHM advice, p. 648); oral iron should not be given until 5 days after last injection; infection (discontinue if ongoing bacteraemia)

**Contra-indications** history of allergic disorders including asthma, eczema, and anaphylaxis

**Hepatic impairment** use with caution; avoid in conditions where iron overload increases risk of impairment

**Pregnancy** avoid in first trimester

**Side-effects** taste disturbances; less commonly nausea, vomiting, abdominal pain, diarrhoea, hypotension, tachycardia, flushing, palpitation, chest pain, bronchospasm, dyspnoea, headache, dizziness, fever, myalgia, pruritus, rash, injection-site reactions; rarely peripheral oedema, hypertension, hypersensitivity reactions (including anaphylaxis), fatigue, asthenia, and paraesthesia; bradycardia, confusion, arthralgia, and increased sweating also reported

**Dose**
- By slow intravenous injection or by intravenous infusion, calculated according to body-weight and iron deficit, consult product literature; CHILD under 14 years, not recommended
- By slow intravenous injection or by intravenous infusion, calculated according to body-weight and iron deficit; consult product literature; CHILD not recommended but see BNF for Children

**Venoferr** injection, iron (as iron sucrose) 20 mg/mL, net price 5-mL vial = £10.24

**Iron Isomaltoside 1000**

A complex of ferric iron and isomaltosides containing 10% (100 mg/mL) of iron

**Indications** iron deficiency anaemia, see notes above

**Cautions** hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available (see MHRA/CHM advice, p. 648); oral iron should not be given until 5 days after last injection; infection (discontinue if ongoing bacteraemia)

**Contra-indications** history of allergic disorders including asthma and eczema; active rheumatoid arthritis

**Hepatic impairment** avoid in decompensated liver disease and hepatitis

**Pregnancy** avoid in first trimester

**Side-effects** less commonly nausea, vomiting, constipation, abdominal pain, dyspnoea, dysphonia, flushing, numbness, fever, cramps, blurred vision, pruritus, rash, hypersensitivity reactions (including anaphylaxis), injection-site reactions; rarely diarrhoea, angioedema, tachycardia, arrhythmias, hypotension, chest pain, malaise, seizures, tremor, dizziness, restlessness, loss of consciousness, altered mental status, myalgia, arthralgia, sweating; very rarely hypertension, foetal bradycardia, palpitation, headache, paraesthesia, haemolysis, transient deafness

**Dose**
- By slow intravenous injection or by intravenous infusion, ADULT over 18 years, calculated according to body-weight and iron deficit, consult product literature
- By slow intravenous injection or by intravenous infusion, ADULT over 18 years, net price 1-mL vial = £16.95, 5-mL vial = £84.75, 10-mL vial = £169.50

**Monoferr** injection, iron (as iron isomaltoside 1000) 100 mg/mL, net price 1-mL vial = £16.95, 5-mL vial = £84.75, 10-mL vial = £169.50

**Cosmofer** injection, iron (as iron dextran) 50 mg/mL, net price 2-mL amp = £7.97, 10-mL amp = £39.85

**Venofer** injection, iron (as iron sucrose) 20 mg/mL, net price 5-mL vial = £10.24
plexes given by mouth. Vitamin B₁₂ in larger oral doses of 1–2 mg daily [unlicensed] may be effective.

**Hydroxocobalamin** has completely replaced cyanocobalamin as the form of vitamin B₁₂ of choice for therapy; it is retained in the body longer than cyanocobalamin and thus for maintenance therapy can be given at intervals of up to 3 months. Treatment is generally initiated with frequent administration of intramuscular injections to replenish the depleted body stores. Thereafter, maintenance treatment, which is usually for life, can be instituted. There is no evidence that doses larger than those recommended provide any additional benefit in vitamin B₁₂ neuropathy.

**Folic acid** has few indications for long-term therapy since most causes of folate deficiency are self-limiting or will yield to a short course of treatment. It should not be used in undiagnosed megaloblastic anaemia unless vitamin B₁₂ is administered concurrently otherwise neuropathy may be precipitated (see above).

In **folate-deficient megaloblastic anaemia** (e.g. because of poor nutrition, pregnancy, or antiepileptic drugs), daily folic acid supplementation for 4 months brings about haematological remission and replenishes body stores.

For prophylaxis in **chronic haemolytic states, malabsorption, or in renal dialysis**, folic acid is given daily or sometimes weekly, depending on the diet and the rate of haemolysis.

For prophylaxis in pregnancy, see Prevention of Neural Tube Defects below.

Folic acid is also used for the prevention of methotrexate-induced side-effects in severe Crohn’s disease (see section 1.5.3, p. 716), rheumatic disease (see section 10.1.3, p. 716), and severe psoriasis (see section 13.5.3, p. 801).

**Folinic acid** is also effective in the treatment of folate-deficient megaloblastic anaemia but it is generally used in association with cytotoxic drugs (see section 8.1); it is given as calcium folinate.

**Prevention of neural tube defects** Folic acid supplements taken before and during pregnancy can reduce the occurrence of neural tube defects. The risk of a neural tube defect occurring in a child should be assessed and folic acid given as follows:

Women at a low risk of conceiving a child with a neural tube defect should be advised to take folic acid as a medicinal or food supplement at a dose of 400 micrograms daily before conception and until week 12 of pregnancy. Women who have not been taking folic acid and who suspect they are pregnant should start at once and continue until week 12 of pregnancy.

Couples are at a high risk of conceiving a child with a neural tube defect if either partner has a neural tube defect (or either partner has a family history of neural tube defects), if they have had a previous pregnancy affected by a neural tube defect, or if the woman has coeliac disease (or other malabsorption state), diabetes mellitus, sickle-cell anaemia, or is taking antiepileptic medicines (see also section 4.8.1).

Women in the high-risk group who wish to become pregnant (or who are at risk of becoming pregnant) should be advised to take folic acid 5 mg daily and continue until week 12 of pregnancy (women with sickle-cell disease should continue taking their normal dose of folic acid 5 mg daily (or to increase the dose to 5 mg daily) and continue this throughout pregnancy).

There is no justification for prescribing multiple-ingredient vitamin preparations containing vitamin B₁₂ or folic acid.

---

**HYDROXOCOBALAMIN**

**Indications** see under dose below; cyanide poisoning (see Emergency Treatment of Poisoning, p. 41)

**Cautions** should not be given before diagnosis fully established but see also notes above; **interactions:** Appendix 1 (hydroxocobalamin)

**Breast-feeding** present in milk but not known to be harmful

**Side-effects** nausea, headache, dizziness; fever, hypersensitivity reactions (including rash and pruritus); injection-site reactions; hypokalaemia and thrombocytosis during initial treatment; chromatura

**Dose**

- **By intramuscular injection,** pernicious anaemia and other macrocytic anaemias without neurological involvement, initially 1 mg 3 times a week for 2 weeks then 1 mg every 3 months
- Pernicious anaemia and other macrocytic anaemias with neurological involvement, initially 1 mg on alternate days until no further improvement, then 1 mg every 2 months
- Prophylaxis of macrocytic anaemias associated with vitamin B₁₂ deficiency, 1 mg every 2–3 months
- Tobacco amblyopia and Leber’s optic atrophy, initially 1 mg daily for 2 weeks, then 1 mg twice weekly until no further improvement, thereafter 1 mg every 1–3 months

**CHILD** see BNF for Children

**Hydroxocobalamin (Non-proprietary)**

**Injection,** hydroxocobalamin 1 mg/mL. Net price 1 mL amp = 73p

**Note.** The BP directs that when vitamin B₁₂ injection is prescribed or demanded hydroxocobalamin injection shall be dispensed or supplied

**Brands include** Cobalin-H® Neo-Cytamen®

---

**CYANOCOBALAMIN**

**Indications** see notes above

**Dose**

- **By mouth,** vitamin B₁₂ deficiency of dietary origin, 50–150 micrograms daily taken between meals; **CHILD** 50–105 micrograms daily in 1–3 divided doses
- **By intramuscular injection,** initially 1 mg repeated 10 times at intervals of 2–3 days, maintenance 1 mg every month, but see notes above

**Cyanocobalamin (Non-proprietary)**

**Tablets,** cyanocobalamin 50 micrograms. Net price 50-tab pack = £6.24

**Brands include** Citracor®

**Note.** Currently available brands may not be suitable for vegans

**Liquid** cyanocobalamin 35 micrograms/5 mL. Net price 200 mL = £2.77

**Brands include** Citracor®
FOLIC ACID

Indications see notes above and under dose

Cautions should never be given alone for pernicious anaemia and other vitamin B₁₂ deficiency states (may precipitate subacute combined degeneration of the spinal cord); interactions: Appendix 1 (folic acids)

Side-effects rarely gastro-intestinal disturbances

Dose

- Folate-deficient megaloblastic anaemia, by mouth, ADULT and CHILD over 1 year, 5 mg daily for 4 months (until term in pregnant women); up to 15 mg daily may be required in malabsorption states; CHILD under 1 year, 500 micrograms/kg daily (max. 5 mg) for up to 4 months; up to 10 mg daily may be required in malabsorption states
- Prevention of neural tube defects, by mouth, see notes above
- Prevention of methotrexate-induced side-effects in severe Crohn’s disease [unlicensed], by mouth, see section 15.3
- Prevention of methotrexate-induced side-effects in rheumatic disease [unlicensed], by mouth, ADULT over 18 years 5 mg once weekly; CHILD 2–18 years see BNF for Children
- Prevention of methotrexate-induced side-effects in severe psoriasis [unlicensed], by mouth, see section 13.5.3
- Prophylaxis in chronic haemolytic states, by mouth, ADULT 5 mg every 1–7 days depending on underlying disease
- Prophylaxis of folate deficiency in dialysis, by mouth, ADULT 5 mg every 1–7 days; CHILD 1–12 years 250 micrograms/kg (max. 10 mg) once daily, CHILD 12–18 years 5–10 mg once daily

Folic Acid (Non-proprietary) (Thomson

Tablets, folic acid 400 micrograms, net price 90-tab pack = £2.71; 5 mg, 28-tab pack = £1.91

Syrup, folic acid 2.5 mg/5 mL, net price 150 mL = £9.16

Brands include Lexpec® (sugar-free)

Injection, folic acid 15 mg, net price 1-mL amp = £1.34

Available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104

9.1.3 Drugs used in hypoplastic, haemolytic, and renal anaemias

Anabolic steroids (section 6.4.3), pyridoxine, antilymphocyte immunoglobulin, and various corticosteroids are used in hypoplastic and haemolytic anaemias.

Antilymphocyte immunoglobulin given intravenously through a central line over 12–18 hours each day for 5 days produces a response in about 50% of cases of acquired aplastic anaemia; the response rate may be increased when ciclosporin is given as well. Severe reactions are common in the first 2 days and profound immunosuppression can occur; antilymphocyte immunoglobulin should be given under specialist supervision with appropriate resuscitation facilities. Alternatively, oxymetholone tablets (available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104) can be used in aplastic anaemia at a dose of 1–5 mg/kg daily for 3 to 6 months.

It is unlikely that dietary deprivation of pyridoxine (section 9.6.2) produces clinically relevant haematological effects. However, certain forms of sideroblastic anaemia respond to pharmacological doses, possibly reflecting its role as a co-enzyme during haemoglobin synthesis. Pyridoxine is indicated in both idiopathic acquired and hereditary sideroblastic anaemias. Although complete cures have not been reported, some increase in haemoglobin can occur; the dose required is usually high, up to 400 mg daily. Reversible sideroblastic anaemias respond to treatment of the underlying cause but in pregnancy, haemolytic anaemias, and alcohol dependence, or during isoniazid treatment, pyridoxine is also indicated.

Corticosteroids (see section 6.3) have an important place in the management of a wide variety of haematological disorders. They include conditions with an immune basis such as autoimmune haemolytic anaemia, immune thrombocytopenias and neutropenias, and major transfusion reactions. They are also used in chemotherapy schedules for many types of lymphoma, lymphoid leukaemias, and paraproteinaemias, including multiple myeloma.

Erythropoietins

Epoetins (recombinant human erythropoietins) are used to treat symptomatic anaemia associated with erythropoietin deficiency in chronic renal failure, to increase the yield of autologous blood in normal individuals and to shorten the period of symptomatic anaemia in patients receiving cytotoxic chemotherapy. Epoetin beta is also used for the prevention of anaemia in preterm neonates of low birth-weight; only unreserved formulations should be used in neonates because other preparations may contain benzyl alcohol (see Excipients, p. 2).

Darbepoetin is a hyperglycosylated derivative of epoetin; it has a longer half-life and can be administered less frequently than epoetin.

Methoxy polyethylene glycol-epoetin beta is a continuous erythropoietin receptor activator that is licensed for the treatment of symptomatic anaemia associated with chronic kidney disease. It has a longer duration of action than epoetin.

Other factors, such as iron or folate deficiency, that contribute to the anaemia of chronic renal failure should be corrected before treatment and monitored during therapy. Supplemental iron may improve the response in resistant patients. Aluminium toxicity, concurrent infection, or other inflammatory disease can impair the response to erythropoietin.
MHRA/CHM advice (December 2007)

Erythropoietins—haemoglobin concentration

Overcorrection of haemoglobin concentration in patients with chronic kidney disease may increase the risk of death and serious cardiovascular events, and in patients with cancer may increase the risk of thrombosis and related complications:

- patients should not be treated with erythropoietins for the licensed indications in chronic kidney disease or cancer in patients receiving chemotherapy unless symptoms of anaemia are present;
- the haemoglobin concentration should be maintained within the range 10–12 g/100 mL;
- haemoglobin concentrations higher than 12 g/100 mL should be avoided;
- the aim of treatment is to relieve symptoms of anaemia, and in patients with chronic kidney disease to avoid the need for blood transfusion; the haemoglobin concentration should not be increased beyond that which provides adequate control of symptoms of anaemia (in some patients, this may be achieved at concentrations lower than the recommended range).

See also MHRA/CHM advice below.

MHRA/CHM advice (December 2007 and July 2008) Erythropoietins—tumour progression and survival in patients with cancer

Clinical trial data show an unexplained excess mortality and increased risk of tumour progression in patients with anaemia associated with cancer who have been treated with erythropoietins. Many of these trials used erythropoietins outside of the licensed indications (i.e. overcorrected haemoglobin concentration or given to patients who have not received chemotherapy):

- erythropoietins licensed for the treatment of symptomatic anaemia associated with cancer, are licensed only for patients who are receiving chemotherapy;
- the decision to use erythropoietins should be based on an assessment of the benefits and risks for individual patients; blood transfusion may be the preferred treatment for anaemia associated with cancer chemotherapy, particularly in those with a good cancer prognosis.

See also MHRA/CHM advice above.

NICE guidance

Epoetin alfa, beta and darbepoetin alfa for cancer treatment-induced anaemia (May 2008)

Erythropoietin analogues are not recommended for routine use in the management of cancer treatment-induced anaemia, but may be considered, in combination with intravenous iron, for:

- women receiving platinum-based chemotherapy for ovarian cancer who have symptomatic anaemia with a haemoglobin concentration of 8 g/100 mL or lower (the use of erythropoietin analogues does not preclude the use of existing approaches to the management of anaemia, including blood transfusion when necessary);
- patients who cannot be given blood transfusions and who have profound cancer treatment-related anaemia that is likely to have an impact on survival.

Patients currently treated with erythropoietin analogues for the management of cancer treatment-related anaemia who do not fulfil the criteria outlined above can continue therapy until they and their specialists consider it appropriate to stop.

www.nice.org.uk/TA142

DARBEPOETIN ALFA

Indications see under Dose below

Cautions see Epoetin

Contra-indications see Epoetin

Hepatic impairment manufacturer advises caution

Pregnancy no evidence of harm in animal studies—manufacturer advises caution

Breast-feeding manufacturer advises avoid—no information available

Side-effects see Epoetin; also, oedema, injection-site pain; isolated reports of pure red cell aplasia, particularly following subcutaneous administration in patients with chronic renal failure (discontinue therapy)—see also notes above

Dose

- Symptomatic anaemia associated with chronic renal failure in patients on dialysis (see also MHRA/CHM advice, above), ADULT and CHILD over 11 years, by subcutaneous or intravenous injection, initially 450 nanograms/kg once weekly, adjusted according to response by approx. 25% at intervals of at least 4 weeks; maintenance dose, given once weekly or once every 2 weeks

- Symptomatic anaemia associated with chronic renal failure in patients not on dialysis (see also MHRA/CHM advice, above), ADULT and CHILD over 11 years, by subcutaneous or intravenous injection, initially 750 nanograms/kg once every 2 weeks; adjusted according to response by approx. 25% at intervals of at least 4 weeks; maintenance dose, given subcutaneously or intravenously once weekly or subcutaneously once every 2 weeks or subcutaneously once every month

Note Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL, if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. When changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements. Adjust

Pure red cell aplasia

There have been very rare reports of pure red cell aplasia in patients treated with erythropoietins. In patients who develop a lack of efficacy with erythropoietin therapy and with a diagnosis of pure red cell aplasia, treatment with erythropoietins must be discontinued and testing for erythropoietin antibodies considered. Patients who develop pure red cell aplasia should not be switched to another form of erythropoietin.
doses not more frequently than every 2 weeks during maintenance treatment

- Symptomatic anaemia in adults with non-myeloid malignancies receiving chemotherapy (see also MHRA/CHM advice, p. 653), by subcutaneous injection, initially 6.75 micrograms/kg once every 3 weeks or 2.25 micrograms/kg once weekly (if response inadequate after 9 weeks further treatment may not be effective); if adequate response obtained, reduce dose by 25–50%

**Note** Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL, if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

**Aranesp**

Injection, prefilled syringe, darbepoetin alfa, 25 micrograms/mL net price 0.4 mL (10 micrograms) = £14.68; 40 micrograms/mL, 0.375 mL (15 micrograms) = £22.02; 0.5 mL (20 micrograms) = £29.36; 100 micrograms/mL, 0.3 mL (30 micrograms) = £44.04, 0.4 mL (40 micrograms) = £58.73; 0.5 mL (50 micrograms) = £73.41; 200 micrograms/mL, 0.3 mL (60 micrograms) = £88.09, 0.4 mL (80 micrograms) = £117.45, 0.5 mL (100 micrograms) = £146.81, 0.65 mL (130 micrograms) = £190.86; 500 micrograms/mL, 0.3 mL (150 micrograms) = £220.22, 0.6 mL (300 micrograms) = £440.43, 1 mL (500 micrograms) = £734.05

**Injection (Aranesp® SureClick)**, prefilled disposable injection device, darbepoetin alfa, 40 micrograms/mL net price 0.5 mL (20 micrograms) = £29.36; 100 micrograms/mL, 0.4 mL (40 micrograms) = £58.72; 200 micrograms/mL, 0.3 mL (60 micrograms) = £88.09, 0.4 mL (80 micrograms) = £117.45, 0.5 mL (100 micrograms) = £146.81; 0.65 mL (130 micrograms) = £190.86; 500 micrograms/mL, 0.3 mL (150 micrograms) = £220.22, 0.6 mL (300 micrograms) = £440.43, 1 mL (500 micrograms) = £734.05

**Contra-indications** pure red cell aplasia following erythropoietin therapy (see also notes above); uncontrolled hypertension; patients unable to receive thromboprophylaxis; avoid injections containing benzyl alcohol in neonates (see under preparations, below)

**Hepatic impairment** manufacturers advise caution in chronic hepatic failure

**Pregnancy** no evidence of harm; benefits probably outweigh risk of anaemia and of transfusion in pregnancy

**Breast-feeding** unlikely to be present in milk; minimal effect on infant

**Side-effects** diarrhoea, nausea, vomiting; dose-dependent increase in blood pressure or aggravation of hypertension; in isolated patients with normal or low blood pressure, hypertensive crisis with encephalopathy-like symptoms and generalised tonic-clonic seizures requiring immediate medical attention; headache; dose-dependent increase in platelet count (but thrombocytosis rare) regressing during treatment; influenza-like symptoms (may be reduced if intravenous injection given over 5 minutes); cardiovascular events; shunt thrombosis especially if tendency to hypotension or arteriovenous shunt complications; very rarely sudden loss of efficacy because of pure red cell aplasia, particularly following subcutaneous administration in patients with chronic renal failure (discontinue erythropoietin therapy)—see also notes above, hyperkalaemia, hypersensitivity reactions (including anaphylaxis and angioedema), skin reactions, injection-site reactions, and peripheral oedema also reported

**Dose**

- See under preparations, below

**Epoetin alfa**

**Binocrit** (Sandoz)®

Injection, prefilled syringe, epoetin alfa, net price 1000 units = £4.33; 2000 units = £8.65; 3000 units = £12.98; 4000 units = £17.31; 5000 units = £21.64; 6000 units = £25.96; 8000 units = £40.73; 10 000 units = £43.27

**Note** Biosimilar medicine, p. 1

Dose Symptomatic anaemia associated with chronic renal failure in patients on haemodialysis (see also MHRA/CHM advice, p. 653), by intravenous injection over 1–5 minutes, initially 50 units/kg 3 times weekly increased according to response in steps of 25 units/kg 3 times weekly at intervals of at least 4 weeks; maintenance dose, usually 25–100 units/kg 3 times weekly; CHILD by intravenous injection initially as for adults; maintenance dose, body-weight under 10 kg usually 75–150 units/kg 3 times weekly, body-weight 10–30 kg usually 60–150 units/kg 3 times weekly, body-weight over 30 kg usually 30–100 units/kg 3 times weekly

Symptomatic anaemia associated with chronic renal failure in adults on peritoneal dialysis (see also MHRA/CHM advice, p. 653), by intravenous injection over 1–5 minutes, initially 50 units/kg twice weekly, maintenance dose 25–50 units/kg twice weekly

Severe symptomatic anaemia of renal origin in adults with renal insufficiency not yet on dialysis (see also MHRA/CHM advice, p. 653), by intravenous injection over 1–5 minutes, initially 50 units/kg 3 times weekly increased according to response in steps of 25 units/kg 3 times weekly at intervals of at least 4 weeks; maintenance dose 17–33 units/kg 3 times weekly; max. 200 units/kg 3 times weekly

**Note** Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose...
reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

Symptomatic anaemia in adults receiving cancer chemotherapy (see also MHRA/CHM advice, p. 653), by subcutaneous injection (max. 1 mL per injection site), initially 50 units/kg (equivalent to 450 units/kg once weekly), increased if appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks to 300 units/kg 3 times weekly; discontinue if inadequate response after 4 weeks at higher dose. Note: Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL, if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose of approximately 25% lower than the previous dose.

Symptomatic anaemia in adults receiving cancer chemotherapy (see also MHRA/CHM advice, p. 653), by subcutaneous injection (max. 1 mL per injection site), initially 150 units/kg (equivalent to 450 units/kg once weekly), increased if appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks to 300 units/kg 3 times weekly; discontinue if inadequate response after 4 weeks at higher dose. Note: Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL, if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose of approximately 25% lower than the previous dose.

Symptomatic anaemia in adults with non-myeloid malignancies receiving chemotherapy (see also MHRA/
9.1.3 Drugs used in hypoplastic, haemolytic, and renal anaemias

**Epoetin theta**

**Eporatio® (Ratiopharm UK)**

**Injection**, prefilled syringe, epoetin theta, net price

**Note** If epoetin theta is substituted for another epoetin the same route of administration should be used.

**Dose** symptomatic anaemia associated with chronic renal failure (see also MHRA/CHM advice, p. 653), by subcutaneous injection, ADULT over 18 years, initially 20 units/kg 3 times weekly, increased if necessary in steps of 25% of the previous dose, treatment (response unlikely). Reduce dose by 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL, if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

**Discontinue** approximately 4 weeks after ending chemotherapy.

**Note** Discontinue treatment if haemoglobin concentration does not increase by at least 1 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL, if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

**Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Symptomatic anaemia in adults with non-myeloid malignancies receiving cancer chemotherapy (see also MHRA/CHM advice, p. 653), by subcutaneous injection, initially 20 000 units once weekly, increased if necessary in steps of 25%, weekly maintenance dose may be given in 2 divided doses in stable patients; max. 700 units/kg weekly.

**Note** Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL, if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Symptomatic anaemia in adults with non-myeloid malignancies receiving cancer chemotherapy (see also MHRA/CHM advice, p. 653), by subcutaneous injection, initially 20 000 units once weekly, increased if necessary in steps of 25%, weekly maintenance dose may be given in 2 divided doses in stable patients; max. 700 units/kg weekly.

**Note** Discontinue treatment if haemoglobin concentration does not increase by at least 1 g/100 mL after 12 weeks of therapy (response unlikely). Reduce dose by 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL, if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

**Discontinue** approximately 4 weeks after ending chemotherapy.

**Note** Discontinue treatment if haemoglobin concentration does not increase by at least 1 g/100 mL after 8 weeks of therapy (response unlikely). Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL, if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

**Discontinue** approximately 4 weeks after ending chemotherapy.

**Note** Discontinue treatment if haemoglobin concentration does not increase by at least 1 g/100 mL after 8 weeks of therapy (response unlikely). Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL, if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

**Discontinue** approximately 4 weeks after ending chemotherapy.
Symptomatic anaemia associated with chronic kidney disease in patients currently treated with erythropoietins (see also MHRA/CHM advice, p. 653). ADULT over 18 years, by subcutaneous injection, initially 1.2 micrograms/kg once every 4 weeks, alternatively by subcutaneous or intravenous injection, initially 600 nanograms/kg once every 2 weeks; dose adjusted according to response at intervals of at least 4 weeks; patients treated once every 2 weeks may be given a maintenance dose of double the previous fortnightly dose every 4 weeks

- Symptomatic anaemia associated with chronic kidney disease in patients not on dialysis and on ensuring high iron stores should be considered if the patient is not immune.

Methoxy polyethylene glycol-epoetin beta, net price 30 micrograms/0.3 mL = £44.05; 50 micrograms/0.3 mL = £73.41; 75 micrograms/0.3 mL = £110.11; 100 micrograms/0.3 mL = £146.81; 120 micrograms/0.3 mL = £176.18; 150 micrograms/0.3 mL = £220.22; 200 micrograms/0.3 mL = £293.62; 250 micrograms/0.3 mL = £367.03; 360 micrograms/0.6 mL = £528.56

Sickle-cell disease

Sickle-cell disease is caused by a structural abnormality of haemoglobin resulting in deformed, less flexible red blood cells. Acute complications in the more severe forms include sickle-cell crisis, where infarction of the microvasculature and blood supply to organs results in severe pain. Sickle-cell crisis requires hospitalisation, intravenous fluids, analgesia (section 4.7), and treatment of any concurrent infection. Chronic complications include skin ulceration, renal failure, and increased susceptibility to infection. Pneumococcal vaccine (section 14.4), haemophilus influenzae type b vaccine (section 14.4), and prophylactic penicillin (Table 2, section 5.1) reduce susceptibility to infection. Hepatitis B vaccine (section 14.4) is recommended if the patient is not immune.

In most forms of sickle-cell disease, varying degrees of haemolytic anaemia are present accompanied by increased erythropoiesis; this may increase folate requirements and folate supplementation may be necessary (section 9.1.2).

Hydroxyurea can reduce the frequency of crises and the need for blood transfusions in sickle-cell disease; it should be considered in consultation with a specialist centre. The beneficial effects of hydroxyurea may not become evident for several months. Myelosuppression and skin reactions are the most common side-effects.

Hydroxyurea (Hydroxyurea)

Indications sickle-cell disease (see notes above); chronic myeloid leukaemia, cancer of the cervix (section 8.1.5)

Cautions see section 8.1 and notes above; also monitor renal and hepatic function before and during treatment
9.1.3 Drugs used in hypoplastic, haemolytic, and renal anaemias

**Iron overload**

Severe tissue iron overload can occur in aplastic and other refractory anaemias, mainly as the result of repeated blood transfusions. It is a particular problem in refractory anaemias with hyperplastic bone marrow, especially *thalassaemia major*, where excessive iron absorption from the gut and inappropriate iron therapy can add to the tissue siderosis.

Iron overload associated with haemochromatosis can be treated with repeated venesection. Venesection may also be used for patients who have received multiple transfusions and whose bone marrow has recovered. Where venesection is contra-indicated, the long-term administration of the iron chelating compound *desferrioxamine mesilate* is useful. Subcutaneous infusions of desferrioxamine are given over 8–12 hours, 3–7 times a week. The dose should reflect the degree of iron overload. For children starting therapy (and who have low iron overload) the dose should not exceed 50 mg/kg. For established overload the dose is usually between 20 and 50 mg/kg daily. Desferrioxamine (up to 2 g per unit of blood transfusion) may also be given at the time of blood transfusion and whose bone marrow has recovered.

Iron excretion induced by desferrioxamine is enhanced by administration of ascorbic acid (vitamin C, section 9.6.3) 200 mg daily by mouth (100 mg in infants); it should be given separately from food since it also enhances iron absorption. Ascorbic acid should not be given to patients with cardiac dysfunction; in patients with normal cardiac function ascorbic acid should be introduced 1 month after starting desferrioxamine.

Desferrioxamine infusion can be used to treat aluminium overload in dialysis patients; theoretically 100 mg of desferrioxamine binds with 4.1 mg of aluminium.

**Deferasirox**, an oral iron chelator, is licensed for the treatment of chronic iron overload in adults and children over 6 years with thalassaemia major who receive frequent blood transfusions (more than 7 mL/kg/month of packed red blood cells). It is also licensed for transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in children aged 2–5 years with thalassaemia major who receive frequent blood transfusions, adults and children over 2 years with thalassaemia major who receive infrequent blood transfusions (less than 7 mL/kg/month of packed red blood cells), and in adults and children over 2 years with other anaemias. Deferasirox is also licensed for the treatment of chronic iron overload when desferrioxamine is contra-indicated or inadequate in adults and children over 10 years with non-transfusion-dependent thalassaemia syndromes.

The Scottish Medicines Consortium (p. 4) has advised (January 2007) that deferasirox is accepted for restricted use within NHS Scotland for the treatment of chronic iron overload associated with the treatment of rare acquired or inherited anaemias requiring recurrent blood transfusions. It is not recommended for patients with myelodysplastic syndromes.

**Deferriprone**, an oral iron chelator, is licensed for the treatment of iron overload in patients with thalassaemia major in whom desferrioxamine is contra-indicated or is inadequate. Blood dyscrasias, particularly agranulocytosis, have been reported with deferriprone.

**DEFERASIROX**

**Indications** see notes above

**Cautions**

- eye and ear examinations required before treatment and annually during treatment; monitor body-weight, height, and sexual development in children annually; monitor serum-ferritin concentration monthly; elderly (increased risk of side-effects);
- risk of gastro-intestinal ulceration and haemorrhage; platelet count less than 50 x 10⁹/litre; consider treatment interruption if unexplained cytopenia occurs; not recommended in conditions which may reduce life expectancy (e.g. high-risk myelodysplastic syndromes); history of liver cirrhosis; test liver function before treatment, then every 2 weeks during the first month, and then monthly; measure baseline serum creatinine and monitor renal function weekly during the first month of treatment and monthly thereafter; test for proteinuria monthly; interactions: Appendix 1 (deferasirox)

**Hepatic impairment** use with caution in moderate impairment, reduce dose considerably then gradually increase to max. 50% of normal dose; avoid in severe impairment

**Renal impairment** reduce dose by 10 mg/kg if eGFR 60–90 mL/minute/1.73 m² and if serum creatinine increased by more than 33% of baseline measurement on 2 consecutive occasions—interrupt treatment if deterioration in renal function persists after dose reduction; avoid if eGFR less than 60 mL/minute/1.73 m²

**Pregnancy** manufacturer advises avoid unless essential—toxicity in animal studies
Chronic iron overload in non-transfusion-dependent gastro-intestinal disturbances (reducing Side-effects manufacturer advises avoid—present in milk in animal studies)

**Side-effects**
- gastro-intestinal disturbances (including ulceration and fatal haemorrhage); headache; proteinuria; pruritus; rash; less commonly hepatitis, cholelithiasis, oedema, fatigue, anxiety, sleep disorder, dizziness, pyrexia, pharyngitis, glucosuria, renal tubulopathy, disturbances of hearing and vision (including lens opacity and maculopathy), and skin pigmentation; hepatic failure, acute renal failure, tubulointerstitial nephritis, blood disorders (including anaemia, agranulocytosis, neutropenia, pancytopenia, and thrombocytopenia), hypersensitivity reactions (including anaphylaxis and angioedema), alopecia also reported

**Dose**
- Transfusion-related chronic iron overload, ADULT and CHILD over 2 years initially 10–30 mg/kg once daily according to serum-ferritin concentration and amount of transfused blood (consult product literature); maintenance, adjust dose every 3–6 months in steps of 5–10 mg/kg according to serum-ferritin concentration; usual max. 30 mg/kg daily, but may be increased to max. 40 mg/kg daily and reduced in steps of 5–10 mg/kg once control achieved
- Chronic iron overload in non-transfusion-dependent thalassaemia syndromes, ADULT over 18 years initially 10 mg/kg once daily; maintenance, adjust dose every 3–6 months in steps of 5–10 mg/kg according to serum-ferritin concentration and liver-iron concentration (consult product literature); max. 20 mg/kg daily; CHILD under 18 years see BNF for Children

**Exjade® (Novartis)**
- Dispersible tablets, deferasirox 125 mg, net price 28-tab pack = £117.60; 250 mg, 28-tab pack = £235.20; 500 mg, 28-tab pack = £470.40. Label: 13, 22, counselling, administration
- Counselling Tablets should be dispersed in water, orange juice, or apple juice; if necessary resuspend residue

**DEFERIPRONE**

**Indications** see notes above

**Cautions** monitor neutrophil count weekly and discontinue treatment if neutrophenia develops; monitor plasma-zinc concentration; **Interactions**: Appendix 1 (deferiprone)

**Blood disorders** Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever or sore throat develop

**Contra-indications** history of agranulocytosis or recurrent neutropenia

**Hepatic impairment** manufacturer advises monitor liver function—interrupt treatment if persistent elevation in serum alanine aminotransferase

**Renal impairment** manufacturer advises caution—no information available

**Pregnancy** manufacturer advises avoid before intended conception and during pregnancy—teratogenic and embryotoxic in animal studies; contra-ception advised in women of child-bearing potential

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** gastro-intestinal disturbances (reducing dose and increasing gradually may improve tolerance), increased appetite; headache; red-brown urine discolouration; neutropenia, agranulocytosis; zinc deficiency; arthropathy

**Dose**
- ADULT and CHILD over 6 years 25 mg/kg 3 times daily (max. 100 mg/kg daily)

**Ferriprox® (Swedish Orphan)**
- Tablets, f/c, scored, deferiprone 500 mg, net price 100-tab pack = £152.39; 1 g, 50-tab pack = £175.25. Label: 14, counselling, blood disorders
- Oral solution, red, deferiprone 100 mg/mL, net price 500 mL = £152.39. Label: 14, counselling, blood disorders

**DESFERRIOXAMINE MESILATE**

**(Deferoxamine Mesilate)**

**Indications** see notes above; iron poisoning, see Emergency Treatment of Poisoning, p. 39

**Cautions** eye and ear examinations before treatment and at 3-month intervals during treatment; monitor body-weight and height in children at 3-month intervals—risk of growth retardation with excessive doses; aluminium-related encephalopathy (may exacerbate neurological dysfunction); **Interactions**: Appendix 1 (deferoxamine)

**Renal impairment** use with caution

**Pregnancy** teratogenic in animal studies; manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risk—no information available

**Side-effects** nausea, vomiting, abdominal pain; headache; pyrexia; growth retardation and bone disorders (see Cautions); arthralgia, myalgia; hearing disturbances; injection-site reactions; rarely diarrhoea, hepatic impairment, hypotension (especially when given too rapidly by intravenous injection), anaphylaxis, Yersinia and mucormycosis infections, blood dyscrasias (including thrombocytopenia and leuco-penia), leg cramps, bone pain, visual disturbances (including lens opacity and retinopathy), rash; very rarely acute respiratory distress, neurological disturbances (including dizziness, neuropathy, convulsions, and paraesthesia), renal impairment; muscle spasms also reported

**Dose**
- See notes above; iron poisoning, see Emergency Treatment of Poisoning, p. 39

**Note** For full details and warnings relating to administration, consult product literature

**Desferrioxamine mesilate** (Non-proprietary)
- Injection, powder for reconstitution, desferrioxamine mesilate, net price 500-mg vial = £4.26; 2-g vial = £17.65

**Desferal® (Novartis)**
- Injection, powder for reconstitution, desferrioxamine mesilate, net price 500-mg vial = £4.67; 2-g vial = £18.66

**Paroxysmal nocturnal haemoglobinuria and atypical haemolytic uraemic syndrome**

Eculizumab, a recombinant monoclonal antibody, inhibits terminal complement activation at the C5 protein
and thereby reduces haemolysis and thrombotic microangiopathy. It is used to reduce haemolysis in paroxysmal nocturnal haemoglobinuria, a severe and disabling form of haemolytic anaemia. Eculizumab is also used to reduce thrombotic microangiopathy in atypical haemolytic uraemic syndrome (aHUS).

ECULIZUMAB

Indications paroxysmal nocturnal haemoglobinuria, in those with a history of blood transfusions (under specialist supervision); atypical haemolytic uraemic syndrome (under specialist supervision)

Cautions active systemic infection; monitor for 1 hour after infusion; for paroxysmal nocturnal haemoglobinuria, monitor for intravascular haemolysis (including serum-lactate dehydrogenase concentration) during treatment and for at least 8 weeks after discontinuation; for atypical haemolytic uraemic syndrome, monitor for thrombotic microangiopathy (measure platelet count, serum-lactate dehydrogenase concentration, and serum creatinine) during treatment and for at least 12 weeks after discontinuation

Meningococcal infection. Vaccinate against Neisseria meningitidis at least 2 weeks before treatment (tetravalent vaccine against serotypes A, C, W135 and Y recommended); revaccinate according to current medical guidelines. Patients receiving eculizumab less than 2 weeks after receiving meningococcal vaccine must be given prophylactic antibiotics until 2 weeks after vaccination. Advise patient to report promptly any signs of meningococcal infection. Other immunisations should also be up to date (section 14.1)

Contra-indications unresolved Neisseria meningitidis infection; patients unvaccinated against Neisseria meningitidis (see also Cautions above)

Pregnancy no information available—use only if potential benefit outweighs risk; human IgG antibody known to cross placenta; manufacturer advises effective contraception during and for 5 months after treatment

Breast-feeding no information available—manufacturer advises avoid breast-feeding during and for 5 months after treatment

Side-effects gastrointestinal disturbances; oedema; cough, nasopharyngitis; headache, dizziness, vertigo, fatigue, dysgeusia, paraesthesia; infection (including meningococcal infection); spontaneous erection, dysuria; arthralgia, myalgia; blood disorders (including thrombocytopenia, leucopenia); alopecia, pruritus, rash; influenza-like symptoms; infusion-related reactions; less commonly anorexia, gingival pain, jaundice, palpitation, haematoma, hypotension, chest pain, syncope, tremor, hot flushing, epistaxis, anxiety, depression, mood changes, sleep disturbances, Graves’ disease, menstrual disorders, renal impairment, malignant melanoma, muscle spasms, myelodysplastic syndrome, visual disturbances, tinnitus, hyperhidrosis, petechiae, and skin depigmentation

Dose

- Paroxysmal nocturnal haemoglobinuria, by intravenous infusion, ADULT over 18 years, initially 600 mg once a week for 4 weeks, then 900 mg on week 5; maintenance, 900 mg once every 12–16 days; CHILD see BNF for Children

- Atypical haemolytic uraemic syndrome, by intravenous infusion, ADULT over 18 years, initially 900 mg once a week for 4 weeks, then 1200 mg on week 5; maintenance, 1200 mg once every 12–16 days; CHILD see BNF for Children

Note Consult product literature for details of supplemental doses with concomitant plasmapheresis, plasma exchange, or plasma infusion

SOLIRIS® (Alexion) mAb Concentrate for intravenous infusion, eculizumab 10 mg/mL, net price 30-mL vial = £3150.00. Counselling, meningococcal infection, patient information card

Electrolytes Na⁺ 5 mmol/vial

9.1.4 Drugs used in platelet disorders

Idiopathic thrombocytopenic purpura

Acute idiopathic thrombocytopenic purpura is usually self-limiting in children. In adults, idiopathic thrombocytopenic purpura can be treated with a corticosteroid, e.g. prednisolone 1 mg/kg daily, gradually reducing the dose over several weeks. Splenectomy is considered if a satisfactory platelet count is not achieved or if there is a relapse on reducing the dose of corticosteroid or withdrawing it.

Immunoglobulin preparations (section 14.5.1), are also used in idiopathic thrombocytopenic purpura or where a temporary rapid rise in platelets is needed, as in pregnancy or pre-operatively; they are also used for children often in preference to a corticosteroid. Anti-D (RhD) immunoglobulin (section 14.5.3) is effective in raising the platelet count in about 80% of unsplenectomised rhesus-positive individuals; its effects may last longer than normal immunoglobulin for intravenous use, but further doses are usually required.

Other therapy that has been tried in refractory idiopathic thrombocytopenic purpura includes azathioprine (section 8.2.1), cyclophosphamide (section 8.1.1), vincristine (section 8.1.4), ciclosporin (section 8.2.2), and danazol (section 6.7.2). Rituximab (section 8.2.3) may also be effective and in some cases induces prolonged remission. For patients with chronic severe thrombocytopenia refractory to other therapy, tranexamic acid (section 2.1.1) may be given to reduce the severity of haemorrhage.

ELTROMOPAG and ROMIPLOSTIM are thrombopoietin receptor agonists licensed for the treatment of chronic idiopathic thrombocytopenic purpura in splenectomised patients refractory to other treatments, such as corticosteroids or immunoglobulins, or as a second-line treatment in non-splenectomised patients when surgery is contra-indicated (see also NICE guidance below). Eltrombopag is an oral preparal and romiplostim is an injection which is made biosynthetically by recombinant DNA technology; they should both be used under the supervision of a specialist.

The Scottish Medicines Consortium (p. 4) has advised (July 2010) that eltrombopag (Revolade®) is accepted for restricted use within NHS Scotland for the treatment of both splenectomised and non-splenectomised patients with severe symptomatic immune (idiopathic) thrombocytopenic purpura or a high risk of bleeding.
NICE guidance

**Eltrombopag for treating chronic immune (idiopathic) thrombocytopenic purpura (July 2013)**

Eltrombopag is recommended for the treatment of chronic immune (idiopathic) thrombocytopenic purpura in non-splenectomised adults refractory to other treatments, or as a second-line treatment in non-splenectomised adults when surgery is contra-indicated, only if:

- the manufacturer provides eltrombopag at the agreed discount as part of the patient access scheme
- their condition is refractory to standard active treatments and rescue therapies
- they have severe disease and a high risk of bleeding that needs frequent courses of rescue therapies.

Patients currently receiving eltrombopag whose disease does not meet these criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA221](http://www.nice.org.uk/TA221)

**Romiplostim for the treatment of chronic immune (idiopathic) thrombocytopenic purpura (April 2011)**

Romiplostim is recommended for the treatment of chronic immune (idiopathic) thrombocytopenic purpura in adults:

- if the manufacturer provides romiplostim at the agreed discount as part of the patient access scheme
- whose condition is refractory to standard active treatments and rescue therapies
- who have severe disease and a high risk of bleeding that needs frequent courses of rescue therapies.

[www.nice.org.uk/TA221](http://www.nice.org.uk/TA221)

Eltrombopag is also used, under specialist supervision, to treat thrombocytopenia in patients with chronic hepatitis C infection, where the degree of thrombocytopenia is the main factor preventing the initiation or limiting the ability to maintain optimal interferon-based therapy. For the treatment of chronic hepatitis C, see section 5.3.3.2, p. 429.

---

**ELTROMBOPAG**

**Indications** see notes above

**Cautions** patients of East Asian origin (see under Dose for idiopathic thrombocytopenic purpura); risk factors for thromboembolism; monitor liver function before treatment, every two weeks when adjusting the dose, and monthly thereafter; regular ophthalmological examinations for cataract formation recommended; for idiopathic thrombocytopenic purpura, monitor full blood count including platelet count and peripheral blood smears every week during treatment until a stable platelet count is reached (50 × 10^9/litre) or more for at least 4 weeks, then monthly thereafter; for thrombocytopenia associated with chronic hepatitis C infection, monitor platelet count every week before and during antiviral treatment until a stable platelet count is reached (50–75 × 10^9/litre), then monitor full blood count including platelet count and peripheral blood smears monthly thereafter; **interactions**: Appendix 1 (eltrombopag)

**Hepatic impairment** for idiopathic thrombocytopenic purpura, avoid unless potential benefit outweighs risk—reduce initial dose to 25 mg once daily; for thrombocytopenia associated with chronic hepatitis C infection, in severe hepatic impairment use only if potential benefit outweighs risk and monitor closely—increased risk of hepatic decompensation and thromboembolic events

**Renal impairment** use with caution

**Pregnancy** avoid—toxicity in animal studies; ensure effective contraception during treatment

**Breast-feeding** manufacturer advises avoid

**Side-effects** gastrointestinal disturbances (including nausea, diarrhoea, abdominal pain, and constipation), peripheral oedema, headache, insomnia, parasthesia, fatigue, arthralgia, bone pain, myalgia, cataract, dry eye, pruritus, rash, alopecia; less commonly dry mouth, gingival bleeding, haemorrhoids, taste disturbances, cholestasis, hepatitis, anorexia, changes in appetite, weight gain, flushing, palpitation, QT-interval prolongation, hypertension, tachycardia, thromboembolic events (including deep vein thrombosis, pulmonary embolism, and acute myocardial infarction), cough, sleep disorders, mood changes, depression, anxiety, dizziness, migraine, hemiparesis, tremor, peripheral neuropathy, respiratory and urinary tract infections, renal failure, nocturia, rectosigmoid cancer, blood disorders (including anaemia, haemolytic anaemia, eosinophilia, myelocytosis), gout, eye disorders, vertigo, epistaxis, skin reactions including ecchymosis, sweating

**Dose**

- Idiopathic thrombocytopenic purpura, ADULT over 18 years, initially 50 mg once daily (patients of EAST ASIAN origin such as Chinese, Japanese, Taiwanese, or Korean, initially 25 mg once daily), adjusted to achieve a platelet count of 50 × 10^9/litre or more (consult product literature for dose adjustments); max. 75 mg once daily; discontinue if inadequate response after 4 weeks at maximum dose

- Thrombocytopenia associated with chronic hepatitis C infection (see also notes above), ADULT over 18 years, initially 25 mg once daily, adjusted to achieve a platelet count sufficient to initiate antiviral therapy then a platelet count of 50–75 × 10^9/litre during antiviral therapy (consult product literature for dose adjustments); max. 100 mg once daily; discontinue if inadequate response after 2 weeks at maximum dose

**Counselling** Each dose should be taken at least 4 hours before or after any dairy products (or foods containing calcium), indigestion remedies, or medicines containing aluminium, calcium, iron, magnesium, zinc, or selenium to reduce possible interference with absorption

**Revolade® (GSK)**

**Tablets** f/c, eltrombopag (as olamine) 25 mg (white), net price 28-tab pack = £770.00; 50 mg (brown), 28-tab pack = £1540.00. Counselling, see above

---

**ROMIPLOSTIM**

**Indications** see notes above

**Cautions** monitor full blood count and peripheral blood smears for morphological abnormalities before...
and during treatment; monitor platelet count weekly until 50 × 10^9/litre or more for at least 4 weeks without dose adjustment, then monthly thereafter. **Driving** Dizziness may affect performance of skilled tasks (e.g. driving)

### Hepatic impairment
Avoid in moderate or severe impairment unless potential benefit outweighs risks (e.g. of portal vein thrombosis)

### Renal impairment
Manufacturer advises caution—no information available

### Pregnancy
Manufacturer advises use only if essential—no information available

### Breast-feeding
Manufacturer advises avoid—no information available

#### Indications
Essential thrombocythaemia

- **Anagrelide** inhibits platelet formation. It is licensed for essential thrombocythaemia in patients at risk of thrombo-haemorrhagic events who have not responded adequately to other drugs or who cannot tolerate other drugs. Anagrelide should be initiated under specialist supervision.

**ANAGRELIDE**

### Indications
- Cardiovascular disease—assess cardiac function before and during treatment; concomitant aspirin in patients at risk of haemorrhage; monitor full blood count (monitor platelet count every 2 days for 1 week, then weekly until maintenance dose established), liver function, serum creatinine and urea; interactions: Appendix 1 (anagrelide)

### Cautions
- **Driving** Dizziness may affect performance of skilled tasks (e.g. driving)

### Hepatic impairment
- Manufacturer advises caution in mild impairment; avoid in moderate to severe impairment

### Renal impairment
- Manufacturer advises avoid if eGFR less than 50 mL/minute/1.73 m²

### Pregnancy
- Manufacturer advises avoid (toxicity in animal studies)

### Breast-feeding
- Manufacturer advises avoid—no information available

### Side-effects
- Gastro-intestinal disturbances, palpitation, tachycardia, fluid retention, headache, dizziness, fatigue, anaemia, rash; less commonly pancreatitis, gastro-intestinal haemorrhage, congestive heart failure, hypertension, arrhythmias, syncope, chest pain, dyspnoea, sleep disturbances, paraesthesia, hypoesthesia, depression, nervousness, confusion, amnesia, fever, weight changes, impotence, blood disorders, myalgia, arthralgia, epistaxis, dry mouth, alopecia, skin discoloration, pruritus; rarely gastritis, colitis, postural hypotension, angina, myocardial infarction, vasodilatation, pulmonary hypertension, pulmonary infiltrates, migraine, drowsiness, impaired coordination, dysarthria, asthenia, tinnitus, renal failure, nocturia, visual disturbances, gingival bleeding; also reported allergic alveolitis, interstitial lung disease, pneumonitis, hepatitis, tubulointerstitial nephritis

### Dose
- Initially 500 micrograms twice daily adjusted according to response in steps of 500 micrograms daily at weekly intervals to max. 10 mg daily (max. single dose 2.5 mg); usual dose range 1–3 mg daily in divided doses; **CHILD** under 18 years see *BNF for Children*

#### Capsules
- **Xagrid** (Shire) (![](https://www.shire.com))

- **Capsules**, anagrelide (as hydrochloride), 500 micrograms, net price 100-cap pack = £404.57. Counseling, driving, see above

### Essential thrombocythaemia

- **Glucose 6-phosphate dehydrogenase (G6PD) deficiency** is highly prevalent in individuals originating from most parts of Africa, from most parts of Asia, from Oceania, and from Southern Europe; it can also occur, rarely, in any other individuals. G6PD deficiency is more common in males than it is in females.

- Individuals with G6PD deficiency are susceptible to developing acute haemolytic anaemia when they take a number of common drugs. They are also susceptible to developing acute haemolytic anaemia when they eat fava beans (broad beans, *Vicia faba*); this is termed favism and can be more severe in children or when the fresh fava beans are eaten raw.

- When prescribing drugs for patients with G6PD deficiency, the following three points should be kept in mind:
  - G6PD deficiency is genetically heterogeneous; susceptibility to the haemolytic risk from drugs varies; thus, a drug found to be safe in some G6PD-deficient individuals may not be equally safe in others;
  - Manufacturers do not routinely test drugs for their effects in G6PD-deficient individuals;
  - The risk and severity of haemolysis is almost always dose-related.

- The lists below should be read with these points in mind. Ideally, information about G6PD deficiency should be available before prescribing a drug listed below. However, in the absence of this information, the possibility of haemolysis should be considered, especially if the patient belongs to a group in which G6PD deficiency is common.

- A very few G6PD-deficient individuals with chronic non-spherocytic haemolytic anaemia have haemolysis even in the absence of an exogenous trigger. These patients must be regarded as being at high risk of severe exacerbation of haemolysis following administration of any of the drugs listed below.
9.1.6 Drugs used in neutropenia

Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils and may reduce the duration of chemotherapy-induced neutropenia and thereby reduce the incidence of associated sepsis; there is as yet no evidence that it improves overall survival. Filgrastim (unglycosylated rhG-CSF) and lenograstim (glycosylated rhG-CSF) have similar effects; both have been used in a variety of clinical settings, but they do not have any clear-cut routine indications. In congenital neutropenia filgrastim usually increases the neutrophil count with an appropriate clinical response. Prolonged use may be associated with an increased risk of myelodysplasia.

PEGfilgrastim is a polyethylene glycol-conjugated ( pegylated) derivative of filgrastim; pegylation increases the duration of filgrastim activity. Granulocyte-colony stimulating factors should only be prescribed by those experienced in their use.

Cautions Granulocyte-colony stimulating factors should be used with caution in patients with pre-malignant or malignant myeloid conditions. Full blood counts including differential white cell and platelet counts should be monitored. Treatment should be withdrawn in patients who develop signs of pulmonary infiltration. There have been reports of pulmonary infiltrates leading to acute respiratory distress syndrome—patients with a recent history of pulmonary infiltrates or pneumonia may be at higher risk. Granulocyte-colony stimulating factors should be used with caution in patients with sickle-cell disease. Spleen size should be monitored during treatment because there is a risk of splenomegaly and rupture.

Pregnancy There have been reports of toxicity in animal studies and manufacturers advise not to use granulocyte-colony stimulating factors during pregnancy unless the potential benefit outweighs the risk.

Breast-feeding There is no evidence for the use of granulocyte-colony stimulating factors during breast-feeding and manufacturers advise avoiding their use.

Side-effects Side-effects of granulocyte-colony stimulating factors include gastro-intestinal disturbances, anorexia, headache, asthenia, fever, musculoskeletal pain, bone pain, rash, alopecia, injection-site reactions, thrombocytopenia, and leucocytosis. Less commonly chest pain can occur. Pulmonary side-effects, particularly interstitial pneumonia (see Cautions above), cutaneous vasculitis and acute febrile neutrophilic dermatosis have rarely been reported.

FILGRASTIM
(Recombinant human granulocyte-colony stimulating factor, G-CSF)

Indications (specialist use only) reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes); reduction in duration of neutropenia (and associated sequelae) in myeloablative therapy followed by bone-marrow transplantation; mobilisation of peripheral blood progenitor cells for harvesting and subsequent autologous or allogeneic infusion; severe congenital neutropenia, cyclic neutropenia, or idiopathic neutropenia and history of severe or recurrent infections (distinguish carefully from other haematological disorders, consult product literature); persistent neutropenia in advanced HIV infection.

Cautions see notes above; also regular morphological and cytogenetic bone-marrow examinations recommended in severe congenital neutropenia (possible risk of myelodysplastic syndromes or leukaemia); secondary acute myeloid leukaemia; osteoporotic bone disease (monitor bone density if given for more than 6 months); Interactions: Appendix 1 (Filgrastim).

Contra-indications severe congenital neutropenia (Kostmann’s syndrome) with abnormal cytogenetics.

Pregnancy see notes above.

Breast-feeding see notes above.

Side-effects see notes above; also mucositis, splenic enlargement, hepatomegaly, transient hypotension, epistaxis, urinary abnormalities (including dysuria, proteinuria, and haematuria), osteoporosis, exacerbation of rheumatoid arthritis, anaemia, transient decrease in blood glucose, pseudogout, and raised uric acid; less commonly capillary leak syndrome (including fatal cases); very rarely splenic rupture.

Dose
• Cytotoxic-induced neutropenia, preferably by subcutaneous injection or by intravenous infusion (over 30 minutes), ADULT and CHILD, 500 000 units/kg daily started at least 24 hours after cytotoxic chemother-
apy, continued until neutrophil count in normal range, usually for up to 14 days (up to 38 days in acute myeloid leukaemia)

- Myeloablative therapy followed by bone-marrow transplantation, by intravenous infusion over 30 minutes or over 24 hours or by subcutaneous infusion over 24 hours, 1 million units/kg daily, started at least 24 hours following cytotoxic chemotherapy (and within 24 hours of bone-marrow infusion), then adjusted according to neutrophil count (consult product literature)

- Mobilisation of peripheral blood progenitor cells for harvesting and subsequent infusion

Neupogen® (Amgen)\(^\text{®}\)

Injection, filgrastim 30 million-units (300 micrograms)/mL, net price 1-mL vial = £52.70
Injection (Singleject\(^\text{®}\)), filgrastim 60 million-units (600 micrograms)/mL, net price 0.5-mL prefilled syringe = £52.70; 96 million-units (960 micrograms)/mL, net price 0.5-mL prefilled syringe = £84.06

Nivestim® (Hospira)\(^\text{®}\)

Injection, prefilled syringe, filgrastim, net price 12 million-units (120 micrograms)/0.2 mL = £36.00; 30 million-units (300 micrograms)/0.5 mL = £58.00; 48 million-units (480 micrograms)/0.5 mL = £93.00

Note Biosimilar medicine, p. 1

Ratiogranistim® (Ratiopharm UK)\(^\text{®}\)

Injection, prefilled syringe, filgrastim, net price 30 million-units (300 micrograms)/0.5 mL = £62.25; 48 million-units (480 micrograms)/0.8 mL = £99.29

Note Biosimilar medicine, p. 1

Zarzio® (Sandoz)\(^\text{®}\)

Injection, prefilled syringe, filgrastim, net price 30 million-units (300 micrograms)/0.5 mL = £50.15; 48 million-units (480 micrograms)/0.5 mL = £79.90

Note Biosimilar medicine, p. 1

**LENOGRASTIM**

(Recombinant human granulocyte-colony stimulating factor, rHuG-CSF)

**Indications** (specialist use only) reduction in the duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes)

**Dose**

- Following bone-marrow transplantation, by intravenous infusion or subcutaneous injection, ADULT and CHILD over 2 years 19.2 million units/m\(^2\) daily started the day after transplantation, continued until neutrophil count stable in acceptable range (max. 28 days)

- Following peripheral stem cells transplantation, by intravenous infusion or subcutaneous injection, ADULT 19.2 million units/m\(^2\) daily started the day after transplantation, continued until neutrophil count stable in acceptable range (max. 28 days); CHILD see BNF for Children

- Cytotoxic-induced neutropenia, by subcutaneous injection, ADULT 19.2 million units/m\(^2\) daily started the day after completion of chemotherapy, continued until neutrophil count stable in acceptable range (max. 28 days); CHILD see BNF for Children

- Mobilisation of peripheral blood progenitor cells, used alone, by subcutaneous injection, ADULT 1.28 million units/kg daily for 4–6 days (5–6 days in healthy donors); used following adjunctive myelosuppressive chemotherapy (to improve yield), by subcutaneous injection, 19.2 million units/m\(^2\) daily, started 1–5 days after completion of chemotherapy and continued until neutrophil count in acceptable range; for timing of leucopheresis consult product literature; CHILD see BNF for Children

**Granocyte®** (Chugai)\(^\text{®}\)

Injection, powder for reconstitution, lenograstim, net price 13.4 million-unit (105-microgram) vial = £40.11; 33.6 million-unit (263-microgram) vial = £62.54 (both with 1-mL prefilled syringe water for injections)

**Excipients** include phenylalanine (section 9.4.1)

**PEGFILGRASTIM**

(Pegylated recombinant methionyl human granulocyte-colony stimulating factor)

**Indications** (specialist use only) reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes)

**Cautions** see notes above; also acute leukaemia and myelosuppressive chemotherapy; interactions: Appendix 1 (filgrastim)

**Pregnancy** see notes above

**Breast-feeding** see notes above
Side-effects see notes above; also rarely capillary leak syndrome (including fatal cases); very rarely splenic rupture

Dose

**Note** Dose expressed as filgrastim

- By subcutaneous injection, ADULT over 18 years, 6 mg (0.6 mL) for each chemotherapy cycle, starting 24 hours after chemotherapy

**Neulasta**<sup>®</sup> (Amgen) Injection, pegfilgrastim (expressed as filgrastim) 10 mg/mL, net price 0.6-mL (6-mg) prefilled syringe = £666.38

### 9.1.7 Drugs used to mobilise stem cells

**Plerixafor** is a chemokine receptor antagonist licensed to mobilise haematopoietic stem cells to peripheral blood for collection and subsequent autologous transplantation in patients with lymphoma or multiple myeloma. Plerixafor should be given under specialist supervision following 4 days treatment with a granulocyte-colony stimulating factor (section 9.1.6)

#### Indications

**Plerixafor**<sup>®</sup> (Genzyme) TA Injection, plerixafor 20 mg/mL, net price 1.2 mL-vial = £4882.77

**Electrolyte concentrations—intravenous fluids**

Faeces, vomit, or aspiration should be saved and analysed where possible if abnormal losses are suspected; where this is impracticable the approximations above may be helpful in planning replacement therapy

**9.2 Fluids and electrolytes**

#### 9.2.1 Oral preparations for fluid and electrolyte imbalance

- **Oral potassium**
- **Oral sodium and water**
- **Oral bicarbonate**

Sodium and potassium salts, which may be given by mouth to prevent deficiencies or to treat established deficiencies of mild or moderate degree, are discussed in this section. Oral preparations for removing excess potassium and preparations for oral rehydration therapy are also included here. Oral bicarbonate, for metabolic acidosis, is also described in this section.

For reference to calcium, magnesium, and phosphate, see section 9.5.

**9.2.2 Parenteral preparations for fluid and electrolyte imbalance**

The following tables give a selection of useful electrolyte values:
Compensation for potassium loss is especially necessary:
- in those taking digoxin or anti-arrhythmic drugs, where potassium depletion may induce arrhythmias;
- in patients in whom secondary hyperaldosteronism occurs, e.g. renal artery stenosis, cirrhosis of the liver, the nephrotic syndrome, and severe heart failure;
- in patients with excessive losses of potassium in the faeces, e.g. chronic diarrhoea associated with intestinal malabsorption or laxative abuse.

Measures to compensate for potassium loss may also be required in the elderly since they frequently take inadequate amounts of potassium in the diet (but see below for warning on renal insufficiency). Measures may also be required during long-term administration of drugs known to induce potassium loss (e.g. corticosteroids). Potassium supplements are seldom required with the small doses of diuretics given to treat hypertension; potassium-sparing diuretics (rather than potassium supplements) are recommended for prevention of hypokalaemia due to diuretics such as furosemide or the thiazides when these are given to eliminate oedema.

**Dosage** If potassium salts are used for the prevention of hypokalaemia, then doses of potassium chloride 2 to 4 g (approx. 25 to 50 mmol) daily (in divided doses) by mouth are suitable in patients taking a normal diet. Smaller doses must be used if there is renal insufficiency (common in the elderly) to reduce the risk of hyperkalaemia. Regular monitoring of plasma-potassium concentration is essential in those taking potassium supplements. When there is established potassium depletion larger doses may be necessary, the quantity depending on the severity of any continuing potassium loss (monitoring of plasma-potassium concentration and specialist advice would be required). Potassium depletion is frequently associated with chloride depletion and with metabolic alkalosis, and these disorders require correction.

**Administration** Potassium salts are preferably given as a liquid (or effervescent) preparation, rather than modified-release tablets; they should be given as the chloride (the use of effervescent potassium tablets BPC 1968 should be restricted to hypochloremic states, section 9.2.1.3). Salt substitutes. A number of salt substitutes which contain significant amounts of potassium chloride are readily available as health food products (e.g. LoSalt® and Rethm®). These should not be used by patients with renal failure as potassium intoxication may result.

**Renal impairment** close monitoring required—risk of hyperkalaemia; avoid in severe impairment

**Side-effects** nausea, vomiting, abdominal pain, diarrhoea, flatulence; with modified-release preparations, gastro-intestinal obstruction, ulceration and bleeding also reported

**Dose** See notes above

**Note** Do not confuse Effervescent Potassium Tablets BPC 1968 (section 9.2.1.3) with effervescent potassium chloride tablets. Effervescent Potassium Tablets BPC 1968 do not contain chloride ions and their use should be restricted to hypochloremic states (section 9.2.1.3)

**Kay-Cee-L®** (Geistlich) Syrup, sugar-free, red, potassium chloride 7.5% (1 mmol/mL each of K⁺ and Cl⁻), net price 500 mL = £6.80. Label: 21

**Sando-K®** (HK Pharma) Tablets, effervescent, potassium bicarbonate and chloride equivalent to potassium 470 mg (12 mmol of K⁺) and chloride 285 mg (8 mmol of Cl⁻). Net price 20 = £1.53. Label: 13, 21

**Slow-K®** (Alliance) Tablets, m/r, orange, s/c, potassium chloride 600 mg (8 mmol each of K⁺ and Cl⁻), net price 100 = £5.95. Label: 25, 27, counselling, swallow whole with fluid during meals while sitting or standing

**Note** May be difficult to obtain

**Modified-release preparations** Avoid unless effervescent tablets or liquid preparations inappropriate

**POLYSTYRENE SULFONATE RESINS**

**Indications** hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients

**Cautions** children (impaction of resin with excessive dosage or inadequate dilution); monitor for electrolyte disturbances (stop if plasma-potassium concentration...
below 5 mmol/litre); sodium-containing resin in congestive heart failure, hypertension, and oedema; interactions: Appendix 1 (polystyrene sulfonate resins)

**Contra-indications** obstructive bowel disease; neoplasms with reduced gut motility; calcium-containing resin in hyperparathyroidism, multiple myeloma, sarcoidosis, or metastatic carcinoma

**Renal impairment** use sodium-containing resin with caution

**Pregnancy** manufacturers advise use only if potential benefit outweighs risk—no information available

**Breast-feeding** manufacturers advise use only if potential benefit outweighs risk—no information available

**Side-effects** faecal impaction following rectal administration, gastro-intestinal concretions following oral administration, intestinal necrosis reported with concomitant use of sorbitol, gastric irritation, anorexia, nausea, vomiting, constipation (discontinue treatment—avoid magnesium-containing laxatives), diarrhoea, hypomagnesaemia; gastro-intestinal obstruction, ulceration, necrosis, and ischaemic colitis also reported; with calcium-containing resin, hypercalcaemia (including in dialysed patients and occasionally in those with renal impairment); with sodium-containing resin, sodium retention, hypocalcaemia

**Dose**
- See under preparations

**Calcium Resonium®** (Sanofi-Aventis)

- Powder, buff, calcium polystyrene sulfonate. Net price 300 g = £68.47. Label: 13
- **Dose** By mouth, 15 g 3–4 times daily in a small amount of water or syrup (not fruit juice which has a high potassium content); **CHILD** under 18 years see **BNF for Children**

**Resonium A®** (Sanofi-Aventis)

- **Powder**, buff, sodium polystyrene sulfonate. Net price 454 g = £67.50. Label: 13
- **Dose** By mouth, 15 g 3–4 times daily in a small amount of water or syrup (not fruit juice which has a high potassium content); **CHILD** under 18 years see **BNF for Children**

**Sorbisterit®** (Stanningley)

- **Powder**, buff, sodium polystyrene sulfonate 759–949 mg/g, net price 500 g = £49.95. Label: 13, 21
- **Excipients** include sucrose 51–241 mg per 1 g of powder
- **Dose** By mouth, 20 g 1–3 times daily in 150 mL of water or soft drink (not fruit juice which has a high potassium content); **CHILD** under 18 years see **BNF for Children**

**Sodium Chloride**

**Indications** sodium depletion—see also 9.2.2.1; nebuliser diluent (section 3.1.5); eye (section 11.8.1); oral hygiene (section 12.3.4); wound irrigation (section 13.11.1)

**Slow Sodium®** (HK Pharma)

- **Tablets**, m/r, sodium chloride 600 mg (approx. 10 mmol each of Na⁺ and Cl⁻). Net price 100-tab pack = £6.05. Label: 25
- **Dose** prophylaxis of sodium chloride deficiency 4–8 tablets daily with water (in severe depletion up to max. 20 tablets daily)
- Chronic renal salt wasting, up to 20 tablets daily with appropriate fluid intake

**BNF for Children** under 18 years see **BNF for Children**

**Oral rehydration therapy (ORT)**

As a worldwide problem diarrhoea is by far the most important indication for fluid and electrolyte replacement. Intestinal absorption of sodium and water is enhanced by glucose (and other carbohydrates). Replacement of fluid and electrolytes lost through diarrhoea can therefore be achieved by giving solutions containing sodium, potassium, and glucose or another carbohydrate such as rice starch.

**Oral rehydration solutions should:**
- enhance the absorption of water and electrolytes;
- replace the electrolyte deficit adequately and safely;
- contain an alkalinising agent to counter acidosis;
- be slightly hypotonic (~250 mmol/litre) to prevent the possible induction of osmotic diarrhoea;
- be simple to use in hospital and at home;
- be palatable and acceptable, especially to children;
- be readily available.

It is the policy of the World Health Organization (WHO) to promote a single oral rehydration solution but to use it flexibly (e.g. by giving extra water between drinks of oral rehydration solution to moderately dehydrated infants).

**Oral rehydration solutions used in the UK are lower in sodium (50–80 mmol/litre) than the WHO formulation since, in general, patients suffer less severe sodium loss.**

Rehydration should be rapid over 3 to 4 hours (except in hypernatraemic dehydration in which case rehydration should occur more slowly over 12 hours). The patient should be reassessed after initial rehydration and if still dehydrated rapid fluid replacement should continue. Once rehydration is complete further dehydration is prevented by encouraging the patient to drink normal volumes of an appropriate fluid and by replacing continuing losses with an oral rehydration solution; in infants, breast-feeding or formula feeds should be offered between oral rehydration drinks.

For intravenous rehydration see section 9.2.2.
INDICATIONS
fluid and electrolyte loss in diarrhoea, see notes above

DOSE
• According to fluid loss, usually 200–400 mL solution after every loose motion; INFANT 1–1½ times usual feed volume; CHILD 200 mL after every loose motion

UK formulations
Note After reconstitution any unused solution should be discarded no later than 1 hour after preparation unless stored in a refrigerator when it may be kept for up to 24 hours

Dioralyte® (Sanofi-Aventis)
Oral powder, sodium chloride 470 mg, potassium chloride 300 mg, disodium hydrogen citrate 530 mg, glucose 3.56 g/sachet, net price 6-sachet pack = £2.25, 20-sachet pack (blackcurrant- or citrus-flavoured or natural) = £5.72
Note Reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets reconstituted with 1 litre of water provide Na⁺ 60 mmol, K⁺ 20 mmol, Cl⁻ 60 mmol, citrate 10 mmol, and glucose 90 mmol

Dioralyte® Relief (Sanofi-Aventis)
Oral powder, sodium chloride 350 mg, potassium chloride 300 mg, sodium citrate 580 mg, cooked rice powder 6 g/sachet, net price 6-sachet pack (apricot-, blackcurrant- or raspberry-flavoured) = £2.50, 20-sachet pack (apricot-flavoured) = £7.13
Note Reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets when reconstituted with 1 litre of water provide Na⁺ 60 mmol, K⁺ 20 mmol, Cl⁻ 60 mmol and citrate 10 mmol; contains aspartame (section 9.4.1)

Electrolyte® (Actavis)
Oral powder, sodium chloride 236 mg, potassium chloride 300 mg, sodium bicarbonate 500 mg, anhydrous glucose 4 g/sachet (banana-, blackcurrant-, lemon and lime-, or orange-flavoured). Net price 6-sachet pack (plain or multiflavoured) pack = £1.33, 20-sachet pack (single- or multiflavoured) = £7.13
Note Reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets when reconstituted with 1 litre of water provide Na⁺ 50 mmol, K⁺ 20 mmol, Cl⁻ 40 mmol, HCO₃⁻ 30 mmol, and glucose 111 mmol

WHO formulation
Oral Rehydration Salts (Non-proprietary)
Oral powder, sodium chloride 2.6 g, potassium chloride 1.5 g, sodium citrate 2.9 g, anhydrous glucose 13.5 g. To be dissolved in sufficient water to produce 1 litre (providing Na⁺ 75 mmol, K⁺ 20 mmol, Cl⁻ 65 mmol, citrate 10 mmol, glucose 75 mmol/litre)
Note Recommended by the WHO and the United Nations Children’s Fund but not commonly used in the UK

9.2.1.3 Oral bicarbonate
Sodium bicarbonate is given by mouth for chronic acidaotic states such as uraemic acidosis or renal tubular acidosis. The dose for correction of metabolic acidosis is not predictable and the response must be assessed; sodium bicarbonate 4.8 g daily (57 mmol each of Na⁺ and HCO₃⁻) or more may be required. For severe metabolic acidosis, sodium bicarbonate can be given intravenously (section 9.2.2).
Sodium bicarbonate may also be used to increase the pH of the urine (see section 7.4.3); for use in dyspepsia see section 1.1.1.

SODIUM BICARBONATE
Indications see notes above
Cautions see notes above; respiratory acidosis; interactions: Appendix 1 (antacids)

DOSE
• See notes above

Sodium Bicarbonate (Non-proprietary)
Capsules, sodium bicarbonate 500 mg (approx. 6 mmol each of Na⁺ and HCO₃⁻), net price 56-cap pack = £2.66
Tablets, sodium bicarbonate 600 mg, net price 100 = £27.14
Important Oral solutions of sodium bicarbonate are required occasionally; these are available from ‘special-order’ manufacturers or specialist importing companies, see p. 1184; the strength of sodium bicarbonate should be stated on the prescription

POTASSIUM BICARBONATE
Indications see notes above
Cautions elderly; cardiac disease; interactions: Appendix 1 (potassium salts)
Contra-indications hypochloraemia; plasma-potassium concentration above 5 mmol/litre
Renal impairment close monitoring required—high risk of hyperkalaemia; avoid in severe impairment
Side-effects nausea, vomiting, abdominal pain, diarrhoea, and flatulence

DOSE
• See notes above

Potassium Tablets, Effervescent (Non-proprietary)
Effervescent tablets, potassium bicarbonate 500 mg, potassium acid tartrate 300 mg, each tablet providing 6.5 mmol of K⁺. To be dissolved in water before administration. Net price 56 = E85.64 Label: 13, 21
Note These tablets do not contain chloride; for effervescent tablets containing potassium and chloride, see under Potassium Chloride, section 9.2.1.1

9.2.2 Parenteral preparations for fluid and electrolyte imbalance

9.2.2.1 Electrolytes and water

9.2.2.2 Plasma and plasma substitutes

9.2.2.1 Electrolytes and water
Solutions of electrolytes are given intravenously, to meet normal fluid and electrolyte requirements or to replenish substantial deficits or continuing losses, when the patient is nauseated or vomiting and is unable to take adequate amounts by mouth. When intravenous administration is not possible, fluid (as sodium chloride...
BNF 68 9.2.2 Parenteral preparations for fluid and electrolyte imbalance 669

SODIUM CHLORIDE

Indications  electrolyte imbalance—see also section 9.2.1.2; nebuliser diluent (section 3.1.5); eye (section 11.6.1); oral hygiene (section 12.3.4); wound irrigation (section 13.11.1)

Cautions  restrict intake in impaired renal function, cardiac failure, hypertension, peripheral and pulmonary oedema, toxemia of pregnancy

Side-effects  administration of large doses may give rise to sodium accumulation, oedema, and hyperchloremic acidosis

Dose
- See notes above

Sodium Chloride Intravenous Infusion (Non-
proprietary) (Ψ)

Intravenous infusion, usual strength sodium chloride 0.9% (9 g, 150 mmol each of Na⁺ and Cl⁻/litre), this strength being supplied when normal saline for injection is requested. Net price 2-mL amp = 21p; 5-mL amp = 28p; 10-mL amp = 34p; 20-mL amp = £1.04; 50-mL amp = £4.27

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

Note  The term 'normal saline' should not be used to describe sodium chloride intravenous infusion 0.9%; the term 'physiological saline' is acceptable but it is preferable to give the composition (i.e. sodium chloride intravenous infusion 0.9%).

With other ingredients

Sodium Chloride and Glucose Intravenous Infusion (Non-proprietary) (Ψ)

Intravenous infusion, sodium chloride 0.18% (Na⁺ and Cl⁻ each 30 mmol/litre), glucose 4%

In hospitals, usually 500-mL packs and sometimes other sizes are available

Intravenous infusion, sodium chloride 0.45% (Na⁺ and Cl⁻ each 75 mmol/litre), glucose 2.5%

In hospitals, usually 500-mL packs and sometimes other sizes are available

Intravenous infusion, sodium chloride 0.45% (Na⁺ and Cl⁻ each 75 mmol/litre), glucose 5%

In hospitals, usually 500-mL packs and sometimes other sizes are available

Intravenous infusion, sodium chloride 0.9% (Na⁺ and Cl⁻ each 150 mmol/litre), glucose 5%

In hospitals, usually 500-mL packs and sometimes other sizes are available

Note  See above for warning on hyponatraemia especially in children and elderly

Ringer’s Solution for Injection (Ψ)

Calcium chloride (dihydrate) 322 micrograms, potassium chloride 300 micrograms, sodium chloride 8.6 mg/mL, providing the following ions (in mmol/itre), Ca⁺⁺ 2.2, K⁺ 4, Na⁺ 147, Cl⁻ 156

In hospitals, usually 500- and 1000-mL packs, and sometimes other sizes, are available

Sodium Lactate Intravenous Infusion, Compound (Non-proprietary) (Ψ)

(Hartmann’s Solution for Injection; Ringer-Lactate Solution for Injection)

Intravenous infusion, sodium chloride 0.6%, sodium lactate 0.32%, potassium chloride 0.04%, calcium chloride 0.027% (containing Na⁺ 131 mmol, K⁺ 5 mmol, Ca²⁺ 2 mmol, HCO₃⁻ (as lactate) 28 mmol, Cl⁻ 111 mmol/litre)

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

0.9% or glucose 5%) can also be given by subcutaneous infusion (hypodermoclysis).

The nature and severity of the electrolyte imbalance must be assessed from the history and clinical and biochemical investigations. Sodium, potassium, chloride, magnesium, phosphate, and water depletion can occur singly and in combination with or without disturbances of acid-base balance; for reference to the use of magnesium and phosphates, see section 9.5.

Isotonic solutions may be infused safely into a peripheral vein. Solutions more concentrated than plasma, e.g. 20% glucose, are best given through an indwelling catheter positioned in a large vein.

**Intravenous sodium**

Sodium chloride in isotonic solution provides the most important extracellular ions in near physiological concentrations and is indicated in sodium depletion, which can arise from such conditions as gastro-enteritis, diabetic ketoacidosis, ileus, and ascites. In a severe deficit of 4 to 8 litres, 2 to 3 litres of isotonic sodium chloride may be given over 2 to 3 hours; thereafter the infusion can usually be at a slower rate. Excessive administration should be avoided; the jugular venous pressure should be assessed, the bases of the lungs should be examined for crepitations, and in elderly or seriously ill patients it is often helpful to monitor the right atrial (central) venous pressure.

Chronic hyponatraemia arising from inappropriate secretion of antidiuretic hormone should ideally be corrected by fluid restriction. However, if sodium chloride is required for acute or chronic hyponatraemia, regardless of the cause, the deficit should be corrected slowly to avoid the risk of osmotic demyelination syndrome and the rise in plasma-sodium concentration should not exceed 10 mmol/litre in 24 hours. In severe hyponatraemia, sodium chloride 1.8% may be used cautiously.

**Compound sodium lactate** (Hartmann’s solution) can be used instead of isotonic sodium chloride solution during or after surgery, or in the initial management of the injured or wounded; it may reduce the risk of hyperchloremic acidosis.

**Sodium chloride and glucose** solutions are indicated when there is combined water and sodium depletion. A 1:1 mixture of isotonic sodium chloride and 5% glucose allows some of the water (free of sodium) to enter body cells which suffer most from dehydration while the sodium salt with a volume of water determined by the normal plasma Na⁺ remains extracellular. Maintenance fluid should accurately reflect daily requirements and close monitoring is required to avoid fluid and electrolyte imbalance. Illness or injury increase the secretion of anti-diuretic hormone and therefore the ability to excrete excess water may be impaired. Inappropriate use of hypotonic solutions such as sodium chloride 0.16% and glucose 4% may also cause dilutional hyponatraemia especially in children (see **BNF for Children** and the elderly; if necessary, guidance should be sought from a clinician experienced in the management of fluid and electrolytes.

Combined sodium, potassium, chloride, and water depletion may occur, for example, with severe diarrhoea or persistent vomiting; replacement is carried out with sodium chloride intravenous infusion 0.9% and glucose intravenous infusion 5% with potassium as appropriate.
**Intravenous glucose**

Glucose solutions (5%) are used mainly to replace water deficit and should not be given alone except when there is no significant loss of electrolytes; prolonged administration of glucose solutions without electrolytes can lead to hyponatraemia and other electrolyte disturbances. Average water requirements in a healthy adult are 1.5 to 2.5 litres daily and this is needed to balance unavoidable losses of water through the skin and lungs and to provide sufficient for urinary excretion. Water depletion (dehydration) tends to occur when these losses are not matched by a comparable intake, as may occur in coma or dysphagia or in the elderly or apathetic who may not drink enough water on their own initiative.

Excessive loss of water without loss of electrolytes is uncommon, occurring in fevers, hyperthyroidism, and in uncommon water-losing renal states such as diabetes insipidus or hypercalcaemia. The volume of glucose solution needed to replace deficits varies with the severity of the disorder, but usually lies within the range of 2 to 6 litres.

Glucose solutions are also used to correct and prevent hypoglycaemia and to provide a source of energy in those too ill to be fed adequately by mouth; glucose solutions are a key component of parenteral nutrition (section 9.3).

Glucose solutions are given in regimens with calcium and insulin for the emergency management of hyperkalaemia (see p. 666). They are also given, after correction of hyperglycaemia, during treatment of diabetic ketoacidosis, when they must be accompanied by continuing insulin infusion.

**Intravenous potassium**

Potassium chloride and sodium chloride intravenous infusion is the initial treatment for the correction of severe hypokalaemia and when sufficient potassium cannot be taken by mouth. Ready-mixed infusion solutions should be used when possible; alternatively, potassium chloride concentrate, as ampoules containing 1.5 g (K⁺ 20 mmol) in 10 mL, is thoroughly mixed with 500 mL of sodium chloride 0.9% intravenous infusion and given slowly over 2 to 3 hours, with specialist advice and ECG monitoring in difficult cases. Higher concentrations of potassium chloride may be given in very severe depletion, but require specialist advice.

Repeated measurement of plasma-potassium concentration is necessary to determine whether further infusions are required and to avoid the development of hyperkalaemia, which is especially likely in renal impairment.

Initial potassium replacement therapy should not involve glucose infusions, because glucose may cause a further decrease in the plasma-potassium concentration.
Potassium Chloride, Sodium Chloride, and Glucose Intravenous Infusion (Non-proprietary) (TN)

Intravenous infusion, sodium chloride 0.45% (4.5 g, Na⁺ 75 mmol/litre) with 5% of anhydrous glucose and usually sufficient potassium chloride to provide K⁺ 10–40 mmol/litre (to be specified by the prescriber).

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available.

Intravenous infusion, sodium chloride 0.18% (1.8 g, Na⁺ 30 mmol/litre) with 4% of anhydrous glucose and usually sufficient potassium chloride to provide K⁺ 10–40 mmol/litre (to be specified by the prescriber).

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available.

Potassium Chloride Concentrate, Sterile (Non-proprietary) (TN)

Sterile concentrate, potassium chloride 15% (150 mg, approximately 2 mmol each of K⁺ and Cl⁻/mL). Net price 10-mL amp = 48p

Important: Must be diluted with not less than 50 times its volume of sodium chloride intravenous infusion 0.9% or other suitable diluent and mixed well.

Solutions containing 10 and 20% of potassium chloride are also available in both 5- and 10-mL ampoules.

Bicarbonate and lactate

Sodium bicarbonate is used to control severe metabolic acidosis (pH < 7.1) particularly that caused by loss of bicarbonate (as in renal tubular acidosis or from excessive gastro-intestinal losses). Mild metabolic acidosis associated with volume depletion should first be managed by appropriate fluid replacement because acidosis usually resolves as tissue and renal perfusion are restored. In more severe metabolic acidosis or when the acidosis remains unresponsive to correction of anoxia or hypovolaemia, sodium bicarbonate (1.26%) can be infused over 3–4 hours with plasma-pH and electrolyte monitoring. In severe shock (section 2.7.1), for example in cardiac arrest, metabolic acidosis can develop without sodium or volume depletion; in these circumstances sodium bicarbonate is best given as a small volume of hypertonic solution, such as 50 mL of 8.4% solution intravenously; plasma-pH and electrolytes should be monitored.

Sodium lactate intravenous infusion is no longer used in metabolic acidosis because of the risk of producing lactic acidosis, particularly in seriously ill patients with poor tissue perfusion or impaired hepatic function.

For chronic acidic states, sodium bicarbonate can be given by mouth (section 9.2.1.3).

SODIUM BICARBONATE

Indications: metabolic acidosis, see also notes above.

Dose: By slow intravenous injection, a strong solution (up to 8.4%), or by continuous intravenous infusion, a weaker solution (usually 1.26%), an amount appropriate to the body base deficit (see notes above).

Sodium Bicarbonate Intravenous Infusion (TN)

Usual strength sodium bicarbonate 1.26% (12.6 g, 150 mmol each of Na⁺ and HCO₃⁻/litre); various other strengths available.

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available.

Minijet® Sodium Bicarbonate (UCB Pharma) (TN)

Intravenous injection, sodium bicarbonate in disposable syringe, net price 4.2%, 10 mL = £11.03; 8.4%, 10 mL = £11.10, 50 mL = £12.15

SODIUM LACTATE

Indications: see notes above.

Sodium Lactate (Non-proprietary) (TN)

Intravenous infusion, sodium lactate M/6, contains the following ions (in mmol/litre), Na⁺ 167, HCO₃⁻ (as lactate) 167

Water

Water for Injections (TN)

Net price 1-mL amp = 18p; 2-mL amp = 13p; 5-mL amp = 24p; 10-mL amp = 25p, 10-mL vial = £1.40;

20-mL amp = 39p; 50-mL amp = £1.91; 100-mL vial = £2.96

Note: Water for Injections can be sold or supplied by a pharmacist for a purpose other than parenteral administration, or when dry powder for parenteral administration has been prescribed without the Water for Injections that is needed as a diluent.

9.2.2.2 Plasma and plasma substitutes

Plasma and plasma substitutes (‘colloids’) contain large molecules that do not readily leave the intravascular space where they exert osmotic pressure to maintain circulatory volume. Compared to fluids containing electrolytes such as sodium chloride and glucose (‘crystalloids’), a smaller volume of colloid is required to produce the same expansion of blood volume, thereby shifting salt and water from the extravascular space. If resuscitation requires a volume of fluid that exceeds the maximum dose of the colloid then crystalloids can be given; packed red cells may also be required.

Albumin solutions, prepared from whole blood, contain soluble proteins and electrolytes but no clotting factors, blood group antibodies, or plasma cholinesterases; they may be given without regard to the recipient’s blood group.

Albumin is usually used after the acute phase of illness, to correct a plasma-volume deficit; hypoalbuminaemia itself is not an appropriate indication. The use of albumin solutions in acute plasma or blood loss may be wasteful; plasma substitutes are more appropriate. Concentrated albumin solutions (20%) can be used under specialist supervision in patients with an intravascular fluid deficit and oedema because of interstitial fluid overload, to restore intravascular plasma volume with less exacerbation of the salt and water overload than isotonic solutions. Concentrated albumin solutions may also be used to obtain a diuresis in hypoalbuminaemic patients (e.g. in hepatic cirrhosis).

Recent evidence does not support the previous view that the use of albumin increases mortality.
ALBUMIN SOLUTION
(Human Albumin Solution)
A solution containing protein derived from plasma, serum, or normal placenta, at least 95% of the protein is albumin. The solution may be isotonic (containing 3.5–5% protein) or concentrated (containing 15–25% protein).

Indications see under preparations, and also notes above
Cautions history of cardiac or circulatory disease (administer slowly to avoid rapid rise in blood pressure and cardiac failure, and monitor cardiovascular and respiratory function); increased capillary permeability; correct dehydration when administering concentrated solution
Contra-indications cardiac failure; severe anaemia
Side-effects hypersensitivity reactions (including anaphylaxis) with nausea, vomiting, increased salivation, fever, tachycardia, hypotension and chills reported

Isotonic solutions
Indications: acute or sub-acute loss of plasma volume, e.g., in burns, pancreatitis, trauma, and complications of surgery; plasma exchange
Available as: Human Albumin Solution 4.5% (50-, 100-, 250- and 400-mL bottles—Baxter); Human Albumin Solution 5% (250- and 500-mL bottles—Baxter); Albunorm® 5% (100-, 250-, and 500-mL bottles—Octapharm); Zenalb® 4.5% (50-, 100-, 250-, and 500-mL bottles—BPL)

Concentrated solutions (20%)
Indications: severe hypoaalbuminaemia associated with low plasma volume and generalised oedema where salt and water restriction with plasma volume expansion are required; adjunct in the treatment of hyperbilirubinaemia by exchange transfusion in the newborn; paracentesis of large volume ascites associated with portal hypertension
Available as: Human Albumin Solution 20% (50- and 100-mL vials—Baxter); Albunorm® 20% (50- and 100-mL bottles—Octapharm); Flexbumin® 20% (50- and 100-mL vials—BPL)

Plasma substitutes
Dextran, gelatin, and the etherified starches (beta-starch and pentastarch) are macromolecular substances which are metabolised slowly; they may be used at the outset to expand and maintain blood volume in shock arising from conditions such as burns or septicemia. Plasma substitutes may be used as an immediate short-term measure to treat haemorrhage until blood is available. They are rarely needed when shock is due to sodium and water depletion because, in these circumstances, the shock responds to water and electrolyte repletion; see also section 2.7.1 for the management of shock.

MHRA/CHM advice
MHRA suspends use of hydroxyethyl starch (HES) infusions (June 2013)
The use of hydroxyethyl starch infusions to treat critically ill patients and those undergoing surgery has been suspended in the UK because their benefits no longer outweigh the risk of using them. Studies have suggested an increased risk of renal injury and death in patients treated with these products compared with crystalloids (simple salt solutions). Tetraspan®, Venofundin®, Volulyte®, andVoluven® have all been withdrawn by the manufacturers.

Plasma substitutes should not be used to maintain plasma volume in conditions such as burns or peritonitis where there is loss of plasma protein, water, and electrolytes over periods of several days or weeks. In these situations, plasma or plasma protein fractions containing large amounts of albumin should be given.

Dextran 70 by intravenous infusion is used for volume expansion. Dextran may interfere with blood group cross-matching or biochemical measurements, and these should be carried out before infusion is begun.

Cautions Plasma substitutes should be used with caution in patients with cardiac disease, severe liver disease, or renal impairment; urine output should be monitored. Care should be taken to avoid haematocrit concentration from falling below 25–30% and the patient should be monitored for hypersensitivity reactions.

Side-effects Hypersensitivity reactions may occur including, rarely, severe anaphylactic reactions. Transient increase in bleeding time may occur.

DEXTAN 70
Dextrans of weight average molecular weight about ‘70 000’
Indications short-term blood volume expansion
Cautions see notes above; can interfere with some laboratory tests (see also above); where possible, monitor central venous pressure
Hepatic impairment use with caution in severe impairment
Pregnancy avoid—reports of anaphylaxis in mother causing fetal anoxia, neurological damage and death
Side-effects see notes above
Dose
● See under preparation below
Hypertonic solution

RescueFlow® (Pharmacosmos) *(Intravenous infusion, dextran 70 intravenous infusion 6% in sodium chloride intravenous infusion 7.5%). Net price 250-mL bag = £28.50

Cautions see notes above; severe hyperglycaemia and hyperosmolality

Dose initial treatment of hypovolaemia with hypotension induced by traumatic injury, by intravenous infusion over 2–5 minutes, 250 mL, followed immediately by administration of isotonic fluids

Hypertonic solution

RescueFlow® (Pharmacosmos) *(Intravenous infusion, dextran 70 intravenous infusion 6% in sodium chloride intravenous infusion 7.5%). Net price 250-mL bag = £28.50

Cautions see notes above; severe hyperglycaemia and hyperosmolality

Dose initial treatment of hypovolaemia with hypotension induced by traumatic injury, by intravenous infusion over 2–5 minutes, 250 mL, followed immediately by administration of isotonic fluids

GELATIN

Note The gelatin is partially degraded

Indications low blood volume (but see notes above)

Cautions see notes above

Hepatic impairment use with caution in severe impairment

Pregnancy manufacturer of Geloplasma® advises avoid at the end of pregnancy

Side-effects see notes above

Dose

• By intravenous infusion, initially 500–1000 mL of a 3.5–4% solution (see notes above)

Gelofusine® (B. Braun) *(Intravenous infusion, succinylated gelatin (modified fluid gelatin, average molecular weight 26 500) 40 g, Na⁺ 151 mmol, K⁺ 4 mmol, Mg²⁺ 1 mmol, Cl⁻ 103 mmol, Ca²⁺ 1 mmol, acetate 24 mmol/litre, net price 500–500 mL bag = £6.80, 1-litre bag = £13.60

Gelofusine® (B. Braun) *(Intravenous infusion, succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na⁺ 154 mmol, Cl⁻ 120 mmol/litre, net price 500–500 mL bag = £6.80, 1-litre bag = £13.60

Geloplasma® (Fresenius Kabi) *(Intravenous infusion, partially hydrolysed and succinylated gelatin (modified liquid gelatin) (as hydrous gelatin) 30 g (3%), Na⁺ 150 mmol, K⁺ 5 mmol, Mg²⁺ 1.5 mmol, Cl⁻ 100 mmol, lactate 30 mmol/litre, net price 500–500 mL bag = £5.05

Isoplex® (Beacon) *(Intravenous infusion, succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na⁺ 145 mmol, K⁺ 4 mmol, Mg²⁺ 0.9 mmol, Cl⁻ 105 mmol, lactate 25 mmol/litre, net price 500–500 mL bag = £7.53, 1-litre bag = £14.54

Volplex® (Beacon) *(Intravenous infusion, succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na⁺ 154 mmol, Cl⁻ 125 mmol/litre, net price 500–500 mL bag = £4.70, 1-litre bag = £9.09

ETHERIFIED STARCH

A starch composed of more than 90% of amylopectin that has been etherified with hydroxyethyl groups; the terms pentastarch and hetastarch reflect the degree of etherification

Indications low blood volume

Cautions see notes above; children

Renal impairment use with caution in severe impairment

Side-effects see notes above; also pruritus, raised serum amylase

Dose

• See under preparations below

Hetastarch

Hetastarch (Non-proprietary) *(Intravenous infusion, hetastarch (weight average molecular weight 450 000) 6% in sodium chloride intravenous infusion 0.9%, net price 500–500 mL bag = £8.00

Dose by intravenous infusion, 500–1000 mL, usual daily max. 1500 mL (see notes above)

Pentastarch

Pentastarch (Non-proprietary) *(Intravenous infusion, pentastarch (weight average molecular weight 200 000), net price (in sodium chloride intravenous infusion 0.9%) 10%, 500–500 mL bag = £9.24

Dose by intravenous infusion, pentastarch 10%, 500–1000 mL, max. 1500 mL daily (see notes above)

HAES-steril® (Fresenius Kabi) *(Intravenous infusion, pentastarch (weight average molecular weight 200 000), net price (both in sodium chloride intravenous infusion 0.9%) 6%, 500 mL = £16.50

Dose by intravenous infusion, up to 1500 mL daily (see notes above)

Hemohex® (B. Braun) *(Intravenous infusion, pentastarch (weight average molecular weight 200 000), net price (both in sodium chloride intravenous infusion 0.9%) 6%, 500 mL = £12.50; 10%, 500 mL = £16.50

Cautions see notes above

Dose by intravenous infusion, pentastarch 6%, up to 2500 mL daily, pentastarch 10%, up to 1500 mL daily (see notes above)

9.3 Intravenous nutrition

When adequate feeding through the alimentary tract is not possible, nutrients may be given by intravenous infusion. This may be in addition to ordinary oral or tube feeding—supplemental parenteral nutrition, or may be the sole source of nutrition—total parenteral nutrition (TPN). Indications for this method include preparation of undernourished patients for surgery, chemotherapy, or radiation therapy; severe or prolonged disorders of the gastro-intestinal tract; major surgery, trauma, or burns; prolonged coma or refusal to eat; and some patients with renal or hepatic failure. The composition of proprietary preparations available is given under Parenteral Infusion Fluids for Parenteral Feeding, p. 675.

Parenteral nutrition requires the use of a solution containing amino acids, glucose, fat, electrolytes, trace elements, and vitamins. This is now commonly provided by the pharmacy in the form of a 3-litre bag. A single dose of vitamin B₁₂, as hydroxocobalamin, is given by intramuscular injection; regular vitamin B₁₂ injections are not usually required unless total parenteral nutrition continues for many months. Folic acid is given in a dose of 15 mg once or twice each week, usually in the nutrition solution. Other vitamins are usually given daily; they are generally introduced in the parenteral nutrition solution. Alternatively, if the
The nutrition solution is infused through a central venous catheter inserted under full surgical precautions. Alternatively, infusions through a peripheral vein may be used for supplementary as well as total parenteral nutrition for periods of up to a month, depending on the availability of peripheral veins; factors prolonging cannula life and preventing thrombophlebitis include the use of soft polyurethane paediatric cannulas and use of feeds of low osmolality and neutral pH. Only nutritional fluids should be given by the dedicated intravenous line.

Before starting, the patient should be well oxygenated with a near normal circulating blood volume and attention should be given to renal function and acid-base status. Appropriate biochemical tests should have been carried out beforehand and serious deficits corrected. Nutritional and electrolyte status must be monitored throughout treatment.

Complications of long-term parenteral nutrition include gall bladder sludging, gall stones, cholestasis and abnormal liver function tests. For details of the prevention and management of parenteral nutrition complications, specialist literature should be consulted.

**Protein** is given as mixtures of essential and non-essential synthetic L-amino acids. Ideally, all essential amino acids should be included with a wide variety of non-essential ones to provide sufficient nitrogen together with electrolytes (see also section 9.2.2). Solutions vary in their composition of amino acids; they often contain an energy source (usually glucose) and electrolytes.

**Energy** is provided in a ratio of 0.6 to 1.1 megajoules (150–250 kJ) per gram of protein nitrogen. Energy requirements must be met if amino acids are to be utilised for tissue maintenance. A mixture of carbohydrate and fat energy sources (usually 30–50% as fat) gives better utilisation of amino acids than glucose alone.

**Glucose** is the preferred source of carbohydrate, but if more than 180 g is given per day frequent monitoring of blood glucose is required, and insulin may be necessary. Glucose in various strengths from 10 to 50% must be infused through a central venous catheter to avoid thrombosis.

In parenteral nutrition regimens, it is necessary to provide adequate phosphate in order to allow phosphorylation of glucose and to prevent hypophosphataemia; between 20 and 30 mmol of phosphate is required daily.

Fructose and sorbitol have been used in an attempt to avoid the problem of hyperosmolar hyperglycaemic non-ketotic acidosis but other metabolic problems may occur, as with xylitol and ethanol which are now rarely used.

**Fat** emulsions have the advantages of a high energy to fluid volume ratio, neutral pH, and iso-osmolarity with plasma, and provide essential fatty acids. Several days of adaptation may be required to attain maximal utilisation. Reactions include occasional febrile episodes (usually only with 20% emulsions) and rare anaphylactic responses. Interference with biochemical measurements such as those for blood gases and calcium may occur if samples are taken before fat has been cleared. Daily checks are necessary to ensure complete clearance from the plasma in conditions where fat metabolism may be disturbed. Additives should not be mixed with fat emulsions unless compatibility is known.

**Administration**

Because of the complex requirements relating to parenteral nutrition full details relating to administration have been omitted. In all cases product literature and other specialist literature should be consulted.

### Supplementary preparations

Compatibility with the infusion solution must be ascertained before adding supplementary preparations.

#### Addiphos® (Fresenius Kabi)

**Solution**, sterile, phosphate 40 mmol, K⁺ 30 mmol, Na⁺ 30 mmol/20 mL. For addition to Vamin® solutions and glucose intravenous infusions. Net price 20-mL vial = £1.30

#### Additrace® (Fresenius Kabi)

**Solution**, trace elements for addition to Vamin® solutions and glucose intravenous infusions, traces of Fe⁺⁺, Zn²⁺, Mn⁴⁺, Cu²⁺, Cr³⁺, Se⁴⁺, Mo⁶⁺, F⁻, I⁻. For adults and children over 40 kg. Net price 10-mL amp = £1.96

#### Cernevit® (Baxter)

**Solution**, dl-alpha tocopherol 11.2 units, ascorbic acid 125 mg, biotin 69 micrograms, colecacolferol 220 units, cyanocobalamin 6 micrograms, folic acid 414 micrograms, glycine 250 mg, nicotinamide 46 mg, pantethenic acid (as dexpantenol) 17.25 mg, pyridoxine hydrochloride 5.5 mg, retinol (as palmi-
tate) 3500 units, riboflavin (as dihydrated sodium phosphate) 4.14 mg, thiamine (as cocarboxylase tetrahydroylate) 3.51 mg. Dissolve in 5 mL water for injections. Net price per vial = £4.64

#### Decan® (Baxter)

**Solution**, trace elements for addition to infusion solutions, Fe⁺², Zn²⁺, Cu²⁺, Mn⁴⁺, F⁻, Co³⁺, I⁻, Se⁴⁺, Mo⁶⁺, Cr³⁺. For adults over 40 kg. Net price 40-mL vial = £2.00

#### Dipeptiven® (Fresenius Kabi)

**Solution**, N(2)-L-alanyl-L-glutamine 200 mg/mL (providing L-alanine 82 mg, L-glutamine 134.6 mg). For addition to infusion solutions containing amino acids. Net price 50 mL = £15.94, 100 mL = £25.93

**Dose** amino acid supplement for hypercatabolic or hypermetabolic states, 300–400 mg/kg daily; max. 400 mg/kg daily, dose not to exceed 20% of total amino acid intake

#### Glycophos® Sterile Concentrate (Fresenius Kabi)

**Solution**, sterile, phosphate 20 mmol, Na⁺ 40 mmol/20 mL. For addition to Vamin® and Vaminolact® solutions, and glucose intravenous infusions. Net price 20-mL vial = £3.91

## 9.4 Oral nutrition

### 9.4.1 Foods for special diets

These are preparations that have been modified to eliminate a particular constituent from a food or that are nutrient mixtures formulated as food substitutes for patients who either cannot tolerate or cannot metabolise certain common constituents of food. In certain clinical conditions, some food preparations are regarded as drugs and can be prescribed within the NHS if they have been approved by the Advisory Committee on Borderline Substances (ACBS)—see Appendix 2.

**Phenylketonuria**

Phenylketonuria (hyperphenylalaninaemia, PKU), which results from the inability to metabolise phenylalanine, is managed by restricting dietary intake of phenylalanine to a small amount sufficient for tissue building and repair.

Sapropterin, a synthetic form of tetrahydrobiopterin, is licensed as an adjunct to dietary restriction of phenylalanine in the management of patients with phenylketonuria and tetrahydrobiopterin deficiency.

Aspartame (used as a sweetener in some foods and medicines) contributes to the phenylalanine intake and may affect control of phenylketonuria. Where the presence of aspartame is specified in the product literature this is indicated in the BNF against the preparation; the patient should be informed of this.

**Coeliac disease**

Intolerance to gluten in coeliac disease is managed by completely eliminating gluten from the diet. A range of gluten-free products is available for prescription—see Appendix 2, p. 1022.

### SAPROPTERIN DIHYDROCHLORIDE

**Note**

Sapropterin is a synthetic form of tetrahydrobiopterin

**Indications**

see under Dose below

**Cautions**

monitor blood-phenylalanine concentration before and after first week of treatment—if unsatisfactory response increase dose at weekly intervals to max. dose and monitor blood-phenylalanine concentration weekly; discontinue treatment if unsatisfactory response after 1 month; monitor blood-phenylalanine concentration daily during treatment—discontinue if manganese concentration raised or if cholestasis develops

### 9.4.2 Enteral nutrition

**Vitlipid N®** (Fresenius Kabi)

Emulsion, infant, vitamin A 230 units, ergocalciferol 40 units, dl-alpha tocopherol 0.7 unit, phytomenadione 20 micrograms/mL. For addition to Intralipid®. Net price 10-mL amp = £1.97

**Treflute®** (B. Braun)

Solution, trace elements for addition to infusion solutions, Fe²⁺, Zn²⁺, Mn²⁺, Cu²⁺, Cr³⁺, Se⁴⁺, Mo⁶⁺, I⁻, F⁻. For adults. Net price 10-mL amp = 80p

**Vitlipid N®** (Fresenius Kabi)

Emulsion, adult, vitamin A 330 units, ergocalciferol 20 units, dl-alpha tocopherol 1 unit, phytomenadione 15 micrograms/mL. For addition to Intralipid®. For adults and children over 11 years. Net price 10-mL amp = £1.97

**Sapropterin**

Note Sapropterin is a synthetic form of tetrahydrobiopterin

**Indications**

see under Dose below

**Cautions**

monitor blood-phenylalanine concentration before and after first week of treatment—if unsatisfactory response increase dose at weekly intervals to max. dose and monitor blood-phenylalanine concentration weekly; discontinue treatment if unsatisfactory response after 1 month; monitor blood-phenylalanine concentration daily during treatment—discontinue if manganese concentration raised or if cholestasis develops

---

**Peditrace®** (Fresenius Kabi)

Solution, trace elements for addition to Vaminolact®, Vamin® 14 Electrolyte-Free solutions and glucose intravenous infusions, traces of Zn²⁺, Cu²⁺, Mn²⁺, Se⁴⁺, F⁻, I⁻. For use in neonates (when kidney function established, usually second day of life), infants, and children. Net price 10-mL vial = £3.55

**Solivito N®** (Fresenius Kabi)

Solution, powder for reconstitution, biotin 60 micrograms, cyanocobalamin 5 micrograms, folic acid 400 micrograms, glycine 300 mg, niacinamide 40 mg, pyridoxine hydrochloride 4.9 mg, sodium ascorbate 113 mg, sodium pantothenate 16.5 mg, thiamine mononitrate 3.1 mg. Dissolve in water for injections or glucose intravenous infusion for adding to glucose intravenous infusion or Intralipid®; dissolve in Vitlipid N® or Intralipid® for adding to Intralipid® only. Net price per vial = £1.97

**Tracutil®** (B. Braun)

Solution, trace elements for addition to infusion solutions, Fe²⁺, Zn²⁺, Mn²⁺, Cu²⁺, Cr³⁺, Se⁴⁺, Mo⁶⁺, I⁻, F⁻. For adults. Net price 10-mL amp = 80p
and tyrosine concentrations 1–2 weeks after dose adjustment and during treatment; history of convulsions

**Hepatic impairment** manufacturer advises caution—no information available

**Pregnancy** manufacturer advises caution—consider only if strict dietary management inadequate

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** diarrhoea, vomiting, abdominal pain, nasal congestion, cough, pharyngolaryngeal pain, headache; also reported hypersensitivity reactions

**Dose**

- Phenylketonuria (specialist use only), by mouth, ADULT and CHILD over 4 years, initially 10 mg/kg once daily, preferably in the morning, adjusted according to response; usual dose 5–20 mg/kg daily

- Tetrahydrobiopterin deficiency (specialist use only), by mouth, ADULT and CHILD initially 2–5 mg/kg once daily preferably in the morning, adjusted according to response; max. 20 mg/kg daily; total daily dose may alternatively be given in 2–3 divided doses

**Kuvan** (Merck Serono)®

Dispersible tablets, sapropterin dihydrochloride 100 mg, net price 30-tab pack = £597.22, 120-tab pack = £2388.88. Label: 13, 21

**Counselling** Tablets should be dissolved in water and taken within 20 minutes

### 9.4.2 Enteral nutrition

The body’s reserves of protein rapidly become exhausted in severely ill patients, especially during chronic illness or in those with severe burns, extensive trauma, pancreatitis, or intestinal fistula. Much can be achieved by frequent meals and by persuading the patient to take supplementary snacks of ordinary food between the meals. However, extra calories, protein, other nutrients, and vitamins are often best given by supplementing ordinary meals with enteral sip or tube feeds (preparations, see Appendix 2).

When patients cannot feed normally, for example, patients with severe facial injury, oesophageal obstruction, or coma, a nutritionally complete diet of enteral feeds must be given. The advice of a dietitian should be sought to determine the protein and total energy requirement of the patient and the form and relative contribution of carbohydrate and fat to the energy requirements.

Most enteral feeds contain protein derived from cows’ milk or soya. Elemental feeds containing protein hydrolysates or free amino acids can be used for patients who have diminished ability to break down protein, for example in inflammatory bowel disease or pancreatic insufficiency.

Even when nutritionally complete feeds are given, water and electrolyte balance should be monitored. Haematological and biochemical parameters should also be monitored, particularly in clinically unstable patients. Extra minerals (e.g. magnesium and zinc) may be needed in patients where gastro-intestinal secretions are being lost. Additional vitamins may also be needed. Feeds containing vitamin K may affect the INR in patients receiving warfarin—see interactions: Appendix 1 (vitamins).

**Children** Children have special requirements and in most situations liquid feeds prepared for adults are totally unsuitable—the advice of a paediatric dietitian should be sought; see also BNF for Children, section 9.4.2

**Preparations**

See Borderline Substances, Appendix 2.

#### 9.5 Minerals

**9.5.1 Calcium and magnesium**

**9.5.1.1 Calcium supplements**

**9.5.1.2 Hypercalcaemia and hypercalciuria**

**9.5.1.3 Magnesium**

See section 9.1.1 for iron salts.

**9.5.2 Phosphorus**

**9.5.3 Fluoride**

**9.5.4 Zinc**

**9.5.5 Selenium**

Calcium supplements are usually only required where dietary calcium intake is deficient. This dietary requirement varies with age and is relatively greater in childhood, pregnancy, and lactation, due to an increased demand, and in old age, due to impaired absorption. In osteoporosis, a calcium intake which is double the recommended amount reduces the rate of bone loss. If the actual dietary intake is less than the recommended amount, a supplement of as much as 40 mmol is appropriate, see also Osteoporosis, p. 510 and Vitamin D, p. 689.

In severe acute hypocalcaemia or hypocalcaemic tetany, an initial slow intravenous injection of 10–20 mL of calcium gluconate injection 10% (providing approximately 2.25–4.5 mmol of calcium) should be given, with plasma-calcium and ECG monitoring (risk of arrhythmias if given too rapidly), and either repeated as required or, if only temporary improvement, followed by a continuous intravenous infusion to prevent recurrence. For infusion, dilute 100 mL of calcium gluconate 10% in 1 litre of glucose 5% or sodium chloride 0.9% and give at an initial rate of 50 mL/hour adjusted according to response. Calcium chloride injection is also available, but is more irritant; care should be taken to prevent extravasation. Oral supplements of calcium and vitamin D may also be required in persistent hypocalcaemia (see also section 9.6.4). Concurrent hypomagnesaemia should be corrected with magnesium sulphate (section 9.5.1.3).

For the role of calcium gluconate in temporarily reducing the toxic effects of hyperkalaemia, see p. 666.
CALCIUM SALTS

Indications  see notes above; calcium deficiency
Cautions  sarcoidosis; history of nephrolithiasis; avoid calcium chloride in respiratory acidosis or respiratory failure; interactions: Appendix 1 (antacids, calcium salts).
Contra-indications  conditions associated with hypercalcaemia and hypercalciuria (e.g. some forms of malignant disease)
Renal impairment  use with caution (but see also Calcium Gluconate injection, below)

Side-effects  rarely gastro-intestinal disturbances; with injection, bradycardia, arrhythmias, peripheral vasodilatation, fall in blood pressure, sweating, injection-site reactions, severe tissue damage with extravasation.

Dose
• By mouth, daily in divided doses, see notes above
• By slow intravenous injection, acute hypercalcaemia, see notes above; CHILD see BNF for Children
• By continuous intravenous infusion, acute hypercalcaemia, see notes above

Oral preparations
Calcium Gluconate (Non-proprietary)
Effervescent tablets, calcium gluconate 1 g (calcium 89 mg or Ca²⁺ 2.23 mmol), net price 28-tab pack = £14.82. Label: 13
Note  Each tablet usually contains 4.46 mmol Na⁺
Calcium Lactate (Non-proprietary)
Tablets, calcium lactate 300 mg (calcium 39 mg or Ca²⁺ 1 mmol), net price 84 = £4.57
Adcal® (ProStrakan)
Chewable tablets, fruit flavour, calcium carbonate 1.5 g (calcium 600 mg or Ca²⁺ 15 mmol), net price 100-tab pack = £8.70. Label: 24
Cacit® (Warner Chilcott)
Tablets, effervescent, pink, calcium carbonate 1.25 g, providing calcium citrate when dispersed in water (calcium 500 mg or Ca²⁺ 12.5 mmol), net price 76-tab pack = £11.81. Label: 13
Calcichew® (fakeda)
Tablets, chewable, orange flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca²⁺ 12.5 mmol), net price 100-tab pack = £9.33. Label: 24
Forte tablets (chewable), orange flavour, scored, calcium carbonate 2.5 g (calcium 1 g or Ca²⁺ 25 mmol), net price 60-tab pack = £13.16. Label: 24
Excipients  include aspartame (section 9.4.1)
Calcium-500 (Martindale)
Tablets, pink, p/c, calcium carbonate 1.25 g (calcium 500 mg or Ca²⁺ 12.5 mmol), net price 100-tab pack = £9.46. Label: 25
Calcium-Sandoz® (Alliance)
Syrup, orange flavour, calcium gluconate 1.09 g, calcium lactokionate 727 mg (calcium 108.3 mg or Ca²⁺ 2.7 mmol)/5 mL, net price 300 mL = £4.07
Sandocal® (Novartis Consumer Health)
Sandocal 1000 tablets, effervescent, orange flavour, calcium lactate gluconate 2.263 g, calcium carbonate 1.75 g, providing 1 g calcium (Ca²⁺ 25 mmol), net price 3 × 10-tab pack = £6.91. Label: 13
Excipients  include aspartame (section 9.4.1)

Parenteral preparations
Calcium Gluconate (Non-proprietary) (Prop) Injection, calcium gluconate 10% (Ca²⁺ approx. 225 micromol/mL), net price 10-mL amp = 65p
Note  The MHRA has advised that repeated or prolonged administration of calcium gluconate injection packaged in 10 mL glass containers is contra-indicated in children under 18 years and in patients with renal impairment owing to the risk of aluminium accumulation; in these patients the use of calcium gluconate injection packaged in plastic containers is recommended
Calcium Chloride (Non-proprietary) (Prop) Injection, calcium chloride dihydrate 10% (calcium 27.3 mg or Ca²⁺ 680 micromol/mL), net price 10-mL disposable syringe = £6.94
Brands  include Milikal® Calcium Chloride 10%
Injection, calcium chloride dihydrate 13.4% (calcium 36 mg or Ca²⁺ 910 micromol/mL), net price 10-mL amp = £14.94
With vitamin D
Section 9.6.4
With risedronate sodium and colecaciferol
Section 6.6.2

Hyperparathyroidism  Cinacalcet is licensed for the treatment of secondary hyperparathyroidism in dialysis patients with end-stage renal disease (but see NICE guidance below), for primary hyperparathyroidism in patients where parathyroidectomy is inappropriate, and for the treatment of hypercalcaemia in parathyroid carcinoma. Cinacalcet reduces parathyroid hormone which leads to a decrease in serum calcium concentrations.
Paricalcitol (section 9.6.4) is also licensed for the prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure. Parathyroidectomy may be indicated for hyperparathyroidism.
Dose
- Secondary hyperparathyroidism in patients with end-stage renal disease on dialysis (but see notes above),
  **ADULT** over 18 years, initially 30 mg once daily, adjusted every 2–4 weeks to max. 180 mg daily
- Hypercalcaemia of primary hyperparathyroidism or parathyroid carcinoma, **ADULT** over 18 years, initially 30 mg twice daily, adjusted every 2–4 weeks according to response up to max. 90 mg 4 times daily

**Mimpara** (Amgen)
Tablets, green, 1/c, cinacalcet (as hydrochloride)
30 mg, net price 28-tab pack = £125.75; 60 mg, 28-tab pack = £231.97; 90 mg, 28-tab pack = £347.96.
Label: 21

**9.5.1.3 Magnesium**

Magnesium is an essential constituent of many enzyme systems, particularly those involved in energy generation; the largest stores are in the skeleton. Magnesium salts are not well absorbed from the gastro-intestinal tract, which explains the use of magnesium sulfate (section 1.6.4) as an osmotic laxative.

Magnesium is excreted mainly by the kidneys and is therefore retained in renal failure, but significant hypomagnesaemia (causing muscle weakness and arrhythmias) is rare.

**Hypomagnesaemia** Since magnesium is secreted in large amounts in the gastro-intestinal fluid, excessive losses in diarrhea, stoma or fistula are the most common causes of hypomagnesaemia; deficiency may also occur in alcoholism or as a result of treatment with certain drugs. Hypomagnesaemia often causes secondary hypercalcaemia, and also hypokalaemia and hypophosphataemia.

Symptomatic hypomagnesaemia is associated with a deficit of 0.5–1 mmol/kg; up to 160 mmol Mg^{2+} over up to 5 days may be required to replace the deficit (allowing for urinary losses). Magnesium is given initially by intravenous infusion or by intramuscular injection of magnesium sulfate; the intramuscular injection is painful. Plasma magnesium concentration should be measured to determine the rate and duration of infusion and the dose should be reduced in renal impairment. To prevent recurrence of the deficit, magnesium may be given by mouth in a dose of 24 mmol Mg^{2+} daily in divided doses, but there is limited evidence of benefit; magnesium glycerophosphate tablets and liquid (unlicensed) are available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104. For maintenance (e.g. in intravenous nutrition), parenteral doses of magnesium are of the order of 10–20 mmol Mg^{2+} daily (often about 12 mmol Mg^{2+} daily).

**Arrhythmias** Magnesium sulfate injection has also been recommended for the emergency treatment of serious arrhythmias, especially in the presence of hypokalaemia (when hypomagnesaemia may also be present) and when salvos of rapid ventricular tachycardia show the characteristic twisting wave front known as torsade de pointes (see also section 2.3.1). The usual intravenous dose of magnesium sulfate injection is 8 mmol Mg^{2+} (2 g) over 10–15 minutes (repeated once if necessary).

**Myocardial infarction** Limited evidence that magnesium sulfate prevents arrhythmias and reperfusion injury in patients with suspected myocardial infarction has not been confirmed by large studies. Routine

---

**CINACALCET**

**Indications** see under Dose and notes above

**Cautions** measure serum-calciunm concentration before initiation of treatment and within 1 week after starting treatment or adjusting dose, then monthly for secondary hyperparathyroidism and every 2–3 months for primary hyperparathyroidism and parathyroid carcinoma; treatment should not be initiated in patients with hypocalcaemia; in secondary hyperparathyroidism measure parathyroid hormone concentration 1–4 weeks after starting treatment or adjusting dose, then every 1–3 months; dose adjustment may be necessary if smoking started or stopped during treatment; interactions: Appendix 1 (cinacalcet)

**Hepatic impairment** manufacturer advises caution in moderate to severe impairment—monitor closely especially when increasing dose

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—no information available

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies

**Side-effects** nausea, vomiting, anorexia; dizziness, paraesthesia, asthenia; reduced testosterone concentrations; myalgia; rash; less commonly dyspepsia, diarrhoea, and seizures; hypotension, heart failure, and allergic reactions (including angioedema) also reported.

---

**NICE guidance**

**Cinacalcet for the treatment of secondary hyperparathyroidism in patients with end-stage renal disease on maintenance dialysis therapy (January 2007)**

Cinacalcet is not recommended for the routine treatment of secondary hyperparathyroidism in patients with end-stage renal disease on maintenance dialysis therapy.

Cinacalcet is recommended for the treatment of refractory secondary hyperparathyroidism in patients with end-stage renal disease (including those with calciphylaxis) only in those:

- who have ‘very uncontrolled’ plasma concentration of intact parathyroid hormone (defined as greater than 85 picomol/litre) refractory to standard therapy, and a normal or high adjusted serum calcium concentration, and
- in whom surgical parathyroidectomy is contraindicated, in that the risks of surgery outweigh the benefits.

Response to treatment should be monitored regularly and treatment should be continued only if a reduction in the plasma concentration of intact parathyroid hormone of 30% or greater is seen within 4 months of treatment.

www.nice.org.uk/TA117

---

**Hypercalciuria**

Hypercalciuria should be investigated for an underlying cause, which should be treated. Where a cause is not identified (idiopathic hypercalciuria), the condition is managed by increasing fluid intake and giving bendrofluazide in a dose of 2.5 mg daily (a higher dose is not usually necessary). Reducing dietary calcium intake may be beneficial but severe restriction of calcium intake has not proved beneficial and may even be harmful.

---

**Nutrition and Blood**
use of magnesium sulfate for this purpose is not recommended. For the management of myocardial infarction, see section 2.10.1.

**Eclampsia and pre-eclampsia** Magnesium sulfate injection is the drug of choice for the treatment of seizures and the prevention of recurrent seizures in women with *eclampsia*. Regimens may vary between hospitals. Calcium gluconate injection is used for the management of magnesium toxicity.

Magnesium sulfate injection is also of benefit in women with *pre-eclampsia* in whom there is concern about developing eclampsia. The patient should be monitored carefully (see under Magnesium Sulfate).

### Magnesium Sulfate

**Note** Magnesium Sulfate Injection BP is a sterile solution of Magnesium Sulfate Heptahydrate

**Indications** see notes above; constipation (section 1.6.4); severe acute asthma (section 3.1); paste for boils (section 13.10.5)

**Cautions** see notes above; in severe hypomagnesaemia administer initially via controlled infusion device (preferably syringe pump); monitor blood pressure, respiratory rate, urinary output and for signs of overdosage (loss of patellar reflexes, weakness, nausea, sensation of warmth, flushing, drowsiness, double vision, and slurred speech); interactions: Appendix 1 (magnesium, parenteral)

**Hepatic impairment** avoid in hepatic coma if risk of renal failure

**Renal impairment** avoid or reduce dose; increased risk of toxicity

**Pregnancy** not known to be harmful for short-term intravenous administration in eclampsia, but excessive doses in third trimester cause neonatal respiratory depression

**Side-effects** generally associated with hypomagnesaemia, nausea, vomiting, thirst, flushing of skin, hypotension, arrhythmias, coma, respiratory depression, drowsiness, confusion, loss of tendon reflexes, muscle weakness; colic and diarrhoea following oral administration

**Dose**

- Hypomagnesaemia, see notes above
- Arrhythmias, see notes above
- Prevention of seizures in pre-eclampsia [unlicensed indication], initially by intravenous injection over 5–15 minutes, 4 g (16 mmol Mg²⁺) followed by intravenous infusion, 1 g/hour (4 mmol/hour Mg²⁺) for 24 hours; if seizure occurs, additional dose by intravenous injection, 2 g (8 mmol Mg²⁺)
- Treatment of seizures and prevention of seizure recurrence in eclampsia, initially by intravenous injection over 5–15 minutes, 4 g (16 mmol Mg²⁺), followed by intravenous infusion, 1 g/hour (4 mmol/hour Mg²⁺) for 24 hours after seizure or delivery, whichever is later; if seizure recurs, increase the infusion rate to 1.5–2 g/hour (6–8 mmol/hour Mg²⁺) or give an additional dose by intravenous injection, 2 g (8 mmol Mg²⁺)

**Intravenous administration** For intravenous injection, concentration of magnesium sulfate heptahydrate should not exceed 20% (200 mg/mL or 0.8 mmol/mL Mg²⁺); dilute 1 part of magnesium sulfate injection 50% with at least 1.5 parts of water for injection

**Note** Magnesium sulfate heptahydrate 1 g equivalent to Mg²⁺ approx. 4 mmol

### Magnesium Sulfate Injection, BP

**Non-proprietary** (Trade)

**Injection**, magnesium sulfate heptahydrate 20% (Mg²⁺ approx. 0.8 mmol/mL), net price 20-mL (4-g) amp = £16.98; 50% (Mg²⁺ approx. 2 mmol/mL), 2-mL (1-g) amp = £1.09, 4-mL (2-g) prefilled syringe = £10.23, 5-mL (2.5-g) amp = £5.56, 10-mL (5-g) amp = £1.46; 10-mL (5-g) prefilled syringe = £4.95

**Brands** include Minijet® Magnesium Sulfate Injection BP 50%

**Note** The BP directs that the label states the strength as the % w/v of magnesium sulfate heptahydrate and as the approximate concentration of magnesium ions (Mg²⁺) in mmol/mL

#### 9.5.2.2 Phosphate-binding agents

Calcium-containing preparations are used as phosphate-binding agents in the management of hyperphosphataemic complications of renal failure. Aluminium-
containing preparations are rarely used as phosphate-binding agents and can cause aluminium accumulation.

Sevelamer hydrochloride and sevelamer carbonate are both licensed for the treatment of hyperphosphataemia in patients on haemodialysis or peritoneal dialysis. Sevelamer carbonate is also licensed for the treatment of patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more.

Lanthanum is licensed for the control of hyperphosphataemia in patients with chronic renal failure on haemodialysis or continuous ambulatory peritoneal dialysis (CAPD), and in patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more that cannot be controlled by a low-phosphate diet.

The Scottish Medicines Consortium (p. 4) has advised (March 2007) that lanthanum (Frorenol®) is accepted for restricted use within NHS Scotland for the control of hyperphosphataemia in patients with chronic renal failure on haemodialysis or continuous ambulatory peritoneal dialysis, as a second-line agent, where a non-aluminium, non-calcium phosphate binder is required.

Colestilan is licensed for the treatment of hyperphosphataemia in patients with chronic kidney disease receiving haemodialysis or peritoneal dialysis. The Scottish Medicines Consortium (p. 4) has advised (January 2014) that colestilan (BindRen®) is not recommended for use within NHS Scotland.

### ALUMINIUM HYDROXIDE

**Indications** hyperphosphataemia; dyspepsia (section 1.1)

**Cautions** see notes above; **interactions:** Appendix 1 (antacids)

**Side-effects** constipation; hyperaluminaemia

**Alu-Cap®** (Meda)

- **Capsules,** green/red, dried aluminium hydroxide 475 mg (low Na⁺), net price 120-cap pack = £13.71
- **Dose** phosphate-binding agent in renal failure. 4–20 capsules daily in divided doses with meals

### CALCIUM SALTS

**Indications** hyperphosphataemia

**Cautions** sarcoidosis; history of nephrolithiasis; **interactions:** Appendix 1 (antacids, calcium salts)

**Contra-indications** hypercalcaemia, hypercalciuria

**Side-effects** hypercalcaemia

**Adcal®** section 9.5.1.1

**Calcichew®** section 9.5.1.1

**Calcium-500®** section 9.5.1.1

**PhosLo®** (Pharmacosmos) (Pham)

- **Tablets,** yellow, scored, calcium acetate 1 g (calcium 250 mg or Ca⁺⁺ 6.2 mmol), net price 180-tab pack = £19.79. Label: 25, counselling, with meals
- **Dose** initially 1 tablet 3 times daily with meals, adjusted according to serum-phosphate concentration (usual dose 4–6 tablets daily (1 or 2 tablets with each meal)); max. 12 tablets daily

**PhosLo®** (Fresenius Medical Care) (Pham)

- **Capsules,** calcium acetate (anhydrous) 667 mg (calcium 169 mg or Ca⁺⁺ 4.2 mmol), net price 200-cap pack = £14.40. Counselling, with meals

**Excipients** include propylene glycol (see Excipients, p. 2)

- **Dose** initially 2 capsules with each meal, adjusted according to serum-phosphate concentration (usual dose 3 or 4 capsules with each meal)

**Renacet®** (KoRa)

- **Tablets,** 1/C, calcium acetate 475 mg (calcium 120.25 mg or Ca⁺⁺ 3 mmol), net price 100-tab pack = £5.38, 200-tab pack = £9.71; 950 mg (calcium 240.5 mg or Ca⁺⁺ 6 mmol), scored, net price 100-tab pack = £10.25, 200-tab pack = £18.45. Label: 25, counselling, with meals, avoid other drugs at same time (see below)

**Dose ADULT** over 18 years, 475–950 mg with breakfast and with snacks, 0.95–2.85 g with main meals, 0.95–1.9 g with supper; adjusted according to serum-phosphate concentration; max. 6.65 g daily

**Counselling** Manufacturer advises that other drugs should be taken 1 to 2 hours before or after Renacet® to reduce possible interference with absorption of other drugs

**With magnesium carbonate**

**Osven®** (Fresenius Medical Care) (Pham)

- **Tablets,** 1/C, scored, calcium acetate 435 mg (calcium 110 mg or Ca⁺⁺ 2.7 mmol), heavy magnesium carbonate 235 mg (magnesium 60 mg), net price 180-tab pack = £24.00. Label: 25, counselling, with meals, avoid other drugs at same time (see below)

**Contra-indications** hypercalcaemia, hypermagnesaemia; third-degree AV block; myasthenia gravis

**Dose ADULT** over 18 years, initially 1 tablet 3 times daily with meals, adjusted according to serum-phosphate concentration (usual dose 3–10 tablets daily); max. 12 tablets daily

**Counselling** Manufacturer advises that other drugs should be taken at least 2 hours before or 3 hours after Osven® to reduce possible interference with absorption of other drugs

### COLESTILAN

**Indications** hyperphosphataemia in patients with chronic kidney disease on haemodialysis or peritoneal dialysis

**Cautions** constipation; predisposition to gastrointestinal haemorrhage; malabsorption syndromes; **interactions:** Appendix 1 (colestilan)

**Contra-indications** bowel obstruction; dysphagia; severe gastrointestinal disorders; biliary obstruction; seizure disorders; recent history of peritonitis in peritoneal dialysis patients; serum albumin less than 30 g/L

**Hepatic impairment** manufacturer advises avoid in severe impairment—no information available

**Pregnancy** no information available; not absorbed but supplements of fat-soluble vitamins and folic acid may be required

**Breast-feeding** no information available; not absorbed but supplements of fat-soluble vitamins and folic acid may be required

**Side-effects** constipation, diarrhoea, flatulence, oesophagitis, nausea, vomiting, dyspepsia, gastritis, abdominal pain, decreased appetite; less commonly oesophagitis, gastrointestinal haemorrhage, taste disturbances; rarely intestinal obstruction

**Dose**

- **ADULT** over 18 years, initially 2–3 g 3 times daily with or immediately after meals, increased according to serum-phosphate concentration in steps of 3 g daily (in divided doses) every 2–3 weeks; max. 5 g 3 times daily
**SEVELAMER CARBONATE**

### Indications
hyperphosphataemia in patients on haemodialysis or peritoneal dialysis, and patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more

### Contra-indications
bowel obstruction

### Pregnancy
manufacturer advises use only if potential benefit outweighs risk

### Breast-feeding
unlikely to be present in milk (however, manufacturer advises avoid)

### Side-effects
nausea, vomiting, abdominal pain, constipation, diarrhoea, dyspepsia, flatulence; also reported intestinal obstruction and perforation, ileus, pruritus, rash

### Dose
- **ADULT** over 18 years, initially 2.4–4.8 g daily in 3 divided doses with meals, adjusted according to serum-phosphate concentration every 2–4 weeks (usual dose approx. 6 g daily in 3 divided doses)

### Renvela® (Genzyme) (p. 13)
Tablets, f/c, sevelamer carbonate 800 mg, net price 180-tab pack = £167.04. Label: 25, counselling, with meals

### Excipients
include propylene glycol (see Excipients, p. 2)

### Powder for oral suspension
pale yellow, sevelamer carbonate 2.4 g, net price 60-sachet pack (citrus-flavoured) = £167.04. Label: 13, counselling, with meals

### Note
Each sachet to be dispersed in 60 mL water

---

**SEVELAMER HYDROCHLORIDE**

### Indications
hyperphosphataemia in patients on haemodialysis or peritoneal dialysis

### Cautions
gastro-intestinal disorders; interactions: Appendix 1 (sevelamer)

### Pregnancy
manufacturer advises use only if potential benefit outweighs risk

### Breast-feeding
manufacturer advises use only if potential benefit outweighs risk

### Side-effects
nausea, vomiting, abdominal pain, constipation, diarrhoea, dyspepsia, flatulence; very rarely intestinal obstruction; also reported intestinal perforation, ileus, diverticulitis, pruritus, rash

### Dose
- **ADULT** over 18 years, initially 2.4–4.8 g daily in 3 divided doses with meals, adjusted according to serum-phosphate concentration (usual dose range 2.4–12 g daily in 3 divided doses); **CHILD** see BNF for Children

### Renagel® (Genzyme) (p. 13)
Tablets, f/c, sevelamer hydrochloride 800 mg, net price 180-tab pack = £167.04. Label: 25, counselling, with meals

### Excipients
include propylene glycol (see Excipients, p. 2)

---

**LANTHANUM**

### Indications
see notes above

### Cautions
acute peptic ulcer; ulcerative colitis; Crohn’s disease; bowel obstruction; interactions: Appendix 1 (lanthanum)

### Pregnancy
manufacturer advises avoid—risk may outweigh potential benefit

### Breast-feeding
manufacturer advises use only if potential benefit outweighs risk

### Side-effects
gastro-intestinal disturbances, headache, hypocalcaemia, hyperphosphataemia, hyperparathyroidism, hypercalcaemia, hyperphosphataemia, eosinophilia, arthralgia, myalgia, osteoporosis, sweating, alopecia, accumulation of lanthanum in bone, and transient changes in QT interval also reported

### Dose
- **ADULT** over 18 years, initially 2.4–4.8 g daily in 3 divided doses; **CHILD** see BNF for Children

### BindRen® (Mitsubishi) (p. 13)
Tablets, f/c, colestilan 1 g, net price 198-tab pack = £193.59. Label: 21, counselling, administration

### Note
Each sachet to be mixed with soft food and consumed within 15 minutes

---

**9.5.3 Fluoride**

### Fluoride
Availability of adequate fluoride confers significant resistance to dental caries. It is now considered that the topical action of fluoride on enamel and plaque is more important than the systemic effect.

When the fluoride content of drinking water is less than 0.7 parts per million, daily administration of fluoride tablets or drops provides suitable supplementation. Systemic fluoride supplements should not be prescribed without reference to the fluoride content of the local water supply. Infants need not receive fluoride supplements until the age of 6 months.

Dentifrices which incorporate sodium fluoride or monofluorophosphate are also a convenient source of fluoride.

Individuals who are either particularly caries prone or medically compromised may be given additional prophylaxis.
weekly use of a more concentrated one. High-strength gels must be applied regularly under professional supervision; extreme caution is necessary to prevent children from swallowing any excess. Less concentrated gels are available for home use. Varnishes are also available and are particularly valuable for young or disabled children since they adhere to the teeth and set in the presence of moisture.

Fluoride mouthwash, oral drops, tablets and toothpaste are prescribable on form FP10D (GP14 in Scotland, WP10D in Wales; for details see preparations, below).

There are also arrangements for health authorities to supply fluoride tablets in the course of pre-school dental schemes, and they may also be supplied in school dental schemes.

Fluoride gels are not prescribable on form FP10D (GP14 in Scotland, WP10D in Wales).

**FLUORIDES**

**Note** Sodium fluoride 2.2 mg provides approx. 1 mg fluoride ion

**Indications** prophylaxis of dental caries—see notes above

**Contra-indications** not for areas where drinking water is fluoridated

**Side-effects** occasional white flecks on teeth with recommended doses; rarely yellowish-brown discolouration if recommended doses are exceeded

**Dose**

**Note** Dose expressed as fluoride ion (F–)

- Water content less than F– 300 micrograms/litre (0.3 parts per million), CHILD up to 6 months none; 6 months–3 years F– 250 micrograms daily, 3–6 years F– 300 micrograms daily, over 6 years F– 1 mg daily
- Water content between F– 300 and 700 micrograms/litre (0.3–0.7 parts per million), CHILD up to 3 years none, 3–6 years F– 250 micrograms daily, over 6 years F– 300 micrograms daily
- Water content above F– 700 micrograms/litre (0.7 parts per million), supplements not advised

**Note** These doses reflect the recommendations of the British Dental Association, the British Society of Paediatric Dentistry and the British Association for the Study of Community Dentistry (Br Dent J 1997; 182: 6–7)

**Tablets**

**Counselling** Tablets should be sucked or dissolved in the mouth and taken preferably in the evening

**En-De-Kay®** (Manx)

**Fluotabs 3–6 years**, orange-flavoured, scored, sodium fluoride 1.1 mg (F– 500 micrograms), net price 100-tab pack = £2.38

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Tablets

**Fluotabs 6+ years**, orange-flavoured, scored, sodium fluoride 2.2 mg (F– 1 mg), net price 100-tab pack = £2.79

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Tablets

**Fluor-a-day®** (Dental Health)

**Tablets**, buff, sodium fluoride 1.1 mg (F– 500 micrograms), net price 100-tab pack = £2.79; 2.2 mg (F– 1 mg), 200-tab pack = £2.79

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Tablets

**Oral drops**

**Note** Fluoride supplements not considered necessary below 6 months of age (see notes above)

**En-De-Kay®** (Manx)

**Fluodrops®** (= paediatric drops), sugar-free, sodium fluoride 550 micrograms (F– 250 micrograms)/0.15 mL. Net price 60 mL = £2.38

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Oral Drops

**Mouthwashes**

**Counselling** Avoid eating, drinking, or rinsing mouth for 15 minutes after use

**En-De-Kay®** (Manx)

**Daily fluoride mouthrinse** (= mouthwash), blue, sodium fluoride 0.05%. Net price 250 mL = £1.50

**Dose** CHILD 6 years and over, for daily use, rinse with 10 mL

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Mouthwash 0.05%

**Fluorine®** (= mouthwash), red, sodium fluoride 2%. Net price 100 mL = £4.97. Counselling, see above

**Dose** CHILD 8 years and over, for daily use, dilute 5 drops to 10 mL of water; for weekly use, dilute 20 drops to 10 mL

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Mouthwash 2%

**FluoriGard®** (Colgate-Palmolive)

**Daily dental rinse** (= mouthwash), blue, sodium fluoride 0.05%. Net price 400 mL = £2.99. Counselling, see above

**Dose** CHILD 6 years and over, for daily use, rinse with 10 mL

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Mouthwash 0.05%

**Toothpastes**

**Duraphat®** (Colgate-Palmolive) (Pol)

**Duraphat® 2800 ppm** toothpaste, sodium fluoride 0.619%. Net price 75 mL = £3.26, dual pack (2 × 75 mL) = £5.54. Counselling, see below

**Dose** ADULT and CHILD over 10 years, apply 1 cm twice daily using a toothbrush

**Counselling** Brush teeth for 1 minute before spitting out. Avoid drinking or rinsing mouth for 30 minutes after use

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Toothpaste 0.619%

**Duraphat® 5000 ppm** toothpaste, sodium fluoride 1.1%. Net price 51 g = £6.50. Counselling, see below

**Dose** ADULT and ADOLESCENT over 16 years, apply 2 cm 3 times daily after meals using a toothbrush

**Counselling** Brush teeth for 3 minutes before spitting out

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Toothpaste 1%

**9.5.4 Zinc**

Zinc supplements should not be given unless there is good evidence of deficiency (hypoproteinaemia spurs-}
ously lowers plasma-zinc concentration) or in zinc-lossing conditions. Zinc deficiency can occur as a result of inadequate diet or malabsorption; excessive loss of zinc can occur in trauma, burns, and protein-lossing conditions. A zinc supplement is given until clinical improvement occurs, but it may need to be continued in severe malabsorption, metabolic disease (section 9.8.1), or zinc-lossing states.

Parenteral nutrition regimens usually include trace amounts of zinc (section 9.3). If necessary, further zinc can be added to intravenous feeding regimens. A sug-
Selenium deficiency can occur as a result of inadequate diet or prolonged parenteral nutrition. A selenium supplement should not be given unless there is good evidence of deficiency.

**SELENIUM**

**Indications** selenium deficiency

**Cautions** interactions: Appendix 1 (selenium)

**Dose**
- By mouth or by intramuscular injection or by intravenous injection, 100–500 micrograms daily

**Selenase®**

- **Oral solution**, selenium (as sodium selenite pentahydrate) 50 micrograms/mL, net price 2-mL vial = £4.25
- **Injection**, selenium (as sodium selenite pentahydrate) 50 micrograms/mL, net price 2-mL amp = £1.50, 10-mL vial = £4.25

**Note** May be difficult to obtain

---

**VITAMIN A**

Deficiency of vitamin A (retinol) is associated with ocular defects (particularly xerophthalmia) and an increased susceptibility to infections, but deficiency is rare in the UK (even in disorders of fat absorption). Massive overdose can cause rough skin, dry hair, an enlarged liver, and a raised erythrocyte sedimentation rate and raised serum calcium and serum alkaline phosphatase concentrations.

**Pregnancy** In view of evidence suggesting that high levels of vitamin A may cause birth defects, women who are (or may become) pregnant are advised not to take vitamin A supplements (including tablets and fish-liver oil drops), except on the advice of a doctor or an antenatal clinic; nor should they eat liver or products such as liver pâté or liver sausage.

---

**9.6.1 Vitamin A**

**Retinol**

- **Indications** see notes above
- **Cautions** see notes above; **interactions**: Appendix 1 (vitamins)
- **Pregnancy** excessive doses may be teratogenic; see also notes above
- **Breast-feeding** theoretical risk of toxicity in infants of mothers taking large doses
- **Side-effects** see notes above
- **Dose**
  - See notes above and under preparations

**Halibut-liver Oil**

- **Capsules**, vitamin A 4000 units, vitamin D 400 units (10 micrograms), net price 84-cap pack = £8.42

**Note** May be difficult to obtain
9.6.2 Vitamin B group

**Healthy Start Children’s Vitamin Drops** (Non-proprietary)

**Oral drops**, vitamin A 5000 units, vitamin D 2000 units (50 micrograms), ascorbic acid 150 mg/mL. Available free of charge to children under 4 years in families on the Healthy Start Scheme, or alternatively may be available free of charge to children on the Healthy Start Scheme during pregnancy and until their baby is one year old, or alternatively may be available direct to the public. Further information on where to obtain supplies.

**Note** Healthy Start Vitaminas for women (containing ascorbic acid, vitamin D, and folic acid) are also available free of charge to women on the Healthy Start Scheme during pregnancy and until their baby is one year old, or alternatively may be available direct to the public. Further information on where to obtain supplies.

**Deficiency of the B vitamins, other than vitamin B₁₂** (section 9.1.2), is rare in the UK and is usually treated by preparations containing thiamine (B₁), riboflavin (B₂), and nicotinamide, which is used in preference to nicotinic acid, as it does not cause vasodilatation. Other members (or substances traditionally classified as members) of the vitamin B complex such as aminobenzoic acid, biotin, choline, inositol, and pantothenic acid or panthenol may be included in vitamin B preparations but there is no evidence of their value.

The severe deficiency states Wernicke’s encephalopathy and Korsakoff’s psychosis, especially as seen in chronic alcoholism (section 4.10.1), are best treated initially by the parenteral administration of B vitamins (Pabrinex®, followed by oral administration of thiamine in the longer term. Anaphylaxis has been reported with parenteral B vitamins (see MHRA/CHM advice, below).

As with other vitamins of the B group, pyridoxine (B₆) deficiency is rare, but it may occur during isoniazid therapy (section 5.1.9) or penicillamine treatment in Wilson’s disease (section 9.8.1) and is characterised by peripheral neuritis. High doses of pyridoxine are given in some metabolic disorders, such as hyperoxaluria, and it is also used in sideroblastic anaemia (section 9.1.3). There is evidence to suggest that pyridoxine in a dose not exceeding 100 mg daily may provide some benefit in premenstrual syndrome. It has been tried for a wide variety of other disorders, but there is little sound evidence to support the claims of efficacy, and over-dosage induces toxic effects.

Nicotinic acid inhibits the synthesis of cholesterol and triglyceride (see section 2.12). Folic acid and vitamin B₁₂ are used in the treatment of megaloblastic anaemia (section 9.1.2). Folic acid (available as calcium folinate) is used in association with cytotoxic therapy (section 8.1).

**RIBOFLAVIN** (Riboflavine, vitamin B₂)

**Indications** see notes above

**Preparations**

Injections of vitamins B and C, see under Thiamine

**Oral vitamin B complex preparations**

See p. 689

**THIAMINE** (Vitamin B₁)

**Indications** see notes above

**Cautions** anaphylaxis may occasionally follow injection (see MHRA/CHM advice below)

**MHRA/CHM advice (September 2007)**

Although potentially serious allergic adverse reactions may rarely occur during, or shortly after, parenteral administration, the CHM has recommended that:

1. This should not preclude the use of parenteral thiamine in patients where this route of administration is required, particularly in patients at risk of Wernicke-Korsakoff syndrome where treatment with thiamine is essential;

2. Intravenous administration should be by infusion over 30 minutes;

3. Facilities for treating anaphylaxis (including resuscitation facilities) should be available when parenteral thiamine is administered.

**Breast-feeding** severely thiamine-deficient mothers should avoid breast-feeding as toxic methyl-glyoxal present in milk

**Dose**

- Mild deficiency, by mouth, 25–100 mg daily; severe deficiency, 200–300 mg daily in divided doses

**Thiamine** (Non-proprietary)

**Tablets**, thiamine hydrochloride 50 mg, net price 100 = £3.49; 100 mg, 100 = £5.38

**Brands include** Benerva™ (Mad)

**Pabrinex™** (Archimedes) (Pol)

**I/M High Potency injection**, for intramuscular use only, ascorbic acid 500 mg, nicotinamide 160 mg, pyridoxine hydrochloride 50 mg, riboflavin 4 mg, thiamine hydrochloride 250 mg/7 mL. Net price 7 mL (in 2 amps) = £2.25

**Excipients** include benzyal alcohol (avoid in neonates, see Excipients, p. 2)

**I/V High Potency injection**, for intravenous use only, ascorbic acid 500 mg, anhydrous glucose 1 g, nicotinamide 160 mg, pyridoxine hydrochloride 50 mg, riboflavin 4 mg, thiamine hydrochloride 250 mg/10 mL. Net price 10 mL (in 2 X 5 mL amps) = £2.25

Parenteral vitamins B and C for rapid correction of severe depletion or malabsorption (e.g. in alcoholism, after acute infections, postoperatively, or in psychiatric states), maintenance of vitamins B and C in chronic intermittent haemodialysis.

**Dose** see MHRA/CHM advice above

**Treatment of Wernicke’s encephalopathy**, by intravenous infusion of I/V High Potency, 2–3 pairs 1 times daily for 2 days; if no response, discontinue; if symptoms respond after 2 days, give by intravenous infusion of I/V High Potency or by deep intramuscular injection into the gluteral muscle of IM High Potency, 1 pair once daily for 5 days or for as long as improvement continues

Prophylaxis of Wernicke’s encephalopathy in alcohol
dependence, by intravenous infusion of I/V High Potency or by deep intramuscular injection into the gluteal muscle of I/M High Potency, 1 pair once daily for at least 3–5 days. Psychosis following narcosis or electroconvulsive therapy, toxicity from acute infections, by intravenous infusion of I/V High Potency or by deep intramuscular injection into the gluteal muscle of I/M High Potency, 1 pair twice daily for up to 7 days.

Haemodialysis, by intravenous infusion of I/V High Potency (in sodium chloride intravenous infusion 0.9%), 1 pair every 2 weeks.

Note: Pybactin® doses in BNF may differ from those in product literature.

Oral vitamin B complex preparations

See below

**PYRIDOXINE HYDROCHLORIDE**

(Vitamin B₆)

**Indications** see under Dose

**Cautions** interactions: Appendix 1 (vitamins)

**Side-effects** sensory neuropathy reported with high doses given for extended periods.

**Dose**

- Deficiency states, 20–50 mg up to 3 times daily.
- Isoniazid-induced neuropathy, prophylaxis 10 mg daily (or 20 mg daily if suitable product not available); treatment, 50 mg three times daily; CHILD under 18 years see BNF for Children.
- Idiopathic sideroblastic anaemia, 100–400 mg daily in divided doses.
- Penicillamine-induced neuropathy, prophylaxis in Wilson’s disease [unlicensed use] (see also notes above), 20 mg daily; CHILD under 18 years see BNF for Children.
- Premenstrual syndrome [unlicensed use], 50–100 mg daily (see notes above).

Prolonged use of pyridoxine in a dose of 10 mg daily is considered safe but the long-term use of pyridoxine in a dose of 200 mg or more daily has been associated with neuropathy. The safety of long-term pyridoxine supplementation with doses above 10 mg daily has not been established.

Pyridoxine (Non-proprietary)

- Tablets, pyridoxine hydrochloride 10 mg, net price 500 = £8.46; 20 mg, 500 = £8.53; 50 mg, 28 = £3.19.

**Injections of vitamins B and C**

See under Thiamine.

**NICOTINAMIDE**

**Indications** see notes above; acne vulgaris, see section 13.6.1.

**Injections of vitamins B and C**

See under Thiamine.

**Oral vitamin B complex preparations**

Note: Other multivitamin preparations are in section 9.6.7.

**Vitamin B Tablets, Compound, Strong**

- Tablets, nicotinamide 15 mg, riboflavin 1 mg, thiamine hydrochloride 1 mg, net price 28 = £22.12.
- Dose: prophylactic, 1–2 tablets daily.

**PYRIDOXIN (Non-proprietary)**

- Tablets, pyridoxine hydrochloride 2 mg, net price 500 = £6.55; 20 mg, 500 = £6.58; 50 mg, 28 = £3.19.

**Injections of vitamins B and C**

See under Thiamine.

**ASCORBIC ACID**

**Indications** prevention and treatment of scurvy.

**Cautions** interactions: Appendix 1 (vitamins)

**Dose**

- Prophylactic, 25–75 mg daily; therapeutic, not less than 250 mg daily in divided doses.

**Ascorbic Acid (Non-proprietary)**

- Tablets, ascorbic acid 50 mg, net price 500 = £2.11; 100 mg, 28 = £2.39; 200 mg, 28 = £3.10; 500 mg (label: 24), 28 = £4.50.
- Brands: Include Redoxon®.
- Injection, ascorbic acid 100 mg/mL. Net price 5-mL amp = £4.39. Available from UCB Pharma.

**9.6.3 Vitamin C**

Vitamin C therapy is essential in scurvy, but less florid manifestations of vitamin C deficiency are commonly found, especially in the elderly. It is rarely necessary to prescribe more than 100 mg daily except early in the treatment of scurvy.

Severe scurvy causes gingival swelling and bleeding margins as well as petechiae on the skin. This is, however, exceedingly rare and a patient with these signs is more likely to have leukaemia. Investigation should not be delayed by a trial period of vitamin treatment.

Claims that vitamin C ameliorates colds or promotes wound healing have not been proved.

**9.6.4 Vitamin D**

Note: The term Vitamin D is used for a range of compounds which possess the property of preventing or curing rickets.
They include ergocalciferol (calciferol, vitamin D₂), colecalciferol (vitamin D₃), dihydrotachysterol, alfacalcidol (1α-hydroxycholecalciferol), and calcitriol (1,25-dihydroxycholecalciferol).

Simple vitamin D deficiency can be prevented by taking an oral supplement of only 10 micrograms (400 units) of ergocalciferol (calciferol, vitamin D₂) or colecalciferol (vitamin D₃) daily. Vitamin D deficiency can occur in those whose exposure to sunlight is limited and in those whose diet is deficient in vitamin D. In these individuals, ergocalciferol or colecalciferol in a dose of 20 micrograms (800 units) daily by mouth may be given to treat vitamin D deficiency; higher doses may be necessary for severe deficiency. Patients who do not respond should be referred to a specialist.

Preparations containing calcium with colecalciferol are available for the management of combined calcium and vitamin D deficiency, or for those at high risk of deficiency (see also Osteoporosis, p. 510 and Calcium Supplements, p. 680).

Vitamin D deficiency caused by intestinal malabsorption or chronic liver disease usually requires vitamin D in pharmacological doses, such as ergocalciferol tablets up to 1 mg (40 000 units) daily; the hypocalcaemia of hypoparathyroidism often requires doses of up to 2.5 mg (100 000 units) daily in order to achieve normocalcaemia.

Vitamin D requires hydroxylation by the kidney to its active form, therefore the hydroxylated derivatives alfacalcidol or calcitriol should be prescribed if patients with severe renal impairment require vitamin D therapy. Calcitriol is also licensed for the management of postmenopausal osteoporosis.

Paricalcitol, a synthetic vitamin D analogue, is licensed for the prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure (section 9.5.1.2).

Important. All patients receiving pharmacological doses of vitamin D should have their plasma-calcium concentration checked at intervals (initially once or twice weekly) and whenever nausea or vomiting occur.

### ERGOCALCIFEROL
(Calciferol, Vitamin D₂)

**Indications** see notes above

**Cautions**
- Take care to ensure correct dose in infants;
- Monitor plasma-calcium concentration in patients receiving high doses and in renal impairment (see notes above);
- Interactions: Appendix 1 (vitamins)

**Contra-indications** hyperparathyroidism; metastatic calcification

**Pregnancy** high doses teratogenic in animals but therapeutic doses unlikely to be harmful

**Breast-feeding** caution with high doses; may cause hyperparathyroidism in infant—monitor serum-calcium concentration

**Side-effects** symptoms of overdosage include anaesthesia, lassitude, nausea and vomiting, diarrhoea, constipation, weight loss, polyuria, sweating, headache, thirst, vertigo, and raised concentrations of calcium and phosphate in plasma and urine

**Dose**
- See notes above

**Daily supplements**
- There is no plain vitamin D tablet available for treating simple deficiency (see notes above). Alternatives include vitamins capsules (section 9.6.7), preparations of vitamins A and D (section 9.6.1), and calcium and ergocalciferol tablets (see below) (although the calcium and other vitamins in supplements are unnecessary).

For prescribing information on calcium, see section 9.5.1.1

### Calcium and Ergocalciferol (Non-proprietary)
(Calcium and Vitamin D)

**Tablets**, calcium lactate 300 mg, calcium phosphate 150 mg (calcium 97 mg or Ca²⁺ 2.4 mmol), ergocalciferol 10 micrograms (400 units). Net price 28-tab pack = £10.81. Counselling, crush before administration or may be chewed

**Pharmacological strengths**
- Note The BP directs that when calciferol is prescribed or demanded, colecalciferol or ergocalciferol should be dispensed or supplied

### Ergocalciferol (Non-proprietary)

**Tablets**, ergocalciferol 250 micrograms (10 000 units), net price 100 = £21.99; 1.25 mg (50 000 units), 100 = £30.34

**Note** May be difficult to obtain

**Important** When the strength of the tablets ordered or prescribed is not clear, the intention of the prescriber with respect to the strength (expressed in micrograms or milligrams per tablet) should be ascertained.

**Injection**, for intramuscular use only, ergocalciferol, 7.5 mg (300 000 units)/mL in oil, net price 1-mL amp = £9.35, 2-mL amp = £10.84

**Note** Other formulations of ergocalciferol are available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104

### ALFACALCIDOL
(1α-Hydroxycholecalciferol)

**Indications** see notes above

**Cautions** see under Ergocalciferol; also nephrolithiasis

**Contra-indications** see under Ergocalciferol

**Pregnancy** see under Ergocalciferol

**Breast-feeding** see under Ergocalciferol

**Side-effects** see under Ergocalciferol; also rarely nephrocalcinosis, pruritus, rash, and urticaria

**Dose**
- By mouth or by intravenous injection over 30 seconds, ADULT and CHILD over 20 kg, initially 1 microgram daily (elderly 500 nanograms), adjusted to avoid hypercalcaemia; maintenance, usually 0.25–1 microgram daily; NEONATE and PRETERM NEONATE initially 50–100 nanograms/kg daily, CHILD under 20 kg initially 50 nanograms/kg daily

**Alfacalcidol (Non-proprietary)**

**Capsules**, alfacalcidol 250 nanograms, net price 30-cap pack = £2.62; 500 nanograms 30-cap pack = £5.77; 1 microgram 30-cap pack = £5.89

**One-Alpha® (LEO)**

**Capsules**, alfacalcidol 250 nanograms (white), net price 30-cap pack = £3.37; 500 nanograms (red), 30-cap pack = £6.27; 1 microgram (brown), 30-cap pack = £8.75

**Excipients** include sesame oil

**Oral drops**, sugar-free, alfacalcidol 2 micrograms/mL (1 drop contains approx. 100 nanograms), net price 10 mL = £21.30

**Excipients** include alcohol

**Note** The concentration of alfacalcidol in One-Alpha® drops is 10 times greater than that of the former preparation One-Alpha® solution.
Injection, alfalcacidol 2 micrograms/mL, net price 0.5-mL amp = £2.16, 1-mL amp = £4.11

Excipients include alcohol, propylene glycol (caution in neonates, see Excipients, p. 2)

Note: Shake ampoule for at least 5 seconds before use

### CALCITRIOL
(1,25-Dihydroxycholecalciferol)

**Indications** see notes above

**Cautions** see under Ergocalciferol

**Contra-indications** see under Ergocalciferol

**Pregnancy** see under Ergocalciferol

**Breast-feeding** see under Ergocalciferol

**Side-effects** see under Ergocalciferol

**Dose**
- By mouth, renal osteodystrophy, initially 250 nanograms daily, or on alternate days (in patients with normal or only slightly reduced plasma-calcium concentration), increased if necessary in steps of 250 nanograms at intervals of 2–4 weeks; usual dose 0.5–1 microgram daily; CHILD not established
- Established postmenopausal osteoporosis, 250 nanograms twice daily (monitor plasma-calcium concentration and creatinine, consult product literature)

Calcitriol (Non-proprietary) [Tid]

Capsules, calcitriol 250 nanograms, net price 30-cap pack = £5.41, 100-cap pack = £19.15; 500 nanograms, 30-cap pack = £9.68, 100-cap pack = £25.76

Rocaltritol® (Roche) [Tid]

Capsules, calcitriol 250 nanograms (red/white), net price 100 = £18.04; 500 nanograms (red), 100 = £32.25

### COLECALCIFEROL
(Cholecalciferol, vitamin D₃)

**Indications** see notes above

**Cautions** see under Ergocalciferol

**Contra-indications** see under Ergocalciferol

**Pregnancy** see under Ergocalciferol

**Breast-feeding** see under Ergocalciferol

**Side-effects** see under Ergocalciferol

**Dose**
- See notes above

Desunin® (Meda) [Tid]

Tablets, colecalciferol 20 micrograms (800 units), net price 30-tab pack = £3.60

Fultium-D₃® (Intenis) [Tid]

Capsules, colecalciferol 20 micrograms (800 units) (blue), net price 30-cap pack = £3.60, 90-cap pack = £10.80; 80 micrograms (3200 units) (green), 30-cap pack = £13.32. Label: 25

Excipients include arachis (peanut) oil

Colecalciferol

Various formulations available from ‘special-order’ manufacturers or specialist importing companies, see p. 1124

With calcium

For prescribing information on calcium, see section 9.5.1.1

Accrete D₃® (Intenis)

Tablets, f/c, calcium carbonate 1.5 g (calcium 600 mg or Ca²⁺ 15 mmol), colecalciferol 10 micrograms (400 units), net price 60-tab pack = £2.95

### Adcal-D₃® (ProStrakan)

Tablets (chewable) (lemon or tutti-frutti flavour), calcium carbonate 1.5 g (calcium 600 mg or Ca²⁺ 15 mmol), colecalciferol 10 micrograms (400 units), net price 56-tab pack = £3.65, 112-tab pack = £7.49. Label: 24

Dissolve (effervescent tablets), lemon flavour, calcium carbonate 1.5 g (calcium 600 mg or Ca²⁺ 15 mmol), colecalciferol 10 micrograms (400 units), net price 56-tab pack = £5.99. Label: 13

Caplets (= tablets), f/c, calcium carbonate 750 mg (calcium 300 mg or Ca²⁺ 7.5 mmol), colecalciferol 5 micrograms (200 units), net price 112-tab pack = £3.65

Cacit® D₃ (Warner Chilcott)

Granules, effervescent, lemon flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca²⁺ 12.5 mmol), colecalciferol 10 micrograms (400 units), net price 60-tab pack = £3.58. Label: 24

Calcichew-D₃® (Takeda)

Calcichew-D₃® Tablets (chewable), orange flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca²⁺ 12.5 mmol), colecalciferol 5 micrograms (200 units), net price 100-tab pack = £7.68. Label: 24

Excipients include aspartame (section 9.4.1)

Calcichew-D₃® Forte Tablets (chewable), lemon flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca²⁺ 12.5 mmol), colecalciferol 10 micrograms (400 units), net price 60-tab pack = £4.24, 100-tab pack = £7.08. Label: 24

Excipients include aspartame (section 9.4.1)

Calcichew-D₃® 500 mg/400 unit caplets, f/c, lemon flavour, calcium carbonate providing calcium 500 mg (Ca²⁺ 12.5 mmol), colecalciferol 10 micrograms (400 units), net price 100-tab pack = £7.43

Excipients include propylene glycol, see Excipients, p. 2

Calfovit D₃® (Menarini)

Powder, lemon flavour, calcium phosphate 3.1 g (calcium 1.2 g or Ca²⁺ 30 mmol), colecalciferol 20 micrograms (800 units), net price 30-sachet pack = £4.32. Label: 13, 21

Kalcipos-D₃® (Meda) [Tid]

Tablets (chewable), calcium carbonate providing calcium 500 mg (Ca²⁺ 12.5 mmol), colecalciferol 10 micrograms (400 units), net price 30-tab pack = £4.21. Label: 24

Natcel D₃® (Chiesi)

Tablets, chewable, (aniseed, peppermint, and molasses flavour), calcium carbonate 1.5 g (calcium 600 mg or Ca²⁺ 15 mmol), colecalciferol 10 micrograms (400 units), net price 60-tab pack = £3.63. Label: 24

Excipients include aspartame (section 9.4.1)

With alendronic acid

Section 6.6.2

With risedronate sodium and calcium

Section 6.6.2

### DIHYDROTACHYSTEROL

**Indications** see notes above

**Cautions** see under Ergocalciferol

**Contra-indications** see under Ergocalciferol
Vitamin E has been tried for various other conditions, including muscular abnormalities, which usually respond only to vitamin E supplementation. However, there is little scientific evidence of its value.

Vitamin E has been used for chronic disorders, such as hyperparathyroidism associated with chronic renal failure, and for prevention and treatment of secondary hyperparathyroidism. However, the daily requirement of vitamin E has not been well defined but is probably about 3 to 15 mg daily. There is little evidence that oral supplements of vitamin E are essential in adults, even where there is fat malabsorption, although caution with large doses is advised. In patients on haemodialysis, vitamin E may be necessary in doses more than 1 g daily.

Vitamin K is necessary for the production of blood clotting factors and proteins necessary for the normal calcification of bone.

Because vitamin K is fat soluble, patients with fat malabsorption, especially in biliary obstruction or hepatic disease, may become deficient. Vitamin K is necessary for the production of blood clotting factors and proteins necessary for the normal calcification of bone.

Neonates are relatively deficient in vitamin K and those who do not receive supplements of vitamin K are at risk of serious bleeding including intracranial bleeding. The Chief Medical Officer and the Chief Nursing Officer have recommended that all newborn babies should receive vitamin K.
K to prevent vitamin K deficiency bleeding (previously termed haemorrhagic disease of the newborn). An appropriate regimen should be selected after discussion with parents in the antenatal period.

Vitamin K (as **phytomenadione**) 1 mg may be given by a single intramuscular injection at birth; this prevents vitamin K deficiency bleeding in virtually all babies. For preterm neonates, see BNF for Children.

Alternatively, in healthy babies who are not at particular risk of bleeding disorders, vitamin K may be given by mouth, and arrangements must be in place to ensure the appropriate regimen is followed. Two doses of a colloidal (mixed micelle) preparation of phytomenadione 2 mg should be given by mouth in the first week, the first dose being given at birth and the second dose at 4–7 days. For exclusively breast-fed babies, a third dose of colloidal phytomenadione 2 mg is given by mouth at 1 month of age; the third dose is omitted in formula-fed babies because formula feeds contain adequate vitamin K. An alternative regimen is to give one dose of phytomenadione 1 mg by mouth at birth (using the contents of a phytomenadione capsule, see preparation below) to protect from the risk of vitamin K deficiency bleeding in the first week; for exclusively breast-fed babies, further doses of phytomenadione 1 mg are given by mouth (using the contents of a phytomenadione capsule) at weekly intervals for 12 weeks.

### MENADIOL SODIUM PHOSPHATE

**Indications**  
see notes above

**Cautions**  
G6PD deficiency (section 9.1.5) and vitamin E deficiency (risk of haemolysis); **Interactions:** Appendix 1 (vitamins)

**Contra-indications**  
neonates and infants

**Pregnancy**  
avoid in late pregnancy and labour unless benefit outweighs risk of neonatal haemolytic anaemia, hyperbilirubinaemia, and kernicterus in neonate

**Dose**

- 10–40 mg daily, adjusted as necessary; **CHILD** under 18 years see BNF for Children

**Menadiol Phosphate** (Non-proprietary)

**Tablets,** menadiol sodium phosphate equivalent to 10 mg of menadiol phosphate, net price 100-tab pack = £12.48

### PHYTOMENADIONE

(Vitamin K₃)

**Indications**  
see notes above

**Cautions**  
intravenous injections should be given very slowly (see also below); **Interactions:** Appendix 1 (vitamins)

**Pregnancy**  
use if potential benefit outweighs risk

**Breast-feeding**  
present in milk, but see notes above

**Dose**

- See notes above and section 2.8.2

**Neokay** (Neoeuticals)  
**Capsules,** brown, phytomenadione 1 mg in an oily basis, net price 12-cap pack = £3.95; 100-cap pack = £34.00

**Note**  
The contents of one capsule should be administered by cutting the narrow tubular tip off and squeezing the liquid contents into the mouth; if the baby spits out the dose or is sick within three hours of administration a replacement dose should be given

### Colloidal formulation

**Konakion** (Roche)  
**Injection,** phytomenadione 10 mg/mL in a mixed micelles vehicle, net price 1-mL amp = £38

**Excipients**  
glycocholic acid 54.6 mg/amp, lecithin

**Cautions**  
reduce dose in elderly, liver impairment (glycocholic acid may displace bilirubin); reports of anaphylactoid reactions

**Note**  
**Konakion**  
**MM** may be administered by slow intravenous injection or by intravenous infusion in glucose 5% (see Appendix 4); not for intramuscular injection

**Konakion**  
**MM Paediatric** (Roche)  
**Injection,** phytomenadione 10 mg/mL in a mixed micelles vehicle, net price 0.2-mL amp = £94p

**Excipients**  
glycocholic acid 10.9 mg/amp, lecithin

**Cautions**  
parenteral administration in neonate of less than 2.5 kg (increased risk of kernicterus)

**Note**  
**Konakion**  
**MM Paediatric** may be administered by mouth or by intramuscular injection or by intravenous injection

### 9.6.7 Multivitamin preparations

**Vitamins**

**Capsules,** ascorbic acid 15 mg, nicotinamide 7.5 mg, riboflavin 500 micrograms, thiamine hydrochloride 1 mg, vitamin A 2,500 units, vitamin D 300 units, net price 28-cap pack = £1.50

**Abidec** (Chefaro UK)

**Drops,** vitamins A, B group, C, and D, net price 25 mL (with dropper) = £3.33

**Excipients**  
arachis (peanut) oil

**Note**  
Contains 1333 units of vitamin A (as palmitate) per 0.6-mL dose

**Dalitvit** (LPC)

**Oral drops,** vitamins A, B group, C, and D, net price 25 mL = £3.28, 50 mL = £5.58

**Note**  
Contains 5000 units of vitamin A (as palmitate) per 0.6-mL dose

**Vitamin and mineral supplements and adjuncts to synthetic diets**

**Forc泽al** (Alliance)

**Capsules,** brown/red, vitamins (ascorbic acid 60 mg, biotin 100 micrograms, cyanocobalamin 3 micrograms, folic acid 400 micrograms, nicotinamide 18 mg, pantothenic acid 4 mg, pyridoxine 2 mg, riboflavin 1.6 mg, thiamine 1.2 mg, vitamin A 2,500 units, vitamin D₂ 400 units, vitamin E 10 mg, minerals and trace elements (calcium 100 mg, chromium 200 micrograms, copper 2 mg, iodine 140 micrograms, iron 12 mg, magnesium 50 mg, manganese 3 mg, molybdenum 250 micrograms, phosphorus 77 mg, potassium 4 mg, selenium 50 micrograms, zinc 15 mg), net price 15-cap pack = £3.40, 30-cap pack = £5.93, 90-cap pack = £14.32. Label: 25 Dose vitamin and mineral deficiency and as adjunct in synthetic diets, ADULT 1 capsule daily one hour after a meal

**Ketovite** (Essential)

**Tablets,** yellow, ascorbic acid 16.6 mg, riboflavin 1 mg, thiamine hydrochloride 1 mg, pyridoxine hydrochloride 330 micrograms, nicotinamide 3.3 mg, calcium pantothenate 1.16 mg, alpha tocopherol acetate 5 mg, inositol 50 mg, biotin 170 micrograms, folic acid 250 micrograms, acetylmenaphthone 500 micrograms, net price 100-tab pack = £9.21

**Dose**  
prevention of vitamin deficiency in disorders of carbohydrate or amino-acid metabolism and adjunct in restricted, specialised, or synthetic diets, 1 tablet 3 times daily, use with Ketovite Liquid for complete vitamin supplementation
9.7 Bitters and tonics

Mixtures containing simple and aromatic bitters are traditional remedies for loss of appetite; there is no evidence to support their use.

9.8 Metabolic disorders

9.8.1 Drugs used in metabolic disorders

Wilson’s disease
Penicillamine (see also section 10.1.3) is used in Wilson’s disease (hepatolenticular degeneration) to aid the elimination of copper ions. See below for other indications.

Trientine is used for the treatment of Wilson’s disease only in patients intolerant of penicillamine; it is not an alternative to penicillamine for rheumatoid arthritis or cystinuria. Penicillamine-induced systemic lupus erythematosus may not resolve on transfer to trientine.

Zinc prevents the absorption of copper in Wilson’s disease. Symptomatic patients should be treated initially with a chelating agent because zinc has a slow onset of action. When transferring from chelating treatment to zinc maintenance therapy, chelating treatment should be co-administered for 2–3 weeks until zinc produces its maximal effect.

PENICILLAMINE

Indications see under Dose below

Cautions section 10.1.3; also neurological involvement in Wilson’s disease

Contra-indications section 10.1.3

Renal impairment section 10.1.3

Pregnancy section 10.1.3

Breast-feeding section 10.1.3

Side-effects section 9.6.2—perhaps anaemia; leucopenia

Dose

- Wilson’s disease, 1.5–2 g daily in divided doses before food; max. 2 g daily for 1 year; maintenance 0.75–1 g daily; ELDERLY 20 mg/kg daily in divided doses, adjusted according to response; CHILD see BNF for Children

- Autoimmune hepatitis (used rarely; after disease controlled with corticosteroids), initially 500 mg daily in divided doses increased slowly over 3 months; usual maintenance dose 1.25 g daily; ELDERLY not recommended

- Cystinuria, therapeutic, 1–3 g daily in divided doses before food, adjusted to maintain urinary cystine below 200 mg/litre; prophylactic (maintain urinary cystine below 300 mg/litre) 0.5–1 g at bedtime; maintain adequate fluid intake (at least 3 litres daily); ELDERLY minimum dose to maintain urinary cystine below 200 mg/litre; CHILD see BNF for Children

- Severe active rheumatoid arthritis, section 10.1.3

Preparations

Section 10.1.3

TRIENTINE DIHYDROCHLORIDE

Indications Wilson’s disease in patients intolerant of penicillamine

Cautions see notes above; interactions: Appendix 1 (trientine)

Pregnancy manufacturer advises use only if potential benefit outweighs risk; monitor maternal and neonatal serum-copper concentration; teratogenic in animal studies

Side-effects nausea, rash; very rarely anaemia; duodenitis and colitis also reported

Dose

- ADULT and CHILD over 12 years, 1.2–2.4 g daily in 2–4 divided doses before food; CHILD 2–12 years, initially 0.6–1.5 g daily in 2–4 divided doses before food, adjusted according to response

Trientine Dihydrochloride (Univar) child Capsules, trientine dihydrochloride 300 mg. Label: 6, 22

ZINC ACETATE

Indications Wilson’s disease (initiated under specialist supervision)

Cautions portal hypertension (risk of hepatic decomposition when switching from chelating agent); monitor full blood count and serum cholesterol; interactions: Appendix 1 (zinc)

Pregnancy reduce dose to 25 mg 3 times daily adjusted according to plasma-copper concentration and urinary copper excretion

Breast-feeding manufacturer advises avoid; present in milk—may cause zinc-induced copper deficiency in infant

Side-effects gastric irritation (usually transient; may be reduced if first dose taken mid-morning or with a little protein); less commonly sideroblastic anaemia and leucopenia

Dose

Note Dose expressed as elemental zinc

- Wilson’s disease, 50 mg 3 times daily (max. 50 mg 5 times daily), adjusted according to response; CHILD 1–6 years, 25 mg twice daily; 6–16 years, body-weight under 57 kg, 25 mg 3 times daily, body-weight over 57 kg, 50 mg 3 times daily; ADOLESCENT 16–18 years, 50 mg 3 times daily

Wilzin (Orphan Europe) child Capsules, zinc (as acetate) 25 mg (blue), net price 250-cap pack = £132.00; 50 mg (orange), 250-cap pack = £242.00. Label: 23
Carnitine deficiency

Levocarnitine is available for the management of primary carnitine deficiency due to inborn errors of metabolism or of secondary deficiency in haemodialysis patients.

LEVOCARNITINE

(Carnitine)

Indications primary and secondary carnitine deficiency

Cautions diabetes mellitus; monitoring of free and acyl carnitine in blood and urine recommended

Renal impairment accumulation of metabolites may occur with chronic oral administration in severe impairment

Pregnancy appropriate to use; no evidence of teratogenicity in animal studies

Side-effects nausea, vomiting, abdominal pain, diarrhoea, body odour; side-effects may be dose-related—monitor tolerance during first week and after any dose increase

Dose

- Primary deficiency, by mouth, up to 200 mg/kg daily in 2–4 divided doses; usual max. 3 g daily; by intravenous injection over 2–3 minutes, up to 100 mg/kg daily in 2–4 divided doses
- Secondary deficiency, by intravenous injection over 2–3 minutes, 20 mg/kg after each dialysis session (dosage adjusted according to plasma-carnitine concentration); maintenance (if benefit gained from first intravenous course), by mouth, 1 g daily

Levocarnitine (Non-proprietary) (Patent)

Paediatric oral solution, levocarnitine 300 mg/mL (30%), net price 20 mL = £55.55

Carnitor® (Sigma-Tau) (Patent)

Tablets, levocarnitine 330 mg, net price 90-tab pack = £103.95

Chewable tablets, levocarnitine 1 g, net price 10-tab pack = £35.00

Oral liquid, levocarnitine 100 mg/mL (10%), net price 10 × 10-mL (1-g) single-dose bottle = £35.00

Injection, levocarnitine 200 mg/mL, net price 5-mL amp = £11.90

Fabry’s disease

Agalsidase alfa and agalsidase beta, enzymes produced by recombinant DNA technology, are licensed for long-term enzyme replacement therapy in Fabry’s disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

AGALSIDASE ALFA AND BETA

Indications Fabry’s disease (specialist use only)

Cautions interactions: Appendix 1 (agalsidase alfa and beta)

Infusion-related reactions Infusion-related reactions very common; manage by slowing the infusion rate or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature

Pregnancy use with caution

Breast-feeding use with caution—no information available

Side-effects gastro-intestinal disturbances, taste disturbances; tachycardia, bradycardia, palpitation, hypertension, hypotension, chest pain, oedema, flushing, dyspnoea, cough, rhonorrhoea; headache, fatigue, dizziness, asthenia, paraesthesia, syncope, neuropathic pain, tremor, sleep disturbances; influenza-like symptoms, nasopharyngitis; muscle spasms, myalgia, arthralgia; eye irritation; tinnitus; hypersensitivity reactions, angioedema, pruritus, urticaria, rash, acne; less commonly cold extremities, parosmia, ear pain and swelling, skin discoloration, and injection-site reactions

Fabrazyme® (Genzyme) (Patent)

Intravenous infusion, powder for reconstitution, agalsidase beta, net price 5-mg vial = £315.08; 35-mg vial = £2196.59

Dose By intravenous infusion, ADULT and CHILD over 8 years 1 mg/kg every 2 weeks

Replagal® (Shire HGT) (Patent)

Concentrate for intravenous infusion, agalsidase alfa 1 mg/mL, net price 3.5-mL vial = £1088.64

Dose By intravenous infusion, ADULT and CHILD over 7 years 200 micrograms/kg every 2 weeks

Gaucher’s disease

Imiglucerase, an enzyme produced by recombinant DNA technology, is administered as enzyme replacement therapy for non-neurological manifestations of type I or type III Gaucher’s disease, a familial disorder affecting principally the liver, spleen, bone marrow, and lymph nodes.

Velaglucerase alfa, an enzyme produced by recombinant DNA technology, is administered as enzyme replacement therapy for the treatment of type I Gaucher’s disease.

Miglustat, an inhibitor of glucosylceramide synthase, is licensed for the treatment of mild to moderate type I Gaucher’s disease in patients for whom enzyme replacement therapy is unsuitable; it is given by mouth; see p. 698.

IMIGLUCERASE

Indications (specialist use only) non-neurological manifestations of type I or type III Gaucher’s disease

Cautions monitor immunoglobulin G (IgG) antibody concentration; when stabilised, monitor all parameters and response to treatment at intervals of 6–12 months

Pregnancy manufacturer advises use with caution—limited information available

Breast-feeding no information available

Side-effects hypersensitivity reactions (including urticaria, angioedema, cyanosis, hypotension, flushing, tachycardia, paraesthesia, backache); less commonly nausea, vomiting, diarrhoea, abdominal cramps, headache, dizziness, fatigue, fever, arthralgia, and injection-site reactions

Dose

- By intravenous infusion, initially 60 units/kg once every 2 weeks (doses as low as 15 units/kg once every 2 weeks may improve haematological parameters and organomegaly); maintenance, adjust dose according to response; CHILD under 18 years see BNF for Children
**Cerezyme® (Genzyme)**

Intravenous infusion, powder for reconstitution, imiglucerase, net price 200-unit vial = £535.65; 400-unit vial = £1071.29

**Electrolytes**

Na⁺ 0.62 mmol/200-unit vial, 1.24 mmol/400-unit vial

---

**Galsulfase**

Concentrate for intravenous infusion, net price 3-mL vial = £1985.00

**IDURSULFASE**

Concentrate for intravenous infusion, 1 mg/mL, net price 5-mL vial = £982.00

---

**VELAGLUCERASE ALFA**

Indications (specialist use only) type I Gaucher’s disease

Cautions

- Monitor immunoglobulin G (IgG) antibody concentration in severe infusion-related reactions or if there is a lack or loss of effect with velaglucerase alfa

Infusion-related reactions

- Infusion-related reactions very common; manage by slowing the infusion rate, or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipycyte, or corticosteroid—consult product literature

**Pregnancy**

- Manufacturer advises avoid unless essential

**Breast-feeding**

- Manufacturer advises avoid—present in milk in animal studies

**Side-effects**

- Abdominal pain, umbilical hernia, gastrointestinal disturbances, swollen tongue; arrhythmia, tachycardia, chest pain, cyanosis, peripheral oedema, hypertension, hypotension, flushing; bronchospasm, hypoxia, cough, wheezing, tachypnoea, dyspnoea, headache, dizziness, tremor, pyrexia; arthralgia; facial oedema, urticaria, pruritus, rash, infusion-site swelling, erythema; pulmonary embolism and anaphylaxis also reported

**Dose**

- By intravenous infusion, 60 units/kg once every 2 weeks; adjusted according to response to 15–60 units/kg once every 2 weeks; CHILD under 18 years see BNF for Children

**VPRIV® (Shire HGT)**

Intravenous infusion, net price 400-unit vial = £1140.20

**Electrolytes**

Na⁺ 0.53 mmol/400-unit vial

---

**Laronidase**

An enzyme produced by recombinant DNA technology, is licensed for long-term replacement therapy in the treatment of non-neurological manifestations of mucopolysaccharidosis I, a lysosomal storage disorder caused by deficiency of alpha-L-iduronidase.

**Idursulfase**

An enzyme produced by recombinant DNA technology, is licensed for long-term replacement therapy in mucopolysaccharidosis II (Hunter syndrome), a lysosomal storage disorder caused by deficiency of alpha-L-iduronidase.

**Galsulfase**

A recombinant form of human N-acetylgalactosamine-4-sulfatase, is licensed for long-term replacement therapy in mucopolysaccharidosis VI (Maroteaux-Lamy syndrome).

**Infusion-related reactions**

- Infusion-related reactions often occur with administration of laronidase, idursulfase, and galsulfase; they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an anti-histamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.

---

**Cautions**

- Respiratory disease; acute febrile or respiratory illness (consider delaying treatment)

**Pregnancy**

- Manufacturer advises avoid unless essential

**Breast-feeding**

- Manufacturer advises avoid—no information available

**Side-effects**

- Abdominal pain, umbilical hernia, gastrointestinal disturbances, swollen tongue; arrhythmia, tachycardia, chest pain, cyanosis, peripheral oedema, hypertension, hypotension, flushing; bronchospasm, hypoxia, cough, wheezing, tachypnoea, dyspnoea, headache, dizziness, tremor, pyrexia; arthralgia; facial oedema, urticaria, pruritus, rash, infusion-site swelling, erythema; pulmonary embolism and anaphylaxis also reported

**Dose**

- By intravenous infusion, ADULT and CHILD over 5 years, 1 mg/kg once weekly

**Naglazyme® (BioMarin)**

Concentrate for intravenous infusion, galasulfase 1 mg/mL, net price 5-mL vial = £982.00

---

**Laronidase**

Indications (specialist use only) non-neurological manifestations of mucopolysaccharidosis I

Cautions

- Monitor immunoglobulin G (IgG) antibody concentration; interactions: Appendix 1 (laronidase)

**Pregnancy**

- Manufacturer advises avoid unless essential

**Breast-feeding**

- Manufacturer advises avoid—no information available

**Side-effects**

- Nausea, vomiting, diarrhoea, abdominal pain; cold extremities, pallor, flushing, tachycardia, blood pressure changes; dyspnoea, cough, angio-oedema, anaphylaxis; headache, parasthesia, dizziness, fatigue, restlessness, influenza-like symptoms; musculoskeletal pain, pain in extremities; rash, pruritus, urticaria, alopecia, infusion-site reactions; bronchospasm and respiratory arrest also reported

**Dose**

- By intravenous infusion, 100 units/kg once weekly; CHILD see BNF for Children
Nephropathic cystinosis
Mercaptamine is available for the treatment of nephropathic cystinosis.

**MERCAPTAMINE**
(Cysteamine)

**Indications** (specialist use only) nephropathic cystinosis

**Cautions** leucocyte-cystine concentration and haematological monitoring required—consult product literature; dose of phosphate supplement may need to be adjusted if transferring from phosphocysteamine to mercaptamine

**Contra-indications** hypersensitivity to penicillamine

**Pregnancy** avoid—teratogenic and toxic in animal studies

**Breast-feeding** avoid

**Side-effects** breath and body odour, nausea, vomiting, diarrhoea; flushing, leucocytosis, fever, rash; less commonly leucopenia, nephrotic syndrome

**Dose**
- Initial doses should be one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks
- Maintenance, ADULT and CHILD over 50 kg body-weight, 2 g daily in 4 divided doses
- CHILD up to 12 years, 1.3 g/m² (approx. 50 mg/kg) daily in 4 divided doses

**Cystagon** (Orphan Europe)

Capsules, mercaptamine (as bitartrate) 50 mg, net price 100-cap pack = £70.00; 150 mg, 100-cap pack = £190.00. Label: 21

Note CHILD under 6 months at risk of aspiration, capsules can be opened and contents sprinkled on food (at a temperature suitable for eating); avoid adding to acidic drinks (e.g. orange juice)

**Pompe disease**
Alglucosidase alfa, an enzyme produced by recombinant DNA technology, is licensed for long-term replacement therapy in Pompe disease, a lysosomal storage disorder caused by deficiency of acid alpha-glucosidase.

**ALGLUCOSIDASE ALFA**

**Indications** (specialist use only) Pompe disease

**Cautions** cardiac and respiratory dysfunction—monitor closely; monitor immunoglobulin G (IgG) antibody concentration

**Infusion-related reactions** Infusion-related reactions very common, calling for use of antihistamine, antipyretic, or corticosteroid; consult product literature for details

**Pregnancy** toxicity in animal studies, but treatment should not be withheld

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** nausea, vomiting, diarrhoea; flushing, tachycardia, blood pressure changes, cold extremities, cyanosis, facial oedema, chest discomfort; cough, tachypnoea, bronchospasm; headache, agitation, tremor, irritability, restlessness, paraesthesia, dizziness, fatigue; pyrexia; antibody formation; myalgia, muscle spasm; sweating, rash, pruritus, urticaria, injection-site reactions; hypersensitivity reactions (including anaphylaxis); severe skin reactions (including ulcerative and necrotising skin lesions) also reported

**Dose**
- By intravenous infusion, ADULT and CHILD 20 mg/kg every 2 weeks

**Myozyme** (Genzyme)

Intravenous infusion, powder for reconstitution, alglucosidase alfa, net price 50-mg vial = £356.06

**Tyrosinaemia type I**
Nitisinone is licensed for the treatment of hereditary tyrosinaemia type I in combination with dietary restriction of tyrosine and phenylalanine.

**NITISINONE**
(NTBC)

**Indications** hereditary tyrosinaemia type I (specialist use only)

**Cautions** slit-lamp examination of eyes recommended before treatment; monitor liver function regularly; monitor platelet and white blood cell count every 6 months

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies

**Breast-feeding** manufacturer advises avoid—adverse effects in animal studies

**Side-effects** thrombocytopenia, leucopenia, granulocytopenia; conjunctivitis, photophobia, corneal opacities, keratitis, eye pain; less commonly leucocytosis, blepharitis, pruritus, exfoliative dermatitis, and erythematous rash

**Dose**
- ADULT and CHILD initially 500 micrograms/kg twice daily, adjusted according to response; max. 2 mg/kg daily

**Note** Capsules can be opened and the contents suspended in a small amount of water or formula diet and taken immediately

**Orfadin** (Swedish Orphan)

Capsules, nitisinone 2 mg, net price 60-cap pack = £564.00; 5 mg, 60-cap pack = £1127.00; 10 mg, 60-cap pack = £2062.00

**Urea cycle disorders**
Sodium phenylbutyrate is used in the management of urea cycle disorders. It is indicated as adjunctive therapy in all patients with neonatal-onset disease and in those with late-onset disease who have a history of hyperammonaemic encephalopathy.

Carglumic acid is licensed for the treatment of hyperammonaemia due to N-acetylglutamate synthase deficiency and organic acidemia.

**Emergency management** For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at www.bimdmg.org.uk.
**CARGLUMIC ACID**

**Indications** hyperammonaemia due to N-acetylglutamate synthase deficiency and organic acidaemia under specialist supervision; see also notes above

**Pregnancy** manufacturer advises avoid unless essential—no information available

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies

**Side-effects** sweating; less commonly diarrhoea, vomiting, bradycardia, pyrexia

**Dose**
- Hyperammonaemia due to N-acetylglutamate synthase deficiency, **ADULT** and **CHILD** initially 100–250 mg/kg daily in 2–4 divided doses immediately before food, adjusted according to plasma-ammonia concentration; maintenance 10–100 mg/kg daily in 2–4 divided doses
- Hyperammonaemia due to organic acidemia, **ADULT** and **CHILD** initially 100–250 mg/kg daily in 2–4 divided doses immediately before food, adjusted according to plasma-ammonia concentration

**Carbaglu**<sup>®</sup> (Orphan Europe) (<sup>TM</sup>)

**Dispersible tablets**, carglumic acid 200 mg, net price 5-tab pack = £299.00, 60-tab pack = £3499.00.

**Label:** 13

**Note** Must be dispersed in at least 5–10 mL of water and taken orally immediately, or administered via a nasogastric tube

**SODIUM PHENYL BUTYRATE**

**Indications** adjunct in long-term treatment of urea cycle disorders (under specialist supervision); see also notes above

**Cautions** congestive heart failure; **interactions**: Appendix 1 (sodium phenylbutyrate)

**Hepatic impairment** manufacturer advises caution

**Renal impairment** manufacturer advises caution

**Pregnancy** avoid—toxicity in animal studies; manufacturer advises adequate contraception during administration

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** gastro-intestinal disturbances, weight gain, taste disturbance, decreased appetite; syncope, oedema; headache, depression, irritability; renal tubular acidosis, menstrual disorders; bowel disorders, metabolic acidosis, alkalosis; rash, body odour; less commonly rectal bleeding, peptic ulcer, pancreatitis, and arrhythmias

**Dose**
- **ADULT** 9.9–13 g/m<sup>2</sup> daily in divided doses with meals (max. 20 g daily); **CHILD** see BNF for Children

**Ammonaps**<sup>®</sup> (Swedish Orphan) (<sup>TM</sup>)

- **Tablets**, sodium phenylbutyrate 500 mg. Contains Na<sup>+</sup> 2.7 mmol/tablet. Net price: 250-tab pack = £493.00
- **Granules**, sodium phenylbutyrate 940 mg/g. Contains Na<sup>+</sup> 5.4 mmol/g of sodium phenylbutyrate. Net price: 266-g pack = £860.00

**Note** Granules should be mixed with food before taking immediately; measuring spoons are provided to measure 1 g, 150 mg, and 100 mg of powder

**Betaine**

**Indications** (specialist use only) adjunctive treatment of hyperammonaemia

**Cautions** monitor plasma-methionine concentration before and during treatment—interrupt treatment if symptoms of cerebral oedema occur

**Pregnancy** manufacturer advises avoid unless essential—limited information available

**Breast-feeding** manufacturer advises caution—no information available

**Side-effects** less commonly gastro-intestinal disorders, anorexia, reversible cerebral oedema (see Cautions), agitation, depression, personality disorder, sleep disturbances, urinary incontinence, alopecia, and urticaria

**Dose**
- **ADULT** and **CHILD** over 10 years, 3 g twice daily, adjusted according to response; max. 20 g/day; **CHILD** under 10 years 50 mg/kg twice daily; dose and frequency adjusted according to response; max. 75 mg/kg twice daily

**Cystadane**<sup>®</sup> (Orphan Europe) (<sup>TM</sup>)

- **Powder**, betaine (anhydrous), net price: 180 g = £347.00

**Note** Powder should be mixed with water, juice, milk, formula, or food until completely dissolved and taken immediately

**Other metabolic disorders**

**Miglustat** is available for the treatment of progressive neurological manifestations of Niemann-Pick type C disease, a neurodegenerative disorder characterised by impaired intracellular lipid trafficking; it is also licensed for the treatment of mild to moderate type 1 Gaucher’s disease for whom imiglucerase is unsuitable, see also p. 695.

**MIGLUSTAT**

**Indications** mild to moderate type 1 Gaucher’s disease (specialist supervision only); Niemann-Pick type C disease (specialist supervision only)

**Cautions** monitor cognitive and neurological function; monitor growth and platelet count in Niemann-Pick type C disease

**Hepatic impairment** no information available—manufacturer advises caution
Renal impairment for Gaucher’s disease initially 100 mg twice daily if eGFR 50–70 mL/minute/1.73 m²; initially 100 mg once daily if eGFR 30–50 mL/minute/1.73 m²; for Niemann-Pick type C disease, initially 200 mg twice daily if eGFR 50–70 mL/minute/1.73 m²; initially 100 mg twice daily if eGFR 30–50 mL/minute/1.73 m²; child under 12 years—consult product literature; avoid if eGFR less than 30 mL/minute/1.73 m²

Pregnancy manufacturer advises avoid (toxicity in animal studies)—effective contraception must be used during treatment; also men should avoid fathering a child during and for 3 months after treatment

Breast-feeding manufacturer advises avoid—no information available

Side-effects diarrhoea, flatulence, abdominal pain, dyspepsia, constipation, nausea, vomiting, anorexia, weight changes, tremor, dizziness, headache, peripheral neuropathy, ataxia, amnesia, hypoesthesia, paraesthesia, insomnia, depression, chills, malaise, decreased libido, thrombocytopenia, muscle spasm and weakness

Dose

- Gaucher’s disease, ADULT over 18 years, 100 mg 3 times daily; reduced if not tolerated to 100 mg 1–2 times daily
- Niemann-Pick type C disease, ADULT and CHILD over 12 years, 200 mg 3 times daily; CHILD 4–12 years, body surface area less than 0.47 m², 100 mg once daily; body surface area 0.47–0.73 m², 100 mg twice daily; body surface area 0.73–0.88 m², 100 mg three times daily; body surface area 0.88–1.25 m², 200 mg twice daily; body surface area greater than 1.25 m², adult dose

Zavesca® (Actelion)  
Capsules, miglustat 100 mg, net price 84-cap pack = £3934.17 (hospital only)

9.8.2 Acute porphyrias

The acute porphyrias (acute intermittent porphyria, variegate porphyria, hereditary coproporphyria, and 5-aminolaevulinic acid dehydratase deficiency porphyria) are hereditary disorders of haem biosynthesis; they have a prevalence of about 1 in 10 000 of the population.

Great care must be taken when prescribing for patients with acute porphyria, since certain drugs can induce acute porphyrinogenic crises. Since acute porphyrias are hereditary, relatives of affected individuals should be screened and advised about the potential danger of certain drugs.

Treatment of serious or life-threatening conditions should not be withheld from patients with acute porphyria. When there is no safe alternative, treatment should be started and urinary porphobilinogen excretion should be measured regularly; if it increases or symptoms occur, the drug can be withdrawn and the acute attack treated. If an acute attack of porphyria occurs during pregnancy, contact an expert porphyria service for further advice.

Haem arginate is administered by short intravenous infusion as haem replacement in moderate, severe, or unremitting acute porphyrinogenic crises.

The National Acute Porphyria Service (NAPS) provides clinical support and treatment with haem arginate from three centres (University Hospital of Wales, Addenbrooke’s Hospital, and King’s College Hospital). To access the service telephone (029) 2074 7747 and ask for the Acute Porphyria Service.

HAEM ARGINATE
(Human hemin)

Indications acute porphyrias (acute intermittent porphyria, porphyria variegata, hereditary coproporphyria)

Pregnancy manufacturer advises avoid unless essential

Breast-feeding manufacturer advises avoid unless essential—no information available

Side-effects pain and thrombophlebitis at injection site; rarely hypersensitivity reactions and fever; also reported headache

Dose

- By intravenous infusion, ADULT and CHILD 3 mg/kg once daily (max. 250 mg daily) for 4 days; if response inadequate, repeat 4-day course with close biochemical monitoring

Normosang® (Orphan Europe)  
Concentrate for intravenous infusion, haem arginate 25 mg/mL, net price 10-mL amp = £434.25

Drugs unsafe for use in acute porphyrias

The following list contains drugs on the UK market that have been classified as ‘unsafe’ in porphyria because they have been shown to be porphyrinogenic in animals or in vitro, or have been associated with acute attacks in patients. Absence of a drug from the following lists does not necessarily imply that the drug is safe. For many drugs no information about porphyria is available.

An up-to-date list of drugs considered safe in acute porphyrias is available at www.wmic.wales.nhs.uk/porphyria_info.php

Further information may be obtained from: www.porphyria-europe.org

and also from:

Welsh Medicines Information Centre  
University Hospital of Wales  
Cardiff, CF14 4XW  
Tel: (029) 2074 2979/3877

Note Quite modest changes in chemical structure can lead to changes in porphyrinogenicity but where possible general statements have been made about groups of drugs; these should be checked first.

---

1. Contact Welsh Medicines Information Centre for further advice.
2. Includes tricyclic (and related) antidepressants and MAOIs, fluoxetine, duloxetine, venlafaxine, and trazodone thought to be safe.
3. Alimemazine, chlorphenamine, desloratadine, fexofenadine, ketotifen, loratadine, and promethazine thought to be safe.
4. Includes primidone and thiopental.
5. Amlodipine, felodipine, and nifedipine thought to be safe.
6. Progestogens are more porphyrinogenic than oestrogens; oestrogens may be safe at least in replacement doses.
7. Safety uncertain, contact Welsh Medicines Information Centre for further advice.
8. Applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure.
9. Includes co-trimoxazole and sulfasalazine.
10. Glipizide and glibenclamide are thought to be safe.
11. Although evidence of hazard is uncertain, manufacturer advises avoid.
12. Small amounts in medicines probably safe.
13. May be used with caution if safer alternative not available.
14. Buprenorphine, codeine, diamorphine, dihydrocodeine, fentanyl, methadone, morphone, oxycodone, pethidine, and tramadol are thought to be safe.

| 10.3.2 | Rubefacients, topical NSAIDs, capsaicin, and poultices | 737 |

---

**Rheumatoid arthritis and other inflammatory disorders**

A *non-steroidal anti-inflammatory drug* (NSAID) is indicated for pain and stiffness resulting from inflammatory rheumatic disease; analgesics such as paracetamol or codeine can also be used. For advice on the prophylaxis and treatment of NSAID-associated gastrointestinal ulcers, see p. 51.

Drugs are also used to influence the rheumatic disease process itself (section 10.1.3). For *rheumatoid arthritis* these *disease-modifying antirheumatic drugs* (DMARDs) include methotrexate, cytokine modulators, azathioprine, ciclosporin, cyclophosphamide, leflunomide, penicillamine, gold, antimalarials (chloroquine and hydroxychloroquine), and sulfasalazine. Corticosteroids also have a significant role in the management of rheumatoid arthritis (section 10.1.2.1).

Drugs which may affect the disease process in *psoriatic arthritis* include sulfasalazine, gold, azathioprine, methotrexate, leflunomide, and cytokine modulators (section 10.1.3).

For long-term control of *gout*, xanthine-oxidase inhibitors or uricosuric drugs (section 10.1.4) can be used.

---

**Osteoarthritis and soft-tissue disorders**

For pain relief in osteoarthritis and soft-tissue disorders, paracetamol (section 4.7.1) should be used first and may need to be taken regularly. A *topical NSAID* (section 10.3.2) or *topical capsaicin 0.025%* (section 10.3.2) should also be considered, particularly in knee or hand osteoarthritis. An *oral NSAID* (section 10.1.1) can be substituted for, or used in addition to, paracetamol. If further pain relief is required in osteoarthritis, then the addition of an *opioid analgesic* (section 4.7.2) may be considered, but with a substantial risk of adverse effects; however, an opioid analgesic should be considered.
before a NSAID in patients taking low-dose aspirin. For advice on the prophylaxis and treatment of NSAID-associated gastro-intestinal ulcers, see p. 51.

Intra-articular corticosteroid injections (section 10.1.2.2) may produce temporary benefit in osteoarthrits, especially if associated with soft-tissue inflammation.

Non-drug measures, such as weight reduction and exercise, should also be encouraged.

Glucosamine (section 10.1.5) and rubefacients (section 10.3.2) are not recommended for the treatment of osteoarthritis.

Hyaluronic acid and its derivatives are available for osteoarthritis of the knee, but are not recommended. Sodium hyaluronate (Durosale®, Eulnex®; Ferma-thron®, Hyalgan®®, Orthovic®, Ostenil®, Ostenil Plus®; Abbot 60®, Suplar®; Synocrom®, Reputis®), or hylan G-C F 20 (Sylvance®) is injected intra-articularly to supplement natural hyaluronic acid in the synovial fluid. These injections may reduce pain over 1–6 months, but are associated with a short-term increase in knee inflammation. Sodium hyaluronate (SportVias®) is also licensed for the relief of pain and optimisation of recovery following ankle sprain, and for the relief of chronic pain and disability associated with tennis elbow.

10.1.1 Non-steroidal anti-inflammatory drugs

In single doses non-steroidal anti-inflammatory drugs (NSAIDs) have analgesic activity comparable to that of paracetamol (section 4.7.1), but paracetamol is preferred, particularly in the elderly (see also Prescribing for the Elderly, p. 25).

In regular full dosage NSAIDs have both a lasting analgesic and an anti-inflammatory effect which makes them particularly useful for the treatment of continuous or regular pain associated with inflammation. Therefore, although paracetamol often gives adequate pain control in osteoarthritis, NSAIDs are more appropriate than paracetamol or the opioid analgesics in the inflammatory arthritides (e.g., rheumatoid arthritis) and in some cases of advanced osteoarthritis. NSAIDs can also be of benefit in the less well defined conditions of back pain and soft-tissue disorders.

Choice Differences in anti-inflammatory activity between NSAIDs are small, but there is considerable variation in individual response and tolerance to these drugs. About 10% of patients will respond to any NSAID; of the others, those who do not respond to one may well respond to another. Pain relief starts soon after taking the first dose and a full analgesic effect should normally be obtained within a week, whereas an anti-inflammatory effect may not be achieved (or may not be clinically assessable) for up to 3 weeks. If appropriate responses are not obtained within these times, another NSAID should be tried.

NSAIDs reduce the production of prostaglandins by inhibiting the enzyme cyclo-oxygenase. They vary in their selectivity for inhibiting different types of cyclo-oxygenase; selective inhibition of cyclo-oxygenase-2 is associated with less gastro-intestinal intolerance. Several other factors also influence susceptibility to gastro-intestinal effects, and a NSAID should be chosen on the basis of the incidence of gastro-intestinal and other side-effects.

Ibuprofen is a propionic acid derivative with anti-inflammatory, analgesic, and anti-pyretic properties. It has fewer side-effects than other non-selective NSAIDs but its anti-inflammatory properties are weaker. Doses of 1.6 to 2.4 g daily are needed for rheumatoid arthritis and it is unsuitable for conditions where inflammation is prominent, such as acute gout. Dextibuprofen is the active enantiomer of ibuprofen. It has similar properties to ibuprofen and is licensed for the relief of mild to moderate pain and inflammation.

Other propionic acid derivatives:

Naproxen is one of the first choices because it combines good efficacy with a low incidence of side-effects (but more than ibuprofen, see NSAIDs and Gastro-intestinal Events, below).

Penprofen is as effective as naproxen, and flurbiprofen may be slightly more effective. Both are associated with slightly more gastro-intestinal side-effects than ibuprofen.

Ketoprofen has anti-inflammatory properties similar to ibuprofen and has more side-effects (see also NSAIDs and Gastro-Intestinal Events, below).

Dexketoprofen, an isomer of ketoprofen, has been introduced for the short-term relief of mild to moderate pain.

Tiaprofenic acid is as effective as naproxen; it has more side-effects than ibuprofen (important: reports of severe cystitis, see CSM advice on p. 712).

Drugs with properties similar to those of propionic acid derivatives:

Diclofenac and aceclofenac are similar in efficacy to naproxen.

Etodolac is comparable in efficacy to naproxen; it is licensed for symptomatic relief of osteoarthritis and rheumatoid arthritis.

Indometacin has an action equal to or superior to that of naproxen, but with a high incidence of side-effects including headache, dizziness, and gastro-intestinal disturbances (see also NSAIDs and Gastro-intestinal Events, below).

Mefenamic acid has minor anti-inflammatory properties. It has occasionally been associated with diarrhoea and haemolytic anaemia which require discontinuation of treatment.

Meloxicam is licensed for the short-term relief of pain in osteoarthritis and for long-term treatment of rheumatoid arthritis and ankylosing spondylitis.

Nabumetone is comparable in effect to naproxen.

Phenylbutazone is licensed for ankylosing spondylitis, but is not recommended because it is associated with serious side-effects, in particular haematological reactions; it should be used only by a specialist in severe cases where other treatments have been found unsuitable.

Piroxicam is as effective as naproxen and has a long duration of action which permits once-daily administration. However, it has more gastro-intestinal side-effects than most other NSAIDs, and is associated with more frequent serious skin reactions (important: see CHMP advice, p. 711).
Celecoxib is similar in tolerance to naproxen.

**Tenoxicam** is similar in activity and tolerance to naproxen. Its long duration of action allows once-daily administration.

Tolafenamic acid is licensed for the treatment of migraine (section 4.7.1.1).

**Ketorolac** and the selective inhibitor of cyclo-oxygenase-2, parecoxib, are licensed for the short-term management of postoperative pain (section 15.1.4.2).

The selective inhibitors of cyclo-oxygenase-2, etoricoxib and celecoxib, are as effective as non-selective NSAIDs such as diclofenac and naproxen. Although selective inhibitors can cause serious gastro-intestinal events, available evidence appears to indicate that the risk of serious upper gastro-intestinal events is lower with selective inhibitors compared to non-selective NSAIDs; this advantage may be lost in patients who require concomitant low-dose aspirin.

Celecoxib and etoricoxib are licensed for the relief of pain in osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis; etoricoxib is also licensed for the relief of pain from acute gout.

**Dental and orofacial pain** Most mild to moderate dental pain and inflammation is effectively relieved by NSAIDs. Those used for dental pain include ibuprofen and diclofenac.

For information on the risks of serious gastro-intestinal side-effects of NSAIDs, see p. 704.

For further information on the management of dental and orofacial pain, see p. 274.

**Cautions and contra-indications** NSAIDs should be used with caution in the elderly (risk of serious side-effects and fatalities, see also Prescribing for the Elderly p. 25), in allergic disorders (they are contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID), and in coagulation defects. Long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment. Caution is also required in patients with connective-tissue disorders, see Side-effects below.

In patients with cardiac impairment, caution is required since NSAIDs may impair renal function (see also Side-effects, below). All NSAIDs are contra-indicated in severe heart failure. *Diclofenac* and the selective inhibitors of cyclo-oxygenase-2 (*celecoxib*, *etoricoxib*, and *parecoxib*) are contra-indicated in ischaemic heart disease, cerebrovascular disease, peripheral arterial disease, and mild to severe heart failure. They should be used with caution in patients with a history of cardiac failure, left ventricular dysfunction, hypertension, in patients with oedema for any other reason, and in patients with other risk factors for cardiovascular events. Other non-selective NSAIDs should be used with caution in uncontrolled hypertension, heart failure, ischaemic heart disease, peripheral arterial disease, cerebrovascular disease, and when used long term in patients with risk factors for cardiovascular events.

**NSAIDs and cardiovascular events** All NSAID use (including cyclo-oxygenase-2 selective inhibitors) can, to varying degrees, be associated with a small increased risk of thrombotic events (e.g. myocardial infarction and stroke) independent of baseline cardiovascular risk factors or duration of NSAID use; however, the greatest risk may be in those receiving high doses long term.

Cyclo-oxygenase-2 selective inhibitors, diclofenac (150 mg daily) and ibuprofen (2.4 g daily) are associated with an increased risk of thrombotic events. The increased risk for diclofenac is similar to that of licensed doses of *etoricoxib*. Naproxen (1 g daily) is associated with a lower thrombotic risk, and low doses of ibuprofen (1.2 g daily or less) have not been associated with an increased risk of myocardial infarction.

The lowest effective dose of NSAID should be prescribed for the shortest period of time to control symptoms and the need for long-term treatment should be reviewed periodically.

All NSAIDs (including cyclo-oxygenase-2 selective inhibitors) are contra-indicated in patients with active gastro-intestinal ulceration or bleeding. Piroxicam, ketoprofen, and ketorolac are contra-indicated in patients with any history of gastro-intestinal bleeding, ulceration, or perforation. Other non-selective NSAIDs are contra-indicated in patients with a history of recurrent gastro-intestinal ulceration or haemorrhage (two or more distinct episodes), and in patients with a history of gastro-intestinal bleeding or perforation related to previous NSAID therapy (see also, p. 704). While it is preferable to avoid NSAIDs in patients with active or previous gastro-intestinal ulceration or bleeding, and to withdraw them if gastrointestinal lesions develop, nevertheless patients with serious rheumatic diseases (e.g. rheumatoid arthritis) are usually dependent on NSAIDs for effective relief of pain and stiffness. Patients at risk of gastro-intestinal ulceration (including the elderly), who need NSAID treatment should receive gastroprotective treatment; for advice on the prophylaxis and treatment of NSAID-associated gastro-intestinal ulcers, see section 1.3. NSAIDs should also be used with caution in Crohn’s disease or ulcerative colitis, as these conditions may be exacerbated.

For interactions of NSAIDs, see Appendix 1 (NSAIDs).

**Hepatic impairment** NSAIDs should be used with caution in patients with hepatic impairment; there is an increased risk of gastro-intestinal bleeding and fluid retention. NSAIDs should be avoided in severe liver disease; see also individual drugs.

**Renal impairment** NSAIDs should be avoided if possible or used with caution in patients with renal impairment; the **lowest effective dose** should be used for the **shortest possible duration**, and renal function should be **monitored**. Sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure; deterioration in renal function has also been reported after topical use; see also individual drugs.

**Pregnancy** Most manufacturers advise avoiding the use of NSAIDs during pregnancy or avoiding them unless the potential benefit outweighs the risk. NSAIDs should be avoided during the third trimester because use is associated with a risk of closure of fetal ductus.
arteriosus in utero and possibly persistent pulmonary hypertension of the newborn. In addition, the onset of labour may be delayed and its duration may be increased. See also individual monographs for celecoxib and etoricoxib.

Breast-feeding NSAIDs should be used with caution during breast-feeding; see also individual drugs.

Side-effects Gastro-intestinal disturbances including discomfort, nausea, diarrhoea, and occasionally bleeding and ulceration occur (see also NSAIDs and Gastro-intestinal Events; below and Cautions above). Systemic as well as local effects of NSAIDs contribute to gastrointestinal damage; taking oral formulations with milk or food, or using enteric-coated formulations, or changing the route of administration may only partially reduce symptoms such as dyspepsia.

NSAIDs and gastro-intestinal events All NSAIDs are associated with serious gastro-intestinal toxicity; the risk is higher in the elderly. Evidence on the relative safety of non-selective NSAIDs indicates differences in the risks of serious upper gastro-intestinal side-effects—piroxicam (see also CHMP advice, p. 711), ketoprofen, and ketorolac are associated with the highest risk; indometacin, diclofenac, and naproxen are associated with intermediate risk, and ibuprofen with the lowest risk (although high doses of ibuprofen have been associated with intermediate risk). Selective inhibitors of cyclo-oxygenase-2 are associated with a lower risk of serious upper gastro-intestinal side-effects than non-selective NSAIDs.

Recommendations are that NSAIDs associated with a low risk e.g. ibuprofen are generally preferred; to start at the lowest recommended dose and not to use more than one oral NSAID at a time. See also Cautions and Contra-indications, p. 703. The combination of a NSAID and low-dose aspirin can increase the risk of gastro-intestinal side-effects; this combination should be used only if absolutely necessary and the patient should be monitored closely.

Other side-effects include hypersensitivity reactions (particularly rashes, angioedema, and bronchospasm—see below), headache, dizziness, nervousness, depression, drowsiness, insomnia, vertigo, hearing disturbances such as tinnitus, photosensitivity, and haematuria. Blood disorders have also occurred. Fluid retention may occur (rarely precipitating congestive heart failure); blood pressure may be raised.

Asthma Any degree of worsening of asthma may be related to the ingestion of NSAIDs, either prescribed or (in the case of ibuprofen and others) purchased over the counter.

Renal failure may be provoked by NSAIDs, especially in patients with pre-existing renal impairment (important, see Renal impairment, above). Rarely, papillary necrosis or interstitial fibrosis associated with NSAIDs can lead to renal failure. Hepatic damage, alveolitis, pulmonary eosinophilia, pancreatitis, visual disturbances, Stevens-Johnson syndrome, and toxic epidermal necrolysis are other rare side-effects. Induction of or exacerbation of colitis or Crohn’s disease has been reported. Aseptic meningitis has been reported rarely with NSAIDs—patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible.

Overdosage: see Emergency Treatment of Poisoning, p. 35.

ACELOFENAC

Indications pain and inflammation in rheumatoid arthritis, osteoarthritis and ankylosing spondylitis

Cautions see notes above; avoid in acute porphyria (section 9.8.2)

Contra-indications see notes above

Hepatic impairment initially 100 mg daily; see also notes above

Renal impairment avoid in moderate to severe impairment; see also notes above

Pregnancy see notes above

Breast-feeding manufacturer advises avoid; see also notes above

Side-effects see notes above

Dose
- 100 mg twice daily; CHILD not recommended

Acelofenac (Non-proprietary) Tablets, acelofenac 100 mg, net price 60-tab pack = £9.63. Label: 21

Preservex® (Almirall) Tablets, f/c, acelofenac 100 mg, net price 60-tab pack = £9.63. Label: 21

ACEMETACIN (Glycolic acid ester of indometacin)

Indications pain and inflammation in rheumatic disease and other musculoskeletal disorders; postoperative analgesia

Cautions see under Indometacin and notes above

Driving Dizziness may affect performance of skilled tasks (e.g. driving)

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment see notes above

Pregnancy see notes above

Breast-feeding manufacturer advises avoid; see also notes above

Side-effects see under Indometacin and notes above

Dose
- 120 mg daily in divided doses with food, increased if necessary to 180 mg daily; CHILD not recommended

Emflex® (Merck Serono) Capsules, yellow/orange, acemetacin 60 mg, net price 90-cap pack = £28.20. Label: 21, counselling, driving

CELECOXIB

Indications pain and inflammation in osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis

Cautions see notes above; monitor blood pressure before and during treatment

Contra-indications see notes above; sulfonamide sensitivity; inflammatory bowel disease

Hepatic impairment halve initial dose in moderate impairment; see also notes above
Renal impairment  avoid if eGFR less than 30 mL/minute/1.73 m$^2$; see also notes above

Pregnancy  avoid (teratogenic in animal studies); see also notes above

Breast-feeding  avoid—present in milk in animal studies; see also notes above

Side-effects  see notes above; dyspnoea, influenza-like symptoms; less commonly stomatitis, palpitation, cerebral infarction, fatigue, paraesthesia, muscle cramps; rarely taste disturbance, alopecia; very rarely seizures; also reported chest pain

Dose
- Osteoarthritis, 200 mg daily in 1–2 divided doses, increased if necessary to max. 300 mg daily; CHILD not recommended
- Rheumatoid arthritis, 100 mg twice daily, increased if necessary to max. 200 mg twice daily; CHILD not recommended
- Ankylosing spondylitis, 200 mg daily in 1–2 divided doses, increased if necessary to max. 400 mg daily in 1–2 divided doses; CHILD not recommended

Note  Discontinue if no improvement after 2 weeks on max. dose

Celebrex® (Pharmacia)  Tablets, 100 mg, red, net price 60-tab pack = £21.55; 200 mg (white/gold), 30-tab pack = £42.30

### DEXIBUPROFEN

**Indications**  pain and inflammation associated with osteoarthritis and other musculoskeletal disorders; mild to moderate pain and inflammation including dysmenorrhoea and dental pain

**Cautions**  see notes above

**Contra-indications**  see notes above

**Hepatic impairment**  see notes above

**Renal impairment**  reduce initial dose; avoid if eGFR less than 30 mL/minute/1.73 m$^2$; see also notes above

**Pregnancy**  see notes above

**Breast-feeding**  present in milk—but risk to infant minimal; see also notes above

**Side-effects**  see notes above

**Dose**
- 600–900 mg daily in up to 3 divided doses; increased if necessary to max. 1.2 g daily (900 mg daily for dysmenorrhoea); max. single dose 400 mg (300 mg for dysmenorrhoea); CHILD not recommended

Seractil® (Genus)  Tablets, f/c, scored, dexketoprofen (as trometamol) 25 mg, net price 20-tab pack = £3.67, 50-tab pack = £9.18. Label: 22

### DEXKETOPROFEN

**Indications**  short-term treatment of mild to moderate pain including dysmenorrhoea

**Cautions**  see notes above

**Contra-indications**  see notes above

**Hepatic impairment**  reduce initial dose to max. 50 mg daily in mild to moderate impairment; see also notes above

**Renal impairment**  reduce initial dose to 50 mg daily; avoid in moderate to severe impairment; see also notes above

**Pregnancy**  see notes above

**Breast-feeding**  manufacturer advises avoid—no information available; see also notes above

**Side-effects**  see notes above

**Dose**
- 12.5 mg every 4–6 hours or 25 mg every 8 hours; max. 75 mg daily; ELDERLY initially max. 50 mg daily; CHILD not recommended

Keral® (Menarini)  Tablets, f/c, scored, dexketoprofen (as trometamol) 25 mg, net price 20-tab pack = £3.67, 50-tab pack = £9.18. Label: 22

### DICLOFENAC POTASSIUM

**Indications**  pain and inflammation in rheumatic disease and other musculoskeletal disorders; acute gout; postoperative pain; migraine; fever in ear, nose, or throat infection in children

**Cautions**  see notes above

**Contra-indications**  see notes above

**Renal impairment**  avoid in severe impairment; see also notes above

**Hepatic impairment**  see notes above

**Pregnancy**  see notes above

**Breast-feeding**  amount in milk too small to be harmful; see also notes above

**Side-effects**  see notes above

**Dose**
- Rheumatic disease, musculoskeletal disorders, acute gout, 75–150 mg daily in 2–3 divided doses; CHILD over 14 years, 75–100 mg daily in 2–3 divided doses
- Postoperative pain, 75–150 mg daily in 2–3 divided doses; CHILD 9–14 years (body-weight 35 kg and over), up to 2 mg/kg (max. 100 mg) daily in 3 divided doses; CHILD over 14 years, 75–100 mg daily in 2–3 divided doses
- Migraine, 50 mg at onset, repeated after 2 hours if necessary then after 4–6 hours; max. 200 mg in 24 hours; CHILD not recommended
- Fever in ear, nose, or throat infection, CHILD over 9 years (body-weight 35 kg and over), up to 2 mg/kg (max. 100 mg) daily in 3 divided doses

Diclofenac Potassium (Non-proprietary)  Tablets, diclofenac potassium 25 mg, net price 28-tab pack = £3.23, 50-mg (brown), 28-tab pack = £6.18. Label: 21

Voltarol® Rapid (Novartis)  Tablets, s/c, diclofenac potassium 25 mg (red), net price 30-tab pack = £3.46, 50 mg (brown), 30-tab pack = £6.62. Label: 21

### DICLOFENAC SODIUM

**Indications**  pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders; acute gout; postoperative pain

**Cautions**  see notes above

1. 12.5 mg tablets can be sold to the public for the treatment of headache, dental pain, period pain, rheumatic and muscular pain, backache and the symptoms of cold and flu (including fever), in patients aged over 14 years subject to max. single dose of 25 mg. max. daily dose of 75 mg for max. 3 days, and max. pack size of 18 × 12.5 mg
Contra-indications see notes above; avoid suppositories in proctitis; avoid injections containing benzyl alcohol in neonates (see preparations below)

Intravenous use Additional contra-indications include concurrent NSAID or anticoagulant use (including low-dose heparins), history of haemorrhagic diathesis, history of confirmed or suspected cerebrovascular bleeding, operations with high risk of haemorrhage, history of asthma, moderate or severe renal impairment (see also Renal impairment below), hypovolaemia, dehydration;

Hepatic impairment see notes above

Renal impairment avoid in severe impairment; avoid intravenous use if serum creatinine greater than 160 micromol/litre; see also notes above

Pregnancy see notes above

Breast-feeding amount in milk too small to be harmful; see also notes above

Side-effects see notes above; suppositories may cause rectal irritation; injection site reactions

Dose
- By mouth, 75–150 mg daily in 2–3 divided doses
- By rectum in suppositories, 75–150 mg daily in divided doses
- Juvenile idiopathic arthritis, CHILD 6 months–18 years, by mouth, see BNF for Children
- Postoperative pain, CHILD 6 months–18 years, by rectum, see BNF for Children

Diclofenac Sodium (Non-proprietary) Tablets, e/c, diclofenac sodium 25 mg, net price 84-tab pack = £1.25; 50 mg, 84-tab pack = £1.10. Label: 5, 25

Brands include Defenac®, Defocloflex®, Diclozap®, Fenacot®, Flamaron®

Dental prescribing on NHS Diclofenac Sodium Tablets may be prescribed

Suppositories, diclofenac sodium 100 mg, net price 10 = £3.03

Brands include Econac®

Dyloject® (Therabel) injection, diclofenac sodium 37.5 mg/mL, net price 2-mL vial = £4.80

Note May be difficult to obtain

Dose by deep intramuscular injection into the gluteal muscle, acute exacerbations of pain and postoperative pain, 75 mg once daily (twice daily in severe cases) for max. 2 days

Ureteric colic, 75 mg then a further 75 mg after 30 minutes if necessary

By intravenous injection (in supervised settings), acute postoperative pain, 75 mg repeated after 4–6 hours if necessary; max. 150 mg in 24 hours for 2 days

Prevention of postoperative pain, initially after surgery 25–50 mg over 15–60 minutes then 5 mg/hour; max. 150 mg in 24 hours for 2 days

Dose by deep intramuscular injection into the gluteal muscle, acute exacerbations of pain and postoperative pain, 75 mg once daily (twice daily in severe cases) for max. 2 days; CHILD 2–18 years, see BNF for Children

Urretic colic, 75 mg then a further 75 mg after 30 minutes if necessary

Dose by deep intramuscular injection into the gluteal muscle, acute exacerbations of pain and postoperative pain, 75 mg once daily (twice daily in severe cases) for max. 2 days

Prevention of postoperative pain, initially after surgery 25–50 mg over 15–60 minutes then 5 mg/hour; max. 150 mg in 24 hours for 2 days

Injection, diclofenac sodium 25 mg/mL, net price 3-mL amp = 83p

Excipients include benzyl alcohol (avoid in neonates unless there is no safer alternative, see Excipients, p. 2), propylene glycol

Dose by deep intramuscular injection into the gluteal muscle, acute exacerbations of pain and postoperative pain, 75 mg once daily (twice daily in severe cases) for max. 2 days; CHILD 2–18 years, see BNF for Children

Prevention of postoperative pain, initially after surgery 25–50 mg over 15–60 minutes then 5 mg/hour; max. 150 mg in 24 hours for 2 days

Suppositories, diclofenac sodium 12.5 mg, net price 10 = 58p; 25 mg, 10 = £1.03; 50 mg, 10 = £1.70; 100 mg, 10 = £3.03

Modifying release

Diclomax® (Galen) Capsules, m/r, yellow, diclofenac sodium 75 mg, net price 28-cap pack = £6.97. Label: 21, 25

Dose ADULT over 18 years, 1 capsule 1–2 times daily or 2 capsules once daily; CHILD 12–18 years see BNF for Children

Diclomax Retard® (Galen) Capsules, m/r, diclofenac sodium 100 mg, net price 28-cap pack = £8.00. Label: 25

Dose ADULT over 18 years, 1 capsule once daily; CHILD 12–18 years see BNF for Children

Motifene® 75 mg (Daichi Sankyo) Capsules, e/c, m/r, diclofenac sodium 75 mg (enclosing e/c pellets containing diclofenac sodium 25 mg and m/r pellets containing diclofenac sodium 50 mg), net price 56-cap pack = £8.00. Label: 25

Excipients include propylene glycol (see Excipients, p. 2)

Dose ADULT over 18 years, 1 capsule 1–2 times daily; CHILD 12–18 years see BNF for Children

Voltarol® 75 mg SR (Novartis) Tablets, m/r, f/c, pink, diclofenac sodium 75 mg, net price 28-cap pack = £6.46; 56-tab pack = £12.92. Label: 21, 25

Dose ADULT over 18 years, 1 tablet 1–2 times daily; CHILD 12–18 years see BNF for Children

Note Other brands of modified-release tablets containing diclofenac sodium 75 mg include Defenac® SR, Desxon® 75 SR, Dicloflex® 75 SR, Fenacot® 75 mg SR, Flumaton® 75 MR, Flumaron® SR, Flexor® 75 MR 75, Rhumalac® Retard 75, Rhumalgan® CR, Slofenac® SR, Volusal® Retard 75

Voltarol® Retard (Novartis) Tablets, m/r, f/c, red, diclofenac sodium 100 mg, net price 28-tab pack = £9.47. Label: 21, 25

Dose ADULT over 18 years, 1 tablet over 18 times daily; CHILD 12–18 years see BNF for Children

Note Other brands of modified-release tablets containing diclofenac sodium 100 mg include Defenac® Retard, Desxon® Retard 100, Dicloflex® Retard, Fenacot® Retard 100 mg, Flumaton® 100 MR, Slofenac® SR, Volusal® Retard 100

With misoprostol

For prescribing information on misoprostol, see section 1.3.4

Arthrotec® (Pharmacia) Tablets, e/c, diclofenac sodium (in e/c core) 50 mg, misoprostol 200 micrograms, net price 60-tab pack = £11.98. Label: 21, 25

Dose prophylaxis against NSAID-induced gastrointestinal ulceration in patients requiring diclofenac for rheumatoid
arthritis or osteoarthritis, 1 tablet 2–3 times daily with food; CHILD not recommended  

**Arthrotec®** 75 tablets, diclofenac sodium (in e/c core) 75 mg, misoprostol 200 micrograms, net price 60-tab pack = £15.83. Label: 21, 25  

**Dose** prophyaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis, 1 tablet twice daily with food; CHILD not recommended  

**Note** The BNF recommends a higher starting dose of misoprostol for prophylaxis against NSAID-induced gastroduodenal ulceration than that provided by Arthrotec® (see section 1.3.4)  

**Misofen®** (Morningside)  

Tablets, diclofenac sodium (in e/c core) 50 mg, misoprostol 200 micrograms, net price 60-tab pack = £11.98. Label: 21, 25  

**Dose** prophyaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis, 1 tablet 2–3 times daily with food; CHILD not recommended  

Tablets, diclofenac sodium (in e/c core) 75 mg, misoprostol 200 micrograms, net price 60-tab pack = £15.83. Label: 21, 25  

**Dose** prophyaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis, 1 tablet twice daily with food; CHILD not recommended  

**Note** The BNF recommends a higher starting dose of misoprostol for prophylaxis against NSAID-induced gastroduodenal ulceration than that provided by Misofen® (see section 1.3.4)

**Topical preparations**  
Section 10.3.2

---

**ETODOLOAC**

**Indications** pain and inflammation in rheumatoid arthritis and osteoarthritis  

**Cautions** see notes above  

**Contra-indications** see notes above  

**Hepatic impairment** see notes above  

**Renal impairment** avoid in severe impairment; see also notes above  

**Pregnancy** see notes above  

**Breast-feeding** manufacturer advises avoid; see also notes above  

**Side-effects** see notes above; also stomatitis, vascularitis, palpitation, dyspnoea, confusion, fatigue, paraesthesia, tremor, urinary frequency, dysuria, pyrexia, and pruritus  

**Dose**  

- **ADULT** over 18 years, 300–600 mg daily in 1–2 divided doses  

**Etodolac** (Non-proprietary)  

- **Capsules**, etodolac 300 mg, net price 60-cap pack = £8.14  

**Brands include** Eccoxolac®

**Modified release**  

**Etopan XL®** (Taro)  

- **Tablets**, m/r, f/c, grey, etodolac 600 mg, net price 30-tab pack = £14.60. Label: 25  

**Dose** 1 tablet daily. CHILD not recommended  

**Lodine SR®** (Almirall)  

- **Tablets**, m/r, f/c, light-grey, etodolac 600 mg, net price 30-tab pack = £15.50. Label: 25  

**Dose** 1 tablet daily. CHILD not recommended

---

**ETORICOXIB**

**Indications** pain and inflammation in osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis; acute gout  

**Cautions** see notes above; also dehydration; monitor blood pressure before treatment, 2 weeks after initiation and periodically during treatment  

**Contra-indications** see notes above; inflammatory bowel disease; uncontrolled hypertension (persistently above 140/90 mmHg)  

**Hepatic impairment** max. 60 mg daily in mild impairment; max. 60 mg on alternate days or 30 mg once daily in moderate impairment; see also notes above  

**Renal impairment** avoid if eGFR less than 30 mL/minute/1.73 m²; see also notes above  

**Pregnancy** manufacturer advises avoid (teratogenic in animal studies); see also notes above  

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies; see also notes above  

**Side-effects** see notes above; also palpitation, fatigue, influenza-like symptoms, ecchymosis; less commonly dry mouth, taste disturbance, mouth ulcer, appetite and weight change, atrial fibrillation, transient ischaemic attack, chest pain, flushing, cough, dyspnoea, epistaxis, anxiety, mental acuity impaired, paraesthesia, electrolyte disturbance, myalgia and arthralgia; very rarely confusion and hallucinations  

**Dose**  

- Osteoarthritis, **ADULT** and **CHILD** over 16 years, 30 mg once daily, increased if necessary to 60 mg once daily  

- Rheumatoid arthritis and ankylosing spondylitis, **ADULT** and **CHILD** over 16 years, 90 mg once daily  

- Acute gout, **ADULT** and **CHILD** over 16 years, 120 mg once daily for max. 8 days  

**Arcoxia®** (MSD)  

- **Tablets**, f/c, etoricoxib 30 mg (blue-green), net price 28-tab pack = £13.99; 60 mg (dark green), 28-tab pack = £20.11; 90 mg (white), 28-tab pack = £22.96; 120 mg (pale green), 7-tab pack = £6.03, 28-tab pack = £24.11

---

**FENOPROFEN**

**Indications** pain and inflammation in rheumatic disease and other musculoskeletal disorders; mild to moderate pain  

**Cautions** see notes above  

**Contra-indications** see notes above  

**Hepatic impairment** see notes above  

**Renal impairment** see notes above  

**Pregnancy** see notes above  

**Breast-feeding** amount too small to be harmful; see also notes above  

**Side-effects** see notes above; upper respiratory-tract infection, nasopharyngitis, and cystitis also reported  

**Dose**  

- 300–600 mg 3–4 times daily; max. 3 g daily; **CHILD** not recommended  

**Fenoprofen®** 300 (Typharm)  

- **Tablets**, orange, fenoprofen (as calcium salt) 300 mg, net price 100-tab pack = £9.45 Label: 21

---

10 Musculoskeletal and joint diseases
FLURBIPROFEN

**Indications**  pain and inflammation in rheumatic disease and other musculoskeletal disorders; mild to moderate pain including dysmenorrhoea; migraine; postoperative analgesia; sore throat (section 12.3.1)

**Cautions**  see notes above

**Contra-indications**  see notes above

**Hepatic impairment**  see notes above

**Renal impairment**  avoid in severe impairment; see also notes above

**Pregnancy**  see notes above

**Breast-feeding**  small amount present in milk—manufacturer advises avoid; see also notes above

**Side-effects**  see notes above; also stomatitis; confusion, hallucinations, and fatigue

**Dose**
- **ADULT** and **CHILD** over 12 years, 150–200 mg daily in 2–4 divided doses, increased in acute conditions to 300 mg daily
- **Dysmenorrhoea**, **ADULT** and **CHILD** over 12 years, initially 100 mg, then 50–100 mg every 4–6 hours; max. 300 mg daily

**Flurbiprofen** (Non-proprietary)  Tablets, flurbiprofen 50 mg, net price 100 = £10.27; 100 mg, 100 = £19.46. Label: 21

**Froben** (Abbott Healthcare)  Tablets, yellow, s/c, flurbiprofen 50 mg, net price 100 = £10.27; 100 mg, 100 = £19.46. Label: 21

IBUPROFEN

**Indications**  pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders; mild to moderate pain including dysmenorrhoea; postoperative analgesia; migraine; dental pain; fever with discomfort and pain in children; post-immunisation pyrexia (section 14.1)

**Cautions**  see notes above

**Contra-indications**  see notes above

**Hepatic impairment**  see notes above

**Renal impairment**  avoid in severe impairment; see also notes above

**Pregnancy**  see notes above

**Breast-feeding**  amount too small to be harmful but some manufacturers advise avoid (including topical use); see also notes above

**Side-effects**  see notes above

**Dose**
- **ADULT** and **CHILD** over 12 years, initially 100 mg, then 50–100 mg every 4–6 hours; max. 300 mg daily
- **CHILD** 1–3 months, see **BNF for Children**; **CHILD** 3–6 months (body-weight over 5 kg), 50 mg 3 times daily (max. 30 mg/kg daily in 3–4 divided doses); **CHILD** 6 months–1 year, 50 mg 3–4 times daily (max. 30 mg/kg daily in 3–4 divided doses); **CHILD** 1–4 years, 100 mg 3 times daily (max. 30 mg/kg daily in 3–4 divided doses); **CHILD** 4–7 years, 150 mg 3 times daily (max. 30 mg/kg daily in 3–4 divided doses); **CHILD** 7–10 years, 200 mg 3 times daily (up to 30 mg/kg daily (max. 2.4 g) in 3–4 divided doses); **CHILD** 10–12 years, 300 mg 3 times daily (up to 30 mg/kg daily (max. 2.4 g) in 3–4 divided doses)

**Ibuprofen** (Non-proprietary)  Tablets, coated, ibuprofen 200 mg, net price 84-tab pack = £3.08; 400 mg, 84-tab pack = £3.15; 600 mg, 84-tab pack = £6.93. Label: 21

**Brufen** (Abbott Healthcare)  Tablets, 1/4, ibuprofen 200 mg, net price 100-tab pack = £3.92; 400 mg, 100-tab pack = £8.16; 600 mg, 100-tab pack = £12.24. Label: 21

**Syrup**, orange, ibuprofen 100 mg/5 mL, net price 500 mL (orange-flavoured) = £8.88. Label: 21

**Granules**, effervescent, ibuprofen 600 mg/sachet, net price 20-sachet pack = £8.80. Label: 13, 21

**Electrolytes**  **Na** (sugar-free) approx. 6.5 mmol/sachet

**Modified release**

**Brufen Retard** (Abbott Healthcare)  Tablets, m/r, ibuprofen 600 mg, net price 56-tab pack = £7.74. Label: 25, 27

**Dose**  **ADULT** and **CHILD** over 12 years, 2 tablets daily as a single dose, preferably in the early evening, increased in severe cases to 3 tablets daily in 2 divided doses

**Topical preparations**  Section 10.3.2

INDOMETACIN

(Indomethacin)

**Indications**  pain and moderate to severe inflammation in rheumatic disease and other acute musculoskeletal disorders; acute gout; dysmenorrhoea; premature labour (section 7.1.3)

**Cautions**  see notes above; also epilepsy, parkinsonism, psychiatric disturbances; during prolonged therapy ophthalmic and blood examinations particularly advisable; avoid rectal administration in proctitis and haemorrhoids

**Driving**  Dizziness may affect performance of skilled tasks (e.g. driving)

**Contra-indications**  see notes above

**Hepatic impairment**  see notes above

**Renal impairment**  avoid in severe impairment; see also notes above

**Pregnancy**  see notes above

**Breast-feeding**  amount probably too small to be harmful—manufacturers advise avoid; see also notes above

**Side-effects**  see notes above; rarely confusion, convulsions, psychiatric disturbances, syncope, blood

1. Can be sold to the public in certain circumstances
orders (particularly thrombocytopenia), hyper-glycaemia, peripheral neuropathy, intestinal stric-
tures; also reported hyperkalaemia; suppositories may
cause rectal irritation and occasional bleeding

**Dose**

- By mouth, rheumatic disease, 50–200 mg daily in
divided doses; CHILD see BNF for Children

Acute gout, 150–200 mg daily in divided doses

Dysmenorrhoea, up to 75 mg daily

- By rectum in suppositories, 100 mg at night and in the
morning if required; CHILD not recommended

Combined oral and rectal treatment, max. total daily
dose 150–200 mg

**Indometacin** (Non-proprietary) 

*Capsules,* indometacin 25 mg, net price 28-cap pack

= £1.17; 50 mg, 28-cap pack = £1.22. Label: 21,
counselling, driving, see above

*Suppositories,* indometacin 100 mg, net price 10 =

£17.61. Counselling, driving, see above

**Modified release**

**Indometacin** m/r preparations 

*Capsules,* m/r, indometacin 75 mg. Label: 21, 25,
counselling, driving, see above

*Brands include* *Indolar SR*®, *Pardelprin* ®

*Dose* 75 mg, 1–2 times daily (once daily in
dysmenorrhoea); CHILD not recommended

**KETOPROFEN**

**Indications** pain and mild inflammation in rheumatic
disease and other musculoskeletal disorders, and after
orthopaedic surgery; acute gout; dysmenorrhoea

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; see
also notes above

**Pregnancy** see notes above

**Breast-feeding** amount probably too small to be
harmful but manufacturers advise avoid; see also
notes above

**Side-effects** see notes above; suppositories may
cause rectal irritation

**Dose**

- By mouth, rheumatic disease, 100–200 mg daily in 2–
4 divided doses; CHILD not recommended

Pain and dysmenorrhoea, 50 mg up to 3 times daily;
CHILD not recommended

- By rectum in suppositories, rheumatic disease, 100 mg
at bedtime; CHILD not recommended

Combined oral and rectal treatment, max. total daily
dose 200 mg

**Ketoprofen** (Non-proprietary) 

*Capsules,* ketoprofen 50 mg, net price 28-cap pack

= £9.32; 100 mg, 56-cap pack = £6.66. Label: 21

*Orudis*® (Sanofi-Aventis) 

*Capsules,* ketoprofen 50 mg (green/purple), net
price 112-cap pack = £15.14; 100 mg (pink), 56-cap
pack = £15.49. Label: 21

*Suppositories,* ketoprofen 100 mg. Net price 10 =

£6.65

**MEFENAMIC ACID**

**Indications** pain and inflammation in rheumatoid
arthritis and osteoarthritis; postoperative pain; mild to
moderate pain; dysmenorrhoea and menorrhagia

**Cautions** see notes above; epilepsy; acute porphyria

(section 9.8.2)

**Contra-indications** see notes above; inflammatory
bowel disease

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; see
also notes above

**Pregnancy** see notes above

**Breast-feeding** amount too small to be harmful but
manufacturer advises avoid; see also notes above

**Side-effects** see notes above; diarrhea or rashes
(withdraw treatment), stomatitis; less commonly
polyarthritis and fatigue; rarely hypotension, palpita-
tion, glucose intolerance, thrombocytopenia, haemo-
lytic anaemia (positive Coombs’ test), and aplastic
anaemia

**Dose**

- ADULT over 18 years, 500 mg 3 times daily

- CHILD 12–18 years, acute pain including dysmenorr-
hoea, menorrhagia, 500 mg 3 times daily

**Mefenamic Acid** (Non-proprietary) 

*Capsules,* mefenamic acid 50 mg, net price 100-
cap pack = £2.17. Label: 21

*Tablets,* mefenamic acid 500 mg, net price 28-tab
pack = £1.66. Label: 21

*Suspension,* mefenamic acid 50 mg/5 mL, net price
125 mL = £79.98. Label: 21

*Excipients* include ethanol
Meloxicam

**Indications** pain and inflammation in rheumatic disease, exacerbation of osteoarthritis (short-term), ankylosing spondylitis

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid if eGFR less than 25 mL/minute/1.73 m²; see also notes above

**Pregnancy** see notes above

**Breast-feeding** amount too small to be harmful but manufacturer advises avoid; see also notes above

**Side-effects** see notes above

**Dose**
- Oral: meloxicam 7.5 mg once daily, reduced to 7.5 mg once daily in elderly
- Oral: meloxicam 15 mg once daily, increased if necessary to max. 15 mg once daily
- Oral: meloxicam 7.5 mg once daily, increased if necessary to max. 15 mg once daily in children

**Contra-indications** see notes above

Meloxicam (Non-proprietary)

**Tablets** meloxicam 7.5 mg, net price 30-tab pack = £1.03; 15 mg, 30-tab pack = £1.13. Label: 21

Nabumetone

**Indications** pain and inflammation in osteoarthritis and rheumatoid arthritis

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** manufacturer advises avoid; see also notes above

**Side-effects** see notes above

**Dose**
- Oral: nabumetone 500 mg, divided doses, max. 3 g daily
- Oral: nabumetone 1 g, once daily
- Oral: nabumetone 1 g, divided doses, max. 3 g daily

**Contra-indications** see notes above

Nabumetone (Non-proprietary)

**Tablets** nabumetone 500 mg, net price 56-tab pack = £8.55. Label: 21

Relifex® (Meda)

**Tablets** red, f/c, nabumetone 500 mg. Net price 56-tab pack = £6.18. Label: 21

**Suspension** sugar-free, nabumetone 500 mg/5 mL. Net price 300-mL pack = £28.90. Label: 21

Naproxen

**Indications** pain and inflammation in rheumatic disease, including juvenile idiopathic arthritis and other musculoskeletal disorders; dysmenorrhoea; acute gout

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid if eGFR less than 30 mL/minute/1.73 m²; see also notes above

**Pregnancy** see notes above

**Breast-feeding** amount too small to be harmful but manufacturer advises avoid; see also notes above

**Side-effects** see notes above

**Dose**
- Oral: naproxen 500 mg, once daily
- Oral: naproxen 500 mg, once daily, increased if necessary to max. 15 mg once daily
- Oral: naproxen 500 mg, once daily, increased if necessary to max. 15 mg once daily in children

**Contra-indications** see notes above

Naproxen (Non-proprietary)

**Tablets** naproxen 250 mg, net price 28-tab pack = £1.15; 500 mg, 28-tab pack = £1.82. Label: 21

**Brands include Anthrox®

**Tablets** e/c, naproxen 250 mg, net price 56-tab pack = £2.71; 375 mg, 56-tab pack = £6.42; 500 mg, 56-tab pack = £5.02. Label: 5, 25

**With esomeprazole**

For prescribing information on esomeprazole, see section 1.3.5

**Vimovo® (AstraZeneca)

**Tablets** I, c, m/r, naproxen 500 mg, esomeprazole (as magnesium trihydrate) 20 mg, net price 60-tab pack = £14.95. Label: 22, 25

**Note** Naproxen component is gastro-resistant

**Dose** patients requiring naproxen for osteoarthritis, rheumatoid arthritis, or ankylosing spondylitis, who are at risk of NSAID-associated duodenal or gastric ulcer and when treatment with lower doses of naproxen or other NSAIDs ineffective, ADULT over 18 years, 1 tablet twice daily

**With misoprostol**

For prescribing information on misoprostol, see section 1.3.4

**Napratec® (Pharmacia)

**Combination pack** 56 yellow scored tablets, naproxen 500 mg; 56 white scored tablets, misoprostol 200 micrograms. Net price = £23.76. Label: 21

**Dose** patients requiring naproxen for rheumatoid arthritis, osteoarthritis, or ankylosing spondylitis, with prophylaxis against NSAID-induced gastrointestinal ulceration, 1 naproxen 500-mg tablet and 1 misoprostol 200-microgram tablet taken together twice daily with food; ADULT over 18 years, 1 tablet twice daily

**Note** The BNF recommends a higher starting dose of misoprostol for prophylaxis against NSAID-induced gastrointestinal ulceration than that provided by Napratec® (see section 1.3.4)

1. Can be sold to the public for the treatment of primary dysmenorrhoea in women aged 15–50 years subject to max. single dose of 500 mg, max. daily dose of 750 mg for max. 3 days, and a max. pack size of 9 × 250 mg tablets
PIROXICAM

**Indications**  
Rheumatoid arthritis, osteoarthritis, and ankylosing spondylitis (see also CHMP advice below)

**Cautions**  
See notes above and CHMP advice below

**Contra-indications**  
Inflammatory bowel disease; see also notes above

**Hepatic impairment**  
See notes above

**Renal impairment**  
See notes above

**Pregnancy**  
Be aware of death in the newborn following perinatal use

**Breast-feeding**  
Amount too small to be harmful; see also notes above

**Side-effects**  
See notes above

**Dose**
- By mouth, max. 20 mg once daily (see also CHMP advice below); Child 6–18 years, juvenile idiopathic arthritis, see BNF for Children.

---

**CHMP advice**  
**Piroxicam (June 2007)**

The CHMP has recommended restrictions on the use of piroxicam because of the increased risk of gastro-intestinal side effects and serious skin reactions. The CHMP has advised that:

- Piroxicam should be initiated only by physicians experienced in treating inflammatory or degenerative rheumatic diseases.
- Piroxicam should not be used as first-line treatment.
- In adults, use of piroxicam should be limited to the symptomatic relief of osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis.
- Piroxicam dose should not exceed 20 mg daily.
- Piroxicam should no longer be used for the treatment of acute painful and inflammatory conditions.
- Treatment should be reviewed 2 weeks after initiating piroxicam, and periodically thereafter.
- Concomitant administration of a gastro-protective agent (section 1.3) should be considered.

**Note**
Topical preparations containing piroxicam are not affected by these restrictions.

---

**SULINDAC**

**Indications**  
Pain and inflammation in rheumatic disease and other musculoskeletal disorders; acute gout

**Cautions**  
See notes above; also history of renal stones, cholestasis, hepatitis, hepatic failure; also urine discoloration occasionally reported

**Contra-indications**  
See notes above

**Hepatic impairment**  
See notes above

**Renal impairment**  
Avoid in severe impairment; see also notes above

**Pregnancy**  
See notes above

**Breast-feeding**  
See notes above

**Side-effects**  
See notes above; jaundice with fever, cholestasis, hepatitis, hepatic failure; also urine discoloration occasionally reported

**Dose**
- 200 mg twice daily (may be reduced according to response); max. 400 mg daily; acute gout should respond within 7 days; limit treatment of peri-articular disorders to 7–10 days; Child not recommended

---

**TENOXICAM**

**Indications**  
Pain and inflammation in rheumatic disease and other musculoskeletal disorders

**Cautions**  
See notes above

**Contra-indications**  
See notes above

**Hepatic impairment**  
See notes above

**Renal impairment**  
Avoid in severe impairment; see also notes above

**Pregnancy**  
See notes above

**Breast-feeding**  
Present in milk in animal studies; see also notes above

**Side-effects**  
See notes above

**Dose**
- By mouth, rheumatic disease, Adult over 18 years, 20 mg daily
- Acute musculoskeletal disorders, Adult over 18 years, 20 mg daily for 7 days; max. duration of treatment 14 days (including treatment by intravenous or intramuscular injection)
- By intravenous or intramuscular injection, Adult over 18 years, initial treatment for 1–2 days if oral administration not possible, 20 mg once daily

---

**TIAPROFENIC ACID**

**Indications**  
Pain and inflammation in rheumatic disease and other musculoskeletal disorders

**Cautions**  
See notes above

**Contra-indications**  
See notes above

---

**Topical preparations**  
Section 10.3.2
Having reports of severe cystitis the CSM has recommended that tiaprofenic acid should not be given to patients with urinary-tract disorders and should be stopped if urinary symptoms develop. Patients should be advised to stop taking tiaprofenic acid and to report to their doctor promptly if they develop urinary-tract symptoms (such as increased frequency, nocturia, urgency, pain on urinating, or blood in urine).

Hepatic impairment reduce dose in mild or moderate impairment; see also notes above
Renal impairment reduce dose in mild or moderate impairment; avoid in severe impairment; see also notes above
Pregnancy see notes above
Breast-feeding amount too small to be harmful; see also notes above
Side-effects see notes above

Dose:
- ADULT over 18 years, 300 mg twice daily

Surgam® (Sanofi-Aventis) 20 mg Tablets, tiaprofenic acid 300 mg, net price 56-tab pack = £14.95. Label: 21

Aspirin
Aspirin (section 4.7.1) has been used in high doses to treat rheumatoid arthritis, but other NSAIDs are now preferred.

10.1.2 Corticosteroids

10.1.2.1 Systemic corticosteroids

10.1.2.2 Local corticosteroid injections

The general actions, uses, and cautions of corticosteroids are described in section 6.3. Short-term treatment with corticosteroids can help to rapidly improve symptoms of rheumatoid arthritis. Long-term treatment in rheumatoid arthritis should be considered only after evaluating the risks and all other treatment options have been considered. Corticosteroids can induce osteoporosis, and prophylaxis should be considered on long-term treatment (section 6.6).

In severe, possibly life-threatening, situations a high initial dose of corticosteroid is given to induce remission and the dose is then reduced gradually and discontinued altogether. Relapse may occur as the dose of corticosteroid is reduced, particularly if the reduction is too rapid. The tendency is therefore to increase the maintenance dose and consequently the patient becomes dependent on corticosteroids. For this reason pulse doses of corticosteroids (e.g. methylprednisolone up to 1 g intravenously on 3 consecutive days) are used to suppress highly active inflammatory disease while longer-term treatment with a disease-modifying drug is commenced.

Prednisolone 7.5 mg daily may reduce the rate of joint destruction in moderate to severe rheumatoid arthritis of less than 2 years’ duration. The reduction in joint destruction must be distinguished from mere symptomatic improvement (which lasts only 6 to 12 months at this dose) and care should be taken to avoid increasing the dose above 7.5 mg daily. Evidence supports maintenance of this anti-erosive dose for 2–4 years only after which treatment should be tapered off to reduce long-term adverse effects.

A modified-release preparation of prednisolone (section 6.3.2) is also available for the treatment of moderate to severe rheumatoid arthritis.

Polymyalgia rheumatica and giant cell (temporal) arteritis are always treated with corticosteroids. The usual initial dose of prednisolone in polymyalgia rheumatica is 10–15 mg daily and in giant cell arteritis 40–60 mg daily (the higher dose being used if visual symptoms occur). Treatment should be continued until remission of disease activity and doses are then reduced gradually to about 7.5–10 mg daily for maintenance. Relapse is common if therapy is stopped prematurely. Many patients require treatment for at least 2 years and in some patients it may be necessary to continue long-term low-dose corticosteroid treatment.

Polyarteritis nodosa and polymyositis are usually treated with corticosteroids. An initial dose of 60 mg of prednisolone daily is often used and reduced to a maintenance dose of 10–15 mg daily.

Systemic lupus erythematosus is treated with corticosteroids when necessary using a similar dosage regimen to that for polyarteritis nodosa and polymyositis (above). Patients with pleurisy, pericarditis, or other systemic manifestations will respond to corticosteroids. It may then be possible to reduce the dosage; alternate-day treatment is sometimes adequate, and the drug may be gradually withdrawn. In some mild cases corticosteroid treatment may be stopped after a few months. Many mild cases of systemic lupus erythematosus do not require corticosteroid treatment. Alternative treatment with anti-inflammatory analgesics, and possibly chloroquine or hydroxychloroquine, should be considered.

Ankylosing spondylitis should not be treated with long-term corticosteroids; rarely, pulse doses may be needed and may be useful in extremely active disease that does not respond to conventional treatment.

Corticosteroids are injected locally for an anti-inflammatory effect. In inflammatory conditions of the joints, particularly in rheumatoid arthritis, they are given by intra-articular injection to relieve pain, increase mobility, and reduce deformity in one or a few joints; they can also provide symptomatic relief while waiting for DMARDs to take effect. Full aseptic precautions are essential; infected areas should be avoided. Occasionally an acute inflammatory reaction develops after an intra-articular or soft-tissue injection of a corticosteroid. This may be a reaction to the microcrystalline suspension of the corticosteroid used, but must be distinguished from sepsis introduced into the injection site.

Smaller amounts of corticosteroids may also be injected directly into soft tissues for the relief of inflammation in conditions such as tennis or golfer’s elbow or compression neuropathies. In tendinitis, injections should be made into the tendon sheath and not directly into the tendon (due to the absence of a true tendon sheath and a high risk of rupture, the Achilles tendon should not be injected).
LOCAL CORTICOSTEROID INJECTIONS

Indications local inflammation of joints and soft tissues (for details, consult product literature)

Caution see notes above and consult product literature; see also section 6.3.2

Contra-indications see notes above and consult product literature; avoid injections containing benzyl alcohol in neonates (see preparations below)

Side-effects see notes above and consult product literature

Dose See under preparations

Betamethasone

Deltastab® (AMCo)®

Injection, betamethasone (as sodium phosphate) 4 mg/mL, net price 1-mL amp = £1.22.

Dexamethasone

Deltastab® (AMCo)®

Injection, dexamethasone (as sodium phosphate) 0.7 mg/mL, net price 1-mL vial = £0.35.

Injection, dexamethasone (as sodium phosphate) 4 mg/mL, net price 1-mL vial = £1.27.

Dose by intra-articular injection (for details consult product literature), 0.3–3 mg according to size; where appropriate may be repeated at intervals of 3–21 days according to response

Injection, dexamethasone (as sodium phosphate) 3.3 mg/mL, net price 1-mL amp = £1.14, 2-mL vial = £4.80.

Dose by intra-articular injection (for details consult product literature), 0.3–3 mg according to size; where appropriate may be repeated at intervals of 3–21 days according to response

Hydrocortisone acetate

Hydrocortistab® (AMCo)®

Injection (aqueous suspension), hydrocortisone acetate 25 mg/mL, net price 1-mL amp = £6.87.

Dose by intra-articular injection (for details consult product literature), 4–80 mg, according to size; where appropriate may be repeated at intervals of 7–35 days; also for intralesional injection

Methylprednisolone acetate

Depo-Medrone® (Pharmacia)®

Injection (aqueous suspension), methylprednisolone acetate 40 mg/mL, net price 1-mL vial = £3.44, 2-mL vial = £6.18, 3-mL vial = £8.96.

Dose by intra-articular injection (for details consult product literature), 4–80 mg, according to size; where appropriate may be repeated at intervals of 7–35 days

PRECAUTIONS

Depo-Medrone® with Lidocaine (Pharmacia)®

Injection (aqueous suspension), methylprednisolone acetate 40 mg, lidocaine hydrochloride 10 mg/mL, net price 1-mL vial = £3.94, 2-mL vial = £7.06.

Dose by intra-articular injection (for details consult product literature), 4–80 mg, according to size; where appropriate may be repeated at intervals of 7–35 days

Prednisolone acetate

Deltastab® (AMCo)®

Injection (aqueous suspension), prednisolone acetate 25 mg/mL, net price 1-mL amp = £6.87.

Dose by intra-articular injection (for details consult product literature), 5–25 mg according to size; not more than 3 joints should be treated on any one day; where appropriate may be repeated when relapse occurs

For intramuscular injection, see section 6.3.2

Triaclinolone acetonide

Adcortyl® intra-articular/intramuscular (Squibb)®

Injection (aqueous suspension), triaclinolone acetate 10 mg/mL, net price 1-mL amp = £8.9; 5-mL vial = £3.83.

Excipients include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

Dose by intra-articular injection (for details consult product literature), 2.5–15 mg according to size (for larger doses use Kenalog®), where appropriate may be repeated when relapse occurs; CHILD under 18 years see BNF for Children

By intradermal injection, (for details consult product literature): 2–3 mg; max. 5 mg at any one site (total max. 30 mg); where appropriate may be repeated at intervals of 1–2 weeks; CHILD under 6 years not recommended

Kenalog® intra-articular/intramuscular (Squibb)®

Injection (aqueous suspension), triaclinolone acetate 40 mg/mL, net price 1-mL vial = £1.49.

Dose by intra-articular injection (for details consult product literature), 4–40 mg according to size; total max. 80 mg (for doses below 5 mg use Adcortyl® intra-articular/ Intradermal), where appropriate may be repeated when relapse occurs; CHILD under 18 years see BNF for Children

For intramuscular injection, see section 6.3.2

10.1.3 Drugs that suppress the rheumatic disease process

Certain drugs such as those affecting the immune response can suppress the disease process in rheumatoid arthritis and psoriatic arthritis; gold, penicillamine, hydroxychloroquine, chloroquine, and sulfasalazine can also suppress the disease process in rheumatoid arthritis while sulfasalazine and possibly gold can suppress the disease process in psoriatic arthritis. Unlike NSAIDs, which are used only for symptom control, disease-modifying anti-rheumatic drugs (DMARDs) can affect the progression of disease but may require 2–6 months of treatment for a full therapeutic response. Response to DMARDs may allow the NSAID dose to be reduced or withdrawn. All patients with suspected inflammatory joint disease should be referred to a specialist as soon as possible to confirm diagnosis and evaluate disease activity; early initiation of DMARDs is recommended to control the signs and symptoms, and to limit joint damage.

Choice The choice of a disease-modifying anti-rheumatic drug should take into account co-morbidity and patient preference. Methotrexate, sulfasalazine, intramuscular gold, and penicillamine are similar in efficacy. However, methotrexate or sulfasalazine may be better tolerated. A combination of DMARDs (including methotrexate and at least one other DMARD) and a short-term corticosteroid (section 10.1.2), should be given to patients with newly diagnosed active rheumatoid arthritis, ideally within 3 months of the onset of persistent symptoms. If the use of particular DMARDs is contra-
indicated and combination therapy is not possible, monotherapy with a suitable DMARD should be given and the dose rapidly increased until clinically effective. In patients with established and stable rheumatoid arthritis, cautiously reduce drug doses to the lowest that are clinically effective. Response to drug treatment often produces a reduction in requirements of both corticosteroids and other drugs.

Gold and penicillamine are effective in palindromic rheumatism. Systemic and discoid lupus erythematosus are sometimes treated with chloroquine or hydroxychloroquine.

If a disease-modifying anti-rheumatic drug does not lead to an objective benefit within 6 months, it should be replaced by a different one.

Juvenile idiopathic arthritis Many children with juvenile idiopathic arthritis (juvenile chronic arthritis) do not require disease-modifying antirheumatic drugs. Methotrexate is effective (see BNF for Children); sulfasalazine is an alternative [unlicensed indication] but it should be avoided in systemic-onset juvenile idiopathic arthritis (see BNF for Children). Gold and penicillamine are no longer used. For the role of cytokine modulators in juvenile idiopathic arthritis, see BNF for Children.

**Gold**

Gold can be given as sodium aurothiomalate for active progressive rheumatoid arthritis; it must be given by deep intramuscular injection and the area gently massaged. A test dose of 10 mg must be given followed by doses of 50 mg at weekly intervals until there is definite evidence of remission. Benefit is not to be expected until about 300–500 mg has been given; it should be discontinued if there is no remission after 1 g has been given. In patients who do respond, the interval between injections is then gradually increased to 4 weeks and treatment is continued for up to 5 years after complete remission. If relapse occurs the dosage frequency may be immediately increased to 50 mg weekly and only once control has been obtained again should the dosage frequency be decreased; if no response is seen within 2 months, alternative treatment should be sought. It is important to avoid complete relapse since second courses of gold are not usually effective. Sodium aurothiomalate should be discontinued in the presence of blood disorders, gastro-intestinal bleeding (associated with ulcerative enterocolitis), or unexplained proteinuria (associated with immune complex nephritis) which is repeatedly above 300 mg/litre. Urine tests and full blood counts (including total and differential white cell and platelet counts) must therefore be performed before starting treatment and before each intramuscular injection. Rashes with pruritus often occur after 2 to 6 months of treatment and may necessitate discontinuation.

**Contra-indications**

- history of blood disorders or bone marrow aplasia, exfoliative dermatitis, systemic lupus erythematosus, nécrotising enterocolitis, pulmonary fibrosis
- Hepatic impairment caution in mild to moderate impairment, avoid in severe impairment
- Renal impairment caution in mild to moderate impairment; avoid in severe impairment
- Pregnancy manufacturer advises avoid but limited data suggests usually not necessary to withdraw if condition well controlled—consider reducing dose and frequency
- Breast-feeding manufacturer advises avoid—present in milk; theoretical possibility of rashes and idiosyncratic reactions

**Side-effects**

- see notes above; also severe anaphylactic reactions; stomatitis, taste disturbances, colitis, hepatotoxicity with cholestatic jaundice, pulmonary fibrosis, peripheral neuropathy, mouth ulcers, proteinuria, blood disorders (sometimes sudden and fatal), nephrotic syndrome, gold deposits in eye, alopecia, and skin reactions (including, on prolonged parenteral treatment, irreversible pigmentation in sun-exposed areas)

**Dose**

- By deep intramuscular injection, administered on expert advice, see notes above

**Penicillamine**

Penicillamine has a similar action to gold. More patients are able to continue treatment than with gold but side-effects are common.

Patients should be warned not to expect improvement for at least 6 to 12 weeks after treatment is initiated. Penicillamine should be discontinued if there is no improvement within 1 year.

Blood counts, including platelets, and urine examinations should be carried out before starting treatment and then every 1 or 2 weeks for the first 2 months then every 4 weeks to detect blood disorders and proteinuria (they should also be carried out in the week after any dose increase). A reduction in platelet count calls for discontinuation with subsequent re-introduction at a lower dosage and then, if possible, gradual increase. Proteinuria, associated with immune complex nephritis, occurs in up to 30% of patients, but may resolve despite continuation of treatment; treatment may be continued until renal function tests remain normal, oedema is absent, and the 24-hour urinary excretion of protein does not exceed 2 g.

Nausea may occur but is usually not a problem provided that penicillamine is taken before food or on retiring and that low initial doses are used and only gradually increased. Loss of taste can occur about 6 weeks after treatment is started but usually returns 6 weeks later irrespective of whether treatment is discontinued; mineral supplements are not recommended. Rashes are a common side-effect. Those that occur in the first few months of treatment disappear when the drug is stopped and treatment may then be re-introduced at a lower dose level and gradually increased.

Patients who are hypersensitive to penicillin may react rarely to penicillamine.
**Penicillamine**

**Indications**  
see notes above and under Dose

**Cautions**  
see notes above; concomitant nephrotoxic drugs (increased risk of toxicity), gold treatment (avoid concomitant use if adverse reactions to gold);  
interactions: Appendix 1 (penicillamine)

**Blood counts and urine tests**  
See notes above. Longer intervals may be adequate in cystinuria and Wilson’s disease. Consider withdrawal if platelet count falls below 120,000/mm$^3$ or white blood cells below 2000/mm$^3$ or if 3 successive falls within reference range (can restart at reduced dose when counts return to within reference range but permanent withdrawal necessary if recurrence of leucopenia or thrombocytopenia)

**Counselling**  
Warn patient to tell doctor promptly if sore throat, fever, infection, non-specific illness, unexplained bleeding and bruising, purpura, mouth ulcers, or rashes develop

**Contra-indications**  
lupus erythematosus

**Renal impairment**  
reduce dose and monitor renal function or avoid (consult product literature)

**Pregnancy**  
fetal abnormalities reported rarely; avoid if possible

**Breast-feeding**  
manufacturer advises avoid unless potential benefit outweighs risk—no information available

**Side-effects**  
(see also notes above) initially nausea, anorexia, fever; proteinuria, thrombocytopenia; rarely mouth ulceration, stomatitis, male and female breast enlargement, haematuria (withdraw immediately if cause unknown), alopecia, pseudoxanthoma elasticum, elastosis perforans, skin laxity; also reported pancreatitis, vomiting, cholestatic jaundice, pulmonary haemorrhage, bronchiolitis, pneumonitis, blood disorders including neutropenia, agranulocytosis, aplastic anaemia, haemolytic anaemia and leucopenia, nephrotic syndrome, glomerulonephritis, Goodpasture’s syndrome, septic arthritis in patients with rheumatoid arthritis, lupus erythematosus, myasthenia gravis, polymyositis, rheumatoid arthritis, urticaria, dermatomyositis, pellagrous, Stevens-Johnson syndrome, late rashes (consider dose reduction)

**Dose**

- Severe active rheumatoid arthritis, administered on expert advice, **ADULT** over 18 years, initially 125–250 mg daily for 1 month increased by similar amounts at intervals of not less than 4 weeks to usual maintenance of 500–750 mg daily in divided doses; max. 1.5 g daily; if remission sustained for 6 months, reduction of daily dose by 125–250 mg every 12 weeks may be attempted: **ELDERLY** initially up to 125 mg daily for 1 month increased by similar amounts at intervals of not less than 4 weeks; max. 1 g daily

- Wilson’s disease, autoimmune hepatitis, and cystinuria, section 9.8.1

**Antimalarials**

The antimalarial **hydroxychloroquine** is used to treat rheumatoid arthritis of moderate inflammatory activity; **chloroquine** is also licensed for treating inflammatory disorders but is used much less frequently and is generally reserved for use if other drugs have failed. Chloroquine and hydroxychloroquine are effective for mild systemic lupus erythematosus, particularly involving the skin and joints. These drugs should not be used for psoriatic arthritis.

Chloroquine and hydroxychloroquine are better tolerated than gold or penicillamine. Retinopathy (see below) rarely occurs provided that the recommended doses are not exceeded; in the elderly it is difficult to distinguish drug-induced retinopathy from changes of ageing.

Mepacrine (section 5.4.4) is sometimes used in discoid lupus erythematosus [unlicensed].

**Cautions**  
Manufacturers recommend regular ophthalmological examination but the evidence of practical value is unsatisfactory (see advice of the Royal College of Ophthalmologists, below). Chloroquine and hydroxychloroquine should be used with caution in neurological disorders (especially in those with a history of epilepsy), in severe gastro-intestinal disorders, in G6PD deficiency (section 9.1.5), in acute porphyria, and in the elderly (see also above). Chloroquine and hydroxychloroquine may exacerbate psoriasis and aggravate myasthenia gravis. Concurrent use of hepatoxic drugs should be avoided; other interactions: Appendix 1 (chloroquine and hydroxychloroquine).

**Screening for ocular toxicity**  
A review group convened by the Royal College of Ophthalmologists has updated guidelines for screening to prevent ocular toxicity on long-term treatment with chloroquine and hydroxychloroquine (**Hydroxychloroquine and Ocular Toxicity: Recommendations on Screening 2009**). Chloroquine should be considered (for treating chronic inflammatory conditions) only if other drugs have failed.

All patients taking chloroquine should receive ophthalmic examination according to a protocol arranged locally between the prescriber and the ophthalmologist. The following recommendations relate to hydroxychloroquine, which is only rarely associated with toxicity.

**Before treatment:**

- Assess renal and liver function (adjust dose if impaired)

- Ask patient about visual impairment (not corrected by glasses). If impairment or eye disease present, assessment by an optometrist is advised and any abnormality should be referred to an ophthalmologist

- Record near visual acuity of each eye (with glasses where appropriate) using a standard reading chart

- Initiate hydroxychloroquine treatment if no abnormality detected (at a dose not exceeding hydroxychloroquine sulphate 6.5 mg/kg daily)

**During treatment:**

- Ask patient about visual symptoms and monitor visual acuity annually using the standard reading chart

- Refer to ophthalmologist if visual acuity changes or if vision blurred and warn patient to seek prescribing doctor’s advice about stopping treatment

---

**Penicillamine (Non-proprietary)**

**Tablets**  
penicillamine 125 mg, net price 56-tab pack = £11.20; 250 mg, 56-tab pack = £21.89. Label: 6, 22, counselling, blood disorder symptoms (see above)

**Distamine® (Alliance)**

**Tablets**  
1/2c; penicillamine 125 mg, net price 100-tab pack = £10.34; 250 mg, 100-tab pack = £17.78. Label: 6, 22, counselling, blood disorder symptoms (see above)
Hydroxychloroquine Sulfate

**Indications**
Active rheumatoid arthritis (including juvenile idiopathic arthritis), systemic and discoid lupus erythematosus; dermatological conditions caused or aggravated by sunlight.

**Cautions**
See notes above.

**Hepatic impairment**
See notes above.

**Renal impairment**
Manufacturer advises caution and monitoring of plasma-hydroxychloroquine concentration in severe impairment.

**Pregnancy**
See notes above.

**Breast-feeding**
Avoid—risk of toxicity in infant; see also notes above.

**Side-effects**
See notes above; also reported bronchospasm.

**Dose**
- Administered on expert advice, 200–400 mg daily (but not exceeding 6.5 mg/kg daily based on ideal body-weight, see also recommendations above), for at least 6 months.

**Chloroquine**

**Indications**
Active rheumatoid arthritis, systemic and discoid lupus erythematosus; malaria (section 5.4.1).

**Cautions**
See notes above.

**Hepatic impairment**
See notes above.

**Renal impairment**
Manufacturer advises caution; reduce dose.

**Pregnancy**
See notes above.

**Breast-feeding**
See notes above.

**Side-effects**
See notes above.

**Dose**
- Administered on expert advice, by mouth, adult over 18 years, chloroquine (base) 150 mg daily; max. 2.5 mg/kg daily based on ideal body-weight, see also recommendations above.

**Note**
Chloroquine base 150 mg = chloroquine sulfate 200 mg = chloroquine phosphate 250 mg (approx.).

**Preparations**
Section 5.4.1.

**Important**
To avoid excessive dosage in obese patients, the doses of hydroxychloroquine and chloroquine should be calculated on the basis of ideal body-weight. Ocular toxicity is unlikely if the dose of chloroquine phosphate does not exceed 4 mg/kg daily (equivalent to chloroquine base approx. 2.5 mg/kg daily).

**Hepatic impairment**
Chloroquine and hydroxychloroquine should be used with caution in moderate to severe hepatic impairment.

**Pregnancy**
It is not necessary to withdraw an anti-malarial drug during pregnancy if the rheumatic disease is well controlled; however, the manufacturer of hydroxychloroquine advises avoiding use.

**Breast-feeding**
Chloroquine and hydroxychloroquine are present in breast milk and breast-feeding should be avoided when they are used to treat rheumatic disease.

**Side-effects**
The side-effects of chloroquine and hydroxychloroquine include gastrointestinal disturbances, headache and skin reactions (rashes, pruritus); those occurring less frequently include ECG changes, convulsions, visual changes, retinal damage (see above), keratopathy, otorrhexis, hair depigmentation, hair loss, and discoloration of skin, nails, and mucous membranes. Side-effects that occur rarely include blood disorders (including thrombocytopenia, agranulocytosis, and aplastic anaemia), mental changes (including thrombocytopenia, agranulocytosis, and aplastic anaemia), mental changes (including emotional disturbances and psychosis), myopathy (including cardiomypathy and neumomyopathy), angioedema, acute generalised exanthematous pustulosis, exfoliative dermatitis, Stevens-Johnson syndrome, photosensitivity, and hepatic damage; diffuse parenchymal lung disease, and drug rash with eosinophilia and exfoliative dermatitis, Stevens-Johnson syndrome, edema, acute generalised exanthematous pustulosis, (including cardiomyopathy and neuromyopathy), angioedema, acute generalised exanthematous pustulosis, exfoliative dermatitis, Stevens-Johnson syndrome, photosensitivity, and hepatic damage; diffuse parenchymal lung disease, and drug rash with eosinophilia and exfoliative dermatitis, Stevens-Johnson syndrome, when used in cases that have not responded more toxic and they are used in cases that have not responded to other disease-modifying drugs.

**Azathioprine**
Is a disease-modifying antirheumatic drug suitable for moderate to severe rheumatoid arthritis. Azathioprine, ciclosporin, cyclophosphamide, leflunomide, and the cytokine modulators are considered more toxic and they are used in cases that have not responded to other disease-modifying drugs.

**Methotrexate**
Is usually given in an initial dose of 7.5 mg by mouth once a week, adjusted according to response to a maximum of 15 mg once a week (occasionally 20 mg once a week). Regular full blood counts (including differential white cell count and platelet count), renal and liver function tests are required. In patients who experience mucosal or gastrointestinal side-effects with methotrexate, folic acid 5 mg every week (unlicensed indication), on a different day from the methotrexate, may help to reduce the frequency of such side-effects.

**Azathioprine**
Is usually given in a dose of up to 2.5 mg/kg daily in divided doses. Blood counts are needed to detect possible neutropenia or thrombocytopenia (usually resolved by reducing the dose). Nausea, vomiting, and diarrhoea may occur, usually starting early during the course of treatment, and may necessitate withdrawal of the drug; herpes zoster infection may also occur.

**Leflunomide**
Acts on the immune system as a disease-modifying antirheumatic drug. Its therapeutic effect starts after 4–6 weeks and improvement may continue for a further 4–6 months. Leflunomide, which is similar...
in efficacy to sulfasalazine and methotrexate, may be chosen when these drugs cannot be used. The active metabolite of leflunomide persists for a long period; active procedures to wash the drug out are required in case of serious adverse effects, or before starting treatment with another disease-modifying antirheumatic drug, or, in men or women, before conception. Side-effects of leflunomide include bone-marrow toxicity; its immunosuppressive effects increase the risk of infection and malignancy.

Cyclosporin is licensed for severe active rheumatoid arthritis when conventional second-line therapy is inappropriate or ineffective. There is some evidence that cyclosporin may retard the rate of erosive progression and improve symptom control in those who respond only partially to methotrexate.

Cyclophosphamide (section 8.1.1) may be used at a dose of 1 to 1.5 mg/kg daily by mouth for rheumatoid arthritis with severe systemic manifestations [unlicensed indication]; it is toxic and regular blood counts (including platelet counts) should be carried out. Cyclophosphamide can also be given intravenously in a dose of 0.5 to 1 g (with prophylactic mesna) for severe systemic rheumatoid arthritis and for other connective tissue diseases (especially with active vasculitis), repeated initially at fortnightly then at monthly intervals (according to clinical response and haematological monitoring).

Drugs that affect the immune response are also used in the management of severe cases of systemic lupus erythematosus and other connective tissue disorders. They are often given in conjunction with corticosteroids for patients with severe or progressive renal disease. They may be used in cases of polymyositis that are resistant to corticosteroids. They are used for their corticosteroid-sparing effect in patients whose corticosteroid requirements are excessive. Azathioprine is usually used.

In the specialist management of psoriatic arthritis affecting peripheral joints, leflunomide, methotrexate, or azathioprine [unlicensed indication] may be used.

AZATHIOPRINE

Indications see notes above; inflammatory bowel disease (section 1.5.3); autoimmune conditions and prophylaxis of transplantation rejection (section 8.2.1); severe refractory eczema [unlicensed indication] (section 13.5.3)

Cautions section 8.2.1

Hepatic impairment section 8.2.1

Renal impairment section 8.2.1

Pregnancy section 8.2.1

Breast-feeding section 8.2.2

Side-effects section 8.2.1

Dose

By mouth, initially, rarely more than 3 mg/kg daily, reduced according to response; maintenance 1–3 mg/kg daily; consider withdrawal if no improvement within 3 months

Preparations Section 8.2.1

LEFLUNOMIDE

(Cyclosporin)

Indications severe active rheumatoid arthritis when conventional second-line therapy inappropriate or ineffective; severe acute ulcerative colitis [unlicensed indication] (section 1.5.3); graft-versus-host disease (section 8.2.2); atopic dermatitis and psoriasis (section 13.5.3)

Cautions section 8.2.2

Additional cautions in rheumatoid arthritis Contra-indicated in abdominal renal function, uncontrolled hypertension (see also below), uncontrolled infections, and malignancy. Measure serum creatinine at least twice before treatment and monitor every 2 weeks for first 3 months, then every month for a further 3 months, then every 4–8 weeks depending on the stability of the disease, concomitant medication, and concomitant diseases. (or more frequently if dose increased or concomitant NSAIDs introduced or increased (see also interactions: Appendix 1 [(ciclosporin)]), reduce dose if serum creatinine increases more than 30% above baseline in more than 1 measurement; if above 50%, reduce dose by 50% (even if within normal range) and discontinue if reduction not successful within 1 month; monitor blood pressure (discontinue if hypertension develops that cannot be controlled by antihypertensive therapy); monitor hepatic function if concomitant NSAIDs given.

Hepatic impairment section 8.2.2

Renal impairment see Cautions above

Pregnancy see section 8.2.2

Breast-feeding section 8.2.2

Side-effects section 8.2.2

Thyroid

By mouth, administered in accordance with expert advice, initially 2.5 mg/kg daily in 2 divided doses, if necessary increased gradually after 6 weeks; max. 4 mg/kg daily (discontinue if response insufficient after 3 months); dose adjusted according to response for maintenance and treatment reviewed after 6 months (continue only if benefits outweigh risks); CHILD and under 18 years, not recommended

Important For preparations and counselling and for advice on conversion between the preparations, see section 8.2.2

Preparations Section 8.2.2

AZATHIOPRINE

Indications see notes above; inflammatory bowel disease (section 1.5.3); autoimmune conditions and prophylaxis of transplantation rejection (section 8.2.1); severe refractory eczema [unlicensed indication] (section 13.5.3)

Cautions section 8.2.1

Hepatic impairment section 8.2.1

Renal impairment section 8.2.1

Pregnancy section 8.2.1

Breast-feeding section 8.2.2

Side-effects section 8.2.1

Dose

By mouth, initially, rarely more than 3 mg/kg daily, reduced according to response; maintenance 1–3 mg/kg daily; consider withdrawal if no improvement within 3 months

Preparations Section 8.2.1

LEFLUNOMIDE

(Cyclosporin)

Indications severe active rheumatoid arthritis when conventional second-line therapy inappropriate or ineffective; severe acute ulcerative colitis [unlicensed indication] (section 1.5.3); graft-versus-host disease (section 8.2.2); atopic dermatitis and psoriasis (section 13.5.3)

Cautions section 8.2.2

Additional cautions in rheumatoid arthritis Contra-indicated in abdominal renal function, uncontrolled hypertension (see also below), uncontrolled infections, and malignancy. Measure serum creatinine at least twice before treatment and monitor every 2 weeks for first 3 months, then every month for a further 3 months, then every 4–8 weeks depending on the stability of the disease, concomitant medication, and concomitant diseases. (or more frequently if dose increased or concomitant NSAIDs introduced or increased (see also interactions: Appendix 1 [(ciclosporin)]), reduce dose if serum creatinine increases more than 30% above baseline in more than 1 measurement; if above 50%, reduce dose by 50% (even if within normal range) and discontinue if reduction not successful within 1 month; monitor blood pressure (discontinue if hypertension develops that cannot be controlled by antihypertensive therapy); monitor hepatic function if concomitant NSAIDs given.

Renal impairment see Cautions above

Pregnancy see section 8.2.2

Breast-feeding section 8.2.2

Side-effects section 8.2.2

Thyroid

By mouth, administered in accordance with expert advice, initially 2.5 mg/kg daily in 2 divided doses, if necessary increased gradually after 6 weeks; max. 4 mg/kg daily (discontinue if response insufficient after 3 months); dose adjusted according to response for maintenance and treatment reviewed after 6 months (continue only if benefits outweigh risks); CHILD and under 18 years, not recommended

Important For preparations and counselling and for advice on conversion between the preparations, see section 8.2.2

Preparations Section 8.2.2
Untreated rheumatoid arthritis is a lifelong disease, and there is a risk of joint damage, including joint destruction. Treatment can prevent or delay joint destruction, improve function, and reduce pain and stiffness. In some cases, surgery may be necessary. It is important to treat rheumatoid arthritis early to achieve maximum benefit.

DOSAGE AND ADMINISTRATION

**Dose**

- Rheumatoid arthritis, **ADULT** over 18 years, initially 100 mg once daily for 3 days, then 20 mg once daily.
- **Pсорiatric arthritis**, **ADULT** over 18 years, initially 100 mg once daily for 3 days, then 20 mg once daily.

**Leflunomide** (Non-proprietary)

Tablets, leflunomide, 10 mg; net price 30-tab pack = £15.92; 20 mg, 30-tab pack = £16.76. Label: 4

**Arava** (Sanofi-Aventis)

Tablets, f/c, leflunomide 10 mg (white), net price 30-tab pack = £51.13; 20 mg (yellow), 30-tab pack = £61.56; 100 mg (white), 3-tab pack = £30.67. Label: 4

**SIDE EFFECTS**

- Diarrhoea, nausea, vomiting, anorexia, oral mucosal disorders, abdominal pain; increased blood pressure; headache, dizziness, asthma, parasthesia; leucopenia, tenosynovitis; alopecia, rash, dry skin, pruritus; less commonly taste disturbance, anxiety, hyperlipidaemia, hypokalaemia, hypophosphataemia, anaemia, thrombocytopathy, and tendon rupture;
- rarely hepatis, jaundice (see Hepatotoxicity, above), peripheral neuropathy, vasculitis, progressive multifocal leucoencephalopathy, Stevens-Johnson syndrome, and toxic epidermal necrolysis;
- severe infection, cosinophilia, and pancytopenia; very rarely pancreatitis, hepatic failure (see Hepatotoxicity, above), sepsis, renal impairment, and concomitant use with another anti-folate drug (e.g. trimethoprim).

**INTERACTIONS**

- Aspirin and other NSAIDs:
  - Pulmonary toxicity may be a special problem in rheumatoid arthritis (patient to seek medical attention if dyspnoea, cough or fever; monitor for symptoms at each visit—discontinue if pneumonitis suspected). Aspirin and other NSAIDs are given concurrently the dose of methotrexate should be carefully monitored. Patients should be advised to avoid self-medication with over-the-counter aspirin or ibuprofen.

**CONTRA-INDICATIONS**

- Severe hepatic disease; severe renal impairment or dialysis; moderate or severe hepatic impairment—no information available.

**SIDE EFFECTS**

- Diarrhoea, nausea, vomiting, anorexia, oral mucosal disorders, abdominal pain; increased blood pressure; headache, dizziness, asthma, parasthesia; leucopenia, tenosynovitis; alopecia, rash, dry skin, pruritus; less commonly taste disturbance, anxiety, hyperlipidaemia, hypokalaemia, hypophosphataemia, anaemia, thrombocytopathy, and tendon rupture;
- rarely hepatis, jaundice (see Hepatotoxicity, above), peripheral neuropathy, vasculitis, progressive multifocal leucoencephalopathy, Stevens-Johnson syndrome, and toxic epidermal necrolysis;
- severe infection, cosinophilia, and pancytopenia; very rarely pancreatitis, hepatic failure (see Hepatotoxicity, above), sepsis, renal impairment, and concomitant use with another anti-folate drug (e.g. trimethoprim).

**INTERACTIONS**

- Aspirin and other NSAIDs:
  - Pulmonary toxicity may be a special problem in rheumatoid arthritis (patient to seek medical attention if dyspnoea, cough or fever; monitor for symptoms at each visit—discontinue if pneumonitis suspected). Aspirin and other NSAIDs are given concurrently the dose of methotrexate should be carefully monitored. Patients should be advised to avoid self-medication with over-the-counter aspirin or ibuprofen.

**CONTRA-INDICATIONS**

- Severe hepatic disease; severe renal impairment or dialysis; moderate or severe hepatic impairment—no information available.

**SIDE EFFECTS**

- Diarrhoea, nausea, vomiting, anorexia, oral mucosal disorders, abdominal pain; increased blood pressure; headache, dizziness, asthma, parasthesia; leucopenia, tenosynovitis; alopecia, rash, dry skin, pruritus; less commonly taste disturbance, anxiety, hyperlipidaemia, hypokalaemia, hypophosphataemia, anaemia, thrombocytopathy, and tendon rupture;
- rarely hepatis, jaundice (see Hepatotoxicity, above), peripheral neuropathy, vasculitis, progressive multifocal leucoencephalopathy, Stevens-Johnson syndrome, and toxic epidermal necrolysis;
- severe infection, cosinophilia, and pancytopenia; very rarely pancreatitis, hepatic failure (see Hepatotoxicity, above), sepsis, renal impairment, and concomitant use with another anti-folate drug (e.g. trimethoprim).

**INTERACTIONS**

- Aspirin and other NSAIDs:
  - Pulmonary toxicity may be a special problem in rheumatoid arthritis (patient to seek medical attention if dyspnoea, cough or fever; monitor for symptoms at each visit—discontinue if pneumonitis suspected). Aspirin and other NSAIDs are given concurrently the dose of methotrexate should be carefully monitored. Patients should be advised to avoid self-medication with over-the-counter aspirin or ibuprofen.

**CONTRA-INDICATIONS**

- Severe hepatic disease; severe renal impairment or dialysis; moderate or severe hepatic impairment—no information available.
Methotrexate

Moderate to severe active rheumatoid arthritis,

**Dose**
- Moderate to severe active rheumatoid arthritis, by **mouth**, ADULT over 18 years, 7.5 mg once weekly, adjusted according to response; max. weekly dose 20 mg
- Severe active rheumatoid arthritis, by **subcutaneous or by intramuscular or by intravenous injection**, ADULT over 18 years, 7.5 mg once weekly, increased according to response by 2.5 mg weekly; max. weekly dose 25 mg
- **CHILD** under 18 years see **BNF for Children**

**Important**
Note that the above dose is a weekly dose. To avoid error with low-dose methotrexate, it is recommended that:
- the patient is carefully advised of the **dose** and frequency and the reason for taking methotrexate and any other prescribed medicine (e.g. folic acid);
- only one strength of methotrexate tablet (usually 2.5 mg) is prescribed and dispensed;
- the prescription and the dispensing label clearly show the dose and frequency of methotrexate administration;
- the patient is warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort, and dark urine), and respiratory effects (e.g. shortness of breath).

**Methotrexate treatment booklets**
Methotrexate treatment booklets should be issued where appropriate.

In **England**, **Wales**, and **Northern Ireland**, they are available for purchase from:
3M Security Print and Systems Limited
Gorse Street, Chadderton
Oldham
OL9 9QH
Tel: 0845 610 1112

GP practices can obtain supplies through their Local Area Team stores.
NHS Hospitals can order supplies from [www.nhsforms.co.uk](http://www.nhsforms.co.uk) or by emailing nhsforms@mmm.com.

In **Scotland**, treatment booklets can be obtained by emailing stockorders.dppas@apsgroup.co.uk. These booklets include advice for adults taking oral methotrexate for inflammatory conditions, and a section for recording results of blood tests and dosage information.

**Methotrexate** (Non-proprietary)

**Cytokine modulators**
Cytokine modulators should be used under specialist supervision.

Adalimumab, certolizumab pegol, etanercept, golimumab, and infliximab inhibit the activity of tumour necrosis factor alpha (TNF-α).

**Adalimumab** is licensed for moderate to severe active **rheumatoid arthritis** when response to other disease-modifying antirheumatic drugs (including methotrexate) has been inadequate (see also NICE guidance October 2007, p. 721 and August 2010, p. 721); it is also licensed for severe, active, and progressive disease in adults not previously treated with methotrexate. In the treatment of rheumatoid arthritis, adalimumab should be used in combination with methotrexate, but it can be given alone if methotrexate is inappropriate. Adalimumab is also licensed for the treatment of active and progressive **psoriatic arthritis** (see also NICE guidance, p. 721) and severe active **ankylosing spondylitis** (see also NICE guidance, p. 721) that have not responded adequately to other disease-modifying antirheumatic drugs. It is also licensed for the treatment of severe axial spondyloarthritis without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of NSAIDs. For the role of adalimumab in inflammatory bowel disease, see section 1.5.3. For the role of adalimumab in plaque psoriasis, see section 13.5.3. For the role of adalimumab in juvenile idiopathic arthritis see **BNF for Children**.

**Certolizumab pegol** is licensed for use in patients with moderate to severe active **rheumatoid arthritis** when response to disease-modifying antirheumatic drugs (including methotrexate) has been inadequate (see also NICE guidance, below). Certolizumab pegol can be used in combination with methotrexate, or as a monotherapy if methotrexate is not tolerated or is contra-indicated. Certolizumab pegol is also licensed for the treatment of severe active **ankylosing spondylitis** in patients who have had an inadequate response to, or are intolerant of NSAIDs. It is also licensed for the treatment of severe active **axial spondyloarthritis**, without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of NSAIDs.

**NICE guidance**
**Certolizumab pegol for the treatment of rheumatoid arthritis (February 2010)**
Certolizumab pegol is an option for the treatment of patients with rheumatoid arthritis only if:
- certolizumab pegol is used as described in the NICE guidance (October 2007) for other tumour necrosis factor (TNF) inhibitors, (see Adalimumab, Etanercept and Infliximab for the treatment of Rheumatoid Arthritis, below) and
- the manufacturer provides the first 12 weeks of certolizumab pegol (10 prefilled 200-mg syringes) free of charge to all patients starting treatment.

[www.nice.org.uk/TA186](http://www.nice.org.uk/TA186)

**Etanercept** is licensed for the treatment of moderate to severe active **rheumatoid arthritis** either alone or in combination with other disease-modifying antirheumatic drugs (including methotrexate). Etanercept is licensed for the treatment of moderate to severe active **rheumatoid arthritis** when response to other disease-modifying antirheumatic drugs (including methotrexate) has been inadequate (see also NICE guidance, below). Etanercept is also licensed for the treatment of severe active **psoriatic arthritis** (see also NICE guidance, p. 721) and severe active **ankylosing spondylitis** (see also NICE guidance, p. 721) that have not responded adequately to other disease-modifying antirheumatic drugs. It is also licensed for the treatment of severe axial spondyloarthritis without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of NSAIDs. For the role of etanercept in plaque psoriasis, see section 13.5.3. For the role of etanercept in juvenile idiopathic arthritis see **BNF for Children**.
combination with methotrexate when the response to other disease-modifying antirheumatic drugs is inadequate and in severe, active and progressive rheumatoid arthritis in patients not previously treated with methotrexate (see also NICE guidance October 2007, p. 721 and August 2010, p. 721). It is also licensed for the treatment of active and progressive psoriatic arthritis inadequately responsive to other disease-modifying antirheumatic drugs (see also NICE guidance, p. 721), and for severe ankylosing spondylitis inadequately responsive to conventional therapy (see also NICE guidance, p. 721). For the role of etanercept in plaque psoriasis, see section 13.5.3.

Golimumab is licensed in combination with methotrexate for the treatment of moderate to severe active rheumatoid arthritis when response to disease-modifying antirheumatic drug (DMARD) therapy (including methotrexate) has been inadequate (see also NICE guidance below); it is also licensed in combination with methotrexate for patients with severe, active, and progressive rheumatoid arthritis not previously treated with methotrexate. Golimumab is also licensed for the treatment of active and progressive psoriatic arthritis, as monotherapy or in combination with methotrexate, when response to DMARD therapy has been inadequate (see also NICE guidance below); it is also licensed for the treatment of severe active ankylosing spondylitis when there is an inadequate response to conventional treatment (see also NICE guidance below).

The Scottish Medicines Consortium (p. 4) has advised (June 2012) that golimumab (Simponi™) is accepted for restricted use within NHS Scotland at a dose of 50 mg, alone or in combination with methotrexate, for the treatment of active and progressive psoriatic arthritis in adults whose disease has not responded to adequate trials of at least two standard DMARDs, administered either individually or in combination.

NICE guidance
Golimumab for the treatment of rheumatoid arthritis after the failure of previous disease-modifying antirheumatic drugs (June 2011)
Golimumab, in combination with methotrexate, is an option for the treatment of rheumatoid arthritis in adults who have had an inadequate response to conventional disease-modifying antirheumatic drugs (DMARDs) only, including methotrexate, if:
- golimumab is used as described in the NICE guidance (October 2007) for other tumour necrosis factor (TNF) inhibitors (see Adalimumab, etanercept, and infliximab for the treatment of rheumatoid arthritis, p. 721), and
- the manufacturer provides the 100-mg dose of golimumab at the same price as the 50-mg dose
Alternatively, golimumab, in combination with methotrexate, is an option for the treatment of rheumatoid arthritis in adults who have had an inadequate response to DMARDs including a TNF inhibitor, if:
- golimumab is used as described in the NICE guidance (August 2010) for other TNF inhibitors (see Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor, p. 721), and
- the manufacturer provides the 100-mg dose of golimumab at the same price as the 50-mg dose

Infliximab is licensed for the treatment of active rheumatoid arthritis in combination with methotrexate when the response to other disease-modifying antirheumatic drugs, including methotrexate, is inadequate (see also NICE guidance October 2007, p. 721 and August 2010, p. 721); it is also licensed in combination with methotrexate for patients not previously treated with methotrexate or other DMARDs who have severe, active, and progressive rheumatoid arthritis. Infliximab is also licensed for the treatment of ankylosing spondylitis, in patients with severe axial symptoms who have not responded adequately to conventional therapy (but see also NICE guidance, p. 721) and in combination with methotrexate (or alone if methotrexate is not tolerated or is contra-indicated) for the treatment of active and progressive psoriatic arthritis which has not responded adequately to disease-modifying antirheumatic drugs (see also NICE guidance, p. 721).

Rituximab is licensed in combination with methotrexate for the treatment of severe active rheumatoid arthritis in patients whose condition has not responded adequately to other disease-modifying antirheumatic drugs (including one or more tumour necrosis factor inhibitors) or who are intolerant of them (see also NICE guidance, p. 721). For the role of rituximab in malignant disease, see section 8.2.3.
BNF 68  
10.1.3 Drugs that suppress the rheumatic disease process  

NICE guidance

**Adalimumab, etanercept, and infliximab for the treatment of rheumatoid arthritis**  
(October 2007)

The tumour necrosis factor alpha (TNF-α) inhibitors adalimumab, etanercept, and infliximab are options for the treatment of adults with active rheumatoid arthritis who have failed to respond to at least 2 disease-modifying antirheumatic drugs (DMARDs), including methotrexate (unless contra-indicated). TNF-α inhibitors should be given in combination with methotrexate; however, when methotrexate cannot be used because of intolerance or contra-indications, adalimumab or etanercept can be given as monotherapy.

Adalimumab, etanercept, and infliximab should be withdrawn if response is not adequate within 6 months. Response to treatment should be monitored at least every 6 months in patients who respond initially; treatment should be withdrawn if response is not maintained. An alternative TNF-α inhibitor may be considered for patients in whom treatment is withdrawn because of intolerance before the initial 6-month assessment of efficacy.

Use of TNF-α inhibitors for the treatment of severe, active, and progressive rheumatoid arthritis in adults not previously treated with methotrexate or other DMARDs is not recommended.

www.nice.org.uk/TA130

---

NICE guidance

**Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor**  
(August 2010)

Rituximab, in combination with methotrexate, is an option for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or are intolerant of, other disease-modifying antirheumatic drugs (DMARDs), including at least 1 tumour necrosis factor (TNF) inhibitor. Repeat courses of rituximab should be given no more frequently than every 6 months, and should only be continued if an adequate response is achieved and maintained.

Adalimumab, etanercept, infliximab, or abatacept, in combination with methotrexate, are options for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or have an intolerance of, other DMARDs including at least 1 TNF inhibitor, and who cannot use rituximab because of contra-indications or intolerance. In patients who cannot use methotrexate because of intolerance or contra-indications, adalimumab or etanercept can be given as monotherapy. Treatment should be continued only if there is adequate response. Patients should be monitored at least every 6 months.

www.nice.org.uk/TA195

---

NICE guidance

**Adalimumab, etanercept, and infliximab for the treatment of ankylosing spondylitis**  
(May 2008)

Adalimumab or etanercept are treatment options for adults with severe active ankylosing spondylitis whose disease satisfies specific criteria for diagnosis where there is confirmation of sustained active spinal disease, and where treatment with two or more NSAIDs taken sequentially at maximum tolerated or recommended doses for 4 weeks has failed to control symptoms.

Response to adalimumab or etanercept treatment should be assessed at 12-week intervals and continued only if response is adequate. If response to treatment is not maintained, a repeat assessment should be made after a further 6 weeks and treatment discontinued if there is an inadequate response. Patients who are intolerant of adalimumab or etanercept during the initial 12 weeks may receive the alternative TNF-α inhibitor (adalimumab or etanercept). However an alternative TNF-α inhibitor is not recommended in patients who fail to respond initially or fail to maintain an adequate response.

Infliximab is not recommended for the treatment of ankylosing spondylitis. Patients who are already receiving infliximab for the treatment of ankylosing spondylitis can continue treatment until they and their specialist consider it appropriate to stop.

See full NICE guidance for specific criteria to diagnose severe active ankylosing spondylitis, confirm sustained active spinal disease, and assess response to treatment.

www.nice.org.uk/TA143

---

NICE guidance

**Etanercept, infliximab, and adalimumab for the treatment of psoriatic arthritis**  
(August 2010)

Etanercept, infliximab, or adalimumab are recommended for the treatment of active and progressive psoriatic arthritis in adults who have peripheral arthritis with at least 3 tender joints and at least 3 swollen joints, and who have not responded adequately to at least 2 standard disease-modifying antirheumatic drugs (used alone or in combination).

Etanercept, infliximab, and adalimumab should be discontinued if there is an inadequate response at 12 weeks.

www.nice.org.uk/TA199

---

Side-effects  
Adalimumab, certolizumab pegol, etanercept, golimumab, infliximab, and rituximab have been associated with infections, sometimes severe, including tuberculosis, septicaemia, and hepatitis B reactivation. Other side-effects include nausea, abdominal pain, worsening heart failure, hypersensitivity reactions, fever, headache, depression, antibody formation (including lupus erythematosus-like syndrome), pruritus, injection-site reactions, and blood disorders (including anaemia, leucopenia, thrombocytopenia, pancytopenia, and aplastic anaemia).

Abatacept prevents the full activation of T-lymphocytes. It is licensed for moderate to severe active rheumatoid arthritis in combination with methotrexate, in...
with an antihistamine, with or without an antipyretic, may be considered.

Tocilizumab antagonises the actions of interleukin-6. Tocilizumab is licensed for use in patients with moderate to severe active rheumatoid arthritis when response to at least one disease-modifying antirheumatic drug or tumour necrosis factor inhibitor has been inadequate, or in those who are intolerant of these drugs. Tocilizumab can be used in combination with methotrexate, or as monotherapy if methotrexate is not tolerated or is contra-indicated (see also NICE guidance below). For the role of tocilizumab in juvenile idiopathic arthritis see BNF for Children.

The Scottish Medicines Consortium (p. 4) has advised (July 2013) that tocilizumab (RoActemra®) is accepted for restricted use within NHS Scotland for adults with severe active rheumatoid arthritis, confirmed on at least two occasions, one month apart. This advice is contingent upon continuing availability of abatacept at the price agreed in the patient access scheme.

### NICE guidance

**Abatacept for the treatment of rheumatoid arthritis after the failure of conventional disease-modifying anti-rheumatic drugs (April 2013)**

Abatacept, in combination with methotrexate, is an option for the treatment of highly active rheumatoid arthritis in adults who have had an inadequate response to at least two conventional disease-modifying antirheumatic drugs, including methotrexate, if:

- abatacept is used as described in the NICE guidance (October 2007) for other tumour necrosis factor (TNF) inhibitors (see Adalimumab, etanercept, and infliximab for the treatment of rheumatoid arthritis, and the manufacturer provides abatacept with the discount agreed in the patient access scheme)

Patients already receiving abatacept for this indication, who do not fulfil the criteria for treatment should continue treatment until they and their specialist consider it appropriate to stop.

[Nice.org.uk/TA280](www.nice.org.uk/TA280)

**Anakinra** inhibits the activity of interleukin-1. Anakinra (in combination with methotrexate) is licensed for the treatment of rheumatoid arthritis which has not responded to methotrexate alone; it is not, however, recommended for routine management of rheumatoid arthritis, see NICE guidance below.

The Scottish Medicines Consortium (p. 4) has advised (July 2002) that anakinra is not recommended for the treatment of rheumatoid arthritis within NHS Scotland.

### NICE guidance

**Anakinra for the treatment of rheumatoid arthritis (February 2009)**

Anakinra is not recommended for the treatment of rheumatoid arthritis except when used in a controlled long-term clinical study. Patients who are already receiving anakinra for rheumatoid arthritis should continue treatment until they and their specialist consider it appropriate to stop.

**Belimumab** inhibits the activity of B-lymphocyte stimulator. Belimumab is licensed as adjunctive therapy in patients with active, autoantibody-positive systemic lupus erythematosus with a high degree of disease activity despite standard therapy. Infusion-related side-effects are reported commonly with belimumab, including severe or life-threatening hypersensitivity and infusion reactions. These occur predominantly during the first 2 infusions. Delay in the onset of acute hypersensitivity reactions has been observed; patients should remain under clinical supervision for several hours following at least the first 2 infusions. Premedication

**Ustekinumab** inhibits the activity of interleukins 12 and 23. It is licensed for the treatment of active psoriatic arthritis (in combination with methotrexate or alone) in patients who have had an inadequate response to one or more disease-modifying antirheumatic drugs.

The Scottish Medicines Consortium (p. 4) has advised (February 2014) that ustekinumab (Stelara®) is accepted for restricted use within NHS Scotland either alone or in combination with methotrexate, for the treatment of active psoriatic arthritis in adults who have responded
inadequately to previous therapy with a non-biological disease-modifying anti-rheumatic drug, and failed on, or are unsuitable for, treatment with a TNF inhibitor.

**ABATACEPT**

**Indications** see under Cytokine Modulators, above

**Cautions** predisposition to infection (screen for latent tuberculosis and viral hepatitis); do not initiate until active infections are controlled; children should be brought up to date with current immunisation schedule (section 14.1) before initiating therapy; progressive multifocal leukoencephalopathy—continue treatment if neurological symptoms present; elderly (increased risk of side-effects); **interactions:** Appendix 1 (abatacept)

**Contra-indications** severe infection (see also Cautions)

**Pregnancy** manufacturer advises avoid unless essential—effective contraception required during treatment and for 4 weeks after last dose

**Breast-feeding** present in milk in animal studies—manufacturer advises avoid breast-feeding during treatment and for 14 weeks after last dose

**Side-effects** abdominal pain, diarrhoea, dyspepsia, nausea, vomiting, stomatitis, flushing, hypertension, cough, dizziness, fatigue, headache, paraesthesia, infection, leucopenia, pain in extremities, conjunctivitis; *less commonly* gastritis, tachycardia, bradycardia, palpitation, hypotension, bronchospasm, dysphonia, hyperhidrosis, weight gain, depression, anxiety, sleep disorder, menstrual disturbances, basal and squamous cell carcinoma, skin papilloma, thrombocytopenia, arthralgia, visual disturbance, dry eye, bruising, alopecia, dry skin, psoriasis; *also reported* lymphoma, lung cancer

**Dose**
- Rheumatoid arthritis (see notes above), by intravenous infusion, **ADULT** over 18 years, body-weight less than 60 kg, 500 mg, repeated 2 weeks and 4 weeks after initial infusion, then every 4 weeks; body-weight 60–100 kg, 750 mg repeated 2 weeks and 4 weeks after initial infusion, then every 4 weeks; body-weight over 100 kg, 1 g repeated 2 weeks and 4 weeks after initial infusion, then every 4 weeks; by subcutaneous injection (following intravenous infusion loading dose), **ADULT** over 18 years, 125 mg given within a day of the loading dose, then 125 mg weekly

**Note** Patients who are unable to receive an infusion may initiate subcutaneous abatacept without receiving an intravenous loading dose

Polyarticular juvenile idiopathic arthritis **CHILD 6–17 years**, see BNF for Children

**Note** Review treatment if no response within 6 months

**Orenica** (Bristol-Myers Squibb)

**Intravenous infusion**, powder for reconstitution, abatacept, net price 250 mg vial = £302.40

**Electrolytes** Na+ < 0.5 mmol/vial

**Injection**, abatacept, net price 125 mg pre-filled syringe = £302.40

**ADALIMUMAB**

**Indications** see under Cytokine Modulators above; inflammatory bowel disease (section 1.5.3); psoriasis (section 13.5.3)

**Cautions** predisposition to infection; monitor for infection before, during, and for 4 months after treatment (see also Tuberculosis below); do not initiate until active infections are controlled; discontinue if new serious infection develops; hepatitis B virus—monitor for active infection; children should be brought up to date with current immunisation schedule (section 14.1) before initiating therapy; mild heart failure (discontinue if symptoms develop or worsen—avoid in moderate or severe heart failure); demyelinating disorders (risk of exacerbation); history or development of malignancy; monitor for non-melanoma skin cancer before and during treatment, especially in patients with a history of PUVA treatment for psoriasis or extensive immunosuppressant therapy; **interactions:** Appendix 1 (adalimumab)

**Tuberculosis** Patients should be evaluated for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment (section 14.1) before initiating adalimumab. Patients who have previously received adequate treatment for tuberculosis can start adalimumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting adalimumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with adalimumab. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

**Blood disorders** Patients should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop

**Contra-indications** severe infection (see also Cautions)

**Pregnancy** avoid; manufacturer advises effective contraception required during treatment and for at least 5 months after last dose

**Breast-feeding** avoid; manufacturer advises avoid for at least 5 months after last dose

**Side-effects** see under Cytokine Modulators (p. 721) and Cautions above; also vomiting, dyspepsia, gastrointestinal haemorrhage, dizziness, hyperlipidaemia, hypertension, oedema, flushing, chest pain, tachycardia, cough, dysphonia, mood changes, sleep disturbances, anxiety, paraesthesia, haematuria, renal impairment, benign tumours, skin cancer, electrolyte disturbances, hyperuricaemia, dehydration, musculoskeletal pain, eye disorders, rash, dermatitis, onycholysis, impaired healing; *less commonly* dysphagia, pancreatitis, cholelithiasis, hepatic steatosis, cholesterol, arrhythmias, vascular occlusion, aortic aneurysm, interstitial lung disease, pneumonitis, tremor, neuropathy, erectile dysfunction, nocturia, malignancy (including solid tumours, lymphoma, and leukaemia), rhabdomyolysis, hearing loss, tinnitus; rarely autoimmune hepatitis, myocardial infarction, demyelinating disorders; *also reported* pulmonary embolism, pleural effusion, sarcoidosis, Stevens-Johnson syndrome, cutaneous vasculitis, new onset or worsening psoriasis

**Dose**
- By subcutaneous injection, rheumatoid arthritis, **ADULT** over 18 years, 40 mg on alternate weeks; if necessary increased to 40 mg weekly in patients receiving adalimumab alone; review treatment if no response within 12 weeks

Psoriatic arthritis, ankylosing spondylitis, severe axial spondyloarthritis, **ADULT** over 18 years, 40 mg on alternate weeks; discontinue treatment if no response within 12 weeks

Polyarticular juvenile idiopathic arthritis, **CHILD 2–18 years**, see BNF for Children
**Humira**<sup>®</sup> (AbbVie) (*FSM*)

**Injection**, adalimumab, net price 40-mg prefilled pen or prefilled syringe = £352.14; 40 mg/0.8-mL vial = £352.14. Label: 10, alert card, counselling, tuberculosis and blood disorders

**Benlysta**<sup>®</sup> (GSK) (*FSM*)

**Intravenous infusion**, belimumab, net price 120-mg vial = £121.50; 400-mg vial = £405.00

---

**ANAKINRA**

**Indications** see under Cytokine Modulators above

**Cautions** predisposition to infection; history of asthma (risk of serious infection). **interactions**: Appendix 1 (anakinra)

**Blood disorders** Neutropenia reported commonly. Monitor neutrophil count before treatment, then every month for 6 months, then every 3 months—discontinue if neutrophenia develops. Patients should be instructed to seek medical advice if symptoms suggestive of neutrophenia (such as fever, sore throat, infection) develop

**Contra-indications** neutrophenia

**Renal impairment** caution if eGFR 30–50 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** manufacturer advises avoid; effective contraception must be used during treatment

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** injection-site reactions; headache; hypersensitivity reactions, vomiting, depression, insomnia, migraine, infections, pyrexia, leucopenia, pain in extremities

**Dose**

- By subcutaneous injection, ADULT over 18 years, 100 mg once daily

**Kinere**<sup>®</sup> (Swedish Orphan) (*FSM*)

**Injection**, anakinra, net price 100-mg prefilled syringe = £26.23. Counselling, blood disorder symptons

**BELIMUMAB**

**Indications** see under Cytokine Modulators above

**Cautions** predisposition to infection; do not initiate until active infections controlled; history of malignancy. **interactions**: Appendix 1 (belimumab)

**Renal impairment** caution in severe impairment—no information available

**Pregnancy** avoid unless essential; manufacturer advises adequate contraception during treatment and for at least 4 months after last dose

**Breast-feeding** avoid—present in milk in animal studies

**Side-effects** see notes above; also diarrhoea, nausea, hypersensitivity reactions, vomiting, depression, insomnia, migraine, infections, pyrexia, leucopenia, pain in extremities

**Dose**

- By intravenous infusion, ADULT over 18 years, 10 mg/kg, repeated 2 weeks and 4 weeks after initial infusion, then every 4 weeks; review treatment if no response within 6 months

**CERTOLIZUMAB PEGOL**

**Indications** see under Cytokine Modulators above

**Cautions** predisposition to infection; monitor for infection before, during, and for 5 months after treatment (see also Tuberculosis below); do not initiate until active infections are controlled; discontinue if new serious infection develops until infection controlled; hepatitis B virus—monitor for active infection; mild heart failure (discontinue if symptoms develop or worsen)—avoid in moderate to severe heart failure; demyelinating CNS disorders (risk of exacerbation); history or development of malignancy; **interactions**: Appendix 1 (certolizumab pegol)

**Tuberculosis** Patients should be evaluated for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment (section 5.1.9) for at least 2 months before starting certolizumab pegol. Patients who have previously received adequate treatment for tuberculosis can start certolizumab pegol but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated, adequately, chemoprophylaxis should ideally be completed before starting certolizumab pegol. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with certolizumab pegol. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop

**Blood disorders** Patients should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop

**Contra-indications** severe active infection (see also Cautions)

**Pregnancy** avoid; manufacturer advises adequate contraception during treatment and for at least 5 months after last dose

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risk—no information available

**Side-effects** see under Cytokine Modulators (p. 721) and Cautions above; hypertension, sensory abnormalities, rash; less commonly ascites, cholestasis, gastrointestinal disorders (including perforation and ulcer), hepatic disorders, appetite disorders, cardiomyopathies (including heart failure), dyslipidaemia, syncope, oedema, dizziness, ischaemic coronary artery disorders, arrhythmias, asthma, pleural effusion, cough, peripheral neuropathy, tremor, anxiety, mood disorders, influenza-like illness, menstrual disorders, renal impairment, haematuria, malignancy (including solid tumours, lymphoma, and leukaemia), skin cancer, benign tumours, haemorrhage, electrolyte disorders, muscle disorders, visual disturbance, ocular inflammation, tinnitus, ecchymosis, impaired healing, alopecia, photosensitivity, acne, skin discoloration, nail dystrophies, inflammation, tinnitus, hair loss, hyperactivity, hypertension, sensory abnormalities, rash; less commonly ascites, cholestasis, gastrointestinal disorders (including perforation and ulcer), hepatic disorders, appetite disorders, cardiomyopathies (including heart failure), dyslipidaemia, syncope, oedema, dizziness, ischaemic coronary artery disorders, arrhythmias, asthma, pleural effusion, cough, peripheral neuropathy, tremor, anxiety, mood disorders, influenza-like illness, menstrual disorders, renal impairment, haematuria, malignancy (including solid tumours, lymphoma, and leukaemia), skin cancer, benign tumours, haemorrhage, electrolyte disorders, muscle disorders, visual disturbance, ocular inflammation, tinnitus, ecchymosis, impaired healing, alopecia, photosensitivity, acne, skin discoloration, nail disorders, new onset or worsening psoriasis, dermatitis; rarely cholelithiasis, splenomegaly, atrioventricular block, cerebrovascular accident, Raynaud’s phenomenon, interstitial lung disease, impaired coordination, trigeminal neuralgia, seizures, thyroid disorders, sexual dysfunction, nephropathy; also reported multiple sclerosis

**Dose**

- By subcutaneous injection, rheumatoid arthritis, ADULT over 18 years, 400 mg, repeated 2 weeks and 4 weeks after initial injection, then 200 mg every 2 weeks; review treatment if no response within 12 weeks

Severe ankylosing spondylitis, severe axial spondyloarthritis, ADULT over 18 years, 400 mg, repeated 2 weeks and 4 weeks after initial injection, then 200 mg every 2 weeks; review treatment if no response within 12 weeks

---

724 10.1.3 Drugs that suppress the rheumatic disease process BNF 68

---
ETANERCEPT

**Indications** see under Cytokine Modulators above

**Cautions** predisposition to infection (avoid if predisposition to septicemia); significant exposure to herpes zoster virus—interrupt treatment and consider varicella–zoster immunoglobulin; hepatitis B virus—monitor for active infection; monitor for worsening hepatitis C infection; children should be brought up to date with current immunisation schedule (section 14.1) before initiating therapy; heart failure (risk of exacerbation); history or increased risk of demyelinating disorders; history or development of malignancy; monitor for skin cancer before and during treatment, particularly in those at risk (including patients with psoriasis or a history of PUVA treatment); history of blood disorders; diabetes mellitus; **interactions**: Appendix 1 (etanercept)

**Side-effects** see under Cytokine Modulators above; also dyspepsia, hyperlipidaemia, arrhythmia, gastrointestinal disorders, rash, new onset or worsening psoriasis; toxic epidermal necrolysis; also reported very rarely demyelinating disorders, seizures, lymphoma, Stevens-Johnson syndrome, vasculitis; very rarely toxic epidermal necrolysis; also reported appendicitis, gastritis, oesophagitis, inflammatory bowel disease, vomiting, diabetes mellitus, malignancy (including solid tumours and leukaemia), macrophage activation syndrome, and cutaneous ulcer

**Dose**
- By subcutaneous injection, rheumatoid arthritis, psoriatic arthritis, ankylosing spondylitis, ADULT over 18 years, 25 mg twice weekly or 50 mg once weekly
- Juvenile idiopathic arthritis, CHILD 2–17 years, see BNF for Children

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies

**Side-effects** see under Cytokine Modulators (p. 721); also less commonly interstitial lung disease, skin cancer, uveitis, rash, new onset or worsening psoriasis; rarely demyelinating disorders, seizures, lymphoma, Stevens-Johnson syndrome, vasculitis; very rarely toxic epidermal necrolysis; also reported appendicitis, gastritis, oesophagitis, inflammatory bowel disease, vomiting, diabetes mellitus, malignancy (including solid tumours and leukaemia), macrophage activation syndrome, and cutaneous ulcer

**Dose**
- By subcutaneous injection, certolizumab pegol, net price 200-mg prefilled syringe = £357.50. Label: 10, alert card, counselling, tuberculosis and blood disorders

**GOLIMUMAB**

**Indications** see under Cytokine Modulators above; ulcerative colitis (section 1.5.3)

**Cautions** predisposition to infection; monitor for infection before, during, and for 5 months after treatment (see also Tuberculosis below); do not initiate until active infections are controlled; discontinue if new serious infection develops until infection controlled; hepatitis B virus—monitor for active infection; moderate or severe heart failure (discontinue if symptoms develop or worsened); demyelinating disorders (risk of exacerbation); history or development of malignancy; **interactions**: Appendix 1 (golimumab)

**Tuberculosis** Patients should be evaluated for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment (section 5.1.9) for at least 2 months before starting golimumab. Patients who have previously received adequate treatment for tuberculosis can start etanercept but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting golimumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with etanercept. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop

**Blood disorders** Patients should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop

**Contra-indications** active infection; avoid injections containing benzyl alcohol in neonates (see preparations below)

**Hepatic impairment** use with caution in moderate to severe alcoholic hepatitis

**Pregnancy** avoid—limited information available; manufacturer advises effective contraception required during treatment and for 3 weeks after last dose

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies

**Side-effects** see under Cytokine Modulators (p. 721) and under Cautions above; also dyspepsia, hypertension, dizziness, asthma; less commonly constipation, taste disturbance, gastritis, colitis, stomatitis, gastro-oesophageal reflux disease, cholelithiasis, hepatic disorders, hyperlipidaemia, arrhythmia, ischaemic coronary artery disorders, Raynaud’s syndrome, heart failure, thrombosis, flushing, bronchospasm, interstitial lung disease, demyelinating disorders, insomnia, paraesthesia, hyperglycaemia,

Enbrel® (Pfizer) Injection, powder for reconstitution, etanercept, net price 25-mg vial (with solvent) = £89.38. Label: 10, alert card, counselling, tuberculosis and blood disorders

**Paediatric injection, powder for reconstitution, etanercept, net price 10-mg vial (with solvent) = £35.75; 25-mg vial (with solvent) = £89.38. Label: 10, alert card, counselling, tuberculosis and blood disorders**

**Excipients** include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

**Injection, etanercept, net price 25-mg prefilled syringe = £89.38; 50-mg prefilled pen or prefilled syringe = £178.75. Label: 10, alert card, counselling, tuberculosis and blood disorders**

thyroid disorders, menstrual disorders, malignancy (including lymphoma, melanoma), bone fractures, visual disturbance, eye irritation, new onset or worsening psoriasis, alopecia, dermatitis; rarely impaired wound healing

**Dose**
- By subcutaneous injection, ADULT over 18 years, 50 mg once a month on the same date each month, review treatment if no response after 3–4 doses; body-weight over 100 kg, if inadequate response to 3–4 doses of 50 mg once a month, dose can be increased to 100 mg once a month, review treatment if inadequate response to this higher dose after 3–4 doses

**Note** If dose administered more than 2 weeks late, subsequent doses should be administered on the new monthly due date

**Simponi®** (MSD) 
Injection, golimumab, net price 50-mg prefilled pen or prefilled syringe = £762.97; 100-mg prefilled pen = £1525.94. Label: 10, alert card, counselling, tuberculosis and blood disorders

**INFLIXIMAB**

**Indications** see under Cytokine Modulators above; inflammatory bowel disease (section 1.5.3); psoriasis (section 13.5.3)

**Cautions** predisposition to infection; monitor for infection before, during, and for 6 months after treatment (see also Tuberculosis below); discontinue if new serious infection develops; hepatitis B virus—monitor for active infection; mild heart failure (discontinue if symptoms develop or worsen); demyelinating disorders (risk of exacerbation); history or development of malignancy; history of prolonged immunosuppressant or PUVA treatment in patients with psoriasis; interactions: Appendix 1 (infliximab)

**Tuberculosis** Patients should be evaluated for tuberculosis before starting treatment. Active tuberculosis should be treated with standard treatment (section 5.1.9) for at least 2 months before starting infliximab. Patients who have previously received adequate treatment for tuberculosis can start infliximab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting infliximab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with infliximab. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop

**Blood disorders** Patients should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop

**Hypersensitivity reactions** Hyper-sensitivity reactions (including fever, chest pain, hypotension, hypertension, dyspnoea, transient visual loss, pruritus, urticaria, serum sickness-like reactions, angioedema, anaphylaxis) reported during or within 1–2 hours after infusion (risk greatest during first or second infusion or in patients who discontinue other immunomodulating agents). All patients should be observed carefully for 1–2 hours after infusion and resuscitation equipment should be available for immediate use. Prophylactic antipyretics, antihistamines, or hydrocortisone may be administered. Monitor for symptoms of delayed hypersensitivity if readministered after a prolonged period. Patients should be advised to keep Alert card with them at all times and seek medical advice if symptoms of delayed hypersensitivity develop

**Contra-indications** severe infections (see also under Cautions); moderate or severe heart failure

**Pregnancy** use only if essential; manufacturer advises adequate contraception during and for at least 6 months after last dose

**Breast-feeding** amount probably too small to be harmful

**Side-effects** see under Cytokine Modulators (p. 721) and under Cautions above; also constipation, diarrhoea, dyspepsia, gastro-intestinal haemorrhage, gastro-oesophageal reflux, flushing, hypotension, hypertension, palpitation, tachycardia, sleep disturbances, dizziness, paraesthesia, hypoesthesia, arthralgia, myalgia, epistaxis, alopecia, rash, ecchymosis, hyperhydrosis, new onset or worsening psoriasis, dry skin; less commonly hepatitis, cholecystitis, intestinal perforation, pancreatitis, heart failure, arrhythmia, bradycardia, syncope, peripheral ischaemia, pleurisy, pulmonary oedema, amenia, agitation, confusion, nervousness, neuropathy, seizures, vaginitis, eye disorders, bullous eruption, cholestasis, selenium, impaired healing, rosacea, hyperkeratosis, abnormal skin pigmentation; rarely pericardial effusion, vasospasm, interstitial lung disease, leukaemia, lymphoma, demyelinating disorders, Stevens-Johnson syndrome, toxic epidermal necrolysis; also reported hepatic failure

**Dose**
- By intravenous infusion, rheumatoid arthritis (in combination with methotrexate), ADULT over 18 years, 3 mg/kg, repeated 2 weeks and 6 weeks after initial infusion, then every 8 weeks; if response inadequate after 12 weeks, dose may be increased in steps of 1.5 mg/kg every 8 weeks, up to max. 7.5 mg/kg every 8 weeks; alternatively, 3 mg/kg may be given every 4 weeks; discontinue if no response by 12 weeks of initial infusion or after dose adjustment

Ankylosing spondylitis, ADULT over 18 years, 5 mg/kg, repeated 2 weeks and 6 weeks after initial infusion, then every 6–8 weeks; discontinue if no response by 6 weeks of initial infusion

Psoriatic arthritis (in combination with methotrexate), ADULT over 18 years, 5 mg/kg, repeated 2 weeks and 6 weeks after initial infusion, then every 8 weeks

**Remicade®** (MSD) 
Intravenous infusion, powder for reconstitution, infliximab, net price 100-mg vial = £419.62. Label: 10, alert card, counselling, tuberculosis, blood disorders

**RITUXIMAB**

**Indications** see under Cytokine Modulators above; malignant disease (section 8.2.3)

**Cautions** section 8.2.3, p. 623; predisposition to infection

**Alert card** Patients with rheumatoid arthritis should be provided with the patient alert card before administration

**Contra-indications** section 8.2.3, p. 622; severe infection

**Pregnancy** section 8.2.3, p. 625

**Breast-feeding** section 8.2.3, p. 625

**Side-effects** section 8.2.3, p. 622 and under Cytokine Modulators (p. 721); also dyspepsia; hypertension, hypotension; rhinitis, sore throat; asthenia, paraesthesia, migraine; arthralgia, muscle spasm; urticaria

**Dose**
- By intravenous infusion, ADULT, rheumatoid arthritis (in combination with methotrexate), 1 g, repeated 2 weeks after initial infusion

Important Patients should receive premedication before each infusion (consult product literature for details) and be provided with a patient alert card

**Preparations** Section 8.2.3
**Tocilizumab**

**Indications** see under Cytokine Modulators above

**Cautions** predisposition to infection or history of recurrent or chronic infection; interrupt treatment if serious infection occurs; history of intestinal ulceration or diverticulitis; monitor hepatic transaminases every 4–8 weeks for first 6 months, then every 12 weeks; monitor neutrophil and platelet counts 4–8 weeks after starting treatment and then as indicated; low platelet or absolute neutrophil count (discontinue if absolute neutrophil count less than 0.5 × 10^9/litre or platelet count less than 50 × 10^9/microlitre); monitor lipid profile 4–8 weeks after starting treatment and then as indicated; monitor for demyelinating disorders; **interactions**: Appendix 1 (tocilizumab)

**Tuberculosis** Patients should be evaluated for tuberculosis before treatment. Patients with latent tuberculosis should be treated with standard therapy (section 5.1.9) before starting tocilizumab

**Counselling** Patients should be advised to seek immediate medical attention if symptoms of infection occur, or if symptoms of diverticular perforation such as abdominal pain, haemorrhage, or fever accompanying change in bowel habits occur

**Contra-indications** severe active infection (see also Cautions); do not initiate if absolute neutrophil count less than 2 × 10^9/litre (see also Cautions)

**Hepatic impairment** manufacturer advises caution (see also Dose below)

**Renal impairment** manufacturer advises monitor renal function closely in moderate or severe impairment

**Pregnancy** manufacturer advises avoid unless essential (toxicity in animal studies); effective contraception required during and for 3 months after treatment

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risk —no information available

**Side-effects** abdominal pain, mouth ulceration, gastritis, raised hepatic transaminases; dizziness, peripheral oedema, hypertension, hypercholesterolaemia; headache; infection (including upper respiratory tract infection); antibody formation, hypersensitivity, leucopenia, neutropenia; rash, pruritus; less commonly gastric ulcer, gastro-intestinal perforation, hypertiglyceridaemia, hypothyroidism, nephrolithiasis, infusion related reactions, anaphylaxis, and thrombocytopenia also reported

**Dose**
- Rheumatoid arthritis, by intravenous infusion, ADULT over 18 years, 8 mg/kg (max. 800 mg) once every 4 weeks; for details of dose adjustment in patients with liver enzyme abnormalities, or low absolute neutrophil or platelet count, consult product literature
- Juvenile idiopathic arthritis, CHILD 2–18 years, see **BNF for Children**

**RoActemra** (Roche)

**Concentrate for intravenous infusion**, tocilizumab 20 mg/mL, net price 4 mL (80-mg) vial = £102.40, 10 mL (200-mg) vial = £256.00, 20 mL (400-mg) vial = £512.00. Alert card, counselling, see above

**Usteekinumab**

**Indications** see under Cytokine Modulators above; plaque psoriasis (section 13.5.3)

**Cautions** see section 13.5.3, p. 804

**Important** See section 13.5.3, p. 804 for information on tuberculosis

**Contra-indications** section 13.5.3, p. 804

**Pregnancy** section 13.5.3, p. 804

**Breast-feeding** section 13.5.3, p. 804

**Side-effects** section 13.5.3, p. 804

**Dose**
- By subcutaneous injection, ADULT over 18 years, body-weight under 100 kg, initially 45 mg, then 45 mg 4 weeks after initial dose, then 45 mg every 12 weeks; body-weight over 100 kg, initially 45–90 mg, then 45–90 mg 4 weeks after initial dose, then 45–90 mg every 12 weeks

**Note** Review treatment if no response within 28 weeks

**Preparations**

Section 13.5.3

**Sulfasalazine**

Sulfasalazine has a beneficial effect in suppressing the inflammatory activity of rheumatoid arthritis. Sulfasalazine may also be used by specialists, in the management of psoriatic arthritis affecting peripheral joints [unlicensed indication]. Side-effects include rashes, gastrointestinal intolerance and, especially in patients with rheumatoid arthritis, occasional leucopenia, neutropenia, and thrombocytopenia. These haematological abnormalities occur usually in the first 3 to 6 months of treatment and are reversible on cessation of treatment. Close monitoring of full blood counts (including differential white cell count and platelet count) is necessary initially, and at monthly intervals during the first 3 months (liver function tests also being performed at monthly intervals for the first 3 months). Although the manufacturer recommends renal function tests, evidence of practical value is unsatisfactory.

**SULFASALAZINE**

(Sulphasalazine)

**Indications** active rheumatoid arthritis; inflammatory bowel disease, see section 1.5.1 and notes above

**Cautions** see section 1.5.1 and notes above

Blood disorders Patients should be advised to report any unexplained bleeding, bruising, purpura, sore throat, fever or malaise. A blood count should be performed and the drug stopped immediately if there is suspicion of a blood dyscrasia.

**Contra-indications** see section 1.5.1 and notes above

**Hepatic impairment** section 1.5.1

**Renal impairment** section 1.5.1

**Pregnancy** section 1.5.1

**Breast-feeding** section 1.5.1

**Side-effects** see section 1.5.1 and notes above

**Dose**
- By mouth, administered on expert advice, as enteric-coated tablets, initially 500 mg daily, increased by 500 mg at intervals of 1 week to a max. of 2–3 g daily in divided doses

Sulfasalazine (Non-proprietary) Tablets, e/c, sulfasalazine 500 mg, net price 112-tab pack = £8.07 Label: 5, 14, 25, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained

Brands include Sulazine EC®

Salazopyrin EN-Tabs® (Pharmacia) Tablets, e/c, yellow, f/c, sulfasalazine 500 mg, net price 112-tab pack = £8.43. Label: 5, 14, 25, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained

**BNF 68**

10.1.3 Drugs that suppress the rheumatic disease process 727

10 Musculoskeletal and joint diseases
10 Musculoskeletal and joint diseases

It is important to distinguish drugs used for the treatment of acute attacks of gout from those used in the long-term control of the disease. The latter exacerbate and prolong the acute manifestations if started during an attack.

**Acute attacks of gout**

Acute attacks of gout are usually treated with high doses of NSAIDs such as diclofenac, etoricoxib, indomethacin, ketoprofen, naproxen, or sulindac (section 10.1.1). Colchicine is an alternative in patients in whom NSAIDs are contra-indicated. Aspirin is not indicated in gout. Allopurinol, febuxostat, and uricosurics are not effective in treating an acute attack and may prolong it indefinitely if started during the acute episode.

The use of colchicine is limited by the development of toxicity at higher doses, but it is of value in patients with heart failure since, unlike NSAIDs, it does not induce fluid retention; moreover, it can be given to patients receiving anticoagulants.

Oral or parenteral corticosteroids are an effective alternative in those who cannot tolerate NSAIDs or who are resistant to other treatments. Intra-articular injection of a corticosteroid can be used in acute monarticular gout [unlicensed indication]. A corticosteroid by intramuscular injection can be effective in podagra.

Canakinumab, a recombinant mononal antibody, can be used for the symptomatic treatment of frequent gouty arthritis attacks (at least 3 in the previous 12 months). It is licensed for use in patients whose condition has not responded adequately to treatment with NSAIDs or colchicine, or who are intolerant of them.

**Colchicine**

**Indications** acute gout; short-term prophylaxis during initial therapy with allopurinol and uricosuric drugs; prophylaxis of familial Mediterranean fever (recurrent polyserositis)

**Cautions** see notes above; also elderly; gastro-intestinal disease; cardiac disease; interactions: Appendix 1 (colchicine).

**Contra-indications** blood disorders

**Hepatic impairment** use with caution

**Renal impairment** reduce dose or increase dosage interval if eGFR 10–50 mL/minute/1.73 m²; avoid if eGFR less than 10 mL/minute/1.73 m²

**Pregnancy** avoid—teratogenicity in animal studies

**Breast-feeding** present in milk but no adverse effects reported; manufacturers advise caution

**Side-effects** nausea, vomiting, and abdominal pain; excessive doses may cause profuse diarrhoea, gastrointestinal haemorrhage, rash, renal and hepatic damage; rarely peripheral neuritis, inhibition of spermatogenesis, myopathy, alopecia, and with prolonged treatment blood disorders

**Dose**

- Acute gout, 500 micrograms 2–4 times daily until symptoms relieved, max. 6 mg per course; course not to be repeated within 3 days

- Prevention of gout attacks during initial treatment with allopurinol or uricosuric drugs, 500 micrograms twice daily

- Prophylaxis of familial Mediterranean fever [unlicensed], 0.5–2 mg once daily

**Note** BNF doses may differ from those in the product literature.

**Canakinumab**

**Indications** acute gout; malignant disease (section 8.2.4)

**Cautions** section 8.2.4

**Contra-indications** section 8.2.4

**Hepatic impairment** section 8.2.4

**Renal impairment** section 8.2.4

**Pregnancy** section 8.2.4

**Breast-feeding** section 8.2.4

**Side-effects** section 8.2.4

**Dose**

- By subcutaneous injection. ADULT over 18 years, 150 mg as a single dose; may be repeated at least 12 weeks after initial response if symptoms recur

**Note** Patients who do not respond to initial dose should not be retreated

**Preparations** Section 8.2.4

**Long-term control of gout**

Frequent recurrence of acute attacks of gout, the presence of tophi, or signs of chronic gouty arthritis may call for the initiation of long-term (‘interval’) treatment. For long-term control of gout the formation of uric acid from purines may be reduced with the xanthine-oxidase inhibitors allopurinol or febuxostat; alternatively the uricosuric drug sulfinpyrazone may be used to increase the excretion of uric acid in the urine. Treatment should be continued indefinitely to prevent further attacks of gout by correcting the hyperuricaemia. These drugs should never be started during an acute attack; they are usually started 1–2 weeks after the attack has settled. The initiation of treatment may precipitate an acute attack, and therefore an anti-inflammatory analgesic or colchicine should be used as a prophylactic and continued for at least one month after the hyperuricaemia has been corrected. However, if an acute attack develops during treatment, then the treatment should continue at the same dosage and the acute attack treated in its own right.

Allopurinol is widely used and is especially useful in patients with renal impairment or urate stones when uricosuric drugs cannot be used; it is not indicated for the treatment of asymptomatic hyperuricaemia. It can cause rashes.

Febuxostat is licensed for the treatment of chronic hyperuricaemia where urate deposition has already occurred; it is not indicated for patients in whom the rate of urate formation is greatly increased, such as in malignant disease or in Lesch-Nyhan syndrome.
Allopurinol

Indications prophylaxis of gout and of uric acid and calcium oxalate renal stones; prophylaxis of hyperuricaemia associated with cancer chemotherapy

Cautions administer prophylactic NSAID (not aspirin or salicylates) or colchicine for at least 6 months after starting febuxostat to avoid precipitating an acute attack; transplant recipients; monitor liver function tests before and during treatment; contraindications: Appendix 1 (febuxostat)

Contra-indications not a treatment for acute gout but continue if attack develops when already receiving febuxostat, and treat attack separately (see notes above)

Hepatic impairment reduce dose

Renal impairment max. 100 mg daily, increased only if response inadequate; in severe impairment, reduce daily dose below 100 mg or increase dose interval; if facilities available, adjust dose to maintain plasma-oxipurinol concentration below 100 micromol/litre

Pregnancy toxicity not reported; manufacturer advises use only if no safer alternative and disease carries risk for mother or child

Breast-feeding present in milk—not known to be harmful

Febuxostat

Febuxostat is recommended as an option for the management of chronic hyperuricaemia in adults only for patients who are intolerant of allopurinol or for whom allopurinol is contra-indicated.

Side-effects rashes (withdraw therapy; if rash mild re-introduce cautiously but discontinue promptly if recurrence—hypersensitivity reactions occur rarely and include exfoliation, fever, lymphadenopathy, arthralgia, and eosinophilia resembling Steven-Johnson syndrome or toxic epidermal necrolysis, vasculitis, hepatitis, renal impairment, and very rarely seizures); gastrointestinal disorders; rarely malaise, headache, vertigo, drowsiness, visual and taste disturbances, hypertension, alopecia, hepatoxicity, paraesthesia and neuropathy, gynaecomastia, blood disorders (including leucopenia, thrombocytopenia, haemolytic anaemia and aplastic anaemia)

Dose

- Initially 100 mg daily, preferably after food, then adjusted according to plasma uric acid concentration; usual maintenance dose in mild conditions 100–200 mg daily, in moderate to severe conditions 300–600 mg daily, in severe conditions 700–900 mg daily; doses over 300 mg daily given in divided doses; CHILD under 15 years, (in neoplastic conditions, enzyme disorders) 10–20 mg/kg daily (max. 400 mg daily)

Allopurinol (Non-proprietary) tablets, allopurinol 100 mg, net price 28-tab pack = £9.70, 300 mg, 28-tab pack = £1.00. Brand include Caplenal®, Cosuric®, Rimapurin®

Zyloric® (Aspen) tablets, allopurinol 100 mg, net price 100-tab pack = £10.19; 300 mg, 28-tab pack = £7.31. Brand: 8, 21, 27

Febuxostat

Indications treatment of chronic hyperuricaemia in adults (but see also NICE guidance above)

Cautions administer prophylactic NSAID (not aspirin or salicylates) or colchicine for at least 6 months after starting febuxostat to avoid precipitating an acute attack; transplant recipients; monitor liver function tests before and during treatment; contraindications: Appendix 1 (febuxostat)

Contra-indications not a treatment for acute gout but continue if attack develops when already receiving febuxostat, and treat attack separately (see notes above)

Hepatic impairment max. 80 mg daily in mild impairment; no dose information available in moderate or severe impairment

Renal impairment use with caution if eGFR less than 30 mL/minute/1.73 m²—no information available

Pregnancy manufacturer advises avoid—limited information available

Breast-feeding manufacturer advises avoid—present in milk in animal studies

Side-effects gastro-intestinal disturbances, abnormal liver function tests, oedema, headache, rash; less commonly cholelithiasis, hyperlipidaemia, taste and smell disturbances, hypertension, chest pain, flushing, atrial fibrillation, ECG abnormalities, palpitation, dyspnoea, bronchitis, upper respiratory tract infection, cough, dizziness, paraesthesia, hypoaesthesia, hemiparesis, drowsiness, insomnia, appetite and weight change, diabetes mellitus, increased thyroid stimulating hormone, decreased libido, erectile dysfunction, haematuria, nephrolithiasis, increased

1. The Scottish Medicines Consortium issued similar advice in August 2010

NICE guidance

Febuxostat for the management of hyperuricaemia in patients with gout (December 2008)

Febuxostat is recommended as an option for the management of chronic hyperuricaemia in gout only for patients who are intolerant of allopurinol or for whom allopurinol is contra-indicated.

For the purposes of this guidance, intolerance of allopurinol is defined as adverse effects that are sufficiently severe to warrant discontinuation, or to prevent full dose escalation for optimal effectiveness.

www.nice.org.uk/TA164

Sulfinpyrazone can be used instead of allopurinol, or in conjunction with it in cases that are resistant to treatment.

Probenecid (available from 'special-order' manufacturers or specialist importing companies, see p. 1104) is a uricosuric drug used to prevent nephrotoxicity associated with cidofovir (section 5.3.2.2).

Benzbromarone (available from 'special-order' manufacturers or specialist importing companies, see p. 1104) is a uricosuric drug that can be used in patients with mild renal impairment.

Crystallisation of urate in the urine can occur with the uricosuric drugs and it is important to ensure an adequate urine output especially in the first few weeks of treatment. As an additional precaution the urine may be rendered alkaline.

Aspirin and other salicylates antagonise the uricosuric drugs; they do not antagonise allopurinol but are nevertheless not indicated in gout.
Musculoskeletal and joint diseases

10

Musculoskeletal and joint diseases

urinary frequency, renal failure, proteinuria, myalgia, arthralgia, arthritis, muscle weakness, muscle spasm, bursitis, dermatitis; rarely pancreatitis, hepatitis, jaundice, thirst, asthenia, nervousness, tubulo-interstitial nephritis, pancytopenia, thrombocytopenia, rhabdomyolysis, blurred vision, mouth ulceration, tinnitus

MHRA/CHM advice

Serious hypersensitivity reactions (June 2012)

There have been rare but serious reports of hypersensitivity reactions, including Stevens-Johnson syndrome and acute anaphylactic shock with febuxostat. Patients should be advised of the signs and symptoms of severe hypersensitivity; febuxostat must be stopped immediately if these occur (early withdrawal is associated with a better prognosis), and must not be restarted in patients who have ever developed a hypersensitivity reaction to febuxostat. Most cases occur during the first month of treatment; a prior history of hypersensitivity to allopurinol and/or renal disease may indicate potential hypersensitivity to febuxostat.

Dose

• ADULT over 18 years, 80 mg once daily, if after 2–4 weeks serum uric acid greater than 6 mg/100 mL, increase to 120 mg once daily

Adenuric® (Menarini) Tablets, both yellow, f/c, febuxostat 80 mg, net price 28-tab pack = £24.36; 120 mg 28-tab pack = £24.36

SULFINPYRAZONE

(Sulphinpyrazone)

Indications gout prophylaxis, hyperuricaemia

Cautions ensure adequate fluid intake (about 2–3 litres daily) and render urine alkaline if uric acid overload high; peptic ulceration; transient false-positive Benedict’s test; G6PD-deficiency (section 9.1.5); interactions: Appendix 1 (probenecid)

Contra-indications history of blood disorders, nephrolithiasis, acute gout attack; avoid aspirin and salicylates

Renal impairment avoid if eGFR less than 30 mL/minute/1.73m²

Breast-feeding present in milk

Side-effects gastro-intestinal disturbances; less commonly sore gums, flushing, headache, dizziness, urinary frequency, anaemia, alopecia; hepatic necrosis, hypersensitivity reactions (including anaphylaxis, pruritus, urticaria, fever, and Stevens-Johnson syndrome); nephrotic syndrome, haemolytic anaemia, leucopenia, and aplastic anaemia also reported

Dose

• Used with cidofovir, see section 5.3.2.2

Probencid (Non-proprietary) Tablets, probenecid 500 mg. Label: 12, 21, 27

Available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104

Hyperuricaemia associated with cytotoxic drugs

Allopurinol is used to prevent hyperuricaemia associated with cytotoxic drugs—see section 8.1 (Hyperuricaemia) and Allopurinol above.

Rasburicase is licensed for the prophylaxis and treatment of acute hyperuricaemia, before and during initiation of chemotherapy, in patients with haematological malignancy and a high tumour burden at risk of rapid lysis.

RASBURICASE

Indications prophylaxis and treatment of acute hyperuricaemia with initial chemotherapy for haematological malignancy

Cautions monitor closely for hypersensitivity; atopic allergies; may interfere with test for uric acid—consult product literature

Contra-indications G6PD deficiency (section 9.1.5)

Pregnancy manufacturer advises caution—no information available

Breast-feeding manufacturer advises caution—no information available

Side-effects fever; less commonly nausea, vomiting, diarrhoea, headache, hypersensitivity reactions (including rash, bronchospasm and anaphylaxis); haemolytic anaemia, methaemoglobinemia

Dose

• By intravenous infusion, 200 micrograms/kg once daily for up to 7 days according to plasma-uric acid concentration
Glucosamine

Glucosamine is a natural substance found in mucopolysaccharides, mucoproteins, and chitin. It is licensed for symptomatic relief of mild to moderate osteoarthritis of the knee, but is not recommended. The mechanism of action is not understood and there is limited evidence to show it is effective.

The Scottish Medicines Consortium (p. 4) has advised (May 2009) that glucosamine (Alateris®) and (July 2011) glucosamine (Glusartel®) are not recommended for use within NHS Scotland for the symptomatic relief of mild to moderate osteoarthritis of the knee.

**GLUCOSAMINE**

**Indications**  symptomatic relief of mild to moderate osteoarthritis of the knee

**Cautions**  impaired glucose tolerance (monitor blood-glucose concentration before treatment and periodically thereafter); predisposition to cardiovascular disease (monitor cholesterol); asthma; interactions: Appendix 1 (glucosamine)

**Contra-indications**  shellfish allergy

**Pregnancy**  manufacturers advise avoid—no information available

**Breast-feeding**  manufacturers advise avoid—no information available

**Side-effects**  nausea, abdominal pain, dyspepsia, flatulence, diarrhoea, constipation, drowsiness, headache, flushing; rash; rash, pruritus; also reported visual disturbances, hair loss

**Dose**  
- See under preparations
- **Alateris®** (Dee)  
  Tablets, scored, glucosamine (as hydrochloride) 625 mg, net price 60-tab pack = £18.40
  **Dose ADULT** over 18 years, 2 tablets once daily; review treatment if no benefit after 2–3 months
- **Dolenio®** (Alissa)  
  Tablets, f/c, scored, glucosamine sulfate (as sodium chloride) 1.5 g, net price 30-tab pack = £18.20
  **Dose ADULT** over 18 years, 1 tablet once daily; review treatment if no benefit after 2–3 months
- **Glusartel®** (HFA Healthcare)  
  Oral powder, sugar-free, glucosamine sulfate (as sodium chloride) 1.5 g/sachet, net price 30-sachet pack = £18.40. Label: 13
  **Dose ADULT** over 18 years, 1 sachet (dissolved in at least 250 mL of water) once daily; review treatment if no benefit after 2–3 months

**Anticholinesterases**

Anticholinesterase drugs enhance neuromuscular transmission in voluntary and involuntary muscle in myasthenia gravis. They prolong the action of acetylcholine by inhibiting the action of the enzyme acetylcholinesterase. Excessive dosage of these drugs can impair neuromuscular transmission and precipitate cholinergic crises by causing a depolarising block. This may be difficult to distinguish from a worsening myasthenic state.

Muscarinic side-effects of anticholinesterases include increased sweating, increased salivary and gastric secretions, increased gastro-intestinal and uterine motility, and bradycardia. These parasympathomimetic effects are antagonised by atropine.

**Neostigmine** produces a therapeutic effect for up to 4 hours. Its pronounced muscarinic action is a disadvantage, and simultaneous administration of an antimuscarinic drug such as atropine or propantheline may be required to prevent colic, excessive salivation, or diarrhoea. In severe disease neostigmine can be given every 2 hours. The maximum that most patients can tolerate is 180 mg daily.

**Pyridostigmine** is less powerful and slower in action than neostigmine but it has a longer duration of action. It is preferable to neostigmine because of its smoother action and the need for less frequent dosage. It is particularly preferred in patients whose muscles are weak on waking. It has a comparatively mild gastrointestinal effect but an antimuscarinic drug may still be required. It is inadvisable to exceed a total daily dose of 450 mg in order to avoid acetylcholine receptor down-regulation; patients requiring doses exceeding 450 mg daily will usually require input from a specialised neuromuscular service. Immunosuppressant therapy is usually considered if the dose of pyridostigmine exceeds 360 mg daily.

Neostigmine is also used to reverse the actions of the non-depolarising neuromuscular blocking drugs (see section 15.1.6).
**NEOSTIGMINE**

**Indications** myasthenia gravis; other indications

**Cautions** asthma (extreme caution), bradycardia, arrhythmias, recent myocardial infarction, epilepsy, hypotension, parkinsonism, vagotonia, peptic ulceration, hyperthyroidism; atropine or other antidote to muscarinic effects may be necessary (particularly when neostigmine is given by injection), but not given routinely because it may mask signs of overdosage; interactions: Appendix 1 (parasympathomimetics)

**Contra-indications** intestinal or urinary obstruction

**Renal impairment** may need dose reduction

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** amount probably too small to be harmful

**Side-effects** nausea, vomiting, increased salivation, diarrhea, abdominal cramps (more marked with higher doses); signs of overdosage include bronchoconstriction, increased bronchial secretions, lacrimation, excessive sweating, involuntary defaecation and micturition, miosis, nystagmus, bradycardia, heart block, arrhythmias, hypotension, agitation, excessive dreaming, and weakness, eventually leading to fasciculation and paralysis

**Dose**

- **By mouth**, neostigmine bromide 15–30 mg at suitable intervals throughout day, total daily dose 75–300 mg (but see also notes above); **NEONATE** 1–5 mg every 4 hours, half an hour before feeds; **CHILD** up to 6 years initially 7.5 mg, 6–12 years initially 15 mg, usual total daily dose 15–90 mg

- **By subcutaneous or intramuscular injection** ADULT and **CHILD** over 12 years, neostigmine metil硫酸ate 1–2.5 mg at suitable intervals throughout day (usual total daily dose 5–20 mg); **NEONATE** 150 micrograms/kg every 6–8 hours 30 minutes before feeds, increased to max. 300 micrograms/kg every 4 hours, if necessary (unlicensed); **CHILD** 1 month–12 years 200–500 micrograms as required

**Neostigmine** (Non-proprietary) (BNF)

Tablets, scored, neostigmine bromide 15 mg, net price 140 = £68.31

**Injection** Section 15.1.6

---

**PYRIDOSTIGMINE BROMIDE**

**Indications** myasthenia gravis

**Cautions** see under Neostigmine; weaker muscarinic action

**Contra-indications** see under Neostigmine

**Renal impairment** reduce dose; excreted by kidney

**Pregnancy** see under Neostigmine

**Breast-feeding** see under Neostigmine

**Side-effects** see under Neostigmine

**Dose**

- **By mouth**, 30–120 mg at suitable intervals throughout day, total daily dose 0.3–1.2 g (but see also notes above); **CHILD** under 18 years, see **BNF for Children**

**Mestinon** (Meda) (BNF)

Tablets, scored, pyridostigmine bromide 60 mg, net price 200 = £45.57

---

**Immunosuppressant therapy**

Corticosteroids (section 6.3) are established as treatment for myasthenia gravis; although they are commonly given on alternate days there is little evidence of benefit over daily administration. Corticosteroid treatment is usually initiated under in-patient supervision and all patients should receive osteoporosis prophylaxis (section 6.6).

In **generalised myasthenia gravis** small initial doses of prednisolone (10 mg on alternate days) are increased in steps of 10 mg on alternate days to 1–1.5 mg/kg (max. 100 mg) on alternate days. When given daily, prednisolone is started at 5 mg daily and then increased in steps of 5 mg daily to 60 mg daily or occasionally up to 80 mg daily (0.75–1 mg/kg daily). About 10% of patients experience a transient but very serious worsening of symptoms in the first 2–3 weeks, especially if the corticosteroid is started at a high dose. However, ventilated patients may be started on 1.5 mg/kg (max. 100 mg) on alternate days. Smaller doses of corticosteroid are usually required in **ocular myasthenia**. Once clinical remission has occurred (usually after 2–6 months), the dose of prednisolone should be reduced slowly to the minimum effective dose (usually 10–40 mg on alternate days).

In generalised myasthenia gravis **azathioprine** (section 8.2.1) is usually started at the same time as the corticosteroid and it allows a lower maintenance dose of the corticosteroid to be used; azathioprine is initiated at a dose of 0.5–1 mg/kg daily, which is increased over 3–4 weeks to 2–2.5 mg/kg daily. **Ciclosporin** (section 8.2.2), **methotrexate** (section 8.1.3), or **mycophenolate mofetil** (section 8.2.1) can be used in patients unresponsive or intolerant to other treatments [unlicensed indications].

**Acetylcholine-release enhancers**

Amifampridine is licensed for the symptomatic treatment of Lambert-Eaton myasthenic syndrome (LEMS), a rare disorder of neuromuscular transmission. The **Scottish Medicines Consortium** (p. 4) has advised (July 2012) that amifampridine phosphate (**Firdapse**) is not recommended for use within NHS Scotland for the symptomatic treatment of Lambert-Eaton myasthenic syndrome (**LEMS**).

Fampridine is licensed for the improvement of walking in patients with multiple sclerosis who have a walking disability.

---

**AMIFAMPRIDINE**

**Indications** (specialist use only) symptomatic treatment of Lambert-Eaton myasthenic syndrome

**Cautions** concomitant use of drugs that lower convulsive threshold; non-paraneoplastic form of Lambert-Eaton myasthenic syndrome; clinical and ECG monitoring required at treatment initiation and yearly thereafter

**Contra-indications** epilepsy; uncontrolled asthma; congenital QT syndrome; avoid concomitant use of drugs that prolong QT interval; avoid concomitant use of drugs with a narrow therapeutic index

**Hepatic impairment** use with caution; in mild impairment reduce initial dose to 10 mg daily in divided doses, increased in steps of 5 mg every 7 days; in moderate or severe impairment reduce initial dose to 5 mg daily in divided doses, increased in steps of 5 mg every 7 days

---

**AYDR®** (Meda) (BNF)

Tablets, scored, pyridostigmine bromide 60 mg, net price 200 = £45.57

---

**732 10.2.1 Drugs that enhance neuromuscular transmission**

**BNF 68**
The drugs described below are used for the relief of chronic muscle spasm or spasticity associated with multiple sclerosis or other neurological damage; they are not indicated for spasm associated with minor injuries. Baclofen, diazepam, and tizanidine act principally on the central nervous system. Dantrolene, has a peripheral site of action; cannabis extract has both a central and a peripheral action. Skeletal muscle relaxants differ in action from the muscle relaxants used in anaesthesia (section 15.1.5), which block transmission at the neuromuscular junction.

The underlying cause of spasticity should be treated and any aggravating factors (e.g. pressure sores, infection) remedied. Skeletal muscle relaxants are effective in most forms of spasticity except the rare alpha variety. The major disadvantage of treatment with these drugs is that reduction in muscle tone can cause a loss of splinting action of the spastic leg and trunk muscles and sometimes lead to an increase in disability.

Baclofen inhibits transmission at spinal level and also depresses the central nervous system. The dose should be increased slowly to avoid the major side-effects of sedation and muscular hypotonia (other adverse events are uncommon).

A cannabis extract containing dronabinol (delta-9-tetrahydrocannabinol) and cannabidiol is licensed as an adjunct treatment for moderate to severe spasticity associated with multiple sclerosis in patients who have not responded adequately to other skeletal muscle relaxants. The dose should be titrated over 2 weeks; response to treatment should be reviewed after 4 weeks and treatment stopped if an adequate response is not achieved.

Dantrolene acts directly on skeletal muscle and produces fewer central adverse effects making it a drug of choice. The dose should be increased slowly.

Diazepam can also be used. Sedation and occasionally extensor hypotonia are disadvantages. Other benzodiazepines also have muscle-relaxant properties. Muscle-relaxant doses of benzodiazepines are similar to anxiolytic doses (section 4.1.2).

Tizanidine is an alpha2-adrenoceptor agonist indicated for spasticity associated with multiple sclerosis or spinal cord injury.

### Skeletal muscle relaxants

The drugs described below are used for the relief of chronic muscle spasm or spasticity associated with multiple sclerosis or other neurological damage; they are not indicated for spasm associated with minor injuries. Baclofen, diazepam, and tizanidine act principally on the central nervous system. Dantrolene, has a peripheral site of action; cannabis extract has both a central and a peripheral action. Skeletal muscle relaxants differ in action from the muscle relaxants used in anaesthesia (section 15.1.5), which block transmission at the neuromuscular junction.

The underlying cause of spasticity should be treated and any aggravating factors (e.g. pressure sores, infection) remedied. Skeletal muscle relaxants are effective in most forms of spasticity except the rare alpha variety. The major disadvantage of treatment with these drugs is that reduction in muscle tone can cause a loss of splinting action of the spastic leg and trunk muscles and sometimes lead to an increase in disability.

Baclofen inhibits transmission at spinal level and also depresses the central nervous system. The dose should be increased slowly to avoid the major side-effects of sedation and muscular hypotonia (other adverse events are uncommon).

A cannabis extract containing dronabinol (delta-9-tetrahydrocannabinol) and cannabidiol is licensed as an adjunct treatment for moderate to severe spasticity associated with multiple sclerosis in patients who have not responded adequately to other skeletal muscle relaxants. The dose should be titrated over 2 weeks; response to treatment should be reviewed after 4 weeks and treatment stopped if an adequate response is not achieved.

Dantrolene acts directly on skeletal muscle and produces fewer central adverse effects making it a drug of choice. The dose should be increased slowly.

Diazepam can also be used. Sedation and occasionally extensor hypotonia are disadvantages. Other benzodiazepines also have muscle-relaxant properties. Muscle-relaxant doses of benzodiazepines are similar to anxiolytic doses (section 4.1.2).

Tizanidine is an alpha2-adrenoceptor agonist indicated for spasticity associated with multiple sclerosis or spinal cord injury.
**Baclofen**

**Dose**
- **By mouth,** ADULT over 18 years, initially 5 mg 3 times daily, gradually increased; usual maintenance dose to establish **maintenance dose** (ranging from 12 micrograms to 2 mg daily for spasticity of spinal origin or 22 micrograms to 1.4 mg daily for spasticity of cerebral origin) retaining some spasticity to avoid sensation of paralysis; **CHILD 4–18 years** (spasticity of cerebral or spinal origin only), initial **test dose** 25–50 micrograms then titrated as for ADULT, initial **maintenance dose** 25–200 micrograms daily, adjusted according to response

**Side-effects**
- Gastro-intestinal disturbances, dry mouth; hypotension, respiratory or cardiovascular depression; sedation; drowsiness, confusion, dizziness, ataxia, hallucinations, nightmares, headache, euphoria, insomnia, depression, anxiety, agitation, tremor; seizure; urinary disturbances; myalgia; visual disorders; rash, hyperhidrosis; rarely taste disturbances, abdominal pain, changes in hepatic function, paraesthesia, erectile dysfunction, dysarthria; very rarely hypothermia

**Contra-indications**
- Significant cardiovascular disease; history of epilepsy; monitor oral mucosa—interrupt treatment if lesions or persistent soreness; **interactions:** Appendix 1 (cannabis extract)

**Breast-feeding**
- Avoid—present in milk

**Renal impairment**
- Risk of toxicity—use smaller doses (e.g. 5 mg daily by mouth) and if necessary increase dosage interval; if eGFR less than 15 mL/minute/1.73 m² manufacturer advises use by mouth only if potential benefit outweighs risk, excreted by kidney

**Pregnancy**
- Manufacturer advises use only if potential benefit outweighs risk (toxicity in animal studies)

**Liquid**
- Sugar-free, raspberry-flavoured, baclofen 5 mg/5 mL, net price 300 mL = £8.59. Label: 2, 8, 21

**Intrathecal injection**
- Baclofen 50 micrograms/mL, net price 1-mL amp (for test dose) = £2.63; 500 micrograms/mL, 20-mL amp (for use with implantable pump) = £58.34; 2 mg/mL, 5-mL amp (for use with implantable pump) = £58.34
**DIAZEPAM**

**Indications** muscle spasm of varied aetiology, including tetanus; other indications (section 4.1.2, section 4.8, section 15.1.4.1)

**Cautions** section 4.1.2; special precautions for intravenous injection (section 4.8.2)

**Contra-indications** section 4.1.2

**Hepatic impairment** section 4.1.2

**Renal impairment** section 4.1.2

**Pregnancy** section 4.1.2

**Breast-feeding** section 4.1.2

**Side-effects** section 4.1.2; also hypotonia

**Dose**

- Muscle spasm, by mouth, 2–15 mg daily in divided doses, increased if necessary in spastic conditions to 60 mg daily according to response
- Cerebral spasticity in selected cases, **CHILD** 2–40 mg daily in divided doses
- By intramuscular or by slow intravenous injection (into a large vein at a rate of not more than 5 mg/minute), in acute muscle spasm, 10 mg repeated if necessary after 4 hours

*Note* Only use intramuscular route when oral and intravenous routes not possible; emulsion formulation preferred for intravenous injection; special precautions for intravenous injection, see section 4.8.2

**Preparations**

**TIZANIDINE**

**Indications** spasticity associated with multiple sclerosis or spinal cord injury or disease

**Cautions** elderly; monitor liver function monthly for first 4 months and in those who develop unexplained nausea, anorexia or fatigue; concomitant administration of drugs that prolong QT interval; avoid abrupt withdrawal (risk of rebound hypertension and tachycardia, see under Withdrawal, below); interactions: Appendix 1 (muscle relaxants)

**Withdrawal** Rebound hypertension and tachycardia can occur on abrupt withdrawal; to minimise risk, discontinue gradually and monitor blood pressure

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Hepatic impairment** avoid in severe impairment; use in moderate impairment only if potential benefit outweighs risk

**Renal impairment** manufacturer advises caution

**Pregnancy** avoid (toxicity in animal studies)

**Breast-feeding** avoid (present in milk in animal studies)

**Side-effects** dry mouth, nausea, gastro-intestinal disturbance, altered liver enzymes (discontinue if persistently raised—consult product literature), hypotension, drowsiness, fatigue, dizziness; less commonly bradycardia; also reported hepatitis, liver failure, insomnia, hallucinations, confusion, convulsions, syncope, asthenia, blurred vision

**Dose**

- **ADULT** over 18 years, initially 2 mg daily as a single dose increased according to response at intervals of at least 3–4 days in steps of 2 mg daily (and given in divided doses) usually up to 24 mg daily in 3–4 divided doses; max. 36 mg daily

**Tizanidine (Non-proprietary)**

**Tablets**, tizanidine (as hydrochloride) 2 mg net price 120-tab pack = £17.25; 4 mg, 120-tab pack = £24.07. Label: 2, 8

**ZANAFLEX®** (TEVA UK)®

**Tablets**, scored, tizanidine (as hydrochloride) 2 mg, net price 120-tab pack = £30.41; 4 mg, 120-tab pack = £42.18. Label: 2, 8

**Other muscle relaxants**

The clinical efficacy of methocarbamol and meprobamate (section 4.1.2) as muscle relaxants is not well established, although they have been included in compound analgesic preparations.

**METHOCARBAMOL**

**Indications** short-term symptomatic relief of muscle spasm (but see notes above)

**Cautions** interactions: Appendix 1 (muscle relaxants)

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced
Contra-indications  coma or pre-coma, brain damage, epilepsy, myasthenia gravis
Hepatic impairment  manufacturer advises caution; half-life may be prolonged
Renal impairment  manufacturer advises caution
Pregnancy  manufacturer advises avoid unless potential benefit outweighs risks
Breast-feeding  present in milk in animal studies—manufacturer advises caution

Side-effects  nausea, vomiting, dyspepsia; hypersensitivity reactions (including urticaria, angioedema, anaphylaxis); fever, headache, drowsiness, dizziness, hypotension, bradycardia, confusion, amnesia, restlessness, anxiety, tremor, seizures; blurred vision, nasal congestion; rash, pruritus; leucopenia, cholestatic jaundice

Dose  
- 1.5 g 4 times daily; may be reduced to 750 mg 3 times daily; elderly up to 750 mg 4 times daily may be sufficient; child not recommended

Robaxin® (Amlodil®)
750 Tablets, f/c, scored, methocarbamol 750 mg, net price 100 = £12.65. Label: 2

**Nocturnal leg cramps**

Quinine salts (section 5.4.1), such as quinine sulfate 200–300 mg at bedtime, are effective in reducing the frequency of nocturnal leg cramps by about 25% in ambulatory patients; however, because of potential toxicity, quinine is not recommended for routine treatment and should not be used unless cramps cause regular disruption to sleep. Quinine should only be considered when cramps are very painful or frequent; when other treatable causes of cramp have been excluded; and when non-pharmacological treatments have not worked (e.g. passive stretching exercises). It may take up to 4 weeks for improvement to become apparent; if there is benefit, quinine treatment can be continued. Patients should be monitored closely during the early stages for adverse effects as well as for benefit. Treatment should be interrupted at intervals of approximately 3 months to assess the need for further quinine treatment. In patients taking quinine long term, a trial discontinuation may be considered. Quinine is toxic in overdosage and accidental fatalities have occurred (see also below).

**QUININE**

Indications  see notes above; malaria (section 5.4.1)
Cautions  see section 5.4.1 and notes above
Contra-indications  section 5.4.1
Pregnancy  section 5.4.1
Breast-feeding  section 5.4.1
Side-effects  section 5.4.1; important: very toxic in overdosage—immediate advice from poison centres essential (see also p. 39)

Dose  
- See notes above

Preparations  Section 5.4.1

**Extravasation**

Extravasation injury follows leakage of drugs or intravenous fluids from the veins or inadvertent administration into the subcutaneous or subdermal tissue. It must be dealt with promptly to prevent tissue necrosis. Acidic or alkaline preparations and those with an osmolality greater than that of plasma can cause extravasation injury; excipients including alcohol and polyethylene glycol have also been implicated. Cytotoxic drugs commonly cause extravasation injury. In addition, certain patients such as the very young and the elderly are at increased risk. Those receiving anticoagulants are more likely to lose blood into surrounding tissues if extravasation occurs, while those receiving sedatives or analgesics may not notice the early signs or symptoms of extravasation.

**Prevention of extravasation**  Precautions should be taken to avoid extravasation; ideally, drugs likely to cause extravasation injury should be given through a central line and patients receiving repeated doses of hazardous drugs peripherally should have the cannula reset at regular intervals. Attention should be paid to the manufacturers’ recommendations for administration. Placing a glyceryl trinitrate patch (section 2.6.1) distal to the cannula may improve the patency of the vessel in patients with small veins or in those whose veins are prone to collapse.

Patients should be asked to report any pain or burning at the site of injection immediately.

**Management of extravasation**  If extravasation is suspected the infusion should be stopped immediately but the cannula should not be removed until after an attempt has been made to aspirate the area (through the cannula) in order to remove as much of the drug as possible. Aspiration is sometimes possible if the extravasation presents with a raised bleb or blister at the injection site and is surrounded by hardened tissue, but it is often unsuccessful if the tissue is soft or soggy. Corticosteroids are usually given to treat inflammation, although there is little evidence to support their use in extravasation. Hydrocortisone or dexamethasone (section 6.3.2) can be given either locally by subcutaneous injection or intravenously at a site distant from the injury. Antihistamines (section 3.4.1) and analgesics (section 4.7) may be required for symptom relief.

The management of extravasation beyond these measures is not well standardised and calls for specialist advice. Treatment depends on the nature of the offending substance; one approach is to localise and neutralise the substance whereas another is to spread and dilute it.
The first method may be appropriate following extravasation of vesicant drugs and involves administration of an antidote (if available) and the application of cold compresses 3–4 times a day (consult specialist literature for details of specific antidotes). Spreading and diluting the offending substance involves infiltrating the area with physiological saline, applying warm compresses, elevating the affected limb, and administering hyaluronidase (section 10.3.1). A saline flush-out technique (involving flushing the subcutaneous tissue with physiological saline) may be effective but requires specialist advice. Hyaluronidase should not be administered following extravasation of vesicant drugs (unless it is either specifically indicated or used in the saline flush-out technique). Dexrazoxane (section 8.1) is licensed for the treatment of anthracycline-induced extravasation.

**10.3.1 Enzymes**

**Collagenase**

Collagenases are proteolytic enzymes that are derived from the fermentation of Clostridium histolyticum and have the ability to break down collagen. A preparation containing a mixture of two collagenases is licensed for the treatment of Dupuytren’s contracture; the preparation should be injected into a palpable cord with a contracture of a metacarpophalangeal joint or proximal interphalangeal joint.

The Scottish Medicines Consortium (p. 4) has advised (April 2012) that collagenase Clostridium histolyticum (Xiapex®) is accepted for restricted use within NHS Scotland as an alternative to limited fasciectomy, for the treatment of Dupuytren’s contracture of moderate severity (as defined by the British Society for Surgery of the Hand) in patients with a palpable cord and up to two affected joints per hand, who are suitable for limited fasciectomy, but for whom percutaneous needle fasciectomy is not considered a suitable treatment option.

### COLLAGENASE

**Indications**  
Dupuytren’s contracture in patients with a palpable cord  
**Cautions**  
coagulation disorders or use of anticoagulants  
**Contra-indications**  
avoid injecting into other structures containing collagen (e.g. tendons, nerves, and blood vessels)—risk of tendon rupture or ligament damage  
**Pregnancy**  
manufacturer advises avoid  
**Breast-feeding**  
systemic absorption by mother negligible  
**Side-effects**  
paraesthesia, hypoesthesia, burning sensation, lymphadenopathy, arthralgia, myalgia, joint swelling, injection site reactions, ecchymosis, hyperhidrosis; less commonly complex regional pain syndrome, monoplegia, tremor, crepitus, muscle spasm and weakness, tendon rupture, ligament injury, wound dehiscence  
**Dose**  
- By intralesional injection into palpable cord, ADULT over 18 years, 580 micrograms; if necessary repeat at intervals of approx. 4 weeks; max. 3 injections per cord; max. 8 injections in total; only one cord may be treated at a time  
**Note**  
reconstitution and injected volumes vary with site of injection—consult product literature

**Xiapex® (Auxilium) **

*Injection,* powder for reconstitution, collagenase *Clostridium histolyticum,* net price 900-microgram vial (with solvent) = £650.00

**Hyaluronidase**

Hyaluronidase is used to render the tissues more readily permeable to injected fluids, e.g. for introduction of fluids by subcutaneous infusion (termed hypodermoclysis).

### HYALURONIDASE

**Indications**  
- enhance permeation of subcutaneous or intramuscular injections, local anaesthetics and subcutaneous infusions; promote resorption of excess fluids and blood  
**Cautions**  
- infants or elderly (control speed and total volume and avoid overhydration especially in renal impairment)  
**Contra-indications**  
do not apply direct to cornea; avoid sites where infection or malignancy; not for anaesthesia in unexplained premature labour; not to be used to reduce swelling of bites or stings; not for intravenous administration; not to be used to enhance the absorption and dispersion of dopamine and/or alpha-adrenoceptor agonists  
**Side-effects**  
one or oedema; rarely local irritation, infection, bleeding, bruising; occasional severe allergy (including anaphylaxis)  
**Dose**  
- With subcutaneous or intramuscular injection, 1500 units dissolved directly in solution to be injected (ensure compatibility)  
- With local anaesthetics, 1500 units mixed with local anaesthetic solution (ophthalmology, 15 units/mL)  
- Hypodermoclysis, 1500 units dissolved in 1 mL water for injections or 0.9% sodium chloride injection, administered before start of 500–1000 mL infusion fluid  
- Extravasation (see notes above) or haematoma, 1500 units dissolved in 1 mL water for injections or 0.9% sodium chloride injection, infiltrated into affected area (as soon as possible after extravasation)  
**Hyalase®** (Wockhardt)  
*Injection,* powder for reconstitution, hyaluronidase (ovine). Net price 1500-unit amp = £7.60

### 10.3.2 Rubefacients, topical NSAIDs, capsaicin, and poultices

Rubefacients act by counter-irritation. Pain, whether superficial or deep-seated, is relieved by any method that itself produces irritation of the skin. Topical rubefacient preparations may contain nicotinate and salicylate compounds, essential oils, capsicum, and camphor. The evidence available does not support the use of topical rubefacients in acute or chronic musculoskeletal pain.
Topical NSAIDs
The use of a NSAID by mouth is effective for relieving musculoskeletal pain. Topical NSAIDs (e.g. fenbufen, ibuprofen, ketoprofen, and piroxicam) may provide some relief of pain in musculoskeletal conditions; they can be considered as an adjuncive treatment in knee or some relief of pain in musculoskeletal conditions; they (ibuprofen, ketoprofen, and piroxicam) may provide for children. Patient packs carry a disease has also been reported). Not generally suitable amounts can result in systemic effects (see section 10.1). Other preparations include benzyl alcohol, propylene glycol, excipients, include benzyl alcohol, propylene glycol, excipients, include hydroxybenzoates (parabens), propylene glycol, excipients, include propylene glycol, fragrance.

Cautions
Apply with gentle massage only. Avoid contact with eyes, mucous membranes, and inflamed or broken skin; discontinue if rash develops. Hands should be washed immediately after use. Not for use with occlusive dressings. Topical application of large amounts can result in systemic effects (see section 10.1.1), including hypersensitivity and asthma (renal disease has also been reported). Not generally suitable for children. Patient packs carry a warning to avoid during pregnancy or breast-feeding.

Hypersensitivity
For NSAID hypersensitivity and asthma warning, see p. 703 and p. 704

Photosensitivity
Patients should be advised against excessive exposure to sunlight of treated areas. In order to avoid possibility of photosensitivity. Patients using preparations containing ketoprofen should be advised not to expose area treated to sunbids or sunlight (even on a bright but cloudy day) during, and for two weeks after stopping treatment; treated areas should be protected with clothing.

Non-proprietary preparations
Ibuprofen (Non-proprietary)

Gel, ibuprofen 5%, net price 30 g = £1.28, 50 g = £2.11, 100 g = £4.22. Counselling, photosensitivity, see above
Dose apply up to 3 times daily

Ketoprofen (Non-proprietary)

Gel, ketoprofen 2.5%, net price 30 g = £4.47, 50 g = £1.64, 100 g = £2.58. Counselling, photosensitivity, see above
Dose apply 2–4 times daily for up to 7 days (usual max. 15 g daily)

Piroxicam (Non-proprietary)

Gel, piroxicam 0.5%, net price 60 g = £2.83; 112 g = £5.28. Counselling, photosensitivity, see above
Dose apply 3–4 times daily

Proprietary preparations
Feldene® (Pfizer)

Gel, piroxicam 0.5%, net price 60 g = £6.00; 112 g = £9.41 (also 7.5 g starter pack, hosp. only). Counselling, photosensitivity, see above
Excipients include benzyl alcohol, propylene glycol
Dose apply 3–4 times daily; therapy should be reviewed after 4 weeks

Fenbid® Forte Gel (AMCo)

Gel, ibuprofen 10%, net price 100 g = £4.00. Counselling, photosensitivity, see above
Excipients include benzyl alcohol
Dose apply up to 4 times daily; therapy should be reviewed after 14 days

Ibufel® Forte (Dermal)

Forte gel, ibuprofen 10%, net price 100 g = £5.79. Counselling, photosensitivity, see above
Excipients none as listed in section 13.1.3
Dose apply up to 3 times daily

1. Smaller pack sizes available on sale to the public

Capsaicin
A preparation containing capsaicin 0.025% can be considered as an adjunct in hand or knee osteoarthritis (see section 10.1). It may need to be used for 1–2 weeks before pain is relieved.

A capsaicin 0.075% cream is licensed for the symptomatic relief of postherpetic neuralgia (section 4.7.3) after lesions have healed, and for the relief of painful diabetic neuropathy (section 6.1.5).

A self-adhesive patch containing capsaicin 8% is licensed for the treatment of peripheral neuropathic pain in non-diabetic patients. The Scottish Medicines Consortium (p. 4) has advised (January 2011) that capsaicin 179 mg (8%) patch (Quen-za®) is accepted for restricted use within NHS Scotland for the treatment of postherpetic neuralgia in patients who have not achieved adequate pain relief from, or who have not tolerated conventional first and second-line treatments. Treatment should be under the supervision of a specialist in pain management.

1. Various pack sizes available on sale to the public
Zacin® (TEVA UK) Cream, capsaicin 0.025%, net price 45 g = £17.71. Excipients include benzyl alcohol, cetyl alcohol. Cautions avoid contact with eyes, inflamed or broken skin; wash hands immediately after use (or wash hands 30 minutes after application if hands treated); not to be used under tight bandages; avoid hot shower or bath just before or after application (burning sensation enhanced); avoid inhalation of vapours. Side-effects transient burning sensation during initial treatment (particularly if too much used or if administered less than 4 times daily); rarely cough, sneezing, eye irritation; dyspnoea and exacerbation of asthma also reported. Dose symptomatic relief in osteoarthritis, apply sparingly 4 times daily (not more often than every 4 hours).

Axsain® (TEVA UK) Cream, capsaicin 0.075%, net price 45 g = £14.58. Excipients include benzyl alcohol, cetyl alcohol. Cautions avoid contact with eyes, inflamed or broken skin; wash hands immediately after use (or wash hands 30 minutes after application if hands treated); not to be used under tight bandages; avoid hot shower or bath just before or after application (burning sensation enhanced); avoid inhalation of vapours. Side-effects transient burning sensation during initial treatment (particularly if too much used or if administered less than 3–4 times daily); rarely cough, sneezing, eye irritation; dyspnoea and exacerbation of asthma also reported. Dose post-herpetic neuralgia (important: after lesions have healed), apply sparingly up to 3–4 times daily (not more often than every 4 hours). Painful diabetic neuropathy, under specialist supervision, apply sparingly 3–4 times daily (not more often than every 4 hours) for 8 weeks then review.

Qutenza® (Astellas) Patches, self-adhesive, capsaicin 179 mg (8%), net price 16280 cm² patch (with cleansing gel) = £210.00. Excipients include butylated hydroxyanisole in cleansing gel (see section 13.1.3). Cautions avoid holding near eyes or mucous membranes; avoid contact with inflamed or broken skin, the face, scalp or in proximity to mucous membranes; monitor blood pressure during treatment procedure; uncontrolled hypertension; recent cardiovascular events. Side-effects application site reactions including transient burning, erythema, pruritus; less commonly nausea, peripheral oedema, first degree AV block, tachycardia, palpitations, hypertension; cough, throat irritation, hypoaesthesia, burning sensation, dysgeusia, pain in extremities, muscle spasm; eye irritation; pruritus Dose peripheral neuropathic pain in non-diabetic patients, applied under supervision of a physician, consult product literature. Note Nitrile gloves to be worn while handling patches and cleaning treatment areas (latex gloves do not provide adequate protection).

Poultices

Kaolin Poultice® Poultice, heavy kaolin 52.7%, thymol 0.05%, boric acid 4.5%, peppermint oil 0.05%, methyl salicylate 0.2%, glycerol 42.5%. Net price 200 g = £2.76. Dose warm and apply directly or between layers of muslin; avoid application of overheated poultice.

Kaolin Poultice K/L Pack® (K/L) Kaolin poultice Net price 4 x 100-g pouches = £6.40.
11 Eye

11.1 Administration of drugs to the eye

Drugs are most commonly administered to the eye by topical application as eye drops or eye ointments. When a higher drug concentration is required within the eye, a local injection may be necessary, see Other Preparations, below.

Eye-drop dispenser devices are available to aid the instillation of eye drops from plastic bottles and some are prescribable on the NHS (consult Drug Tariff—see Appliances and Reagents, p. 1092 for links to online Drug Tariffs). Product-specific devices may be supplied by manufacturers—consult individual manufacturers for information. They are particularly useful for the elderly, visually impaired, arthritic, or otherwise physically limited patients.

Eye drops and eye ointments

Eye drops are generally instilled into the pocket formed by gently pulling down the lower eyelid and keeping the eye closed for as long as possible after application; one drop is all that is needed. Instillation of more than one drop should be discouraged because it may increase systemic side-effects. A small amount of eye ointment is applied similarly; the ointment melts rapidly and blinking helps to spread it.

When two different eye-drop preparations are used at the same time of day, dilution and overflow may occur when one immediately follows the other. The patient should therefore leave an interval of at least 5 minutes between the two; the interval should be extended when eye drops with a prolonged contact time, such as gels and suspensions, are used. Eye ointment should be applied after drops.

Systemic effects may arise from absorption of drugs into the general circulation from conjunctival vessels or from the nasal mucosa after the excess preparation has drained down through the tear ducts. The extent of systemic absorption following ocular administration is highly variable; nasal drainage of drugs is associated with eye drops much more often than with eye ointments. Pressure on the lacrimal punctum for at least a minute after applying eye drops reduces nasolacrimal drainage and therefore decreases systemic absorption from the nasal mucosa.

After using eye drops or eye ointments, patients should be warned not to drive or perform other skilled tasks until vision is clear.

Eye lotions

These are solutions for the irrigation of the conjunctival sac. They act mechanically to flush out irritants or foreign bodies as a first-aid treatment. Sterile sodium chloride 0.9% solution (section 11.8.1) is usually used. Clean water will suffice in an emergency.

Ophthalmic Specials

The Royal College of Ophthalmologists and the UK Ophthalmic Pharmacy Group have produced the Ophthalmic Specials Gui-
dance to help prescribers and pharmacists manage and restrict the use of unlicensed eye preparations. ‘Specials’ should only be prescribed in situations where a licensed product is not suitable for a patient’s needs. The Ophthalmic Specials Guidance can be accessed on the Royal College of Ophthalmologists website (www.rcophth.ac.uk). The guidance will be reviewed every six months to ensure the most accurate and up-to-date information is available.

Other preparations Subconjunctival injection may be used to administer anti-infective drugs, mydriatics, or corticosteroids for conditions not responding to topical therapy; intracameral and intravitreal routes can also be used to administer certain drugs, for example antibacterials. These injections should only be used under specialist supervision.

Dance to help prescribers and pharmacists manage and restrict the use of unlicensed eye preparations. ‘Specials’ should only be prescribed in situations where a licensed product is not suitable for a patient’s needs. The Ophthalmic Specials Guidance can be accessed on the Royal College of Ophthalmologists website (www.rcophth.ac.uk). The guidance will be reviewed every six months to ensure the most accurate and up-to-date information is available.

Preservatives and sensitisers Information on preservatives and on substances identified as skin sensitisers (see section 13.1.3) is provided under Excipients statements in preparation entries. Very rarely, cases of corneal calcification have been reported with the use of phosphate-containing eye drops in patients with significantly damaged corneas—consult product literature for further information.

11.2 Control of microbial contamination

Preparations for the eye should be sterile when issued. Care should be taken to avoid contamination of the contents during use.

Eye drops in multiple-application containers for domiciliary use should not be used for more than 4 weeks after first opening (unless otherwise stated by the manufacturer).

Multiple application eye drops for use in hospital wards are normally discarded 1 week after first opening—local practice may vary. Individual containers should be provided for each patient. A separate container should be supplied for each eye only if there are special concerns about contamination. Containers used before an eye operation should be discarded at the time of the operation and fresh containers supplied postoperatively. A fresh supply should also be provided upon discharge from hospital; in specialist ophthalmology units, it may be acceptable to issue containers that have been dispensed to the patient on the day of discharge.

In out-patient departments single-application containers should be used; if multiple-application containers are used, they should be discarded after single patient use within one clinical session.

In eye surgery single-application containers should be used if possible; if a multiple-application container is used, it should be discarded after single use. Preparations used during intra-ocular procedures and others that may penetrate into the anterior chamber must be isotonic and without preservatives and buffered if necessary to a neutral pH. Specially formulated fluids should be used for intra-ocular surgery; intravenous infusion preparations are not usually suitable for this purpose (Hartmann’s solution may be used in some ocular surgery). For all surgical procedures, a previously unopened container is used for each patient.

11.3 Anti-infective eye preparations

11.3.1 Antibacterials

Bacterial eye infections are generally treated topically with eye drops and eye ointments. Systemic administration is sometimes appropriate in blepharitis. Chloramphenicol has a broad spectrum of activity and is the drug of choice for superficial eye infections. Chloramphenicol eye drops are well tolerated and the recommendation that chloramphenicol eye drops should be avoided because of an increased risk of aplastic anaemia is not well founded.

Other antibacterials with a broad spectrum of activity include the quinolones, ciprofloxacin, levofloxacin, moxifloxacin, and ofloxacin; the aminoglycosides, gentamicin, tobramycin, quinolones (except moxifloxacin), and polymyxin B are effective for infections caused by Pseudomonas aeruginosa.

Ciprofloxacin eye drops are licensed for corneal ulcers; intensive application (especially in the first 2 days) is required throughout the day and night.

Azithromycin eye drops are licensed for trachomatous conjunctivitis caused by Chlamydia trachomatis and for purulent bacterial conjunctivitis. Trachoma which results from chronic infection with Chlamydia trachomatis can be treated with azithromycin by mouth (unlicensed indication).

Fusidic acid is useful for staphylococcal infections. Propamidine isetionate is of little value in bacterial infections but is used by specialists to treat the rare, but...
potentially sight-threatening, condition of *acanthamoeba keratitis* [unlicensed indication] (see also section 11.9).

**Cefuroxime** can be administered by intracameral injection for the prophylaxis of endophthalmitis following cataract surgery, see section 11.8.2.

**With corticosteroids** Many antibacterial preparations also incorporate a corticosteroid but such mixtures should not be used unless a patient is under close specialist supervision. In particular they should not be prescribed for undiagnosed ‘red eye’ which is sometimes caused by the herpes simplex virus and may be difficult to diagnose (section 11.4).

**Administration** Frequency of application depends on the severity of the infection and the potential for irreversible ocular damage; antibacterial eye preparations are usually administered as follows:

- Eye drops, apply 1 drop at least every 2 hours then reduce frequency as infection is controlled and continue for 48 hours after healing.
- Eye ointment, apply either at night (if eye drops used during the day) or 3–4 times daily (if eye ointment used alone).

### AZITHROMYCIN DIHYDRATE

**Indications** see notes above

**Side-effects** ocular discomfort (including pruritus, burning), blurred vision; less commonly eyelid eczema, eyelid erythema, eyelid oedema, conjunctival hyperaemia, keratitis

**Dose**

- Apply twice daily for 3 days; review if no improvement after 3 days

### Single use

**Azyet®** (Spectrum Thea)

- **Eye drops**, azithromycin dihydrate 1.5%, net price 6 × 0.25 g = £9.99

### CHLORAMPHENICOL

**Indications** see notes above

**Pregnancy** avoid unless essential—no information on topical use but risk of ‘neonatal grey-baby syndrome’ with oral use in third trimester

**Breast-feeding** avoid unless essential—theoretical risk of bone-marrow toxicity

**Side-effects** transient stinging; see also notes above

**Dose**

- See Administration in notes above

**Chloramphenicol** (Non-proprietary)

- **Eye drops**, chloramphenicol 0.5%. Net price 10 mL = £1.44
- **Eye ointment**, chloramphenicol 1%. Net price 4 g = £1.08

**Note** Chloramphenicol 0.5% eye drops (in max. pack size 10 mL) and 1% eye ointment (in max. pack size 4 g) can be sold to the public for treatment of acute bacterial conjunctivitis in adults and children over 2 years; max. duration of treatment 5 days

**Chloromycetin®** (AMCo)

- **Redidrops** (= eye drops), chloramphenicol 0.5%. Net price 5 mL = £1.65; 10 mL = 90 p
- **Excipients** include phenylmercuric acetate
- **Ophthalmic ointment** (= eye ointment), chloramphenicol 1%. Net price 4 g = £1.08

**Single use**

**Minims® Chloramphenicol** (Bausch & Lomb)

- **Eye drops**, chloramphenicol 0.5%. Net price 20 × 0.5 mL = £10.53

### CIPROFLOXACIN

**Indications** superficial bacterial infections, see notes above; corneal ulcers

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises caution

**Side-effects** taste disturbance, ocular discomfort, ocular hyperaemia, corneal deposits (reversible after completion of treatment); less commonly nausea, headache, keratopathy, corneal infiltrates, corneal staining, photophobia, blurred vision, eyelid disorders (including oedema, exfoliation, erythema), eye irritation (including pain, swelling, pruritus, dryness), increased lacrimation, conjunctival hyperaemia; rarely diarrhoea, abdominal pain, dizziness, keratitis, corneal disorders including corneal epithelium defect, eye hypoaesthesia, asthenopia, diplopia, ear pain, paranasal sinus hyposecretion, rhinitis, dermatitis

**Dose**

- Superficial bacterial infection, **ADULT** and **CHILD** apply eye drops 4 times daily; in severe infection apply every 2 hours during waking hours for 2 days, then 4 times daily; max. duration of treatment 21 days
- **ADULT** and **CHILD** over 1 year, apply 1.25 cm eye ointment 3 times daily for 2 days, then twice daily for 5 days
- Corneal ulcer, **ADULT** and **CHILD** apply eye drops throughout day and night, day 1 apply every 15 minutes for 6 hours then every 30 minutes, day 2 apply every hour, days 3–14 apply every 4 hours; max. duration of treatment 21 days
- **ADULT** and **CHILD** over 1 year, apply eye ointment throughout day and night; apply 1.25 cm ointment every 1–2 hours for 2 days, then every 4 hours for next 12 days

**Ciloxan®** (Alcon)

- **Ophthalmic solution** (= eye drops), ciprofloxacin (as hydrochloride) 0.3%. Net price 5 mL = £4.70
- **Excipients** include benzalkonium chloride
- **Eye ointment**, ciprofloxacin (as hydrochloride) 0.3%. Net price 3.5 g = £5.22

### FUSIDIC ACID

**Indications** see notes above

**Dose**

- See under preparation below

**Fucithalmic®** (LEO)

- **Eye drops**, m/r, fusidic acid 1% in gel basis (liquifies on contact with eye). Net price 5 g = £2.69
- **Excipients** include benzalkonium chloride
- **Eye ointment**, ciprofloxacin (as hydrochloride) 0.3%. Net price 3.5 g = £5.22

### GENTAMICIN

**Indications** see notes above

**Dose**

- See Administration in notes above

**Gentamicin®** (AMCo)

- **Drops** (for ear or eye), gentamicin (as sulfate) 0.3%. Net price 10 mL = £2.13
- **Excipients** include benzalkonium chloride
LEVOFLOXACIN

**Indications** see notes above

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risk

**Side-effects** ocular burning, visual disturbances; *less commonly* headache, ocular discomfort (including itching, pain, and dryness), conjunctival follicles, lid oedema, lid erythema, photophobia, rhinitis

**Dose**

- **ADULT** and **CHILD** over 1 year, apply every 2 hours (max. 8 times daily) for the first 2 days, then 4 times daily for 3 days

**Oftaquix®** (Kestrel Ophthalmics)

*Eye drops*,
levofoxacin 0.5%, net price 5 mL = £6.95

*Excipients* include benzalkonium chloride

*Unit dose eye drops*, levofoxacin 0.5%, net price 30 × 0.5 mL single use units = £17.95

**MOXIFLOXACIN**

**Indications** see notes above

**Cautions** not recommended for neonates

**Side-effects** taste disturbances, ocular discomfort (including pain, irritation and dryness), hyperaemia; *less commonly* vomiting, headache, paraesthesia, corneal disorders (including keratitis, erosion, and staining), conjunctival haemorrhage, eyelid erythema, visual disturbances, nasal discomfort, pharyngolaryngeal pain; *also reported* nausea, palpitation, dyspnoea, dizziness, raised intra-ocular pressure, photophobia, rash, pruritus

**Dose**

- **ADULT** and **CHILD** over 1 year, apply 3 times daily (continue treatment for 2–3 days after infection improves; review if no improvement within 5 days)

**Moxivix®** (Alcon)

*Eye drops*, moxifloxacin (as hydrochloride) 0.5%, net price 5 mL = £9.80

**OFLOXACIN**

**Indications** see notes above

**Cautions** corneal ulcer or epithelial defect (risk of corneal perforation)

**Pregnancy** manufacturer advises use only if benefit outweighs risk; systemic quinolones have caused arthropathy in animal studies

**Breast-feeding** manufacturer advises avoid

**Side-effects** ocular discomfort and irritation; *also reported* facial oedema, keratitis, visual disturbances, photophobia, increased lacrimation, ocular oedema, dry eyes, ocular hyperaemia

**Dose**

- **ADULT** and **CHILD** over 1 year, apply every 2–4 hours for the first 2 days, then reduce frequency to 4 times daily (max. 10 days treatment)

**Exocin®** (Allergan)

*Ophthalmic solution (= eye drops)*, ofloxacin 0.3%. Net price 5 mL = £2.17

*Excipients* include benzalkonium chloride

**PROPAMIDINE ISETIONATE**

**Indications** local treatment of infections (but see notes above)

**Pregnancy** manufacturer advises avoid unless essential—no information available

**Breast-feeding** manufacturer advises avoid unless essential—no information available

**Side-effects** eye pain and irritation

**Dose**

- See preparations

**Brolene®** (Sanfi-Aventis)

*Eye drops*, propamidine isetionate 0.1%. Net price 10 mL = £2.80

*Excipients* include benzalkonium chloride

**Dose** apply up to 4 times daily

*Eye ointment*, dibrompropamidine isetionate 0.15%. Net price 5 g = £2.92

**Dose** apply 1–2 times daily

**Golden Eye®** (Typharm)

*Eye drops*, propamidine isetionate 0.1%, net price 10 mL = £3.26

*Excipients* include benzalkonium chloride

**Dose** apply up to 4 times daily

*Eye ointment*, dibrompropamidine isetionate 0.15%, net price 5 g = £3.49

**Dose** apply 1–2 times daily

**TOBRAMYCIN**

**Indications** see notes above

**Dose**

- **ADULT** and **CHILD** over 1 year, apply twice daily for 6–8 days; in severe infection, apply 4 times daily on the first day, then twice daily for 5–7 days

**Tobravisc®** (Alcon)

*Eye drops*, tobramycin 0.3%, net price 5 mL = £4.74

*Excipients* include benzododecinium bromide

**11.3.2 Antifungals**

Fungal infections of the cornea are rare but can occur after agricultural injuries, especially in hot and humid climates. Orbital mycosis is rarer, and when it occurs it is usually because of direct spread of infection from the paranasal sinuses. Increasing age, debility, or immunosuppression can encourage fungal proliferation. The spread of infection through blood occasionally produces metastatic endophthalmitis.

Many different fungi are capable of producing ocular infection; they can be identified by appropriate laboratory procedures.

Antifungal preparations for the eye are not generally available. Treatment will normally be carried out at specialist centres, but requests for information about supplies of preparations not available commercially should be addressed to the Strategic Health Authority (or equivalent), or to the nearest hospital ophthalmology unit, or to Moorfields Eye Hospital, 162 City Road, London EC1V 2PD (tel. (020) 7253 3411) or www.moorfields.nhs.uk
11.3.3 Antivirals

Herpes simplex infections producing, for example, dendritic corneal ulcers can be treated with **aciclovir** or **ganciclovir**. Aciclovir eye ointment is used in combination with systemic treatment for ophthalmic zoster (section 5.3.2.1).

Slow-release ocular implants containing **ganciclovir** (available on a named-patient basis from specialist importing companies, see p. 1104) may be inserted surgically to treat immediate sight-threatening CMV retinitis. Local treatments do not protect against systemic infection or infection in the other eye. For systemic treatment of CMV retinitis, see section 5.3.2.2.

### ACICLOVIR
**(Acyclovir)**

**Indications**  
local treatment of herpes simplex infections

**Side-effects**  
local irritation and inflammation, superficial punctate keratopathy; rarely blepharitis; very rarely hypersensitivity reactions including angioedema

**Dose**  
- Apply 1 cm ointment 5 times daily (continue for at least 3 days after complete healing)

**Zovirax®** *(GSK)*

Eye ointment, aciclovir 3%, net price 4.5 g = £9.34

### GANCICLOVIR

**Indications**  
local treatment of herpes simplex infections

**Side-effects**  
burning sensation, tingling, superficial punctate keratitis

**Dose**  
- Apply 5 times daily until healing complete, then apply 3 times daily for a further 7 days

**Virgan®** *(Spectrum Thea)*

Ophthalmic gel, ganciclovir 0.15%, net price 5 g = £19.99

Excipients include benzalkonium chloride

### BETAMETHASONE

**Indications**  
local treatment of inflammation (short-term)

**Cautions**  
see notes above

**Side-effects**  
see notes above

**Dose**  
- Apply eye drops every 1–2 hours until controlled then reduce frequency; apply eye ointment 2–4 times daily or at night when used with eye drops

**Betnesol®** *(Focus)*

Eye drops (for ear, eye, or nose), betamethasone sodium phosphate 0.1%, net price 10 mL = £2.32

Excipients include benzalkonium chloride, disodium edetate

**Vistamethasone®** *(Martindale)*

Eye drops (for ear, eye, or nose), betamethasone sodium phosphate 0.1%, net price 5 mL = £1.02; 10 mL = £1.16

Excipients include benzalkonium chloride

**With neomycin**

**Betnesol-N®** *(RPH)*

Eye drops (for ear, eye, or nose), see section 12.1.1

**Dose**  
apply up to 6 times daily

**DEXAMETHASONE**

**Indications**  
local treatment of inflammation (short-term)

**Cautions**  
see notes above

**Side-effects**  
see notes above

**Dose**  
- Apply eye drops every 30–60 minutes until controlled then reduce frequency to 4–6 times daily

**Maxidex®** *(Alcon)*

Eye drops, dexamethasone 0.1%, net price 5 mL = £1.42; 10 mL = £2.80

Excipients include benzalkonium chloride, disodium edetate, polysorbate 80
**PREDNISOLONE**

**Indications**
- Local treatment of inflammation (short-term)

**Cautions**
- See notes above

**Side-effects**
- See notes above

**Dose**
- Apply every 1–2 hours until controlled then reduce frequency

**Predsol®** (Focus) PNM
- **Drops** (for ear or eye), prednisolone sodium phosphate 0.5%, net price 10 mL = £2.00
- **Exipients** include benzalkonium chloride, disodium edetate

**Pred Forte®** (Allergan) PNM
- **Eye drops**, prednisolone sodium phosphate 0.1%, net price 20 × 0.5 mL = £10.98
- **Exipients** include disodium edetate

**With antibacterials**

**Maxitrol®** (Alcon) PNM
- **Eye drops**, dexamethasone 0.1%, neomycin sulfate 3500 units/g, polymyxin B sulfate 6000 units/mL, net price 5 mL = £1.68
- **Exipients** include benzalkonium chloride, disodium edetate, polysorbate 80

**Tobradex®** (Alcon) PNM
- **Eye drops**, dexamethasone 0.1%, tobramycin 0.3%, net price 5 mL = £1.52; 10 mL = £3.05
- **Exipients** include benzalkonium chloride, disodium edetate, polysorbate 80

**Single use**

**Minims®** Prednisolone Sodium Phosphate (Bausch & Lomb) PNM
- **Eye drops**, prednisolone sodium phosphate 0.5%, net price 20 × 0.5 mL = £11.28
- **Exipients** include disodium edetate

**RIMEXOLONE**

**Indications**
- Local treatment of inflammation (short-term)

**Cautions**
- See notes above

**Side-effects**
- See notes above

**Dose**
- Postoperative inflammation, apply 4 times daily for 2 weeks, beginning 24 hours after surgery
- Steroid-responsive inflammation, apply at least 4 times daily for up to 4 weeks
- Uveitis, apply every hour during daytime in week 1, then every 2 hours in week 2, then 4 times daily in week 3, then twice daily for first 4 days of week 4, then once daily for remaining 3 days of week 4

**Vexol®** (Alcon) PNM
- **Eye drops**, rimexolone 1%, net price 5 mL = £5.66
- **Exipients** include benzalkonium chloride, disodium edetate, polysorbate 80

**Intravitreal corticosteroids**

An intravitreal implant containing dexamethasone (Ozurdex®) is licensed for the treatment of adults with macular oedema following either branch retinal vein occlusion or central retinal vein occlusion; it is also licensed for the treatment of adult patients with inflammation of the posterior segment of the eye presenting as non-infectious uveitis. It should be administered by specialists experienced in the use of intravitreal injections.

The Scottish Medicines Consortium, (p. 4) has advised (May 2012) that dexamethasone intravitreal implant (Ozurdex®) is accepted for restricted use within NHS Scotland for the treatment of adults with macular oedema (i) following central retinal vein occlusion, and (ii) with branch retinal vein occlusion who are not clinically suitable for laser treatment, including patients with dense macular haemorrhage, or patients who have received and failed on previous laser treatment.
**NICE guidance**

**Dexamethasone intravitreal implant for the treatment of macular oedema secondary to retinal vein occlusion (July 2011)**

Dexamethasone intravitreal implant is recommended as an option for the treatment of macular oedema following central retinal vein occlusion.

Dexamethasone intravitreal implant is also recommended as an option for the treatment of macular oedema following branch retinal vein occlusion when:

- treatment with laser photocoagulation has not been beneficial, or
- treatment with laser photocoagulation is not considered suitable because of the extent of macular haemorrhage.

www.nice.org.uk/TA229

An intravitreal implant containing fluocinolone acetonide (Iluvien®) is licensed for the treatment of visual impairment associated with chronic diabetic macular oedema which is insufficiently responsive to available therapies. It should be administered by specialists experienced in the use of intravitreal injections.

The Scottish Medicines Consortium, (p. 4) has advised (February 2014) that fluocinolone acetonide intravitreal implant (Iluvien®) is recommended for restricted use within NHS Scotland for the treatment of vision impairment associated with chronic diabetic macular oedema, considered insufficiently responsive to available therapies, only in patients in whom the affected eye is pseudophakic (has an artificial lens after cataract surgery), and retreatment would take place only if the patient had previously responded to treatment with fluocinolone acetonide and subsequently best corrected visual acuity had deteriorated to less than 20/32.

**NICE guidance**

**Fluocinolone acetonide intravitreal implant for treating chronic diabetic macular oedema after an inadequate response to prior therapy (November 2013)**

Fluocinolone acetonide intravitreal implant is recommended as an option for treating chronic diabetic macular oedema that is insufficiently responsive to available therapies only if:

- the implant is to be used in an eye with an intra-ocular (pseudophakic lens) and
- the manufacturer provides fluocinolone acetonide intravitreal implant with the discount agreed in the patient access scheme.

www.nice.org.uk/TA301

**DEXAMETHASONE**

**Indications** see notes above—specialist use only

**Cautions** monitor intra-ocular pressure and for signs of ocular infection; history of ocular herpes simplex; posterior capsule tear or iris defect (risk of implant migration into the anterior chamber); retinal vein occlusion with significant retinal ischaemia; concomitant administration of anticoagulant or antiplatelet drugs

**Contra-indications** active or suspected ocular or peri-ocular infection; uncontrolled advanced glaucoma; rupture of the posterior lens capsule in patients with aphakia or anterior chamber intra-ocular lens

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—no information available

**Breast-feeding** manufacturer advises avoid unless potential benefit outweighs risk—no information available

**Side-effects** headache, raised intra-ocular pressure, vitreous detachment, retinal detachment, blepharitis, eyelid pruritus, cataract, visual disturbance; also reported glaucoma, ocular infection (including endophthalmitis), corneal oedema

**Dose**

- By intravitreal injection, 700 micrograms into the affected eye

  **Note** Concurrent administration to both eyes not recommended. For further information on administration and repeat dosing, consult product literature

  **Ozurdex® (Allergan)**

  Intravitreal implant, dexamethasone 700 micrograms in disposable applicator, net price = £870.00

**FLUCINOLONE ACETONIDE**

**Indications** see notes above—specialist use only

**Cautions** raised baseline intra-ocular pressure (monitor intra-ocular pressure closely); monitor for raised intra-ocular pressure, retinal detachment, endophthalmitis, vitreous haemorrhage or detachment within 2–7 days following the procedure; monitor intra-ocular pressure at least every 3 months thereafter (for approximately 36 months); concomitant administration of anticoagulant or antiplatelet drugs (higher incidence of conjunctival haemorrhage)

**Contra-indications** pre-existing glaucoma, active or suspected ocular or peri-ocular infection

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—no information available

**Breast-feeding** manufacturer advises avoid unless essential

**Side-effects** cataract, raised intra-ocular pressure, vitreous floaters, glaucoma, ocular discomfort, vitreous haemorrhage, conjunctival haemorrhage, blurred vision, reduced visual acuity; less commonly headache, endophthalmitis, retinal vascular occlusion, optic nerve disorder, maculopathy, optic atrophy, conjunctival ulcer, iris neovascularisation or adhesions, retinal exudates, vitreous degeneration or detachment, posterior capsule opacification, ocular hypertension, sclera thinning, eye discharge or pruritus

**Dose**

- By intravitreal injection, 190 micrograms into the affected eye

  **Note** Concurrent administration to both eyes not recommended. For further information on administration and repeat dosing, consult product literature

  **Iluvien® (Alimera)**

  Intravitreal implant, fluocinolone acetonide 190 micrograms in a disposable applicator, net price = £5500.00

**11.4.2 Other anti-inflammatory preparations**

Other preparations used for the topical treatment of inflammation and allergic conjunctivitis include antihistamines, lodoxamide, and sodium cromoglicate.

Eye drops containing antihistamines, such as antazoline (with xylometazoline as Otrivine-Antistin®),
azelastine, epinastine, ketotifen, and olopatadine, can be used for allergic conjunctivitis.

**Sodium cromoglicate** (sodium cromoglycate) and nedocromil sodium eye drops can be useful for vernal keratoconjunctivitis and other allergic forms of conjunctivitis.

**Lodoxamide** eye drops are used for allergic conjunctival conditions including seasonal allergic conjunctivitis.

**Diclofenac** eye drops (section 11.8.2) and **emedastine** eye drops are also licensed for seasonal allergic conjunctivitis.

Non-steroidal anti-inflammatory eye drops (section 11.8.2) are used for the prophylaxis and treatment of non-steroidal anti-inflammatory eye drops are also licensed for seasonal allergic conjunctivitis.

**Otrivine-Antistin** eye drops (section 11.8.2) are used for perennial allergic conjunctivitis, seasonal allergic conjunctivitis, keratoconjunctivitis and other allergic forms of conjunctivitis.

**Epinastine hydrochloride** is a sympathomimetic; absorption of epinastine hydrochloride can be useful for allergic conjunctivitis; seasonal keratoconjunctivitis; and other allergic forms of conjunctivitis.

**Ketotifen** eye drops transient burning or stinging; distinctive taste reported. **AZELASTINE HYDROCHLORIDE** eye drops transient stinging; blurred vision, mydriasis, eye irritation.

**Nedocromil sodium** eye drops transient burning or stinging; photophobia; headache, drowsiness, skin reactions, and dry mouth also reported.

**Emadine** eye drops transient burning or stinging; blurred vision, local oedema, keratitis, irritation, dry eye, lacrimation, corneal infiltrates (discontinue) and staining; photophobia; headache, and rhinitis occasionally reported.

**Emedastine** eye drops transient burning or stinging; blurred vision, photophobia; headache, and rhinitis.

**Ketotifen** eye drops transient burning or stinging, punctate corneal epithelial erosion; less commonly dry eye, subconjunctival haemorrhage, photophobia; headache, drowsiness, skin reactions, and dry mouth also reported.
Eye

11.5 Mydriatics and cycloplegics

**Side-effects**
Ocular side-effects of mydriatics and cycloplegics include transient stinging and raised intraocular pressure; on prolonged administration, local irritation, hyperaemia, oedema and conjunctivitis can occur. Contact dermatitis can occur with the antimuscarinic mydriatic drugs, especially atropine.

Systemic side-effects of atropine and cyclopentolate can occur, particularly in children and the elderly; see section 1.2 for systemic side-effects of antimuscarinic drugs.

**Antimuscarinics**

**ATROPINE SULFATE**

Indications see notes above

Cautions risk of systemic effects in infants under 3 months; see also notes above

Side-effects see notes above

Atropine (Non-proprietary) £19.00; 1%, 10 mL = £13.25

Single use

Minims® Atropine Sulphate (Bausch & Lomb) £14.46

**CYCLOPENTOLATE HYDROCHLORIDE**

Indications see notes above

Cautions see notes above

Side-effects see notes above

Mydriate® (Intrapharm) £16.73; 1%, 5 mL = £6.73

Excipients include benzalkonium chloride

Single use

Minims® Cyclopentolate Hydrochloride (Bausch & Lomb) £19.00; 1%, 10 mL = £13.25

**HOMATROPINE HYDROBROMIDE**

Indications see notes above

Cautions see notes above

Side-effects see notes above

Homatropine (Non-proprietary) £19.00; 1%, 10 mL = £13.25

**TROPICAMIDE**

Indications see notes above

Cautions see notes above

Side-effects see notes above

Mydriacyl® (Alcon) £19.00; 1%, 10 mL = £13.25

Excipients include benzalkonium chloride, disodium edetate
11.6 Treatment of glaucoma

Glucoma describes a group of disorders characterised by a loss of visual field associated with cupping of the optic disc and optic nerve damage. While glaucoma is generally associated with raised intra-ocular pressure, it can occur when the intra-ocular pressure is within the normal range.

The most common form of glaucoma is primary open-angle glaucoma (chronic open-angle glaucoma), where drainage of the aqueous humour through the trabecular meshwork is restricted. The condition is often asymptomatic, but the patient may present with significant loss of visual-field. Patients with ocular hypertension are at high risk of developing primary open-angle glaucoma.

Drugs that reduce intra-ocular pressure by different mechanisms are available for managing ocular hypertension and glaucoma. A topical beta-blocker or a prostaglandin analogue is usually the drug of first choice for the treatment of ocular hypertension. A prostaglandin analogue should be used to manage patients with early or moderate primary open-angle glaucoma. After checking compliance and eye drop instillation technique, it may be necessary to combine these drugs or add others, such as sympathomimetics, carbonic anhydrase inhibitors, or miotics to control intra-ocular pressure.

Acute angle-closure glaucoma Acute angle-closure glaucoma occurs when the outflow of aqueous humour from the eye is obstructed by bowing of the iris against the trabecular meshwork; it is a medical emergency that requires urgent reduction of intra-ocular pressure to prevent loss of vision. Patients with acute angle-closure glaucoma should be referred immediately for specialist ophthalmology assessment and treatment.

Standard antiglaucoma therapy is used if supplementary treatment is required after iridotomy, iridectomy, laser treatment, or drainage surgery in either primary open-angle or acute angle-closure glaucoma.

Beta-blockers

Topical application of a beta-blocker to the eye reduces intra-ocular pressure effectively in primary open-angle glaucoma, probably by reducing the rate of production of aqueous humour. Administration by mouth also reduces intra-ocular pressure but this route is not used since side-effects may be troublesome.

Beta-blockers used as eye drops include betaxolol, carteolol, levobunolol, and timolol.

Cautions, contra-indications, and side-effects Systemic absorption can follow topical application to the eyes; therefore, eye drops containing a beta-blocker are contra-indicated in patients with bradycardia, heart block, or uncontrolled heart failure. Important: for a warning to avoid in asthma see below. Beta-blocker eye drops should be used with caution in patients with corneal diseases. Consider also other cautions, contra-indications, and side-effects of beta-blockers (p. 102). Local side-effects of eye drops include ocular stinging, burning, pain, itching, erythema, dry eyes and allergic reactions including anaphylaxis and blepharoconjunctivitis; occasionally corneal disorders have been reported. Important Beta-blockers, even those with apparent cardioselectivity, should not be used in patients with asthma or a history of obstructive airways disease, unless no alternative treatment is available. In such cases the risk of inducing bronchospasm should be appreciated and appropriate precautions taken.

Interactions Since systemic absorption may follow topical application the possibility of interactions, in particular, with drugs such as verapamil should be borne in mind. See also Appendix 1 (beta-blockers).
BETAXOLOL

Indications  
see notes above

Cautions  
see notes above

Contra-indications  
see notes above

Side-effects  
see notes above

Dose  

≥ Apply twice daily

Betaxolol (Non-proprietary)  
Eye drops, solution, betaxolol (as hydrochloride) 0.5%, net price 5 mL = £1.90
Excipients  
may include benzalkonium chloride, disodium edetate

Betoptic® (Alcon)  
Ophthalmic solution (= eye drops), betaxolol (as hydrochloride) 0.5%, net price 5 mL = £1.90
Excipients  
include benzalkonium chloride, disodium edetate

Betux® (MSD)  
Ophthalmic suspension (= eye drops), betaxolol (as hydrochloride) 0.25%, net price 5 mL = £2.66
Excipients  
include benzalkonium chloride, disodium edetate

Unit dose eye drop suspension, betaxolol (as hydrochloride) 0.25%, net price 50 x 0.25 mL = £13.77

CARTEOLOL HYDROCHLORIDE

Indications  
see notes above

Cautions  
see notes above

Contra-indications  
see notes above

Side-effects  
see notes above

Dose  

≥ Apply twice daily

Teoptic® (Spectrum Thea)  
Eye drops, carteolol hydrochloride 1%, net price 5 mL = £7.60; 2%, 5 mL = £8.40
Excipients  
include benzalkonium chloride

Once-daily preparations

Tiopex® (Spectrum Thea)  
Unit dose eye gel (= eye drops), timolol (as maleate) 0.1%, net price 30 x 0.4 g = £7.49
Dose  
apply once daily, in the morning

Note  
The Scottish Medicines Consortium (p. 4) has advised (February 2014) that timolol gel eye drops (Tiopex®) are accepted for restricted use within NHS Scotland for the reduction of elevated intraocular pressure in patients with ocular hypertension or chronic open angle glaucoma who have proven sensitivity to preservatives.

With bimatoprost  
See under Bimatoprost

With brimonidine  
See under Brimonidine

With brinzolamide  
See under Brinzolamide

With dorzolamide  
See under Dorzolamide

With latanoprost  
See under Latanoprost

With travoprost  
See under Travoprost

LEVOBUNOLOL HYDROCHLORIDE

Indications  
see notes above

Cautions  
see notes above

Contra-indications  
see notes above

Side-effects  
see notes above; anterior uveitis occasionally reported

Dose  

≥ Apply once or twice daily

Levobunolol (Non-proprietary)  
Eye drops, levobunolol hydrochloride 0.5%. Net price 5 mL = £1.85
Excipients  
may include benzalkonium chloride, disodium edetate, sodium metabisulphite

Betagan® (Allergan)  
Eye drops, levobunolol hydrochloride 0.5%, polyvinyl alcohol (Liquifilm®) 1.4%. Net price 5-mL = £1.85
Excipients  
include benzalkonium chloride, disodium edetate, sodium metabisulphite

Unit dose eye drops, levobunolol hydrochloride 0.5%, polyvinyl alcohol (Liquifilm®) 1.4%. Net price 30 x 0.4 mL = £9.98
Excipients  
include disodium edetate

Prostaglandin analogues and prostamides

The prostaglandin analogues latanoprost, tafluprost, and travoprost, and the synthetic prostamide, bimatoprost, increase uveoscleral outflow and subsequently reduce intra-ocular pressure. They are used to reduce intra-ocular pressure in ocular hypertension or open-angle glaucoma.

Cautions  
Use with caution in patients with aphakia, pseudophakia with torn posterior lens capsule or ante-
rior chamber lenses, and in those with known risk factors for cystoid macular oedema, iritis, uveitis, or a history of significant ocular viral infections. Care is also needed in patients with COPD, asthma or compromised respiratory function. There is no experience of use in inflammatory ocular conditions, neovascular, angle-closure glaucoma, congenital glaucoma, or narrow-angle glaucoma. For use in contact lens wearers see Contact Lenses, p. 763.

**Counselling** Before initiating treatment, patients should be warned of a possible change in eye colour as an increase in the brown pigment in the iris can occur, which may be permanent; particular care is required in those with mixed-coloured irides and those receiving treatment to one eye only. Changes in eyelashes and vellus hair can also occur, and patients should also be advised to avoid repeated contact of the eye drop solution with skin as this can lead to hair growth or skin pigmentation.

**Side-effects** Side-effects of prostaglandin analogues and prostamides include changes in blood pressure, headache, ocular discomfort, conjunctival disorders, brown pigmentation particularly in those with mixed-colour irides, blepharitis, pigmentation of periocular skin, eyelash and vellus hair changes, reduced visual acuity, photophobia, punctate keratitis, transient punctate epithelial erosion, corneal erosion; they may also cause, darkening, thickening and lengthening of eye lashes. Less frequent side-effects include dizziness, asthenopia, and skin rash. There have been rare reports of arthralgia, myalgia, iritis, uveitis, macular oedema, facial oedema, and darkening of palpebral skin. Very rarely chest pain, palpitation, exacerbation of angina, and periorbital changes resulting in deepening of the eyelid sulcus have occurred. Dyspnoea, asthma, exacerbation of asthma and COPD have also been reported.

### BIMATOPROST

**Indications** raised intra-ocular pressure in open-angle glaucoma, ocular hypertension

**Cautions** see notes above; also predisposition to hypotension or bradycardia

**Hepatic impairment** use with caution in moderate to severe impairment—no information available

**Renal impairment** use with caution—no information available

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies

**Side-effects** see notes above; also nausea, bradycardia, malaise, retinal haemorrhage, blepharospasm, eyelid retraction, reactivation of previous corneal infiltrates or ocular infection

**Dose**

- **ADULT** over 18 years, apply once daily, preferably in the evening

**Lumigan®** (Allergan) \( \text{\textregistered} \)

Eye drops, bimatoprost 100 micrograms/mL, net price 3 mL = £12.43, triple pack (3 x 3 mL) = £37.29; 300 micrograms/mL, 3 mL = £10.30, triple pack (3 x 3 mL) = £30.90. Counselling, see Prostaglandin Analogues and Prostamides, above

**Excipients** include benzalkonium chloride

### LATANOPROST

**Indications** raised intra-ocular pressure in open-angle glaucoma, ocular hypertension

**Cautions** see notes above; peri-operative period of cataract surgery; do not use within 5 minutes of thiomersal-containing preparations

**Contra-indications** active herpes simplex keratitis; history of recurrent herpetic keratitis associated with prostaglandin analogues

**Pregnancy** manufacturer advises avoid

**Breast-feeding** may be present in milk—manufacturer advises avoid

**Side-effects** see notes above; also reported nasopharyngitis, pyrexia, (both in children), iris cyst

**Dose**

- Apply once daily, preferably in the evening

**Latanoprost** (Non-proprietary) \( \text{\textregistered} \)

Eye drops, latanoprost 50 micrograms/mL, net price 2.5 mL = £1.77. Counselling, see Prostaglandin Analogues and Prostamides, above

**Excipients** may include benzalkonium chloride

**Xalatan** (Pfizer) \( \text{\textregistered} \)

Eye drops, latanoprost 50 micrograms/mL, net price 2.5 mL = £12.48. Counselling, see Prostaglandin Analogues and Prostamides, above

**Excipients** include benzalkonium chloride
11.6 Treatment of glaucoma

**Single use**

**Monopost**<sup>®</sup> (Spectrum Thea) (TM)

Eye drops, latanoprost 50 micrograms/mL, net price £8.49. Counselling, see Prostaglandin Analogues and Prostamides, p. 751

**Note** The Scottish Medicines Consortium, p. 4 has advised (June 2013) that Monopost<sup>®</sup> is accepted for restricted use within NHS Scotland for the reduction of elevated intra-ocular pressure in patients with open-angle glaucoma and ocular hypertension who have proven sensitivity to benzalkonium chloride

**With timolol**

For prescribing information on timolol, see section 11.6, Beta-blockers

**Latanoprost with Timolol** (Non-proprietary) (TM)

Eye drops, latanoprost 50 micrograms, timolol (as maleate) 5 mg/mL, net price £4.28. Counselling, see Prostaglandin Analogues and Prostamides, p. 751

**Excipients** may include benzalkonium chloride

Dose for raised intra-ocular pressure in patients with open-angle glaucoma and ocular hypertension when beta-blocker or prosta glandin analogue alone not adequate, **ADULT** over 18 years, apply once daily

**Xalacom**<sup>®</sup> (Pharmacia) (TM)

Eye drops, latanoprost 50 micrograms, timolol (as maleate) 5 mg/mL, net price £14.32. Counselling, see Prostaglandin Analogues and Prostamides, p. 751

**Excipients** may include benzalkonium chloride

Dose for raised intra-ocular pressure in patients with open-angle glaucoma and ocular hypertension when beta-blocker or prosta glandin analogue alone not adequate, **ADULT** over 18 years, apply once daily

**TRAVOPROST**

**Indications** raised intra-ocular pressure in open-angle glaucoma; ocular hypertension

**Cautions** use with caution—no information available

**Renal impairment** use with caution—no information available

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—**toxicity in animal studies**

**Breast-feeding** manufacturer advises avoid—present in milk in **animal studies**

**Side-effects** see notes above

**Dose**

- **ADULT** over 18 years, apply once daily, preferably in the evening

**Saflutan**<sup>®</sup> (MSD) (TM)

Unit dose eye drops, tafaupro 15 micrograms/mL, net price £17.41. Counselling, see Prostaglandin Analogues and Prostamides, p. 751

**Excipients** include disodium edetate

**TRAVOPROST**

**Indications** raised intra-ocular pressure in open-angle glaucoma; ocular hypertension

**Cautions** see notes above

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—**toxicity in animal studies**

**Breast-feeding** present in milk in **animal studies**; manufacturer advises avoid

**Side-effects** see notes above; also dry mouth, dysgeusia, peptic ulcer reactivation, gastro-intestinal disorders, constipation, bradycardia, oropharyngeal pain, cough, dysphonia, nasal congestion, throat irritation, malaise, herpes simplex, photopsia, mydriasis, cataract; also reported vertigo, tinnitus

**Dose**

- **ADULT** over 18 years, apply once daily, preferably in the evening

**Travatan**<sup>®</sup> (Alcon) (TM)

Eye drops, travoprost 40 micrograms/mL, net price £10.95. Counselling, see Prostaglandin Analogues and Prostamides, p. 751

**Excipients** include propylene glycol

**With timolol**

For prescribing information on timolol, see section 11.6, Beta-blockers

**DuoTrav**<sup>®</sup> (Alcon) (TM)

Eye drops, travoprost 40 micrograms, timolol (as maleate) 5 mg/mL, net price £13.95, triple pack (3 x 2.5 mL) = £39.68. Counselling, see Prostaglandin Analogues and Prostamides, p. 751

**Excipients** include propylene glycol

Dose for raised intra-ocular pressure in patients with open-angle glaucoma or ocular hypertension when beta-blocker or prosta glandin analogue alone not adequate, **ADULT** over 18 years, apply once daily

**TAFLUPROST**

**Indications** raised intra-ocular pressure in open-angle glaucoma; ocular hypertension

**Cautions** use with caution—no information available

**Renal impairment** use with caution—no information available

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—**toxicity in animal studies**

**Breast-feeding** manufacturer advises avoid—present in milk in **animal studies**

**Side-effects** see notes above

**Dose**

- **ADULT** over 18 years, apply once daily, preferably in the evening

**BRIMONIDINE TARTRATE**

**Indications** raised intra-ocular pressure, see notes above

**Cautions** severe cardiovascular disease; cerebral or coronary insufficiency, Raynaud’s syndrome, thromboangiitis obliterator, postural hypotension, depression; children 2–12 years (increased risk of drowsiness); **interactions:** Appendix 1 (brimonidine)

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving)

**Contra-indications** neonate or child under 2 years

**Hepatic impairment** manufacturer advises use with caution

**Renal impairment** manufacturer advises use with caution

**Pregnancy** manufacturer advises use only if benefit outweighs risk

**Breast-feeding** manufacturer advises avoid

**Sympathomimetics**

Brimonidine, a selective alpha<sub>2</sub>-adrenoceptor agonist, is thought to lower intra-ocular pressure by reducing aqueous humour formation and increasing uveoscleral outflow. It is licensed for the reduction of intra-ocular pressure in open-angle glaucoma or ocular hypertension in patients for whom beta-blockers are inappropriate; it may also be used as adjunctive therapy when intra-ocular pressure is inadequately controlled by other antiglaucoma therapy.

Apraclonidine (section 11.8.2) is another alpha<sub>2</sub>-adrenoceptor agonist that lowers intra-ocular pressure by reducing aqueous humour formation. Eye drops containing apraclonidine 0.5% are used short-term to delay laser treatment or surgery in patients with glaucoma not adequately controlled by another drug; eye drops containing 1% are used for control of intra-ocular pressure after anterior segment laser surgery.
Side-effects dry mouth, gastro-intestinal disturbances, taste disturbances, upper respiratory symptoms, headache, drowsiness, dizziness, malaise, ocular disturbances (including hyperaemia, burning, stinging, pruritus, pain and dryness), visual disturbances, eyelid inflammation, photophobia, corneal erosion and staining, conjunctival disturbances (including blanching, follicules, and infection); less commonly palpitation, arrhythmia, bradycardia, tachycardia, depression, nasal dryness; rarely dyspnoea; very rarely hypertension, hypotension, syncope, insomnia, iritis, miosis

Dose
• Apply twice daily

Brimonidine Tartrate (Non-proprietary) (£/H)
Eye drops, brimonidine tartrate 0.2%, net price 5 mL = £2.00
Brands include Brystorm®
Excipients may include benzalkonium chloride

Alphagan® (Allergan) (£/H)
Eye drops, brimonidine tartrate 0.2%, net price 5 mL = £6.85
Excipients include benzalkonium chloride

With timolol
For prescribing information on timolol, see section 11.6, Beta-blockers

Combigan® (Allergan) (£/H)
Eye drops, brimonidine tartrate 0.2%, timolol (as maleate) 0.5%, net price 5 mL = £10.00
Excipients include benzalkonium chloride

Dose for raised intra-ocular pressure in open-angle glaucoma and for ocular hypertension when beta-blocker alone not adequate, apply twice daily

Carbonic anhydrase inhibitors and systemic drugs

The carbonic anhydrase inhibitors, acetazolamide, brinzolamide, and dorzolamide, reduce intra-ocular pressure by reducing aqueous humour production. Systemic use also produces weak diuresis.

Acetazolamide is given by mouth or by intravenous injection (intramuscular injections are painful because of the alkaline pH of the solution). It is used as an adjunct to other treatment for reducing intra-ocular pressure. Acetazolamide is a sulfonamide derivative; blood disorders, rashes, and other sulfonamide-related side-effects occur occasionally—patients should be told to report any unusual skin rash. It is not generally recommended for long-term use; if electrolyte disturbances and metabolic acidosis occur, these can be corrected by administering potassium bicarbonate (as effervescent potassium tablets, section 9.2.1.3).

Dorzolamide and brinzolamide are topical carbonic anhydrase inhibitors. They are licensed for use in patients resistant to beta-blockers or those in whom beta-blockers are contra-indicated. They are used alone or as an adjunct to a topical beta-blocker. Brinzolamide can also be used as an adjunct to a prostaglandin analogue. Systemic absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.

The osmotic diuretics, intravenous hypertonic mannitol (section 2.2.5) or glycerol by mouth are useful short-term ocular hypotensive drugs.

ACETAZOLAMIDE

Indications reduction of intra-ocular pressure in open-angle glaucoma, secondary glaucoma, and perioperatively in angle-closure glaucoma; diuresis (section 2.2.7), epilepsy

Cautions not generally recommended for prolonged use, but if given, monitor blood count and plasma-electrolyte concentrations; pulmonary obstruction and impaired alveolar ventilation (risk of acidosis); elderly; diabetes mellitus; renal calculi; avoid extra-vasation at injection site (risk of necrosis); interactions: Appendix 1 (diuretics)

Contra-indications hypokalaemia, hyponatraemia, hyperchloraemic acidosis; adrenocortical insufficiency; long-term administration in chronic angle-closure glaucoma; sulfonamide hypersensitivity

Hepatic impairment manufacturer advises avoid

Renal impairment avoid—risk of metabolic acidosis

Pregnancy manufacturer advises avoid, especially in first trimester (toxicity in animal studies)

Breast-feeding amount too small to be harmful

Side-effects see notes above; also nausea, vomiting, diarrhoea, taste disturbance, loss of appetite, paraesthesia, flushing, headache, dizziness, fatigue, irritability, excitement, ataxia, depression, thirst, polyuria, reduced libido; less commonly melaena, drowsiness, confusion, hearing disturbances, fever, glycosuria, metabolic acidosis and electrolyte disturbances on long-term therapy, haematuria, crystalluria, renal and ureteric colic, renal lesions or calculi, renal failure, blood disorders, bone marrow suppression, rash (including Stevens-Johnson syndrome and toxic epidermal necrosis); rarely fulminant hepatic necrosis, hepatitis, cholestatic jaundice, flaccid paralysis, convulsions, photosensitivity; also reported transient myopia

Dose
• Glaucome, by mouth or by intravenous injection, 0.25–1 g daily in divided doses
• Epilepsy, by mouth or by intravenous injection, 0.25–1 g daily in divided doses; CHILD 8–30 mg/kg daily, max. 750 mg daily
Note: Dose by Intramuscular Injection, as for intravenous injection but preferably avoided because of alkalinity

Diamox® (AMCo) (£/H)
Tablets, acetazolamide 250 mg. Net price 112-tab pack = £15.22. Label: 3
Injection, powder for reconstitution, acetazolamide (as sodium salt). Net price 500-mg vial = £14.76

Modified release

Diamox® SR (AMCo) (£/H)
Capsules, m/r, orange, enclosing orange f/c pellets, acetazolamide 250 mg. Net price 30-cap pack = £16.66 Label: 3, 25
Dose glaucoma, 1–2 capsules daily

BRINZOLAMIDE

Indications reduction of intra-ocular pressure in open-angle glaucoma, secondary glaucoma either as adjunct to beta-blockers or prostaglandin analogues or used alone in patients unresponsive to betablockers or if beta-blockers contra-indicated

Cautions systemic absorption follows topical application; renal tubular immaturity or abnormality; interactions: Appendix 1 (brinzolamide)
**Contra-indications** hyperchloreaemic acidosis; sulfonamide hypersensitivity

**Hepatic impairment** manufacturer advises avoid

**Renal impairment** see Cautions above; also avoid if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** avoid—toxicity in animal studies

**Breast-feeding** use only if benefit outweighs risk

**Side-effects** see notes above; also taste disturbances, dry mouth, headache, oculare disturbances (including corneal erosion, corneal oedema, photophobia, and reduced visual acuity); less commonly nausea, vomiting, diarrhoea, dyspepsia, oesophagitis, flatulence, oral hypoaesthesia and paraesthesia, chest pain, bradycardia, palpitation, dyspnoea, cough, upper respiratory tract congestion, pharyngitis, depression, sleep disturbances, nervousness, malaise, drowsiness, amnesia, dizziness, paraesthesia, sinusitis, decreased libido, erectile dysfunction, renal pain, epistaxis, nasal dryness, throat irritation, dysuria, contact dermatitis, erythema

**Dose**

- Apply twice daily increased to max. 3 times daily if necessary

**Azopt**® (Alcon) ®

Eye drops, brinzolamide 10 mg/mL, net price 5 mL = £6.92

**Excipients** include benzalkonium chloride, disodium edetate

**With timolol**

For prescribing information on timolol, see section 11.6, Beta-blockers

**Azarga**® (Alcon) ®

Ophthalmic suspension (= eye drops), brinzolamide 10 mg, timolol (as maleate) 5 mg/mL, net price 5 mL = £11.05

**Excipients** include benzalkonium chloride, disodium edetate

**Dose** for raised intra-ocular pressure in open-angle glaucoma or ocular hypertension when beta-blocker alone not adequate, ADULT over 18 years apply twice daily

**DORZOLAMIDE**

**Indications** raised intra-ocular pressure in ocular hypertension, open-angle glaucoma, pseudo-exfoliative glaucoma either as adjunct to beta-blocker or used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated

**Cautions** systemic absorption follows topical application; history of renal calculi; chronic corneal defects, low endothelial cell count, history of intra-ocular surgery; interactions: Appendix 1 (dorzolamide)

**Contra-indications** hyperchloreaemic acidosis, sulfonamide hypersensitivity

**Hepatic impairment** manufacturer advises caution—no information available

**Renal impairment** avoid if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** manufacturer advises avoid—toxicity in animal studies

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** see notes above; also nausea, bitter taste, headache, anoxia, ocular irritation, blurred vision, lacrimation, conjunctivitis, superficial punctate keratitis, eyelid inflammation; less commonly iridocyclitis; rarely dry mouth, dizziness, paraesthesia, urolithiasis, eyelid crusting, transient myopia, corneal oedema, epistaxis, throat irritation, contact dermatitis, Stevens-Johnson syndrome, toxic epidermal necrolysis

**Dose**

- Used alone, apply 3 times daily
- With topical beta-blocker, apply twice daily

**Dorzolamide** (Non-proprietary) ®

Eye drops, dorzolamide (as hydrochloride) 2%, net price 5 mL = £1.99

**Excipients** may include benzalkonium chloride

**Brands include** Dorzant®

**Trusopt**® (MSD) ®

Ophthalmic solution (= eye drops), in Ocumeter®

Plus metered-dose unit, dorzolamide (as hydrochloride) 2%, net price 5 mL = £6.33

**Excipients** include benzalkonium chloride

**Unit dose eye drops**, dorzolamide (as hydrochloride) 2%, net price 60 × 0.2 mL = £24.18

**With timolol**

For prescribing information on timolol, see section 11.6, Beta-blockers

**Dorzolamide with Timolol** (Non-proprietary) ®

Eye drops, dorzolamide (as hydrochloride) 2%, timolol (as maleate) 0.5%, net price 5 mL = £2.90

**Excipients** may include benzalkonium chloride

**Cosopt**® (MSD) ®

Ophthalmic solution (= eye drops), in Ocumeter®

Plus metered-dose unit, dorzolamide (as hydrochloride) 2%, timolol (as maleate) 0.5%, net price 5 mL = £10.05

**Excipients** include benzalkonium chloride

**Unit dose eye drops**, dorzolamide (as hydrochloride) 2%, timolol (as maleate) 0.5%, net price 60 × 0.2 mL = £28.59

**Miotics**

Miotics act by opening the inefficient drainage channels in the trabecular meshwork.

**Pilocarpine**, a miotic, is not commonly used for the treatment of primary open-angle glaucoma because side-effects, such as pupil miosis, are poorly tolerated. It is used mainly in the treatment of primary angle-closure glaucoma and in some secondary glaucomas.

**Cautions** A darkly pigmented iris may require a higher concentration of the miotic or more frequent administration and care should be taken to avoid overdose. Retinal detachment has occurred in susceptible individuals and those with retinal disease; therefore fundus examination is advised before starting treatment with a miotic. Care is also required in conjunctival or corneal damage. Intra-ocular pressure and visual fields should be monitored in those with chronic simple glaucoma and those receiving long-term treatment with a miotic. Miotics should be used with caution in patients with peptic ulceration, gastro-intestinal spasm, cardiac disease, hypertension, hypotension, marked vasomotor
Local anaesthetics

Oxybuprocaine and tetracaine are widely used topical local anaesthetics. Proxymetacaine causes less initial stinging and is useful for children. Oxybuprocaine or a combined preparation of lidocaine and fluorescein is used for tonometry. Tetracaine produces a more profound anaesthesia and is suitable for use before minor surgical procedures, such as the removal of corneal sutures. It has a temporary disruptive effect on the corneal epithelium. Lidocaine (section 15.2), with or without adrenaline (epinephrine), is injected into the eyelids for minor surgery. Local anaesthetic eye drops should be avoided in preterm neonates because of the immaturity of the metabolising enzyme system.

Tear deficiency, ocular lubricants, and astringents

Certain eye drops, e.g. amphotericin, ceftazidine, cefuroxime, colistimethate sodium, desferrioxamine, dexamethasone, gentamicin, and vancomycin can be prepared aseptically from material supplied for injection. Botulinum toxin type A preparations are licensed for the treatment of blepharospasm (Botox®, Dysport®, and Xeomin®) and for the temporary improvement of moderate to severe wrinkles between the eyebrows in adults under 65 years (Azzalure®, Bocouture®, Botox®, and Vistabel®), see section 4.9.3; preparations are not interchangeable and should be used under specialist supervision.

Chronic soreness of the eyes associated with reduced or abnormal tear secretion (e.g. in Sjögren’s syndrome) often responds to tear replacement therapy or pilocarpine given by mouth (section 12.3.5). The severity

11.7 Local anaesthetics

LIDOCAINE HYDROCHLORIDE
(Lignocaine hydrochloride)

Indications local anaesthetic

Minims® Lidocaine and Fluorescein (Bausch & Lomb) [P] Eye drops, lidocaine hydrochloride 4%, fluorescein sodium 0.25%. Net price 20 × 0.5 mL = £11.24

OXYBUPROCAINE HYDROCHLORIDE
(Benoxinate hydrochloride)

Indications local anaesthetic

Minims® Oxybuprocaine Hydrochloride (Bausch & Lomb) [P] Eye drops, oxybuprocaine hydrochloride 0.4%. Net price 20 × 0.5 mL = £9.72

PROXYMETACAINE HYDROCHLORIDE

Indications local anaesthetic

Minims® Proxymetacaine (Bausch & Lomb) [P] Eye drops, proxymetacaine hydrochloride 0.5%. Net price 20 × 0.5 mL = £11.05

TETRACAINE HYDROCHLORIDE
(Amethocaine hydrochloride)

Indications local anaesthetic

Minims® Tetracaine Hydrochloride (Bausch & Lomb) [P] Eye drops, tetracaine hydrochloride 0.5% and 1%. Net price 20 × 0.5 mL (both) = £9.73

11.8 Miscellaneous ophthalmic preparations

11.8.1 Tear deficiency, ocular lubricants, and astringents

11.8.2 Ocular diagnostic and peri-operative preparations and photodynamic treatment
of the condition and patient preference will often guide
the choice of preparation.

**Hypromellose** is the traditional choice of treatment for
tear deficiency. It may need to be instilled frequently
(e.g. hourly) for adequate relief. Ocular surface mucin is
often abnormal in tear deficiency and the combination
of hypromellose with a mucolytic such as acetylcysteine
can be helpful.

The ability of carbomers to cling to the eye surface may
help reduce frequency of application to 4 times daily.

Polyvinyl alcohol increases the persistence of the tear
film and is useful when the ocular surface mucin is
reduced.

**Sodium hyaluronate** eye drops are also used in the
management of tear deficiency.

**Sodium chloride 0.9%** drops are sometimes useful in
tear deficiency, and can be used as ‘comfort drops’ by
contact lens wearers, and to facilitate lens removal.

They are also used to irritate the eye. Special presenta-
tions of sodium chloride 0.9% and other irrigation solu-
tions are used routinely for intra-ocular surgery. Sodium
chloride 5% eye drops are used for the short-term
treatment of corneal oedema.

Eye ointments containing a paraffin can be used to
lubricate the eye surface, especially in cases of recurrent
corneal epithelial erosion. They may cause temporary
visual disturbance and are best suited for application
before sleep. Ointments should not be used during
contact lens wear.

### ACETYLCESTINE

**Indications** tear deficiency, impaired or abnormal
mucus production

**Dose**

- Apply 3–4 times daily

**Ilube®** (Moorfields) (R)

| Eye drops, acetylcysteine 5%, hypromellose 0.35% | Net price 10 mL = £10.09 |
| Excipients | include benzalkonium chloride, disodium edetate |

**Note** Synthetic high molecular weight polymers of acrylic
acid cross-linked with either allyl ethers of sucrose or allyl
ethers of pentaerythritol

**Indications** dry eyes including keratoconjunctivitis
sica, unstable tear film

**Dose**

- Apply 3–4 times daily or as required

**Carbomer Gel (Non-proprietary)**

| Eye drops, carbomer 980 (polyacrylic acid) | 0.2%, net price 10 g = £2.80 |
| Excipients | include disodium edetate |

**Artelac® Nighttime Gel** (Bausch & Lomb)

| Eye drops, carbomer 2 mg, net price 10 g | £2.96 |

**Clinitas Gel®** (Altacor)

| Eye drops, carbomer 980 (polyacrylic acid) | 0.2%, net price 10 g = £1.49 |

**GelTears®** (Bausch & Lomb)

| Eye drops, carbomer 980 (polyacrylic acid) | 0.2%, net price 10 g = £2.80 |
| Excipients | include benzalkonium chloride |

**Liquivisc®** (Spectrum Thea)

| Gel (eye drops), carbomer 974P (polyacrylic acid) | 0.25%, net price 10 g = £4.50 |
| Excipients | include benzalkonium chloride |

**Lumecare® Carbomer Gel** (Medicom)

| Gel (eye drops), carbomer 980 (polyacrylic acid) | 0.2%, net price 10 g = £2.10 |
| Excipients | include cetrimide |

**Single use**

**Viscotears®** (Alcon)

| Liquid gel (eye drops), carbomer 980 (polyacrylic acid) 0.2% | net price 30 x 0.6-mL single-dose units = £5.42 |

### CARBOMERS

*(Polyacrylic acid)*

**Indications** dry eye conditions

**Dose**

- Apply as required

**Carmellose (Non-proprietary)**

| Eye drops, carmellose sodium 0.5%, net price 10 mL | £7.49 |

**Carmize®** (Aspire)

| Eye drops, carmellose sodium 0.5%, net price 10 mL | £7.49 |

**Optive®** (Allergan)

| Eye drops, carmellose sodium 0.5%, glycerol, net price 10 mL | £7.49 |

**Optive® Plus** (Allergan)

| Eye drops, carmellose sodium 0.5%, glycerol 1%, castor oil 0.25%, net price 10 mL | £7.49 |

**Single use**

**Carmellose (Non-proprietary)**

| Eye drops, carmellose sodium 0.5%, net price 30 x 0.4 mL | £5.75; 1%, 30 x 0.4 mL = £3.00 |

**Carmize®** (Aspire)

| Eye drops, carmellose sodium 0.5%, net price 30 x 0.4 mL | £5.75; 0.9 x 0.4 mL = £15.53; 1% 30 x 0.4 mL = £3.00; 60 x 0.4 mL = £6.00 |

**Celluvisc®** (Allergan)

| Eye drops, carmellose sodium 0.5%, net price 30 x 0.4 mL | £4.80; 90 x 0.4 mL = £15.53; 1% 30 x 0.4 mL = £3.00; 60 x 0.4 mL = £6.00 |

**Melophthal®** (Martindale)

| Eye drops, carmellose sodium 0.5%, net price 30 x 0.4 mL | £5.75; 1%, 30 x 0.4 mL = £3.00 |

**Note** Each unit is resealable and may be used for up to 12
hours

### HYDROXYETHYLCELLULOSE

**Indications** tear deficiency

**Minims® Artificial Tears** (Bausch & Lomb)

| Eye drops, hydroxyethylcellulose 0.44%, sodium
chloride 0.35%, Net price 20 x 0.5 mL | £8.97 |
HYPROMELLOSE

Indications tear deficiency

Note The Royal Pharmaceutical Society has stated that where it is not possible to ascertain the strength of hypromellose prescribed, the prescriber should be contacted to clarify the strength intended.

Hypromellose (Non-proprietary)

Eye drops, hypromellose 0.3%, net price 10 mL = £1.05

Excipients may include benzalkonium chloride

Brands include Lumecare® Hypromellose, Mandanol®

Artelac® (Bausch & Lomb)

Eye drops, hypromellose 0.32%, net price 10 mL = £4.99

Excipients include cetrimide, disodium edetate

Isopto Alkaline® (Alcon)

Eye drops, hypromellose 1%, net price 10 mL = 94p

Excipients include benzalkonium chloride

Isopto Plain® (Alcon)

Eye drops, hypromellose 0.5%, net price 10 mL = 81p

Excipients include benzalkonium chloride

Tear-Lac® (Scope Ophthalmics)

Eye drops, hypromellose 0.3%, dextran ‘70’ 0.1%, net price 28 x 0.4 mL = £13.26

Tears Naturale® (Alcon)

Eye drops, hypromellose 0.3%, dextran ‘70’ 0.1%, net price 15 mL = £1.89

Excipients include benzalkonium chloride, disodium edetate

Single use

Artelac® SDU (Bausch & Lomb)

Eye drops, hypromellose 0.3%, net price 30 x 0.5 mL = £16.95, 60 x 0.5 mL = £32.85

Hydromoor® (Moorfields)

Eye drops, hypromellose 0.3%, net price 30 x 0.4 mL = £5.75

Lumecare® Preservative Free Tear Drops (Medicom)

Eye drops, hypromellose 0.3%, net price 30 x 0.5 mL = £5.72

Tears Naturale® Single Dose (Alcon)

Eye drops, hypromellose 0.3%, dextran ‘70’ 0.1%, net price 28 x 0.4 mL = £13.26

LIQUID PARAFFIN

Indications dry eye conditions

Lacri-Lube® (Allergan)

Eye ointment, white soft paraffin 57.3%, liquid paraffin 42.5%, wool alcohols 0.2%. Net price 3.5 g = £2.51, 5 g = £3.32

Vita-POS® (Scope Ophthalmics)

Eye ointment, retinol palmitate 250 units/g, white soft paraffin, light liquid paraffin, liquid paraffin, wool fat, net price 5 g = £2.75

MACROGOLS

(Polyethylene glycols)

Indications dry eye conditions

Dose Apply as required

Systane® (Alcon)

Eye drops, polyethylene glycol 400 0.4%, propylene glycol 0.3%, hydroxypropyl guar, net price 10 mL = £4.66

Systane® Ultra (Alcon)

Eye drops, polyethylene glycol 400 0.4%, propylene glycol 0.3%, hydroxypropyl guar, sorbitol, net price 10 mL = £6.69

Single use

Systane® (Alcon)

Eye drops, polyethylene glycol 400 0.4%, propylene glycol 0.3%, hydroxypropyl guar, net price 28 x 0.8 mL = £4.66

Systane® Ultra (Alcon)

Eye drops, polyethylene glycol 400 0.4%, propylene glycol 0.3%, hydroxypropyl guar, sorbitol, net price 30 x 0.7 mL = £6.69

PARAFFIN, YELLOW, SOFT

Indications see notes above

Simple Eye Ointment

Ointment, liquid paraffin 10%, wool fat 10%, in yellow soft paraffin. Net price 4 g = £3.43

POLYVINYL ALCOHOL

Indications tear deficiency

Liquifilm Tears® (Allergan)

Ophthalmic solution (= eye drops), polyvinyl alcohol 1.4%, net price 15 mL = £1.93

Excipients include benzalkonium chloride, disodium edetate

Sno Tears® (Bausch & Lomb)

Eye drops, polyvinyl alcohol 1.4%. Net price 10 mL = £1.06

Excipients include benzalkonium chloride, disodium edetate

Single use

Liquifilm Tears® (Allergan)

Ophthalmic solution (= eye drops), polyvinyl alcohol 1.4%, povidone 0.6%, net price 30 x 0.4 mL = £5.35

SODIUM CHLORIDE

Indications see notes above

Sodium Chloride 0.9% Solutions

See section 13.11.1

Balanced Salt Solution

Solution (sterile), sodium chloride 0.64%, sodium acetate 0.39%, sodium citrate 0.17%, calcium chloride 0.048%, magnesium chloride 0.033%, potassium chloride 0.075%

For intra-ocular or topical irrigation during surgical procedures

Single use

Minims® Saline (Bausch & Lomb)

Eye drops, sodium chloride 0.9%. Net price 20 x 0.5 mL = £7.14
**11.8.2 Ocular diagnostic and peri-operative preparations**

**BNF 68**

**Ocular diagnostic preparations**

Fluorescein sodium is used in diagnostic procedures and for locating damaged areas of the cornea due to injury or disease.

**Ocular peri-operative drugs**

Drugs used to prepare the eye for surgery, drugs that are injected into the anterior chamber at the time of surgery, and those used after eye surgery, are included here.

**Cefuroxime**, administered by intra-ocular injection into the anterior chamber of the eye (intracameral use), is used for the prophylaxis of endophthalmitis after cataract surgery.

Non-steroidal anti-inflammatory eye drops such as diclofenac, flurbiprofen, ketorolac, and nepafenac, are used for the prophylaxis and treatment of inflammation, pain, and other symptoms associated with ocular surgery or laser treatment of the eye. **Bromfenac** is used for the treatment of postoperative inflammation following cataract surgery. Diclofenac and flurbiprofen are also used to prevent miosis during ocular surgery.

**Apraclonidine**, an alpha-2-adrenoreceptor agonist, reduces intra-ocular pressure possibly by reducing the production of aqueous humour. It is used to control increases in intra-ocular pressure associated with ocular surgery and as short-term treatment to reduce intra-ocular pressure prior to surgery.

**Acetylcolline**, administered into the anterior chamber of the eye during surgery, rapidly produces miosis which
lacks approximately 20 minutes. If prolonged miosis is required, it can be applied again.

Intra-ocular sodium hyaluronate and balanced salt solution (section 11.8.1) are used during surgical procedures on the eye.

Povidone-iodine is used for peri-ocular and conjunctival antisepsis before ocular surgery to support post-operative infection control.

## ACETYLCOLINE CHLORIDE

**Indications** cataract surgery, penetrating keratoplasty, iridectomy, and other anterior segment surgery requiring rapid complete miosis

**Cautions** gastro-intestinal spasm, peptic ulcer; heart failure; asthma; hyperthyroidism; urinary-tract obstruction; parkinsonism

**Pregnancy** avoid unless potential benefit outweighs risk—no information available

**Breast-feeding** avoid unless potential benefit outweighs risk—no information available

**Side-effects** rarely bradycardia, hypotension, breathing difficulty, sweating, flushing

**Michol-E** (Bausch & Lomb) Ophthalmic solution (section 11.8.1) are used during surgical procedures on the eye.

**Indications** intra-ocular irrigation, powder for reconstitution, acetylcholine chloride 10 mg/mL (1%) when reconstituted, net price 20-mg vial (with solvent) = £7.28

**Miphetol** (SD Healthcare) Ophthalmic solution (section 11.8.1) are used during surgical procedures on the eye.

**Indications** intra-ocular irrigation, powder for reconstitution, acetylcholine chloride 10 mg/mL (1%) when reconstituted, net price 20-mg vial (with solvent) = £7.28

## APRACLONIDINE

**Note** Apraclonidine is a derivative of clonidine

**Indications** control of intra-ocular pressure

**Cautions** history of angina, severe coronary insufficiency, recent myocardial infarction, heart failure, cerebrovascular disease, vasovagal attack, hypertension; Parkinson’s syndrome; Raynaud’s syndrome; thromboangiitis obliterans; depression; monitor intra-ocular pressure and visual fields; loss of effect may occur over time; suspend treatment if reduction in intra-ocular pressure exceeds 30%, excessive reduction in intra-ocular pressure following peri-operative use; interactions: Appendix 1 (apraclonidine)

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving)

**Contra-indications** history of severe or unstable and uncontrolled cardiovascular disease

**Hepatic impairment** manufacturer advises caution

**Renal impairment** use with caution in chronic renal failure

**Pregnancy** manufacturer advises avoid—no information available

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** taste disturbance, conjunctivitis, dry eye, ocular intolerance (withdraw if eye pruritus, ocular hyperaemia, increased lacrimation, or oedema of the eyelids and conjunctiva occur), rhinitis; less commonly chest pain, asthma, dyspnoea, throat irritation, nervousness, irritability, impaired co-ordination, myalgia, mydriasis, keratitis, keratopathy, photophobia, visual impairment, corneal erosion and infiltrates, blepharospasm, blepharitis, eyelid ptosis or retraction, conjunctival vascular disorders, rhinorrhea, parosmia; since absorption may follow topical application, systemic effects (see Clonidine, section 2.5.2) may occur

**Dose**

- See under preparations below

**Iopidine** (Alcon) Ophthalmic solution (= eye drops), apraclonidine 1% (as hydrochloride), net price 12 × 2 single use 0.25-mL units = £77.81

**Dose** control or prevention of postoperative elevation of intra-ocular pressure after anterior segment laser surgery, apply 1 drop 1 hour before laser procedure then 1 drop immediately after completion of procedure; **CHILD** not recommended

**Iopidine 0.5% ophthalmic solution (= eye drops), apraclonidine 0.5% (as hydrochloride), net price 5 mL = £10.88

**Excipients** include benzalkonium chloride

**Dose** short-term adjunctive treatment of chronic glaucoma in patients not adequately controlled by another drug (see note below), apply 1 drop 3 times daily usually for max. 1 month; **CHILD** not recommended

**Note** May not provide additional benefit if patient already using two drugs that suppress the production of aqueous humour

## BROMFENAC

**Indications** postoperative inflammation following cataract surgery

**Yellon** (Bausch & Lomb) Eye drops, bromfenac (as sodium sesquihydrate) 0.09%, net price 5 mL = £8.50

**Excipients** include benzalkonium chloride, disodium edetate, sulfites

## CEFUROXIME

**Indications** prophylaxis of endophthalmitis after cataract surgery

**Cautions** severe risk of infection; complicated cataracts or combined operations with cataract surgery; severe thyroid disease; reduced corneal endothelial cells (less than 2000)

**Dose**

- By intracameral injection, **ADULT** over 18 years, 1 mg into the anterior chamber of the eye at the end of cataract surgery

**Note** For information on administration, consult product literature

**Aprokam** (Spectrum Thea) Injection for intracameral use, cefuroxime (as sodium) 10 mg/mL when reconstituted with 5 mL sodium chloride 0.9%, net price 50-mg vial = £7.95

## DICLOFENAC SODIUM

**Indications** inhibition of intra-operative miosis during cataract surgery (but does not possess intrinsic mydriatic properties); postoperative inflammation in cataract surgery, strabismus surgery or argon laser trabecuoplasty; pain in corneal epithelial defects after photorefractive keratometry, radial keratotomy or accidental trauma; seasonal allergic conjunctivitis (section 11.4.2)
Voltarol® Ophtha Multidose (Spectrum Thea)®
Eye drops, diclofenac sodium 0.1%, net price 5 mL = £6.68
Excipients include benzalkonium chloride, disodium edetate, propylene glycol

Single use
Voltarol® Ophtha (Spectrum Thea)®
Eye drops, diclofenac sodium 0.1%, net price pack of 5 single-dose units = £4.00, 40 single-dose units = £32.00

FLURBIPROFEN SODIUM
Indications inhibition of intra-operative miosis (but does not possess intrinsic mydriatic properties); anterior segment inflammation following postoperative and post-laser trabeculectomy when corticosteroids contra-indicated

Ocufer® (Allergan)®
Ophthalmic solution (= eye drops), flurbiprofen sodium 0.03%, polyvinyl alcohol (Liquifilm®) 1.4%, net price 40 × 0.4 mL = £37.15

KETOROLAC TROMETAMOL
Indications prophylaxis and reduction of inflammation and associated symptoms following ocular surgery

Acular® (Allergan)®
Eye drops, ketorolac trometamol 0.5%, net price 5 mL = £3.00
Excipients include benzalkonium chloride, disodium edetate

NEPAFENAC
Indications prophylaxis and treatment of postoperative pain and inflammation associated with cataract surgery; reduction in the risk of postoperative macular oedema associated with cataract surgery in diabetic patients

Caution avoid sunlight; discontinue immediately if evidence of corneal epithelial breakdown

Side-effects punctuate keratitis; less commonly: naeuea, headache, corneal epithelium defect, iritis, keratitis, corneal deposits, choroidal effusion, ocular discomfort, blurred vision, dry eye, allergic conjunctivitis, eye pruritus, increased lacrimation, photophobia, conjunctival hyperaemia; also reported: dizziness, impaired corneal healing, corneal opacity, reduced visual acuity, eye swelling, dermatochalasis

Nevanac® (Alcon)®
Ophthalmic suspension (= eye drops), nepafenac 1 mg/mL, net price 5 mL= £14.92
Excipients include benzalkonium chloride, disodium edetate

POVIDONE-IODINE
Indications cutaneous peri-ocular and conjunctival antisepsis before ocular surgery

Contra-indications concomitant use with ocular antimicrobial drugs, and ocular formulations containing mercury-based preservatives; preterm neonates

Side-effects rarely conjunctival hyperaemia, superficial punctuate keratitis; also reported residual yellow coloration of the conjunctiva, cytotoxicity on mucous membranes and deep tissue, hypothyroidism in neonates

Dose
• Apply eye drops, leave for 2 minutes, then irrigate thoroughly with sodium chloride 0.9%

Minims® Povidone Iodine (Bausch & Lomb)®
Eye drops, povidone-iodine 5%, net price 20 × 0.4 mL = £16.00

Subfoveal choroidal neovascularisation
Aflibercept, pegaptanib and ranibizumab are vascular endothelial growth factor inhibitors licensed for the treatment of neovascular (wet) age-related macular degeneration. Aflibercept is also licensed for the treatment of macular oedema secondary to central retinal vein occlusion; ranibizumab is also licensed for the treatment of visual impairment due to diabetic macular oedema, macular oedema secondary to branch or central retinal vein occlusion, and choroidal neovascularisation secondary to pathologic myopia. Ranibizumab can be administered concomitantly with laser photocoagulation for the treatment of diabetic macular oedema and for macular oedema secondary to branch retinal vein occlusion. They are given by intravitreal injection by specialists experienced in the management of this condition. There is a potential risk of arterial thromboembolic events and non-ocular haemorrhage following the intravitreal injection of vascular endothelial growth factor inhibitors. Endophthalmitis can occur after intravitreal injections—patients should be advised to report any signs of infection immediately.

The Scottish Medicines Consortium (p. 4) has advised (May 2007) that ranibizumab (Lucentis®) is accepted for use within NHS Scotland for the treatment of neovascular (wet) age-related macular degeneration. The Scottish Medicines Consortium (p. 4) has also advised (October 2011 and April 2013) that ranibizumab (Lucentis®) is accepted for use within NHS Scotland for the treatment of macular oedema secondary to branch or central retinal vein occlusion, and (November 2012) for restricted use for the treatment of visual impairment due to diabetic macular oedema in adults with best corrected visual acuity 75 Early Treatment Diabetic Retinopathy Study letters or less at baseline, and (October 2013) for the treatment of visual impairment due to choroidal neovascularisation secondary to pathologic myopia in adults; SMC advice is contingent upon the continuing availability of ranibizumab at the price agreed in the patient access scheme.

NICE guidance
Aflibercept solution for injection for treating wet age-related macular degeneration (July 2013)
Aflibercept solution for injection is recommended as an option for treating wet age-related macular degeneration only if:
• it is used in accordance with the recommendations for ranibizumab in NICE TA 155
• the manufacturer provides aflibercept solution for injection with the discount agreed in the patient access scheme

www.nice.org.uk/TA294
### NICE guidance

**Aflibercept for treating visual impairment caused by macular oedema secondary to central retinal vein occlusion (February 2014)**

Aflibercept solution for injection is recommended as an option for treating visual impairment caused by macular oedema secondary to central retinal vein occlusion only if the manufacturer provides aflibercept solution for injection with the discount agreed in the patient access scheme.

[www.nice.org.uk/TA305](http://www.nice.org.uk/TA305)

---

**Ranibizumab for the treatment of visual impairment caused by macular oedema secondary to retinal vein occlusion (May 2013)**

Ranibizumab is recommended as an option for treating visual impairment caused by macular oedema:  
- following central retinal vein occlusion or  
- following branch retinal vein occlusion only if treatment with laser photocoagulation has not been beneficial, or when laser photocoagulation is not suitable because of the extent of macular haemorrhage and  
- only if the manufacturer provides ranibizumab with the discount agreed in the patient access scheme revised in the context of NICE technology appraisal guidance 274.

[www.nice.org.uk/TA283](http://www.nice.org.uk/TA283)

---

**Ranibizumab and pegaptanib for the treatment of age-related macular degeneration (updated May 2012)**

Ranibizumab is recommended for the treatment of wet age-related macular degeneration if all of the following apply:  
- the best corrected visual acuity is between 6/12 and 6/96;  
- there is no permanent structural damage to the central fovea;  
- the lesion size is less than or equal to 12 disc areas in greatest linear dimension;  
- there is evidence of recent disease progression;  
- the manufacturer provides ranibizumab with the discount agreed in the patient access scheme (as revised in 2012).

Ranibizumab should only be continued in patients who maintain adequate response to therapy. Pegaptanib is not recommended for the treatment of wet age-related macular degeneration; patients currently receiving pegaptanib for any lesion type can continue therapy until they and their specialist consider it appropriate to stop.

[www.nice.org.uk/TA155](http://www.nice.org.uk/TA155)

---

**Ranibizumab for the treatment of choroidal neovascularisation associated with pathological myopia (November 2013)**

Ranibizumab is recommended as an option for treating visual impairment due to choroidal neovascularisation secondary to pathological myopia when the manufacturer provides ranibizumab with the discount agreed in the patient access scheme.

[www.nice.org.uk/TA298](http://www.nice.org.uk/TA298)

### NICE guidance

**Verteporfin photodynamic therapy for wet age-related macular degeneration (September 2003)**

Photodynamic therapy is recommended for wet age-related macular degeneration with a confirmed diagnosis of classic (no occult) subfoveal choroidal neovascularisation and best-corrected visual acuity of 6/60 or better. Photodynamic therapy is not recommended for wet age-related macular degeneration with predominantly classic but partly occult subfoveal choroidal neovascularisation except in clinical studies.

[www.nice.org.uk/TA68](http://www.nice.org.uk/TA68)

---

**AFLIBERCEPT**

**Indications** see notes above—specialist use only

**Cautions** see notes above; also monitor intra-ocular pressure following injection; patients at risk of retinal pigment epithelial tear

**Contra-indications** ocular or periorcular infection; severe intra-ocular inflammation; clinical signs of irreversible ischaemic visual function loss

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk and recommends women use effective contraception during and for at least 3 months after treatment.
Breast-feeding  manufacturer advises avoid—no information available

Side-effects  see notes above; also conjunctival haemorrhage, vitreous haemorrhage, corneal erosion, eye pain, retinal pigment epithelium tear, retinal degeneration, cataract formation, corneal abrasion or oedema, raised intra-ocular pressure, blurred vision, vitreous floaters, vitreous detachment, foreign body sensation in eye, increased lacrimation, eyelid oedema, ocular hypertension; less commonly retinal tear, retinal detachment, lenticular opacities, corneal epithelium defect, eyelid irritation, iritis, iridocyclitis, anterior chamber flare; rarely vitritis, uveitis

Dose

- Neovascular (wet) age-related macular degeneration, by intravitreal injection, ADULT over 18 years, 2 mg into the affected eye once a month for 3 months, then every 2 months thereafter; review treatment frequency after 12 months
- Macular oedema secondary to central retinal vein occlusion, by intravitreal injection, ADULT over 18 years, 2 mg into the affected eye once a month; monitor visual and anatomical outcomes monthly; continue treatment until visual and anatomical outcomes are stable for 3 monthly assessments (discontinue treatment if no improvement in visual and anatomical outcomes after initial 3 injections); if necessary subsequent doses may be given at least 1 month apart

Note  For further information on administration, consult product literature

Eylea® (Bayer)  ▼ Full Solution for intravitreal injection, aflibercept 40 mg/mL, net price 0.1-mL vial = £816.00

PEGAPTANIB SODIUM

Indications  see notes above—specialist use only

Cautions  see notes above; also monitor intra-ocular pressure (increase may occur following injection, and small, sustained increases reported after repeated dosing); monitor for vitreous haemorrhage and for signs of ocular infection for 2 weeks following injection

Contra-indications  ocular or periocular infection; severe intra-ocular inflammation; signs of irreversible ischaemic visual function loss in patients with retinal vein occlusion

Pregnancy  manufacturer advises avoid unless potential benefit outweighs risk

Breast-feeding  manufacturer advises avoid—no information available

Side-effects  see notes above; also rhinorhoea; headache; eye pain, anterior chamber inflammation, raised intra-ocular pressure, punctate keratitis, vitreous floaters, cataract, conjunctival and retinal haemorrhage, local oedema, conjunctivitis, corneal dystrophy, dry eye, eye discharge, eye irritation, macular degeneration, mydriasis, peribulbar haematoma, photophobia, flashing lights, vitreous disorders; less commonly vomiting, dyspepsia, palpitation, chest pain, hypertension, aortic aneurysm, influenza-like symptoms, nightmares, depression, back pain, asthenopia, blepharitis, corneal deposits, vitreous haemorrhage, chalazion, retinal exudates, eyelid ptosis, decreased intra-ocular pressure, injection-site reactions, retinal detachment, occlusion of retinal blood vessels, ectropion, eye movement disorder, pupillary disorder, iritis, optic nerve cupping, nasopharyngitis, deafness, vertigo, eczema, changes in hair colour, rash, pruritus, night sweats

Dose

- By intravitreal injection, ADULT over 18 years, 300 micrograms once every 6 weeks into the affected eye

Note  For further information on administration, consult product literature. Review treatment if no benefit after 2 consecutive injections

Macugen® (Pfizer)  Full Solution for intravitreal injection, pegaptanib (as sodium salt), net price 300-microgram prefilled syringe = £154.00

RANIBIZUMAB

Indications  see notes above—specialist use only

Cautions  see notes above; also history of stroke or transient ischaemic attack; patients at risk of retinal pigment epithelial tear; monitor intra-ocular pressure, perfusion of the optic nerve head, and for signs of ocular infection following injection; retinal detachment or macular hole—discontinue treatment if rhegmatogenous retinal detachment or stage 3 or 4 macular hole develops; diabetic macular oedema due to type 1 diabetes (limited information available); previous intravitreal injections; active systemic infection; proliferative diabetic retinopathy; uncontrolled hypertension; diabetic patients with HbA1c over 12%

Contra-indications  ocular or periocular infection; severe intra-ocular inflammation; signs of irreversible ischaemic visual function loss in patients with retinal vein occlusion

Pregnancy  manufacturer advises avoid unless potential benefit outweighs risk and recommends women use effective contraception during and for at least 3 months after treatment

Breast-feeding  manufacturer advises avoid—no information available

Side-effects  see notes above; also nausea, headache, nasopharyngitis, cough, anxiety, anaemia, urinary tract infection, arthralgia, raised intra-ocular pressure, visual disturbance, conjunctival, retinal, and vitreous disorders, ocular discomfort, eye haemorrhage, uveitis, iritis, blepharitis, iridocyclitis, cataract, posterior capsule opacification, punctuate keratitis, anterior chamber flare, conjunctivitis, photopsia, photophobia, eyelid oedema, allergic skin reactions; less commonly blindness, hypopyon, hyphaema, keratopathy, corneal disorders, iris adhesion

Dose

- Neovascular (wet) age-related macular degeneration, by intravitreal injection, ADULT over 18 years, 500 micrograms once a month into the affected eye; monitor visual acuity monthly; continue treatment until visual acuity is stable for 3 consecutive months; thereafter monitor visual acuity monthly; if necessary subsequent doses may be given at least 1 month apart
- Diabetic macular oedema, macular oedema secondary to retinal vein occlusion, by intravitreal injection, ADULT over 18 years, 500 micrograms once a month into the affected eye; monitor visual acuity monthly; continue treatment until visual acuity is stable for 3 consecutive months (discontinue treatment if no improvement in visual acuity after initial 3 injections); thereafter monitor visual acuity monthly; if necessary subsequent doses may be given at least 1 month apart
- Choroidal neovascularisation secondary to pathologic myopia, by intravitreal injection, ADULT over 18 years,
initially 500 micrograms as a single injection into the affected eye; monitor for disease activity monthly for first 2 months, then at least every 3 months thereafter during the first year, then as required; if necessary subsequent doses may be given at least 1 month apart

- Concomitant treatment of diabetic macular oedema, or macular oedema secondary to branch retinal vein occlusion, with laser photoacoagulation, by intravitreal injection, ADULT, 500 micrograms at least 30 minutes after laser photoacoagulation

Note For further information on administration, consult product literature

Lucentis® (Novartis) ▼ (PhV)
Solution for intravitreal injection, ranibizumab
10 mg/mL, net price 0.23-mL vial = £742.17

VERTEPORFIN

Indications see notes above—specialist use only

Cautions photosensitivity—avoid exposure of unprotected skin and eyes to bright light during infusion and for 48 hours afterwards; concomitant use with other photosensitising drugs; biliary obstruction; avoid extravasation

Contra-indications acute porphyria

Hepatic impairment use with caution in moderate impairment; avoid in severe impairment

Pregnancy manufacturer advises use only if potential benefit outweighs risk (teratogenic in animal studies)

Breast-feeding no information available—manufacturer advises avoid breast-feeding for 48 hours after administration

Side-effects nausea, hypercholesterolaemia, malaise, back pain, photosensitivity, visual disturbances (including reduced visual acuity, flashing lights, visual-field defects), less commonly hypertension, hyperaesthesia, pyrexia, retinal detachment, subretinal, retinal or vitreous haemorrhage, rarely retinal or choroidal vessel non-perfusion; also reported chest pain, myocardial infarction, vasovagal reactions, macular oedema, metamorphopsia, eyelid oedema, anterior chamber cell or flare, iritis, photopsia, ocular hypertension, abnormal retinograph, ocular discomfort, photophobia, chromatopsia, retinal pigment epitheliopathy; less commonly transient blindness, lens subluxation, scotoma, visual field defect, diplopia, hyphaema, miosis, unequal pupils, corneal abrasion, anterior chamber inflammation, eye inflammation

Dose
- By intravenous infusion over 10 minutes, 6 mg/m²

Note For information on administration and light activation, consult product literature

Visudyne® (Novartis) ▼ (PhV)
Injection, powder for reconstitution, verteporfin, net price 15-mg vial = £850.00

Excipients include butylated hydroxytoluene

Vitreomacular traction

Ocriplasmin is licensed for the treatment of vitreomacular traction, including when associated with a macular hole of diameter less than or equal to 400 microns. It is given by intravitreal injection by specialists experienced in the management of this condition.

NICE guidance Ocriplasmin for treating vitreomacular traction (October 2013)

Ocriplasmin is recommended as an option for treating vitreomacular traction in adults, only if:

- an epiretinal membrane is not present
- they have a stage II full-thickness macular hole with a diameter of 408 microns or less and/or
- they have severe symptoms.

www.nice.org.uk/TA297

OCRIPLASMIN

Indications see notes above—specialist use only

Cautions monitor intra-ocular pressure, visual acuity, and for signs of intra-ocular inflammation or infection following injection; non-proliferative diabetic retinopathy; history of uveitis (including severe active inflammation); significant eye trauma

Contra-indications active or suspected ocular or periocular infection; large diameter macular hole (> 400 microns); high myopia; aphakia; history of rhegmatogenous retinal detachment; lens zonule instability; recent ocular surgery or intra-ocular injection (including laser therapy); proliferative diabetic retinopathy; ischaemic retinopathies; retinal vein occlusions; exudative age-related macular degeneration; vitreous haemorrhage

Pregnancy manufacturer advises use only if potential benefit outweighs risk—no information available

Breast-feeding manufacturer advises use only if potential benefit outweighs risk—no information available

Side-effects conjunctival, retinal, and vitreous disorders, reduced visual acuity, raised intra-ocular pressure, macular hole, macular degeneration, macular oedema, metamorphopsia, eyelid oedema, anterior chamber cell or flare, iritis, photopsia, ocular hypertension, abnormal retinograph, ocular discomfort, photophobia, chromatopsia, retinal pigment epitheliopathy; less commonly transient blindness, lens subluxation, scotoma, visual field defect, diplopia, hyphaema, miosis, unequal pupils, corneal abrasion, anterior chamber inflammation, eye inflammation

Dose
- By intravitreal injection, ADULT over 18 years, 125 micrograms as a single dose into the affected eye

Note Concurrent administration to both eyes not recommended. For further information on administration, consult product literature

Jetrea® (Alcon) ▼ (PhV)
Concentrate for solution for intravitreal injection, ocriplasmin 2.5 mg/mL, net price 0.2-mL vial = £2500.00

11.9 Contact lenses

For cosmetic reasons many people prefer to wear contact lenses rather than spectacles; contact lenses are also sometimes required for medical indications. Visual defects are corrected by either rigid (‘hard’ or gas permeable) lenses or soft (hydrogel or silicone hydrogel) lenses; soft lenses are the most popular type, because they are initially the most comfortable, but they may not give the best vision. Lenses should usually be worn for a specified number of hours each day and removed for sleeping. The risk of infectious and non-infectious keratitis is increased by extended continuous contact lens wear, which is not recommended, except when medically indicated.

Contact lenses require meticulous care. Poor compliance with directions for use, and with daily cleaning and disinfection, can result in complications including ulcerative keratitis or conjunctivitis. One-day disposable lenses, which are worn only once and therefore require no disinfection or cleaning, are becoming increasingly popular.
Acanthamoeba keratitis, a painful and sight-threatening condition, is associated with ineffective lens cleaning and disinfection, the use of contaminated lens cases, or tap water coming into contact with the lenses. The condition is especially associated with the use of soft lenses (including frequently replaced lenses) and should be treated by specialists.

**Contact lenses and drug treatment**  
Special care is required in prescribing eye preparations for contact lens users. Some drugs and preservatives in eye preparations can accumulate in hydrogel lenses and may induce toxic reactions. Therefore, unless medically indicated, the lenses should be removed before instillation of the eye preparation and not worn during the period of treatment. Alternatively, unpreserved drops can be used. Eye drops may, however, be instilled while patients are wearing rigid corneal contact lenses. Ointment preparations should never be used in conjunction with contact lens wear; oily eye drops should also be avoided.

Many drugs given systemically can also have adverse effects on contact lens wear. These include oral contraceptives (particularly those with a higher oestrogen content), drugs which reduce blink rate (e.g. anxiolytics, hypnotics, antihistamines, and muscle relaxants), drugs which reduce lacrimation (e.g. antihistamines, antimuscarinics, phenothiazines and related drugs, some beta-blockers, diuretics, and tricyclic antidepressants), and drugs which increase lacrimation (including ephedrine and hydralazine). Other drugs that may affect contact lens wear are isotretinoin (can cause conjunctival inflammation), aspirin (salicylic acid appears in tears and can be absorbed by contact lenses—leading to irritation), and rifampicin and sulfasalazine (can discolour lenses).
12 Ear, nose, and oropharynx

12.1 Drugs acting on the ear

12.1.1 Otitis externa

Otitis externa is an inflammatory reaction of the meatal skin. It is important to exclude an underlying chronic otitis media before treatment is commenced. Many cases recover after thorough cleansing of the external ear canal by suction or dry mopping. A frequent problem in resistant cases is the difficulty in applying lotions and ointments satisfactorily to the relatively inaccessible affected skin. The most effective method is to introduce a ribbon gauze dressing or sponge wick soaked with corticosteroid ear drops or with an astringent such as aluminium acetate solution. When this is not practical, the ear should be gently cleansed with a probe covered in cotton wool and the patient encouraged to lie with the affected ear uppermost for ten minutes after the canal has been filled with a liberal quantity of the appropriate solution.

If infection is present, a topical anti-infective which is not used systemically (such as neomycin or clioquinol) may be used, but for only about a week as excessive use may result in fungal infections; these may be difficult to treat and require expert advice. Sensitivity to the anti-infective or solvent may occur and resistance to antibacterials is a possibility with prolonged use. Aluminium acetate ear drops are also effective against bacterial infection and inflammation of the ear. Chloramphenicol may be used but the ear drops contain propylene glycol and cause hypersensitivity reactions in about 10% of patients. Solutions containing an anti-infective and a corticosteroid (such as Locorten-Vioform®) are used for treating cases where infection is present with inflammation and eczema.

In view of reports of ototoxicity, manufacturers contraindicate treatment with topical aminoglycosides or polymyxins in patients with a perforated tympanic membrane (eardrum) or patent grommet. However, some specialists do use these drops cautiously in the presence of a perforation or patent grommet in patients with chronic suppurative otitis media (section 12.1.2) and when other measures have failed for otitis externa; treatment should be considered only by specialists in the following circumstance:

- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;
- patients should be counselled on the risk of ototoxicity and given justification for the use of these topical antibiotics;
- baseline audiometry should be performed, if possible, before treatment is commenced.
Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances.

A solution of acetic acid 2% acts as an antifungal and antibacterial in the external ear canal. It may be used to treat mild otitis externa but in severe cases an anti-inflammatory preparation with or without an anti-infective drug is required. A proprietary preparation containing acetic acid 2% (EurCalm® spray) is on sale to the public.

For severe pain associated with otitis externa, a simple analgesic, such as paracetamol (section 4.7.1) or ibuprofen (section 10.1.1), can be used. A systemic antibacterial (Table 1, section 5.1) can be used if there is spreading cellulitis or if the patient is systemically unwell. When a resistant staphylococcal infection (a boil) is present in the external auditory meatus, flucloxacillin (section 5.1) should be used in combination with a suitable anti-infective (see notes above). If infection is present, the corticosteroid should be avoided in the presence of an untreated ear infection. If infection is present, the corticosteroid should be used in combination with a suitable anti-infective (see notes above).

The skin of the pinna adjacent to the ear canal is often affected by eczema. Topical corticosteroid creams and ointments (section 13.4) are then required, but prolonged use should be avoided.

**Astringent preparations**

**ALUMINIUM ACETATE**

**Indications** inflammation in otitis externa (see notes above)

**Dose**
- Insert into meatus or apply on a ribbon gauze dressing or sponge wick which should be kept saturated with the ear drops

**Aluminium Acetate (Non-proprietary)**

**Ear drops** 13%, aluminium sulfate 2.25 g, calcium carbonate 1 g, tartaric acid 450 mg, acetic acid (33%) 2.5 mL, purified water 7.5 mL
Available from manufacturers of ‘special order’ products

**Ear drops** 8%, dilute 8 parts aluminium acetate ear drops (13%) with 5 parts purified water. Must be freshly prepared

**Anti-inflammatory preparations**

**Corticosteroids**

Topical corticosteroids are used to treat inflammation and eczema in otitis externa.

**Cautions** Prolonged use of topical corticosteroid ear preparations should be avoided.

**Contra-indications** Corticosteroid ear preparations should be avoided in the presence of an untreated ear infection. If infection is present, the corticosteroid should be used in combination with a suitable anti-infective (see notes above).

**Side-effects** Local sensitivity reactions may occur.

**BETAMETHASONE SODIUM PHOSPHATE**

**Indications** eczematous inflammation in otitis externa (see notes above)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Betnesol® (RPH) [Pos]**

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%. Net price 10 mL = £2.32

**Excipients** include benzalkonium chloride, disodium edetate

**Dose** ear, apply 2–3 drops every 2–3 hours; reduce frequency when relief obtained, eye, section 11.4.1, nose, section 12.2.1

**Vistamethasone® (Martindale)**

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%. Net price 5 mL = £1.02; 10 mL = £1.16

**Excipients** include benzalkonium chloride, disodium edetate

**Dose** ear, apply 2–3 drops every 3–4 hours; reduce frequency when relief obtained, eye, section 11.4.1, nose, section 12.2.1

**With antibacterial**

**Betnesol-N® (RPH)**

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%, neomycin sulfate 0.5%. Net price 10 mL = £2.39

**Excipients** include benzalkonium chloride, disodium edetate

**Dose** ear, apply 2–3 drops 3–4 times daily, eye, section 11.4.1; nose, section 12.2.3

**DEXAMETHASONE**

**Indications** eczematous inflammation in otitis externa (see notes above)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**With antibacterial**

**Otomize® (Forest)**

**Ear spray**, dexamethasone 0.1%, neomycin sulfate 3250 units/mL, glacial acetic acid 2%. Net price 5 mL pump-action aerosol unit = £3.50

**Excipients** include hydroxybenzoates (parabens)

**Dose** ADULT and CHILD over 2 years, apply 1 metered spray 3 times daily

**Sofradex® (Sanofi-Aventis)**

**Drops** (for ear or eye), dexamethasone (as sodium metasulphobenzoate) 0.05%, flunicasone propionate 0.5%, gramicidin 0.005%. Net price 10 mL = £6.25

**Excipients** include polysorbate 80

**Dose** ear, apply 2–3 drops 3–4 times daily, eye, section 11.4.1

**FLUMETASONE PIVALATE**

(Flumethasone Pivalate)

**Indications** eczematous inflammation in otitis externa (see notes above)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**With antibacterial**

**Locorten-Vioform® (AMCo)**

**Ear drops**, flumetasone pivalate 0.02%, clioquinol 1%. Net price 7.5 mL = £1.76

**Contra-indications** iodine sensitivity

**Dose** ADULT and CHILD over 2 years apply 2–3 drops into the ear twice daily for 7–10 days

**Note** Clioquinol stains skin and clothing
### HYDROCORTISONE

**Indications**  eczematous inflammation in otitis externa (see notes above)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

*With antibacterial*

**Gentisone**<sup>®</sup> HC (AMCo)  
Ear drops, hydrocortisone acetate 1%, gentamicin 0.3% (as sulfate). Net price 10 mL = £4.76

**Excipients** include benzalkonium chloride, disodium edetate

**Dose** ear, apply 2–4 drops 3–4 times daily and at night

### PREDNISOLONE SODIUM PHOSPHATE

**Indications**  eczematous inflammation in otitis externa (see notes above)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Predsol**<sup>®</sup> (RPH)

**Ear drops** for (ear or eye), prednisolone sodium phosphate 0.5%. Net price 10 mL = £2.00

**Excipients** include benzalkonium chloride, disodium edetate

**Dose** ear, apply 2–3 drops every 2–3 hours; reduce frequency when relief obtained, eye, section 11.4.1

### Anti-infective preparations

#### CHLORAMPHENICOL

**Indications**  bacterial infection in otitis externa (but see notes above)

**Cautions** avoid prolonged use (see notes above)

**Side-effects** high incidence of sensitivity reactions to vehicle

**Chloramphenicol** (Non-proprietary)  
**Ear drops**, chloramphenicol in propylene glycol, net price 5%, 10 mL = £33.40; 10%, 10 mL = £19.52

**Dose** ear, apply 2–3 drops 2–3 times daily

#### CLIQUINOL

**Indications** mild bacterial or fungal infections in otitis externa (see notes above)

**Cautions** avoid prolonged use (see notes above);

manufacturer advises avoid in perforated tympanic membrane (but used by specialists for short periods)

**Side-effects** local sensitivity; stains skin and clothing

*With corticosteroid*

**Locorten-Vioform**<sup>®</sup> see Flumetasone, p. 766

#### CLOTRIMAZOLE

**Indications**  fungal infection in otitis externa (see notes above)

**Side-effects** occasional local irritation or sensitivity

**Canesten**<sup>®</sup> (Bayer Consumer Care)

**Solution**, clotrimazole 1% in polyethylene glycol 400 (macrogol 400). Net price 20 mL = £2.30

**Dose** ear, apply 2–3 drops every 2–3 hours continuing for at least 14 days after disappearance of infection, skin, section 13.10.2

### FRAMYCETIN SULFATE

**Indications**  bacterial infection in otitis externa (see notes above)

**Cautions** avoid prolonged use (see notes above)

**Contra-indications** perforated tympanic membrane (see p. 765)

**Side-effects** local sensitivity

*With corticosteroid*

**Sofradex**<sup>®</sup> see Dexamethasone, p. 766

### GENTAMICIN

**Indications**  bacterial infection in otitis externa (see notes above)

**Cautions** avoid prolonged use (see notes above)

**Contra-indications** perforated tympanic membrane (but see also p. 765 and section 12.1.2)

**Side-effects** local sensitivity

**Genticin**<sup>®</sup> (AMCo)

**Drops** (for ear or eye), gentamicin 0.3% (as sulfate).

Net price 10 mL = £2.13

**Excipients** include benzalkonium chloride

**Dose** ear, apply 2–3 drops 3–4 times daily and at night, eye, section 11.3.1

*With corticosteroid*

**Gentisone**<sup>®</sup> HC see Hydrocortisone, above

### NEOYMYCIN SULFATE

**Indications**  bacterial infection in otitis externa (see notes above)

**Cautions** avoid prolonged use (see notes above)

**Contra-indications** perforated tympanic membrane (see p. 765)

**Side-effects** local sensitivity

*With corticosteroid*

**Betnesol-N**<sup>®</sup> see Betamethasone, p. 766

**Otomize**<sup>®</sup> see Dexamethasone, p. 766

### 12.1.2 Otitis media

#### Acute otitis media

Acute otitis media is the commonest cause of severe aural pain in small children. Many infections, especially those accompanying coryza, are caused by viruses. Most uncomplicated cases resolve without antibacterial treatment and a simple analgesic, such as paracetamol, may be sufficient. In children without systemic features, a systemic anti-bacterial (Table 1, section 5.1) may be started after 72 hours if there is no improvement, or earlier if there is deterioration, if the patient is systemically unwell, if the patient is at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis), if mastoiditis is present, or in children under 2 years of age with bilateral otitis media. Perforation of the tympanic membrane in patients with acute otitis media usually heals spontaneously without treatment; if there is no improvement, e.g. pain or discharge persists, a systemic antibacterial (Table 1, section 5.1) can be given. Topical treatment of acute otitis media is ineffective and there is no place for drops containing a local anaesthetic.
Otitis media with effusion  Otitis media with effusion (glue ear) occurs in about 10% of children and in 90% of children with cleft palates. Systemic antibiotics are not usually required. If glue ear persists for more than a month or two, the child should be referred for assessment and follow-up because of the risk of long-term hearing impairment which can delay language development. Untreated or resistant glue ear may be responsible for some types of chronic otitis media.

Chronic otitis media  Opportunistic organisms are often present in the debris, keratin, and necrotic bone of the middle ear and mastoid in patients with chronic otitis media. The mainstay of treatment is thorough cleansing with aural microsuction which may completely resolve long-standing infection. Local cleansing of the meatal and middle ear may be followed by treatment with a sponge stick or ribbon gauze dressing soaked with corticosteroid ear drops or with an astringent such as aluminium acetate solution; this is particularly beneficial for discharging ears or infections of the mastoid cavity. An antibiotic ear ointment may also be used. Acute exacerbations of chronic infection may also require systemic treatment with amoxicillin (or erythromycin if penicillin-allergic); treatment is adjusted according to the results of sensitivity testing.

In view of reports of ototoxicity, manufacturers contra-indicate topical treatment with ototoxic antibiotics in the presence of a tympanic perforation or patent grommet. Ciprofloxacin or ofloxacin eye drops used in the ear [unlicensed use] or ear drops [both unlicensed; available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104] are an effective alternative to such ototoxic ear drops for chronic otitis media in patients with perforation of the tympanic membrane.

However, some specialists do use ear drops containing aminoglycosides or polymyxins [unlicensed indications] cautiously in patients with chronic suppurrative otitis media and a perforation of the tympanic membrane, if the otitis media has failed to settle with systemic antibacterials; treatment should be considered only by specialists in the following circumstances:
- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;
- patients should be counselled on the risk of ototoxicity and given justification for the use of these topical antibiotics;
- baseline audiology should be performed, if possible, before treatment is commenced.

Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances. It is considered that the pus in the middle ear associated with otitis media also carries a risk of ototoxicity.

### 12.1.3 Removal of ear wax

Wax is a normal bodily secretion which provides a protective film on the meatal skin and need only be removed if it causes hearing loss or interferes with a proper view of the ear drum. Wax can be softened using simple remedies such as olive oil ear drops or almond oil ear drops; sodium bicarbonate ear drops are also effective, but may cause dryness of the ear canal. If the wax is hard and impacted, the drops can be used twice daily for several days and this may reduce the need for mechanical removal of the wax. The patient should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear. Some proprietary preparations containing organic solvents can irritate the meatal skin, and in most cases the simple remedies indicated above are just as effective and less likely to cause irritation. Docusate sodium or urea–hydrogen peroxide are ingredients in a number of proprietary preparations for softening ear wax.

If necessary, wax may be removed by irrigation with water (warmed to body temperature). Ear irrigation is generally best avoided in young children, in patients unable to co-operate with the procedure, in those with otitis media in the last six weeks, in otitis externa, in patients with cleft palate, a history of ear drum perforation, or previous ear surgery. A person who has hearing in one ear only should not have that ear irrigated because even a very slight risk of damage is unacceptable in this situation.

- **Almond Oil** (Non-proprietary)
  - Ear drops, almond oil in a suitable container
  - Allow to warm to room temperature before use
- **Olive Oil** (Non-proprietary)
  - Ear drops, olive oil in a suitable container
  - Allow to warm to room temperature before use
- **Sodium Bicarbonate** (Non-proprietary)
  - Ear drops, sodium bicarbonate 5%, net price 10 mL = £1.25
  - Cerumol® (Thorton & Ross)
  - Ear drops, chlorobutanol 5%, arachis (peanut) oil 57.3%. Net price 11 mL = £2.05
  - Exterol® (Dermal)
  - Ear drops, urea–hydrogen peroxide complex 5% in glycerol. Net price 8 mL = £1.75
  - Molcer® (Wallace Mfg)
  - Ear drops, docusate sodium 5%. Net price 15 mL = £8.08
  - Excipients include propylene glycol
  - Otex® (DDD)
  - Ear drops, urea–hydrogen peroxide 5%. Net price 8 mL = £2.89
  - Waxsol® (Meda)
  - Ear drops, docusate sodium 0.5%. Net price 10 mL = £1.95

### 12.2 Drugs acting on the nose

#### 12.2.1 Drugs used in nasal allergy

#### 12.2.2 Topical nasal decongestants

#### 12.2.3 Nasal preparations for infection

Rhinitis is often self-limiting but bacterial sinusitis may require treatment with antibacterials (Table 1, section 5.1). There are few indications for nasal sprays and drops except in allergic rhinitis and perennial rhinitis (section 12.2.1). Many nasal preparations contain sympathomimetic drugs which may damage the nasal cilia (section 12.2.2). Sodium chloride 0.9% solution may be used as a douche or ‘sniff’ following endonasal surgery.
Nasal polyps  Short-term use of corticosteroid nasal drops helps to shrink nasal polyps; to be effective, the drops must be administered with the patient in the ‘head down’ position. A short course of a systemic corticosteroid (section 6.3.2) may be required initially to shrink large polyps. A corticosteroid nasal spray can be used to maintain the reduction in swelling and also for the initial treatment of small polyps.

**12.2.1 Drugs used in nasal allergy**

Mild allergic rhinitis is controlled by antihistamines (see also section 3.4.1) or topical nasal corticosteroids; systemic nasal decongestants are of doubtful value (section 3.10). Topical nasal decongestants can be used for a short period to relieve congestion and allow penetration of a topical nasal corticosteroid.

More persistent symptoms and nasal congestion can be relieved by topical nasal corticosteroids; sodium cromoglicate is an alternative, but may be less effective. The topical antihistamine azelastine is useful for controlling breakthrough symptoms in allergic rhinitis. Topical antihistamines are considered less effective than topical corticosteroids but probably more effective than cromoglicate. In seasonal allergic rhinitis (e.g. hay fever), treatment should begin 2 to 3 weeks before the season commences and may have to be continued for several months; continuous treatment may be required for years in perennial rhinitis.

Montelukast (section 3.3.2) is less effective than topical nasal corticosteroids; montelukast can be used in patients with seasonal allergic rhinitis and concomitant asthma.

Sometimes allergic rhinitis is accompanied by vasomotor rhinitis. In this situation, the addition of topical nasal ipratropium bromide (section 12.2.2) can reduce watery rhinorrhea.

Very disabling symptoms occasionally justify the use of systemic corticosteroids for short periods (section 6.3), for example, in students taking important examinations. They may also be used at the beginning of a course of treatment with a corticosteroid spray to relieve severe mucosal oedema and allow the spray to penetrate the nasal cavity.

**Pregnancy**  If a pregnant woman cannot tolerate the symptoms of allergic rhinitis, treatment with nasal beclometasone, budesonide, fluticasone, or sodium cromoglicate may be considered.

**Antihistamines**

**AZELASTINE HYDROCHLORIDE**

**Indications**  allergic rhinitis

**Side-effects**  irritation of nasal mucosa; bitter taste (if applied incorrectly); very rarely hypersensitivity reactions including rash, pruritus, and urticaria

**Rhinolast® (Meda)**

Nasal spray, azelastine hydrochloride 140 micrograms (0.14 mL)/metered spray. Net price 22 mL (157-spray unit with metered pump) = £10.46

**Excipients**  include sodium edetate

**Dose**  
- **ADULT** and **CHILD** over 6 years, 100 micrograms (2 sprays) into each nostril twice daily; max. total, 400 micrograms (8 sprays) daily; when symptoms controlled, dose reduced to 50 micrograms (1 spray) into each nostril twice daily

**Beclometasone (Non-proprietary)**

Nasal spray, beclometasone dipropionate 50 micrograms/metered spray. Net price 200-spray unit = £2.12

**Brands include**  Nasotec Aquose®

**Note**  Preparations of beclometasone dipropionate can be sold to the public for nasal administration as a nasal spray if supplied for the prevention and treatment of allergic rhinitis in adults over 18 years subject to max. single dose of 140 micrograms per nostril, max. daily dose of 280 micrograms per nostril, and a pack size limit of 36 doses

**Corticosteroids**

Nasal preparations containing corticosteroids (beclometasone, betamethasone, budesonide, fluticasone, mometasone, and triamcinolone) have a useful role in the prophylaxis and treatment of allergic rhinitis (see notes above).

**Cautions**  Corticosteroid nasal preparations should be avoided in the presence of untreated nasal infections, and also after nasal surgery (until healing has occurred); they should also be avoided in pulmonary tuberculosis. Patients transferred from systemic corticosteroids may experience exacerbation of some symptoms. Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged; for cautions and side-effects of systemic corticosteroids, see section 6.3.2. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays. The height of children receiving prolonged treatment with nasal corticosteroids should be monitored; if growth is slowed, referral to a paediatrician should be considered.

**Side-effects**  Local side-effects include dryness, irritation of nose and throat, and epistaxis. Nasal ulceration has been reported, but occurs commonly with nasal preparations containing fluticasone furoate or mometasone furoate. Nasal septal perforation (usually following nasal surgery) occurs very rarely. Raised intra-ocular pressure or glaucoma may occur rarely. Headache, smell and taste disturbances may also occur. Hyperactivity, sleep disturbances, anxiety, depression, and aggression have been reported particularly in children. Hypersensitivity reactions, including bronchospasm, have been reported.

**BECLOMETASONE DIPROPIONATE**

(Becloметasone Dipropionate)

**Indications**  prophylaxis and treatment of allergic and vasomotor rhinitis

**Cautions**  see notes above

**Side-effects**  see notes above

**Dose**

- **ADULT** and **CHILD** over 6 years, 100 micrograms (2 sprays) into each nostril twice daily; max. total, 400 micrograms (8 sprays) daily; when symptoms controlled, dose reduced to 50 micrograms (1 spray) into each nostril twice daily

Beclometasone (Proprietary) **(toul)**

Nasal spray, beclometasone dipropionate 50 micrograms/metered spray. Net price 200-spray unit = £2.12

**Brands include**  Nasotec Aquose®

**Note**  Preparations of beclometasone dipropionate can be sold to the public for nasal administration as a nasal spray if supplied for the prevention and treatment of allergic rhinitis in adults over 18 years subject to max. single dose of 140 micrograms per nostril, max. daily dose of 280 micrograms per nostril, and a pack size limit of 36 doses.
**Beconase** (A&H) (®)
Nasal spray (aqueous suspension), beclometasone dipropionate 50 micrograms/metered spray. Net price 200-spray unit with applicator = £2.19

**Excipients** include benzalkonium chloride, polysorbate 80

**Dose**
ADULT
- Nasal polyps, 27.5 micrograms (1 spray) into each nostril once daily; when control achieved reduce to 55 micrograms (1 spray) into each nostril once daily; CHILD 4–11 years, 55 micrograms (1 spray) into each nostril once daily, preferably in the morning, increased if necessary to 55 micrograms (2 sprays) into each nostril once daily, when control achieved reduce to 27.5 micrograms (1 spray) into each nostril once daily
- Rhinitis, 100 micrograms (2 sprays) into each nostril once daily, preferably in the morning, increased if necessary to 100 micrograms (2 sprays) into each nostril twice daily; when control achieved reduce to 50 micrograms (1 spray) into each nostril once daily; CHILD 4–11 years, 50 micrograms (1 spray) into each nostril once daily, preferably in the morning, increased if necessary to 50 micrograms (2 sprays) into each nostril once daily, when control achieved reduce to 25 micrograms (1 spray) into each nostril once daily

**Side-effects** see notes above

**Cautions** see notes above

**Indications** prophylaxis and treatment of allergic rhinitis and perennial rhinitis, nasal polyps

**Flixonase Nasule** (A&H) (®)
Nasal drops, fluticasone propionate 400 micrograms/unit dose, net price 28 × 0.4-mL units = £12.99

**Excipients** include benzalkonium chloride, polysorbate 80

**Dose**
- Nasal polyps, ADULT over 18 years, 200 micrograms (approx. 6 drops) into each nostril once or twice daily; consider alternative treatment if no improvement after 4–6 weeks
- Nasal polyps, ADULT and ADOLESCENT over 16 years, 200 micrograms (approx. 6 drops) into each nostril once or twice daily, subject to max. single dose of 100 micrograms per nostril, max. daily dose of 200 micrograms per nostril for max. 3 months, and a pack size of 3 mg

**Side-effects** see notes above

**Cautions** see notes above; **interactions:** Appendix 1 (corticosteroids)

**Budesonide**

**Indications** prophylaxis and treatment of allergic and vasomotor rhinitis; nasal polyps

**Excipients** include benzalkonium chloride, disodium edetate

**Dose**
- See preparations

**Budesonide (Non-proprietary)**

**Nasal spray**
- Budesonide 100 micrograms/metered spray, net price 100-spray unit = £5.90
- Budesonide, ADULT and CHILD over 12 years, 100 micrograms (2 sprays) into each nostril once daily in the morning or 100 micrograms (1 spray) into each nostril twice daily; when control achieved reduce to 100 micrograms (1 spray) into each nostril once daily
- Budesonide, ADULT and CHILD over 12 years, 100 micrograms (1 spray) into each nostril twice daily for up to 3 months

**Nasal polyps, ADULT and CHILD over 12 years, 100 micrograms (1 spray) into each nostril twice daily; when control achieved reduce to 100 micrograms (1 spray) into each nostril once daily
- Nasal polyps, ADULT and CHILD over 12 years, 100 micrograms (1 spray) into each nostril twice daily for up to 3 months

**Note** Preparations of budesonide can be sold to the public for nasal administration as a nasal spray if supplied for the prevention and treatment of seasonal allergic rhinitis in adults over 18 years subject to max. single dose of 200 micrograms per nostril, max. daily dose of 200 micrograms per nostril for max. period of 3 months, and a pack size of 10 mg

**Rhinocort Aqua** (AstraZeneca) (®)
Nasal spray, budesonide 64 micrograms/metered spray. Net price 120-spray unit = £3.49

**Excipients** include disodium edetate, polysorbate 80, potassium sorbate

**Dose**
- Rhinitis, ADULT and CHILD over 12 years, 128 micrograms (2 sprays) into each nostril once daily in the morning or 64 micrograms (1 spray) into each nostril twice daily; when control achieved reduce to 64 micrograms (1 spray) into each nostril once daily; max. duration of treatment 3 months
- Nasal polyps, ADULT and CHILD over 12 years, 64 micrograms (1 spray) into each nostril twice daily for up to 3 months

**Betamethasone Sodium Phosphate**

**Indications** non-infected inflammatory conditions of nose

**Cautions** see notes above

**Side-effects** see notes above

**Betnesol** (RPH) (®)

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%, net price 10 mL = £2.19

**Excipients** include benzalkonium chloride, disodium edetate

**Dose**
- Ear, 2–3 drops into each nostril twice daily; eye, section 12.1.1; nose, section 11.4.1

**Vistamethasone** (Martindale) (®)

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%. Net price 5 mL = £1.02, 10 mL = £1.16

**Excipients** include benzalkonium chloride, disodium edetate

**Dose**
- Ear, 2–3 drops into each nostril 2–3 times daily; eye, section 12.1.1; nose, section 11.4.1

**Flixonase** (A&H) (®)
Aqueous nasal spray, fluticasone propionate 50 micrograms/metered spray. Net price 150-spray unit with applicator = £11.01

**Excipients** include benzalkonium chloride, polysorbate 80

**Dose**
- Nasal polyps, ADULT over 18 years, 1 spray into each nostril twice daily; when control achieved reduce to 50 micrograms (1 spray) into each nostril once daily; CHILD 4–11 years, 55 micrograms (1 spray) into each nostril once daily, preferably in the morning, increased if necessary to 55 micrograms (2 sprays) into each nostril once daily, when control achieved reduce to 25 micrograms (1 spray) into each nostril once daily

**Side-effects** see notes above

**Cautions** see notes above

**Indications** prophylaxis and treatment of allergic and perennial rhinitis, nasal polyps

**Cautions** see notes above;

**Side-effects** see notes above

**FLUTICASONE PROPIONATE**

**Indications** prophylaxis and treatment of allergic rhinitis and perennial rhinitis, nasal polyps

**Cautions** see notes above; **interactions:** Appendix 1 (corticosteroids)

**Dose**
- Rhinitis, 100 micrograms (2 sprays) into each nostril once daily, preferably in the morning, increased to max. twice daily if required; when control achieved reduce to 50 micrograms (1 spray) into each nostril once daily; CHILD 4–11 years, 50 micrograms (1 spray) into each nostril once daily, preferably in the morning, increased to max. twice daily if required
- Nasal polyps, see **Flixonase Nasule** (®) below
**MOMETASONE FUROATE**

**Indications** prophylaxis and treatment of allergic rhinitis; nasal polyps

**Cautions** see notes above

**Side-effects** see notes above

**Dose**
- Rhinitis, ADULT and CHILD over 12 years, 100 micrograms (2 sprays) into each nostril once daily, increased if necessary to max. 200 micrograms (4 sprays) into each nostril once daily; when control achieved reduce to 50 micrograms (1 spray) into each nostril once daily; CHILD 6–12 years, 50 micrograms (1 spray) into each nostril once daily
- Nasal polyps, ADULT over 18 years, 100 micrograms (2 sprays) into each nostril once daily, increased if necessary after 5–6 weeks to 100 micrograms (2 sprays) into each nostril twice daily (consider alternative treatment if no improvement after further 5–6 weeks); reduce to the lowest effective dose when control achieved

**Mometasone (Non-proprietary)**

**Nasal spray**, mometasone furoate 50 micrograms/ metered spray, net price 140-spray unit = £7.60

**Excipients** include benzalkonium chloride, polysorbate 80

**Nasonex**

**Nasal spray**, mometasone furoate 50 micrograms/metered spray, net price 140-spray unit = £7.68

**Excipients** include benzalkonium chloride, polysorbate 80

**TRIAMCINOLONE ACETONIDE**

**Indications** prophylaxis and treatment of allergic rhinitis

**Cautions** see notes above

**Side-effects** see notes above

**Nasacort**

**Aqueous nasal spray**, triamcinolone acetonide 55 micrograms/metered spray. Net price 120-spray unit = £7.39

**Excipients** include benzalkonium chloride, disodium edetate, polysorbate 80

**Dose** ADULT and CHILD over 12 years, 110 micrograms (2 sprays) into each nostril once daily; CHILD 6–12 years, 55 micrograms (1 spray) into each nostril once daily, increased if necessary to 110 micrograms (2 sprays) into each nostril once daily; when control achieved, reduce to 55 micrograms (1 spray) into each nostril once daily, max. duration of treatment 3 months; CHILD 2–6 years see BNF for Children

**Note** Preparations of triamcinolone acetonide can be sold to the public for nasal administration as a non-pressure aerosol nasal spray if supplied for the symptomatic treatment of seasonal allergic rhinitis in adults over 18 years, subject to max. daily dose of 110 micrograms per nostril for max. 3 months, and a pack size of 3.575 mg

**Cromoglicate**

**SODIUM CROMOGLICATE**

(Sodium Cromoglicate)

**Indications** prophylaxis of allergic rhinitis

**Side-effects** local irritation; rarely transient bronchospasm

**Rynacrom**

4% aqueous nasal spray, sodium cromoglicate 4% (5.2 mg/spray). Net price 22 mL (150-spray unit with pump) = £17.07

**Excipients** include benzalkonium chloride, disodium edetate.

**Dose** ADULT and CHILD, 1 spray into each nostril 2–4 times daily

## 12.2.2 Topical nasal decongestants

The nasal mucosa is sensitive to changes in atmospheric temperature and humidity and these alone may cause slight nasal congestion. The nose and nasal sinuses produce a litre of mucus in 24 hours and much of this finds its way silently into the stomach via the nasopharynx. Slight changes in the nasal airway, accompanied by an awareness of mucus passing along the nasopharynx causes some patients to be inaccurately diagnosed as suffering from chronic sinusitis. These symptoms are particularly noticeable in the later stages of the common cold. Sodium chloride 0.9% given as nasal drops or spray may relieve nasal congestion by helping to liquefy mucous secretions.

Inhalation of warm moist air is useful in the treatment of symptoms of acute infective conditions. The addition of volatile substances such as menthol and eucalyptus may encourage the use of warm moist air (section 3.8).

Symptoms of nasal congestion associated with vasomotor rhinitis and the common cold can be relieved by the short-term use (usually not longer than 7 days) of decongestant nasal drops and sprays. These all contain sympathomimetic drugs which exert their effect by vasocostriction of the mucosal blood vessels which in turn reduces oedema of the nasal mucosa. They are of limited value because they can give rise to a rebound congestion (rhinitis medicamentosa) on withdrawal, due to a secondary vasodilatation with a subsequent temporary increase in nasal congestion. This in turn tempts the further use of the decongestant, leading to a vicious cycle of events. Ephedrine nasal drops is the safest sympathomimetic preparation and can give relief for several hours.

The CHM/MHRA has stated that non-prescription cough and cold medicines containing ephedrine, oxymetazoline and xylometazoline are more likely to cause a rebound effect. Symptomimetics may cause a hypertensive crisis if used during treatment with a monoamine-oxidase inhibitor including moclobemide.

Systemic nasal decongestants—see section 3.10.

**Sinusitis and oral pain** Sinusitis affecting the maxillary antrum can cause pain in the upper jaw. Where this is associated with blockage of the opening from the sinus into the nasal cavity, it may be helpful to relieve the congestion with inhalation of warm moist air (section 3.8) or with ephedrine nasal drops (see above). For antibacterial treatment of sinusitis, see Table 1, section 5.1.
**12 Ear, nose, and oropharynx**

---

**EPHEDRINE HYDROCHLORIDE**

**Indications** nasal congestion

**Cautions** see section 3.1.1.2 and notes above; also avoid excessive or prolonged use; interactions: Appendix 1 (sympathomimetics)

**Pregnancy** see section 3.1.1.2

**Breast-feeding** see section 3.1.1.2

**Side-effects** local irritation, nausea, headache; after excessive use tolerance with diminished effect, rebound congestion; cardiovascular effects also reported

**Dose**

- Ephedrine (Non-proprietary)
  
  **Nasal drops**, ephedrine hydrochloride 0.5%, net price 10 mL = £1.49; 1%, 10 mL = £1.54
  
  **Note** The BP directs that if no strength is specified 0.5%
  
  Drops should be supplied
  
  **Dose** ADULT and CHILD over 12 years, 1–2 drops into each nostril up to 4 times daily when required, max. duration 7 days
  
  Dental prescribing on NHS Ephedrine nasal drops may be prescribed

**XYLOMETAZOLINE HYDROCHLORIDE**

**Indications** nasal congestion

**Cautions** see under Ephedrine Hydrochloride section 3.1.1.2 and notes above; also angle-closure glaucoma; avoid excessive or prolonged use

**Pregnancy** manufacturer advises avoid

**Breast-feeding** manufacturer advises caution—no information available

**Side-effects** see under Ephedrine Hydrochloride and notes above; also reported transient visual disturbances; in small children, also restlessness, sleep disturbances, and hallucinations (discontinue treatment)

**Dose**

- Xylometazoline (Non-proprietary)
  
  **Nasal drops**, xylometazoline hydrochloride 0.1%, net price 10 mL = £2.10
  
  **Brands include** Otradrops®, Otrivine®
  
  **Dose** 2–3 drops into each nostril 2–3 times daily when required; max. duration 7 days; not recommended for children under 12 years
  
  **Paediatric nasal drops**, xylometazoline hydrochloride 0.05%, net price 10 mL = £1.91
  
  **Brands include** Otradrops®, Otrivine®
  
  **Dose** CHILD 6–12 years 1–2 drops into each nostril 1–2 times daily when required; max. duration 5 days
  
  **Nasal spray**, xylometazoline hydrochloride 0.1%, net price 10 mL = £2.10
  
  **Brands include** Otrivine®, Otrivine® Allergy Relief
  
  **Dose** 1 spray into each nostril 1–3 times daily when required; max. duration 7 days; not recommended for children under 12 years

---

1. Can be sold to the public provided no more than 180 mg of ephedrine base (or salts) are supplied at one time, and pseudoephedrine salts are not supplied at the same time; for conditions that apply to supplies made at the request of a patient, see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition)

---

**Antimuscarinic**

---

**IPRATROPIUM BROMIDE**

**Indications** rhinorrhea associated with allergic and non-allergic rhinitis

**Cautions** see section 3.1.2; avoid spraying near eyes

**Side-effects** epistaxis, nasal dryness, and irritation; very rarely antimuscarinic effects such as gastrointestinal motility disturbances, palpitations, and urinary retention

**Dose**

- **ADULT** and **CHILD** over 12 years, 42 micrograms (2 sprays) into each nostril 2–3 times daily

**Rinatex®** (Boehringer Ingelheim)

**Nasal spray 0.03%**, ipratropium bromide 21 micrograms/metered spray. Net price 180-dose unit = £6.54

**Excipients** include benzalkonium chloride, disodium edetate

---

**12.2.3 Nasal preparations for infection**

There is no evidence that topical anti-infective nasal preparations have any therapeutic value in rhinitis or sinusitis; for elimination of nasal staphylococci, see below.

Systemic treatment of sinusitis—see Table 1 section 5.1.

**Betnesol-N®** (RPH)

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%, neomycin sulfate 0.5%. Net price 10 mL = £2.39

**Excipients** include benzalkonium chloride, disodium edetate

**Dose**

- **Nose** 2–3 drops into each nostril 2–3 times daily
  
  eye, section 11.4.1; ear, section 12.1.1

---

**Nasal staphylococci**

Elimination of organisms such as staphylococci from the nasal vestibule can be achieved by the use of a cream containing chlorhexidine and neomycin (Naseptin®), but re-colonisation frequently occurs. Coagulase-positive staphylococci are present in the noses of 40% of the population.

A nasal ointment containing mupirocin is also available; it should probably be held in reserve for resistant cases. In hospital or in care establishments, mupirocin nasal ointment should be reserved for the eradication (in both patients and staff) of nasal carriage of meticillin-resistant *Staphylococcus aureus* (MRSA). The ointment should be applied 3 times daily for 5 days and a sample taken 2 days after treatment to confirm eradication. The course may be repeated if the sample is positive (and the throat is not colonised). To avoid the development of resistance, the treatment course should not exceed 7 days and the course should not be repeated on more than one occasion. If the MRSA strain is mupirocin-resistant or does not respond after 2 courses, consider alternative products such as chlorhexidine and neomycin cream.
BACTROBAN NASAL® (GSK) (TM)

Nasal ointment, mupirocin 2% (as calcium salt) in white soft paraffin basis. Net price 3g £3.54

**Dose** for eradication of nasal carriage of *Staphylococcus aureus* (MRSA), apply 2–3 times daily to the inner surface of each nostril for 5 days.

**NASEPTIN** (Alliance) (TM)

Cream, chlorhexidine hydrochloride 0.1%, neomycin sulfate 0.5%, net price 15g £1.90

**Excipients** include arachis (peanut) oil, cetostearyl alcohol

**Dose** for eradication of nasal carriage of *Staphylococcus aureus*, apply to nostrils 4 times daily for 10 days; for preventing nasal carriage of *staphylococci*, apply to nostrils twice daily.

### 12.3 Drugs acting on the oropharynx

#### 12.3.1 Drugs for oral ulceration and inflammation

#### 12.3.2 Oropharyngeal anti-infective drugs

#### 12.3.3 Lozenges and sprays

#### 12.3.4 Mouthwashes, gargles, and dentifrices

#### 12.3.5 Treatment of dry mouth

**12.3.1 Drugs for oral ulceration and inflammation**

Ulceration of the oral mucosa may be caused by trauma (physical or chemical), recurrent aphthae, infections, carcinoma, dermatological disorders, nutritional deficiencies, gastro-intestinal disease, haematopoietic disorders, and drug therapy (see also Chemotherapy-induced mucositis and myelosuppression). It is important to establish the diagnosis in each case as the majority of these lesions require specific management in addition to local treatment. Local treatment aims to protect the ulcerated area, to relieve pain, to reduce inflammation, or to control secondary infection. Patients with an unexplained mouth ulcer of more than 3 weeks’ duration require urgent referral to hospital to exclude oral cancer.

**Simple mouthwashes** A saline mouthwash (section 12.3.4) may relieve the pain of traumatic ulceration. The mouthwash is made up with warm water and used at frequent intervals until the discomfort and swelling subsides.

**Antiseptic mouthwashes** Secondary bacterial infection may be a feature of any mucosal ulceration; it can increase discomfort and delay healing. Use of chlorhexidine mouthwash (section 12.3.4) is often beneficial and may accelerate healing of recurrent aphthae.

**Corticosteroids** Topical corticosteroid therapy may be used for some forms of oral ulceration. In the case of aphthous ulcers it is most effective if applied in the ‘prodromal’ phase. Thrush or other types of candidiasis are recognised complications of corticosteroid treatment.

**Hydrocortisone oromucosal tablets** are allowed to dissolve next to an ulcer and are useful in recurrent aphthae and erosive lichenoid lesions.

**Beclometasone dipropionate** inhaler 50–100 micrograms sprayed twice daily on the oral mucosa is used to manage oral ulceration [unlicensed indication]. Alternatively, **betamethasone** soluble tablets dissolved in water can be used as a mouthwash to treat oral ulceration [unlicensed indication]. Systemic corticosteroid therapy (section 6.3.2) is reserved for severe conditions such as pemphigus vulgaris.

**Local analgesics** Local analgesics have a limited role in the management of oral ulceration. When applied topically their action is of a relatively short duration so that analgesia cannot be maintained continuously throughout the day. The main indication for a topical local analgesic is to relieve the pain of otherwise intractable oral ulceration particularly when it is due to major aphthae. For this purpose lidocaine 5% ointment or lozenges containing a local anaesthetic are applied to the ulcer. Lidocaine 10% solution as spray (section 15.2) can be applied thinly to the ulcer [unlicensed indication] using a cotton bud. When local anaesthetics are used in the mouth care must be taken not to produce anaesthesia of the pharynx before meals as this might lead to choking.

**Benzydamine** and **Flurbiprofen** are non-steroidal anti-inflammatory drugs (NSAIDs). Benzydamine mouthwash or spray may be useful in reducing the discomfort associated with a variety of ulcerative conditions. It has also been found to be effective in reducing the discomfort of post-irradiation mucositis. Some patients find the full-strength mouthwash causes some stinging and, for them, it should be diluted with an equal volume of water. Flurbiprofen lozenges are licensed for the relief of sore throat.

**Choline salicylate** is a derivative of salicylic acid and has some analgesic action. The dental gel may provide relief for recurrent aphthae, but excessive application or confinement under a denture irritates the mucosa and can itself cause ulceration.

**Other preparations** Doxycycline rinsed in the mouth may be of value for recurrent aphthous ulceration.

**Periodontitis** Low-dose doxycycline ([Periostat](#)) is licensed as an adjunct to scaling and root planing for the treatment of periodontitis; a low dose of doxycycline reduces collagenase activity without inhibiting bacteria associated with periodontitis. For anti-infectives used in the treatment of destructive (refractory) forms of periodontal disease, see section 12.3.2 and Table 1, section 5.1. For mouthwashes used for oral hygiene and plaque inhibition, see section 12.3.4.

**BENZYDAMINE HYDROCHLORIDE**

**Indications** painful inflammatory conditions of oropharynx

**Side-effects** occasional numbness or stinging; rarely hypersensitivity reactions

**Dose**

- **As a mouthwash** (benzydamine hydrochloride 0.15%), **ADULT** and **CHILD** over 13 years, rinse or gargle, using 15 mL (dilute with an equal volume of water if stinging occurs) every 1½–3 hours as required, usually for not more than 7 days

- **As an oromucosal spray** (benzydamine hydrochloride 0.15%), **ADULT** and **CHILD** over 12 years,
4–8 sprays onto affected area every 1½–3 hours; **CHILD** under 6 years 1 spray per 4 kg body-weight to max. 4 sprays every 1½–3 hours; 6–12 years 4 sprays every 1½–3 hours

Benzydamine hydrochloride (Non-proprietary)  
**Mouthwash**, benzydamine hydrochloride 0.15%, net price 300 mL = £6.45  
**Brands include** *Oroe®*  
**Oromucosal spray**, benzydamine hydrochloride 0.15%, net price 30 mL = £4.24  
**Brands include** *Oroe®*  
**Dental prescribing on NHS** Benzydamine Oromucosal Spray 0.15% may be prescribed

**Difflam®** (Meda)  
**Mouthwash (oral rinse)**, green, benzydamine hydrochloride 0.15%, net price 200 mL (**Difflam® Sore Throat Rinse**) = £6.50  
**Dental prescribing on NHS** May be prescribed as Benzydamine Mouthwash 0.15%  
**Oromucosal spray**, benzydamine hydrochloride 0.15%, net price 30 mL = £4.24

**Corticosteroids**  
**Indications** oral and perioral lesions  
**Contra-indications** untreated oral infection  
**Side-effects** occasional exacerbation of local infection; thrush or other candidal infections

**Betamethasone (Non-proprietary)**  
**Soluble tablets**, betamethasone 500 micrograms (as sodium phosphate), net price 100-tab pack = £19.52. Label: 10, 13, counselling, administration  
**Dose** oral ulceration, [unlicensed indication] **ADULT** and **CHILD** over 12 years, 500 micrograms dissolved in 20 mL water and rinsed around the mouth 4 times daily; not to be swallowed  
**Dental prescribing on NHS** Betamethasone Soluble Tablets 500 micrograms may be prescribed

**Hydrocortisone (Non-proprietary)**  
**Mucoadhesive buccal tablets** (= oromucosal tablets), hydrocortisone 2.5 mg (as sodium succinate). Net price 20 = £4.24  
**Dose** **ADULT** and **CHILD** over 12 years, 1 lozenge 4 times daily; allowed to dissolve slowly in the mouth in contact with the ulcer; **CHILD** under 12 years, only on medical advice  
**Dental prescribing on NHS** May be prescribed as Hydrocortisone Oromucosal Tablets

**Doxycline**  
**Indications** see preparations; other indications (section 5.1.3)  
**Cautions** section 5.1.3; monitor for superficial fungal infection, particularly if predisposition to oral candidiasis  
**Contra-indications** section 5.1.3  
**Hepatic impairment** section 5.1.3  
**Renal impairment** section 5.1.3  
**Pregnancy** section 5.1.3  
**Breast-feeding** section 5.1.3  
**Side-effects** section 5.1.3; fungal superinfection  
**Dose**  
- See preparations  
- **Note** Doxycline stains teeth, avoid in children under 12 years of age

**Periostat®** (Alliance)  
**Tablets, F/C**, doxycycline (as hyclate) 20 mg, net price 56-tab pack = £17.30. Label: 6, 11, 27, counselling, posture  
**Dose** periodontitis (as an adjunct to gingival scaling and root planing), 20 mg twice daily for 3 months; **CHILD** under 12 years not recommended  
**Counselling** Tablets should be swallowed whole with plenty of fluid (at least 100 mL), while sitting or standing  
**Dental prescribing on NHS** May be prescribed as Doxycycline Tablets 20 mg  
**Note** May be difficult to obtain

**Local application**  
For recurrent aphthous ulceration, a 100 mg doxycycline dispersible tablet can be stirred into a small amount of water then rinsed around the mouth for 2–3 minutes 4 times daily usually for 3 days; it should preferably not be swallowed [unlicensed indication].

**Flurbiprofen**  
**Indications** relief of sore throat  
**Cautions** section 10.1.1  
**Contra-indications** section 10.1.1  
**Hepatic impairment** section 10.1.1  
**Renal impairment** section 10.1.1  
**Pregnancy** section 10.1.1  
**Breast-feeding** section 10.1.1  
**Side-effects** taste disturbance, mouth ulcers (move lozenge around mouth); see also section 10.1.1  
**Streph®** (Beckitt Benckiser)  
**Lozenges**, flurbiprofen 8.75 mg, net price 16 = £2.58  
**Dose** **ADULT** and **CHILD** over 12 years, allow 1 lozenge to dissolve slowly in the mouth every 3–6 hours, max. 5 lozenges in 24 hours, for max. 3 days

**Local anaesthetics**  
**Indications** relief of pain in oral lesions  
**Cautions** avoid prolonged use; hypersensitivity; avoid anaesthesia of the pharynx before meals—risk of choking  
**Hepatic impairment** see Lidocaine section 2.3.2  
**Renal impairment** see Lidocaine section 2.3.2  
**Pregnancy** see Lidocaine section 15.2  
**Breast-feeding** see Lidocaine section 2.3.2  
**Lidocaine** (Non-proprietary)  
**Ointment**, lidocaine 5% in a water-miscible basis, net price 15 g = £6.18  
**Dose** rub sparingly and gently on affected areas  
**Dental prescribing on NHS** Lidocaine 5% Ointment may be prescribed

**Xylocaine®** (AstraZeneca)  
**Spray** (= pump spray), lidocaine 10% (100 mg/g) supplying 10 mg lidocaine/spray; 500 spray doses per container. Net price 50–mL bottle = £6.29  
**Dose** apply thinly to the ulcer [unlicensed indication] using a cotton bud  
**Dental prescribing on NHS** May be prescribed as Lidocaine Spray 10%

**Preparations on sale to the public**  
Many mouth ulcer preparations, throat lozenges, and throat sprays on sale to the public contain a local anaesthetic. To identify the active ingredients in such preparations, consult the product literature of the manufacturer.

**Note** The correct proprietary name should be ascertained—many products have very similar names but different active ingredients.
12.3.2 Oropharyngeal anti-infective drugs

The most common cause of a sore throat is a viral infection which does not benefit from anti-infective treatment. Streptococcal sore throats require systemic penicillin therapy (Table 1, section 5.1). Acute ulcerative gingivitis (Vincent’s infection) responds to systemic metronidazole (section 5.1.11).

Preparations administered in the dental surgery for the local treatment of periodontal disease include gels of metronidazole (Elyzol®), minocycline (Dentomycin®), and of topical antibiotics. Thrush also occurs in patients with serious systemic disease associated with reduced immunity such as leukaemia, other malignancies, and HIV infection. Any predisposing condition should be managed appropriately. When thrush is associated with corticosteroid inhalers, rinsing the mouth with water (or cleaning a child’s teeth) immediately after using the inhaler may avoid the problem. Treatment with nystatin or miconazole may be needed. Fluconazole (section 5.2.1) is effective for unresponsive infections or if a topical antifungal drug cannot be used or if the patient has dry mouth. Topical therapy may not be adequate in immunocompromised patients and an oral triazole antifungal is preferred (section 5.2.1).

Acute erythematous candidiasis Acute erythematous (atrophic) candidiasis is a relatively uncommon condition associated with corticosteroid and broad-spectrum antibacterial use and with HIV disease. It is usually treated with fluconazole (section 5.2.1).

Denture stomatitis Patients with denture stomatitis (chronic atrophic candidiasis), should cleanse their dentures thoroughly and leave them out as often as possible during the treatment period. To prevent recurrence of the problem, dentures should not normally be worn at night. New dentures may be required if these measures fail despite good compliance.

Miconazole oral gel can be applied to the fitting surface of the denture before insertion (for short periods only). Denture stomatitis is not always associated with candidiasis and other factors such as mechanical or chemical irritation, bacterial infection, or rarely allergy to the dental base material, may be the cause.

Chronic hyperplastic candidiasis Chronic hyperplastic candidiasis (candidal leucoplakia) carries an increased risk of malignancy; biopsy is essential—this type of candidiasis may be associated with varying degrees of dysplasia, with oral cancer present in a high proportion of cases. Chronic hyperplastic candidiasis is treated with a systemic antifungal such as fluconazole (section 5.2.1) to eliminate candidal overlay. Patients should avoid the use of tobacco.

Angular cheilitis Angular cheilitis (angular stomatitis) is characterised by soreness, erythema and fissuring at the angles of the mouth. It is commonly associated with denture stomatitis but may represent a nutritional deficiency or it may be related to orofacial granulomatosis or HIV infection. Both yeasts (Candida spp.) and bacteria (Staphylococcus aureus and beta-haemolytic streptococci) are commonly involved as interacting, infective factors. A reduction in facial height related to ageing and tooth loss with maceration in the deep occlusive folds that may subsequently arise, predisposes to such infection. While the underlying cause is being identified and treated, it is often helpful to apply miconazole cream (see p. 819) or sodium fusidate ointment (see p. 817); if the angular cheilitis is unresponsive to treatment, miconazole and hydrocortisone cream or ointment (see p. 788) can be used.

Immunocompromised patients For advice on prevention of fungal infections in immunocompromised patients see p. 403.

Drugs used in oropharyngeal candidiasis Nystatin is not absorbed from the gastro-intestinal tract and is applied locally (as a suspension) to the mouth for treating local fungal infections. Miconazole is applied locally (as an oral gel) in the mouth but it is absorbed to the extent that potential interactions need to be considered. Miconazole also has some activity against Gram-positive bacteria including streptococci and staphylococci. Fluconazole (section 5.2.1) is given by mouth for infections that do not respond to topical therapy or when topical therapy cannot be used. It is reliably absorbed and effective. Itraconazole (section 5.2.1) can be used for fluconazole-resistant infections.

If candidal infection fails to respond to 1 to 2 weeks of treatment with antifungal drugs the patient should be sent for investigation to eliminate the possibility of...
underlying disease. Persistent infection may also be caused by reinfection from the genito-urinary or gastro-intestinal tract. Infection can be eliminated from these sources by appropriate antifungal therapy; the patient’s partner may also require treatment to prevent reinfection.

For the role of antiseptic mouthwashes in the prevention of oral candidiasis in immunocompromised patients and treatment of denture stomatitis, see section 12.3.4.

**MICONAZOLE**

**Indications** see preparations

**Cautions** avoid in acute porphyria (section 9.8.2); interactions: Appendix 1 (antifungals, imidazole)

**Contra-indications** with oral gel, impaired swallowing reflex in infants, first 5–6 months of life of an infant born preterm

**Hepatic impairment** avoid

**Pregnancy** manufacturer advises avoid if possible—no information available

**Breast-feeding** manufacturer advises caution—no information available

**Side-effects** nausea, vomiting; rash; with buccal tablets, abdominal pain, taste disturbance, burning sensation at application site, pruritus, and oedema; with oral gel, very rarely diarrhoea (usually on long-term treatment), hepatitis, toxic epidermal necrolysis, and Stevens-Johnson syndrome

**Dose**

- See preparations

  **Daktarin** (Janssen) Oral gel, sugar-free, orange-flavoured, miconazole 24 mg/mL (20 mg/g). Net price 15-g tube = £2.97, 80-g tube = £4.38. Label: 9, counselling, hold in mouth, after food

  **Dose** prevention and treatment of oral candidiasis, by mouth, ADULT and CHILD, over 2 years, 2.5 mL 4 times daily after meals, retain near oral lesions before swallowing (dental prostheses should be removed at night and brushed with gel), CHILD under 2 years see BNF for Children

  **Prevention and treatment of intestinal candidiasis, by mouth, ADULT and CHILD** over 4 months, 5 mg/kg 4 times daily, max. 250 mg (10 mL) 4 times daily

  **Note** Treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared

  **Dental prescribing on NHS** May be prescribed as Miconazole Oromucosal Gel

**Buccal preparation**

**Loramyc** (Therabel) Mucoadhesive buccal tablets, white-yellow, miconazole 50 mg, net price 14-tab pack = £52.12. Label: 10, counselling, administration

**Dose** oropharyngeal candidiasis in immunocompromised ADULT, 50 mg daily preferably taken in the morning for 7 days; if no improvement, continue treatment for a further 7 days

**Counselling** Place rounded side of tablet on upper gum above an incisor tooth and hold upper lip firmly over the gum for 30 seconds using a finger. If tablet detaches within 6 hours, replace with a new tablet. With each dose, use alternate sides of the gum

**Note** The Scottish Medicines Consortium (p. 4) has advised (January 2011) that miconazole mucoadhesive buccal tablets (Loramyc®) are not recommended for use within NHS Scotland.

---

**NYSTATIN**

**Indications** oral and perioral fungal infections

**Side-effects** oral irritation and sensitisation, nausea reported

**Dose**

- Treatment, ADULT and CHILD, 100 000 units 4 times daily after food, usually for 7 days (continued for 48 hours after lesions have resolved)

**Note** Unlicensed for treating candidiasis in NEONATE

**Nystatin** (Non-proprietary)

**Oral suspension** nystatin 100 000 units/mL, net price 30 mL = £20.46. Label: 9, counselling, use of pipette, hold in mouth, after food

**Dental prescribing on NHS** Nystatin Oral Suspension may be prescribed

**Nystan®** (Squibb)

**Oral suspension**, yellow, nystatin 100 000 units/mL, net price 30 mL with pipette = £1.80. Label: 9, counselling, use of pipette, hold in mouth, after food

**Oropharyngeal viral infections**

The management of primary herpetic gingivostomatitis is a soft diet, adequate fluid intake, and analgesics as required, including local use of benzylamidine (section 12.3.1). The use of chlorhexidine mouthwash (section 12.3.4) will control plaque accumulation if toothbrushing is painful and will also help to control secondary infection in general.

In the case of severe herpetic stomatitis, a systemic antiviral such as aciclovir is required (section 5.3.2.1). Valaciclovir and famciclovir are suitable alternatives for oral lesions associated with herpes zoster. Aciclovir and valaciclovir are also used for the prevention of frequently recurring herpes simplex lesions of the mouth, particularly when implicated in the initiation of erythema multiforme. See section 13.10.3 for the treatment of labial herpes simplex infections.

**12.3.3 Lozenges and sprays**

There is no convincing evidence that antiseptic lozenges and sprays have a beneficial action and they sometimes irritate and cause sore tongue and sore lips. Some of these preparations also contain local anaesthetics which relieve pain but may cause sensitisation.

**12.3.4 Mouthwashes, gargles, and dentifrices**

Superficial infections of the mouth are often helped by warm mouthwashes which have a mechanical cleansing effect and cause some local hyperaemia. However, to be effective, they must be used frequently and vigorously. A warm saline mouthwash is ideal and can be prepared either by dissolving half a teaspoonful of salt in a glassful of warm water or by diluting compound sodium chlor-ide mouthwash with an equal volume of warm water.

Mouthwashes containing an oxidising agent, such as hydrogen peroxide, may be useful in the treatment of acute ulcerative gingivitis (Vincent’s infection) since the organisms involved are anaerobes. It also has a mechanical cleansing effect arising from frothing when in contact with oral debris.
Chlorhexidine is an effective antiseptic which has the advantage of inhibiting plaque formation on the teeth. It does not, however, completely control plaque deposition and is not a substitute for effective toothbrushing. Moreover, chlorhexidine preparations do not penetrate significantly into stagnation areas and are therefore of little value in the control of dental caries or of periodontal disease once pocketing has developed. Chlorhexidine mouthwash is used in the treatment of denture stomatitis. It is also used in the prevention of oral candidiasis in immunocompromised patients. Chlorhexidine mouthwash reduces the incidence of alveolar osteitis following tooth extraction. Chlorhexidine mouthwash should not be used for the prevention of endocarditis in patients undergoing dental procedures.

Chlorhexidine can be used as a mouthwash, spray or gel for secondary infection in mucosal ulceration and for controlling gingivitis, as an adjunct to other oral hygiene measures. These preparations may also be used instead of toothbrushing where there is a painful periodontal condition (e.g. primary herpetic stomatitis) or if the patient has a haemorrhagic disorder, or is disabled. Chlorhexidine preparations are of little value in the control of acute necrotising ulcerative gingivitis. There is no convincing evidence that gargles are effective.

### Chlorhexidine Gluconate

**Indications** see under preparations below

**Side-effects** mucosal irritation (if desquamation occurs, discontinue treatment or dilute mouthwash with an equal volume of water); taste disturbance; reversible brown staining of teeth, and of silicate or composite restorations; tongue discoloration; parotid gland swelling and hypersensitivity (including anaphylaxis) reported

**Note** Chlorhexidine gluconate may be incompatible with some ingredients in toothpaste, rinse the mouth thoroughly with water between using toothpaste and chlorhexidine-containing product

Chlorhexidine (Non-proprietary)

**Mouthwash,** chlorhexidine gluconate 0.2%, net price 300 mL = £3.45

**Dose** oral hygiene and plaque inhibition, oral candidiasis, gingivitis, and management of aphthous ulcers; rinse mouth with 10 mL for about 1 minute twice daily

**Denture stomatitis, cleanse and soak dentures in mouthwash solution for 15 minutes twice daily**

**Corsodyl®** (GSK Consumer Healthcare)

**Dental gel,** chlorhexidine gluconate 1%. Net price 50 g = £1.21

**Dose** oral hygiene and plaque inhibition and gingivitis, brush on the teeth once or twice daily

**Oral candidiasis and management of aphthous ulcers, apply to affected areas once or twice daily**

**Dental prescribing on NHS** May be prescribed as Chlorhexidine Gluconate Gel

**Mouthwash,** chlorhexidine gluconate 0.2%, net price 300 mL (original or mint) = £2.28, 600 mL (mint) = £3.85; alcohol-free, 300 mL (mint) = £3.73

**Dose** oral hygiene and plaque inhibition, oral candidiasis, gingivitis, and management of aphthous ulcers, rinse mouth with 10 mL for about 1 minute twice daily

**Denture stomatitis, cleanse and soak dentures in mouthwash solution for 15 minutes twice daily**

**Dental prescribing on NHS** May be prescribed as Chlorhexidine Mouthwash

### Hydrogen Peroxide

**Indications** oral hygiene

**Side-effects** local irritation; very rarely taste disturbance and transient anaesthesia

Eludril® (Fabre)

**Mouthwash or garge,** chlorhexidine gluconate 0.1%, chlorobutanol 0.5% (mint-flavoured), net price 90 mL = £1.36; 250 mL = £2.83, 500 mL = £5.06

**Dose** oral hygiene and plaque inhibition, **ADULT and CHILD** over 6 years, use 10–15 mL (diluted with lukewarm water in measuring cup provided) 2–3 times daily

Denture disinfection, soak previously cleansed dentures in mouthwash (diluted with 2 volumes of water) for 60 minutes

### Hexetidine

**Indications** oral hygiene

**Side-effects** hypersensitivity of papillae of tongue on prolonged use

Hydrogen Peroxide Mouthwash, BP

**Mouthwash,** consists of Hydrogen Peroxide Solution 6% (= approx. 20 volume) BP

**Dose** rinse the mouth for 2–3 minutes with 15 mL diluted in half a tumblerful of warm water 2–3 times daily

**Dental prescribing on NHS** Hydrogen Peroxide Mouthwash may be prescribed

**Peroxyl** (Colgate-Palmolive)

**Mouthwash,** hydrogen peroxide 1.5%, net price 300 mL = £2.94

**Dose** rinse the mouth with 10 mL for about 1 minute up to 4 times daily (after meals and at bedtime)

### Sodium Chloride

**Indications** oral hygiene, see notes above

Sodium Chloride Mouthwash, Compound, BP

**Mouthwash,** sodium bicarbonate 1%, sodium chloride 1.5% in a suitable vehicle with a peppermint flavour.

**Dose** extemporaneous preparations should be prepared according to the following formula: sodium chloride 1.5 g, sodium bicarbonate 1 g, concentrated peppermint emulsion 2.5 mL, double-strength chloroform water 50 mL, water to 100 mL.

To be diluted with an equal volume of warm water

**Dental prescribing on NHS** Compound Sodium Chloride Mouthwash may be prescribed

### Treatment of dry mouth

Dry mouth (xerostomia) may be caused by drugs with antimuscarinic (anticholinergic) side-effects (e.g. anti-spasmodics, tricyclic antidepressants, and some anti-psychotics), by diuretics, by irradiation of the head and
neck region or by damage to or disease of the salivary glands. Patients with a persistently dry mouth may develop a burning or scalded sensation and have poor oral hygiene; they may develop increased dental caries, periodontal disease, intolerance of dentures, and oral infections (particularly candidiasis). Dry mouth may be relieved in many patients by simple measures such as frequent sips of cool drinks or sucking pieces of ice or sugar-free fruit pastilles. Sugar-free chewing gum stimulates salivation in patients with residual salivary function.

**Artificial saliva** can provide useful relief of dry mouth. A properly balanced artificial saliva should be of a neutral pH and contain electrolytes (including fluoride) to correspond approximately to the composition of saliva. The acidic pH of some artificial saliva products may be inappropriate. Of the proprietary preparations, Aquoral®, Biotène Oralbalance®, and Xerotin® can be used for any condition giving rise to a dry mouth. BioXtra®, Glandsosane®, Saliva Orthana®, and Saliveze®, have ACBS approval for dry mouth associated only with radiotherapy or sicca syndrome. Salivix® pastilles, which act locally as salivary stimulants, are also available for any condition leading to a dry mouth and SST tablets may be prescribed for dry mouth in patients with salivary gland impairment (and patent salivary ducts). Pilocarpine tablets are licensed for the treatment of xerostomia following irradiation for head and neck cancer and for dry mouth and dry eyes (xerophthalmia) in Sjögren’s syndrome. They are effective only in patients who have some residual salivary gland function, and therefore should be withdrawn if there is no response.

### Local treatment

**Aquoral®** (Sinclair IS)

**Oral spray**, oxidised glycerol triesters, silicon dioxide, flavouring agents, net price 40-mL bottle = £9.85

**Excipients** include aspartame (see section 9.4.1)

**Dose** symptomatic treatment of dry mouth, 1 spray onto the inside of each cheek 3–4 times daily

**Dental prescribing on NHS** Aquoral® Oral Spray may be prescribed as Artificial Saliva Protective Spray

**AS Saliva Orthana®** (AS Pharma)

**Oral spray**, gastric mucin (porcine) 3.5%, xylitol 2%, sodium fluoride 4.2 mg/litre, with preservatives and flavouring agents, pH neutral. Net price 50-mL bottle = £4.92, 500-mL refill = £34.27

**Dose** ACBS: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome, spray 2–3 times onto oral and pharyngeal mucosa, when required

**Dental prescribing on NHS** AS Saliva Orthana® Oral Spray may be prescribed

**Lozenges**, mucin 65 mg, xylitol 59 mg, in a sorbitol basis, pH neutral. Net price 30-lozenges pack = £3.50

**Dose** ACBS: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome, allow 1 lozenge to dissolve slowly in the mouth when required

**Note** AS Saliva Orthana® lozenges do not contain fluoride

**Dental prescribing on NHS** AS Saliva Orthana® Lozenges may be prescribed

**Biotène Oralbalance®** (GSK)

**Saliva replacement gel**, lactoperoxidase, lactoferrin, lysozyme, glucose oxidase, xylitol in a gel basis, net price 50-g tube = £4.46

**Dose** symptomatic treatment of dry mouth, apply to gums and tongue as required

**Note** Avoid use with toothpastes containing detergents (including foaming agents)

**Dental prescribing on NHS** Biotène Oralbalance® Saliva Replacement Gel may be prescribed as Artificial Saliva Gel

**BioXtra®** (RIS Products)

**Gel**, lactoperoxidase, lactoferrin, lysozyme, whey colostrum, xylitol and other ingredients, net price 40-mL tube = £3.94, 50-mL spray = £3.94

**Dose** ACBS: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome, apply to oral mucosa as required

**Dental prescribing on NHS** BioXtra® Gel may be prescribed

**Glandsosane®** (Fresenius Kabi)

**Aerosol spray**, carmellose sodium 500 mg, sorbitol 1.5 g, potassium chloride 60 mg, sodium chloride 42.2 mg, magnesium chloride 2.6 mg, calcium chloride 7.3 mg, and dipotassium hydrogen phosphate 17.1 mg/50 g, pH 5.75. Net price 50-mL unit (neutral, lemon or peppermint flavoured) = £3.38

**Dose** ACBS: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome, spray onto oral and pharyngeal mucosa as required

**Dental prescribing on NHS** Glandsosane® Aerosol Spray may be prescribed

**Saliveze®** (Wyvern)

**Oral spray**, carmellose sodium (sodium carboxymethylcellulose), calcium chloride, magnesium chloride, potassium chloride, sodium chloride, and dibasic sodium phosphate, pH neutral. Net price 50-mL bottle (mint-flavoured) = £3.50

**Dose** ACBS: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome, 1 spray onto oral mucosa as required

**Dental prescribing on NHS** Saliveze® Oral Spray may be prescribed

**Salivix®** (Galen)

**Pastilles**, sugar-free, reddish-amber, acacia, malic acid and other ingredients. Net price 50-pastille pack = £3.55

**Dose** symptomatic treatment of dry mouth, suck 1 pastille when required

**Dental prescribing on NHS** Salivix® Pastilles may be prescribed as Artificial Saliva Pastilles

**SST** (Medac)

**Tablets**, sugar-free, citric acid, malic acid and other ingredients in a sorbitol base, net price 100-tab pack = £4.86

**Dose** symptomatic treatment of dry mouth in patients with impaired salivary gland function and patent salivary ducts, allow 1 tablet to dissolve slowly in the mouth when required

**Dental prescribing on NHS** May be prescribed as Saliva Stimulating Tablets

**Xerotin** (SpecPharm)

**Oral spray**, sugar-free, water, sorbitol, carmelllose (carboxymethylcellulose), potassium chloride, sodium chloride, potassium phosphate, magnesium chloride, calcium chloride and other ingredients, pH neutral. Net price 100-mL unit = £6.86

**Dose** symptomatic treatment of dry mouth, spray as required

**Dental prescribing on NHS** Xerotin® Oral Spray may be prescribed as Artificial Saliva Oral Spray
Systemic treatment

PILOCARPINE HYDROCHLORIDE

Indications  xerostomia following irradiation for head and neck cancer (see also notes above); dry mouth and dry eyes in Sjogren’s syndrome

Cautions  asthma and chronic obstructive pulmonary disease (avoid if uncontrolled, see Contra-indications); cardiovascular disease (avoid if uncontrolled); cholelithiasis or biliary-tract disease, peptic ulcer, risk of increased urethral smooth muscle tone and renal colic; maintain adequate fluid intake to avoid dehydration associated with excessive sweating; cognitive or psychiatric disturbances; susceptibility to angle-closure glaucoma; interactions: Appendix 1 (parasympathomimetics)

Counselling  Blurred vision or dizziness may affect performance of skilled tasks (e.g. driving) particularly at night or in reduced lighting

Contra-indications  uncontrolled asthma and chronic obstructive pulmonary disease (increased bronchial secretions and increased airways resistance); uncontrolled cardiorenal disease; acute iritis

Hepatic impairment  reduce initial oral dose in moderate or severe cirrhosis

Renal impairment  manufacturer advises caution with tablets

Pregnancy  avoid—smooth muscle stimulant; toxicity in animal studies

Breast-feeding  manufacturer advises avoid—present in milk in animal studies

Side-effects  dyspepsia, diarrhoea, abdominal pain, nausea, vomiting, constipation; flushing, hypertension, palpitation, headache, dizziness, asthenia, influenza-like symptoms, sweating; increased urinary frequency; visual disturbances, lacrimation, ocular pain, conjunctivitis; rhinitis; rash, pruritus; less commonly flatulence, urinary urgency

Dose

- Xerostomia following irradiation for head and neck cancer, 5 mg 3 times daily with or immediately after meals (last dose always with evening meal); if tolerated but response insufficient after 4 weeks, may be increased to max. 30 mg daily in divided doses; max. therapeutic effect normally within 4–8 weeks; discontinue if no improvement after 2–3 months; CHILD not recommended

- Dry mouth and dry eyes in Sjogren’s syndrome, 5 mg 4 times daily (with meals and at bedtime); if tolerated but response insufficient, may be increased to max. 30 mg daily in divided doses; discontinue if no improvement after 2–3 months; CHILD not recommended

Salagen® (Novartis) 
Tablets, f/c, pilocarpine hydrochloride 5 mg. Net price 84-tab pack = £41.14. Label: 21, 27, counselling, driving

- scabies, p. 821

For information on wound management products and elasticated garments, see Appendix 5, p. 1061.

The British Association of Dermatologists list of preferred unlicensed dermatological preparations (specials) is available at www.bad.org.uk/specials.
Gels consist of active ingredients in suitable hydrophilic or hydrophobic bases; they generally have a high water content. Gels are particularly suitable for application to the face and scalp.

Lotions have a cooling effect and may be preferred to ointments or creams for application over a hairy area. Lotions in alcoholic basis can sting if used on broken skin. Shake lotions (such as calamine lotion) contain insoluble powders which leave a deposit on the skin surface.

Ointments are greasy preparations which are normally anhydrous and insoluble in water, and are more occlusive than creams. They are particularly suitable for chronic, dry lesions. The most commonly used ointment bases consist of soft paraffin or a combination of soft, liquid, and hard paraffin. Some ointment bases have both hydrophilic and lipophilic properties; they may have occlusive properties on the skin surface, encourage hydration, and also be miscible with water; they often have a mild anti-inflammatory effect. Water-soluble ointments contain macrogols which are freely soluble in water and are therefore readily washed off; they have a limited but useful role where ready removal is desirable.

Pastes are stiff preparations containing a high proportion of finely powdered solids such as zinc oxide and starch suspended in an ointment. They are used for circumscribed lesions such as those which occur in lichen simplex, chronic eczema, or psoriasis. They are less occlusive than ointments and can be used to protect inflamed, lichenified, or excoriated skin.

Dusting powders are used only rarely. They reduce friction between opposing skin surfaces. Dusting powders should not be applied to moist areas because they can cake and abrade the skin. Talc is a lubricant but it may not absorb moisture; it can cause respiratory irritation. Starch is less lubricant but absorbs water.

**Dilution** The BP directs that creams and ointments should not normally be diluted but that should dilution be necessary care should be taken, in particular, to prevent microbial contamination. The appropriate diluent should be used and heating should be avoided during mixing; excessive dilution may affect the stability of some creams. Diluted creams should normally be used within 2 weeks of preparation.

These amounts are usually suitable for an adult for twice daily application for 1 week. The recommendations do not apply to corticosteroid preparations—for suitable quantities of corticosteroid preparations, see section 13.4.

**13.1.3 Excipients and sensitisation**

Excipients in topical products rarely cause problems. If a patch test indicates allergy to an excipient, products containing the substance should be avoided (see also Anaphylaxis, p. 209). The following excipients in topical preparations are associated, rarely, with sensitisation; the presence of these excipients is indicated in the entries for topical products. See also Excipients, under General Guidance, p. 2.

**13.2 Emollient and barrier preparations**

**13.2.1 Emollients**

<table>
<thead>
<tr>
<th>Emollients bath and shower preparations</th>
</tr>
</thead>
</table>

Emollients soothe, smooth and hydrate the skin and are indicated for all dry or scaling disorders. Their effects are short-lived and they should be applied frequently even after improvement occurs. They are useful in dry and eczematous disorders, and to a lesser extent in psoriasis (section 13.5.2). The choice of an appropriate emollient will depend on the severity of the condition, patient preference, and the site of application. Emollient preparations contained in tubes should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis. Ointments may exacerbate acne and folliculitis. Some ingredients rarely cause sensitisation (section 13.1.3) and this should be suspected if an eczematous reaction

1. Purified versions of wool fat have reduced the problem
Fire hazard with paraffin-based emollients

Emulsifying ointment or 50% Liquid Paraffin and 50% White Soft Paraffin Ointment in contact with dressings and clothing is easily ignited by a naked flame. The risk is greater when these preparations are applied to large areas of the body, and clothing or dressings become soaked with the ointment. Patients should be told to keep away from fire or flames, and not to smoke when using these preparations. The risk of fire should be considered when using large quantities of any paraffin-based emollient.

Preparations such as aqueous cream (section 13.2.1.1) and emulsifying ointment can be used as soap substitutes for hand washing and in the bath; the preparation is rubbed on the skin before rinsing off completely. The addition of a bath oil (section 13.2.1.1) may also be helpful.

Preparations containing an antibiotic (section 13.10) should be avoided unless infection is present or is a frequent complication.

Urea is a keratin softener and hydrating agent used in the treatment of dry, scaling conditions (including ichthyosis) and may be useful in elderly patients. It is occasionally used with other topical agents such as corticosteroids to enhance penetration of the skin.

Non-proprietary emollient preparations

Emulsifying Ointment, BP
Ointment, emulsifying wax 30%, white soft paraffin 50%, liquid paraffin 20%, net price 500 g = £2.12
Excipients include cetostearyl alcohol

Hydrous Ointment, BP
Ointment, (oily cream), dried magnesium sulfate 0.5%, phenoxyethanol 1%, wool alcohols ointment 50%, in freshly boiled and cooled purified water, net price 500 g = £4.89

Liquid and White Soft Paraffin Ointment, NPF
Ointment, liquid paraffin 50%, white soft paraffin 50%, net price 500 g = £2.21

Paraffin, White Soft, BP
White petroleum jelly, net price 100 g = 50p

Paraffin, Yellow Soft, BP
Yellow petroleum jelly, net price 100 g = 54p

Proprietary emollient preparations

Aquamax® (Dermato Logical)
Cream, light liquid paraffin 8%, white soft paraffin 20%, phenoxyethanol 1%, net price 50 g = £1.89, 500 g = £3.99
Excipients include cetostearyl alcohol, polysorbate 60
For dry skin conditions

Aquamol® (Thornton & Ross)
Cream, containing liquid paraffin, white soft paraffin, net price 50 g = £1.22, 500-g pump pack = £6.40
Excipients include cetostearyl alcohol, chlorocresol
For dry skin conditions

Aveeno® (B&J)
Cream, colloidal oatmeal in emollient basis, net price 100 mL = £3.97, 300-mL pump pack = £6.80
Excipients include benzyl alcohol, cetyl alcohol, isopropyl palmitate
ACBS: For endogenous and exogenous eczema, xeroderma, ichthyosis, and senile pruritus (pruritus of the elderly) associated with dry skin

Lotion, colloidal oatmeal in emollient basis, net price 500 mL = £6.66
Excipients include benzyl alcohol, cetyl alcohol, isopropyl palmitate, stearal alcohol
ACBS: as for Aveeno® Cream

Cetraben® (Genus)
Emollient cream, white soft paraffin 13.2%, light liquid paraffin 10.5%, net price 50-g pump pack = £1.40, 150-g pump pack = £3.98, 500-g pump pack = £5.99, 100-g pump pack = £11.62
Excipients include cetostearyl alcohol, hydroxybenzoates (parabens)
For inflamed, damaged, dry or chapped skin including eczema

Dermamist® (Alliance)
Spray application, white soft paraffin 10% in a basis containing liquid paraffin, fractionated coconut oil, net price 250-mL pressurised aerosol unit = £5.97
Excipients none as listed in section 13.1.3
For dry skin conditions including eczema, ichthyosis, pruritus of the elderly

Note: Flammable

Diprobease® (MSD)
Cream, cetyl macrogol 2.25%, cetostearyl alcohol 7.2%, liquid paraffin 6%, white soft paraffin 15%, water-miscible basis used for Diprosone® cream, net price 50 g = £1.28, 500-g pump pack = £6.32
Excipients include cetostearyl alcohol, chlorocresol
For dry skin conditions

Ointment, liquid paraffin 5%, white soft paraffin 95%, basis used for Diprosone® ointment, net price 50 g = £1.28, 500-g pump pack = £5.99
Excipients none as listed in section 13.1.3
For dry skin conditions

Doublebase® (Dermal)
Gel, isopropyl myristate 15%, liquid paraffin 15%, net price 100 g = £2.65, 500 g = £5.83
Excipients none as listed in section 13.1.3
For dry, chapped, or itchy skin conditions

Dayleve Gel, isopropyl myristate 15%, liquid paraffin 15%, net price 100 g = £2.65, 500-g pump pack = £6.29
Excipients none as listed in section 13.1.3
For dry, chapped, or itchy skin conditions

E45® (Reckitt Benckiser)
Cream, light liquid paraffin 12.6%, white soft paraffin 14.5%, hypoallergenic anhydrous wool fat (hypoallergenic lanolin) 1% in self-emulsifying monostearin, net price 50 g = £1.61, 125 g = £2.90, 350 g = £5.17, 500-g pump pack = £9.62
Excipients include cetyl alcohol, hydroxybenzoates (parabens)
For dry skin conditions

Lotion, light liquid paraffin 4%, cetyl macrogol, white soft paraffin 10%, hypoallergenic anhydrous wool fat (hypoallergenic lanolin) 1% in glyceryl monostearate, net price 200 mL = £2.40, 500-mL pump pack = £4.50
Excipients include isopropyl palmitate, hydroxybenzoates (parabens), benzyl alcohol
ACBS: for symptomatic relief of dry skin conditions, such as those associated with atopic eczema and contact dermatitis
**Emollin®** (C D Medical)
Spray, liquid paraffin 50%, white soft paraffin 50% in aerosol basis, net price 150 mL = £3.97, 240 mL = £6.35
Excipients none as listed in section 13.1.3
For dry skin conditions

**Epaderm®** (Molnycke)
Cream, yellow soft paraffin 15%, liquid paraffin 10%, emulsifying wax 5%, net price 50-g pump pack = £1.70, 500-g pump pack = £9.95
Excipients include cetostearyl alcohol, chlorocresol
For dry skin conditions
Ointment, emulsifying wax 30%, yellow soft paraffin 30%, liquid paraffin 40%, net price 125 g = £3.85, 500 g = £6.53, 1 kg = £12.02
Excipients include cetostearyl alcohol
For use as an emollient or soap substitute

**Hydromol** (Alliance)
Cream, sodium pidolate 2.5%, liquid paraffin 13.8%, net price 50 g = £2.19, 100 g = £4.09, 500 g = £11.92
Excipients include cetostearyl alcohol, hydroxybenzoates (parabens)
For dry skin conditions
Ointment, yellow soft paraffin 30%, emulsifying wax 30%, liquid paraffin 40%, net price 125 g = £2.88, 500 g = £4.89, 1 kg = £9.09
Excipients include cetostearyl alcohol
For use as an emollient, bath additive, or soap substitute

**Lipibase®** (Astellas)
Cream, fatty cream basis used for Locoid Lipocream®, net price 50 g = £1.46
Excipients include cetostearyl alcohol, hydroxybenzoates (parabens)
For dry skin conditions, also for use during treatment with topical corticosteroid and as diluent for Locoid Lipocream®

**Oilatum®** (Stiefel)
Cream, light liquid paraffin 6%, white soft paraffin 15%, net price 50 g = £1.63, 150 g = £2.46, 500-mL pump pack = £4.99, 1.05-litre pump pack = £9.98
Excipients include benzyl alcohol, cetostearyl alcohol
For dry skin conditions
Oillatum® Junior Cream, light liquid paraffin 6%, white soft paraffin 15%, net price 150 g = £3.38, 350 mL = £4.65, 500 mL = £4.99, 1.05-litre pump pack = £9.98
Excipients include benzyl alcohol, cetostearyl alcohol
For dry skin conditions

**QV®** (Sound Opinion)
Cream, glycerol 10%, light liquid paraffin 10%, white soft paraffin 5%, net price 100 g = £2.04, 500 g = £5.86, 1.05-kg pump pack = £11.94
Excipients include cetostearyl alcohol, hydroxybenzoates (parabens)
For dry skin conditions including eczema, psoriasis, ichthyosis, pruritus
Intensive ointment, light liquid paraffin 50.5%, white soft paraffin 20%, net price 450 g = £5.65
Excipients include cetostearyl alcohol
For dry skin conditions including eczema, psoriasis, ichthyosis, pruritus
Lotion, white soft paraffin 5%, net price 250 mL = £3.14, 500-mL pump pack = £5.24
Excipients include cetostearyl alcohol, hydroxybenzoates (parabens)
For dry skin conditions including eczema, psoriasis, ichthyosis, pruritus

**Ultrasol** (Bayer)
Cream, water-miscible, containing liquid paraffin and white soft paraffin, net price 50 g = £1.40, 500-g pump pack = £4.80
Excipients include fragrance, hydroxybenzoates (parabens), disodium edetate, stearyl alcohol
For dry skin conditions

**Unguentum M®** (Almirall)
Cream, containing saturated neutral oil, liquid paraffin, white soft paraffin, net price 50 g = £1.41, 100 g = £2.78, 200-mL pump pack = £5.50, 500 g = £8.48
Excipients include cetostearyl alcohol, polysorbate 40, propylene glycol, sorbic acid
For dry skin conditions and nappy rash

**Zerocream®** (Thornton & Ross)
Cream, liquid paraffin 12.6%, white soft paraffin 14.5%, net price 50 g = £1.17, 500-g pump pack = £4.08
Excipients include cetostearyl alcohol, hydroxybenzoates (parabens), lanolin anhydrous
For dry skin conditions

**Zeroderm®** (Thornton & Ross)
Cream, liquid paraffin 12.6%, white soft paraffin 30%, net price 125 g = £2.41, 500 g = £4.10
Excipients include cetostearyl alcohol, polysorbate 60
For dry skin conditions

**Zeroguent®** (Thornton & Ross)
Cream, liquid paraffin 12.6%, refined soya bean oil 5%, net price 100 g = £2.33, 500 g = £4.99
Excipients include cetostearyl alcohol, polysorbate, propylene glycol, sorbic acid
For dry skin conditions

**Preparations containing urea**

**Aquadrade®** (Alliance)
Cream, urea 10%, net price 100 g = £4.37
Excipients none as listed in section 13.1.3
Dose for dry, scaling and itching skin, apply thinly twice daily

**Balneum®** (Almirall)
Cream, urea 5%, ceramide 0.1%, net price 50-g pump pack = £2.85, 500-g pump pack = £9.97
Excipients include cetostearyl alcohol, polysorbates, propylene glycol
Dose for dry skin conditions, apply twice daily

**Balneum® Plus Cream** (Almirall), urea 5%, laurmacrogols 3%, net price 100 g = £3.29, 500-g pump pack = £14.99
Excipients include benzyl alcohol, polysorbates
Dose for dry, scaling and itching skin, apply twice daily

**Calmurid®** (Galterma)
Cream, urea 10%, lactic acid 5%, net price 100 g = £9.27, 500-g pump pack = £35.70
Excipients none as listed in section 13.1.3
Dose for dry, scaling and itching skin, apply a thick layer for 3–5 minutes, massage into area, and remove excess, usually twice daily. Use half-strength cream for 1 week if stinging occurs.

Note Can be diluted with aqueous cream (life of diluted cream 14 days)
### 13.2.1 Emollients

**Dermatonic Once Heel Balm**
- **Cream**, urea 25%, net price 75 mL = £3.60, 200 mL = £8.50
- **Excipients** include beeswax, lanolin
- **Dose** for dry skin on soles of feet, **ADULT** and **CHILD** over 12 years, apply once daily

**E45 Itch Relief Cream** (Reckitt Benckiser)
- **Cream**, urea 5%, macrogol lauryl ether 3%, net price 50 g = £2.81, 100 g = £3.74, 500-g pump pack = £14.99
- **Excipients** include benzyl alcohol, polysorbates
- **Dose** for dry, scaling, and itching skin, apply twice daily

**Eucerin® Hydromol**
- **Cream**, urea 10%, net price 100 mL = £7.59
- **Excipients** include benzyl alcohol, isopropyl myristate, wool fat
- **Dose** for dry skin conditions including eczema, xeroderma, hyperkeratosis, apply thinly and rub into area twice daily

**Eucerin® Intensive** (Beiersdorf)
- **Cream**, urea 10%, net price 250 mL = £7.93
- **Excipients** include benzyl alcohol, isopropyl palmitate
- **Dose** for dry skin conditions including eczema, xeroderma, hyperkeratosis, apply sparingly and rub into area twice daily

**Flexitol** (LaCorium)
- **Heel balm**, urea 25%, net price 40 g = £2.75, 75 g = £3.80, 200 g = £9.40, 500 g = £14.75
- **Excipients** include benzyl alcohol, cetostearyl alcohol
- **Dose** for dry skin on soles of feet and heels, **ADULT** and **CHILD** over 12 years, apply 1–2 times daily

**Hydromol® Intensive** (Alliance)
- **Cream**, urea 10%, net price 30 g = £1.64, 100 g = £4.37
- **Excipients** none as listed in section 13.1.3
- **Dose** for dry, scaling and itching skin, apply thinly twice daily

**Nutraplus®** (Galderma)
- **Cream**, urea 10%, net price 100 g = £4.37
- **Excipients** include hydroxybenzenes (parabens), propylene glycol
- **Dose** for dry, scaling and itching skin, apply 2–3 times daily

### With antimicrobials

**Dermol**
- **Cream**, benzalkonium chloride 0.1%, chlorhexidine hydrochloride 0.1%, isopropyl myristate 10%, liquid paraffin 10%, net price 100-g tube = £2.86, 500-g pump pack = £6.63
- **Excipients** include cetostearyl alcohol
- **Dose** for dry and pruritic skin conditions including eczema and dermatitis, apply to skin or use as soap substitute

**Eczmol** (Genus)
- **Cream**, chlorohexidine gluconate 1% in emollient basis, net price 250 mL = £3.70
- **Excipients** include cetostearyl alcohol
- **Dose** for dry and pruritic skin conditions including eczema and dermatitis, apply to skin or use as soap substitute

### Emollient bath and shower preparations

Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. In dry skin conditions soap should be avoided (see section 13.2.1 for soap substitutes). The quantities of bath additives recommended for adults are suitable for an adult-size bath. Proportionately less should be used for a child-size bath or a washbasin; recommended bath additive quantities for children reflect this.

#### Aqueous Cream, BP
- **Cream**, emulsifying ointment 30%, 1% phenoxethanol 1% in freshly boiled and cooled purified water, net price 100 g = 90p, 500 g = £4.50
- **Excipients** include cetostearyl alcohol

#### Aquamax®
- **Cream wash**, light liquid paraffin 8%, white soft paraffin 20%, phenoxethanol 1%, net price 250 g = £2.99
- **Excipients** include cetostearyl alcohol, polylorubates 60

#### Aveeno® (B&J)
- **Aveeno® Bath oil**, colloidal oatmeal, white oat fraction in emollient basis, net price 250 mL = £4.49
- **Excipients** include beeswax, fragrance
- **Dose** ACBS: for endogenous and exogenous eczema, xeroderma, ichthyosis, and senile pruritus (pruritus of the elderly) associated with dry skin, add 20–30 mL/bath or apply to wet skin and rinse

#### Balneum®
- **Balneum® bath oil**, soya oil 84.75%, net price 200 mL = £2.48, 500 mL = £5.36, 1 litre = £10.39
- **Excipients** include butylated hydroxytoluene, propylene glycol, fragrance
- **Dose** for dry skin conditions including those associated with dermatitis and eczema, add 20–60 mL/bath (INFANT 5–15 mL) do not use undiluted
- **Balneum® Plus® bath oil**, soya oil 82.95%, mixed lauramocrogols 15%, net price 500 mL = £6.66
- **Excipients** include butylated hydroxytoluene, propylene glycol, fragrance
- **Dose** for dry skin conditions including those associated with dermatitis and eczema where pruritus is experienced; add 20 mL/bath (INFANT 5 mL) or apply to wet skin and rinse

#### Cetraben®
- **Emollient bath additive**, light liquid paraffin 82.8%, net price 500 mL = £5.75
- **Excipients** none as listed in section 13.1.3
- **Dose** for dry skin conditions, including eczema, add 1–2 capfuls/bath (CHILD ½–1 capful) or apply to wet skin and rinse

#### Dermalo®
- **Bath emollient**, acetylated wool alcohols 5%, liquid paraffin 65%, net price 500 mL = £3.44
- **Excipients** none as listed in section 13.1.3
- **Dose** for dermatitis, dry skin conditions including ichthyosis and pruritus of the elderly, add 15–20 mL/bath (INFANT and CHILD 5–10 mL) or apply to wet skin and rinse

---

1. The BP permits use of alternative antimicrobials provided their identity and concentration are stated on the label.
Doublebase® (Dermal)  
**Emollient bath additive**, liquid paraffin 65%, net price 500 mL = £5.45  
*Excipients* include cetostearyl alcohol  
**Dose** for dry skin conditions including dermatitis, ichthyosis, and pruritus of the elderly, add 15–20 mL/bath (INFANT 5–10 mL)  
**Emollient shower gel**, isopropyl myristate 15%, liquid paraffin 15%, net price 200 g = £5.21  
*Excipients* none as listed in section 13.1.3  
**Note** Also available as Doublebase® Emollient Wash Gel

E45® (Reckitt Benckiser)  
**Emollient bath oil**, cetyl dimethicone 5%, liquid paraffin 91%, net price 250 mL = £3.19, 500 mL = £5.11  
*Excipients* none as listed in section 13.1.3  
**Dose** for dry skin conditions including dermatitis, pruritus of the elderly, and ichthyosis, add 1–3 capfuls/bath (INFANT 0.5–2 capfuls) or apply to wet skin after showering  
**Emollient wash cream**, soap substitute, zinc oxide 5% in an emollient basis, net price 250-mL pump pack = £3.19  
*Excipients* none as listed in section 13.1.3  
**Dose** ACBS: for endogenous and exogenous eczema, xeroderma, ichthyosis, and senile pruritus (pruritus of the elderly) associated with dry skin, add 15 mL/bath (CHILD 5–10 mL) or apply to wet skin and rinse

Hydromol® (Alliance)  
**Bath and shower emollient**, isopropyl myristate 13%, light liquid paraffin 37.8%, net price 350 mL = £3.88, 500 mL = £4.42, 1 litre = £8.80  
*Excipients* none as listed in section 13.1.3  
**Dose** for dry skin conditions including eczema, ichthyosis, and pruritus of the elderly, add 1–3 capfuls/bath (INFANT ½–2 capfuls) or apply to wet skin and rinse  
**Emollient shower gel**, gel, light liquid paraffin 70%, net price (with fragrance or fragrance-free) 150 g = £5.15  
*Excipients* none as listed in section 13.1.3  
**Dose** for dry skin conditions including dermatitis, pruritus of the elderly, and ichthyosis, apply to wet skin and rinse

LPL 63.4® (Huxley)  
**Emollient bath additive**, light liquid paraffin 63.4%, net price 500 mL = £3.10  
*Excipients* include acetylated wool alcohols, isopropyl palmitate  
**Dose** for dry skin conditions, add 1–3 capfuls/bath (CHILD 1 month–12 years, ½–2 capfuls) or apply to wet skin and rinse

Oilatum® (Stiefel)  
**Emollient bath additive** (emulsion), light liquid paraffin 63.4%, net price 250 mL = £2.75, 500 mL = £4.57  
*Excipients* include acetylated lanolin alcohols, isopropyl palmitate, fragrance  
**Dose** for dry skin conditions including dermatitis, pruritus of the elderly, and ichthyosis, add 1–3 capfuls/bath (INFANT 0.5–2 capfuls) or apply to wet skin and rinse  
**Junior bath additive**, light liquid paraffin 63.4%, net price 150 mL = £2.82, 250 mL = £3.25, 300 mL = £5.10, 600 mL = £5.89  
*Excipients* include acetylated lanolin alcohols, isopropyl palmitate  
**Dose** for dry skin conditions including dermatitis, pruritus of the elderly, and ichthyosis, add 1–3 capfuls/bath (INFANT 0.5–2 capfuls) or apply to wet skin and rinse  
**Shower emollient** (gel), light liquid paraffin 70%, net price (with fragrance or fragrance-free) 150 g = £5.15  
*Excipients* none as listed in section 13.1.3  
**Dose** for dry skin conditions including dermatitis, pruritus of the elderly, and ichthyosis, apply to wet skin and rinse

QV® (Sound Opinion)  
**Bath oil**, light liquid paraffin 85.13%, net price 200 mL = £2.20, 500 mL = £4.66  
*Excipients* none as listed in section 13.1.3  
**Dose** for dry skin conditions including eczema, psoriasis, ichthyosis, and pruritus, add 10 mL/bath (INFANT 5 mL) or apply to wet skin and rinse  
**Gentle wash**, glycerol 15%, net price 250 mL = £3.14, 500-mL pump pack = £5.24  
*Excipients* include hydroxybenzoates (parabens)  
**Dose** for dry skin conditions including eczema, psoriasis, ichthyosis, and pruritus, use as soap substitute

Zerolatum® (Thorn & Ross)  
**Emollient medicated bath oil**, liquid paraffin 65%, acetylated wool alcohols 5%, net price 500 mL = £4.79  
*Excipients* none as listed in section 13.1.3  
**Dose** for dry skin conditions including dermatitis, pruritus of the elderly, and ichthyosis, add 15–20 mL/bath (CHILD 5–10 mL)

With antimicrobials

Dermol® (Dermal)  
**Dermol 600® Bath Emollient**, benzalkonium chloride 0.5%, liquid paraffin 25%, isopropyl myristate 25%, net price 600 mL = £7.55  
*Excipients* include polysorbate 60  
**Dose** for dry and pruritic skin conditions including eczema and dermatitis, add up to 30 mL/bath (INFANT up to 15 mL) do not use undiluted  
**Dermol® 200 Shower Emollient**, benzalkonium chloride 0.1%, chlorhexidine hydrochloride 0.1%, liquid paraffin 2.5%, isopropyl myristate 2.5%, net price 200 mL = £3.55  
*Excipients* include cetostearyl alcohol  
**Dose** for dry and pruritic skin conditions including eczema and dermatitis, apply to skin or use as soap substitute  
**Dermol® Wash Emulsion**, benzalkonium chloride 0.1%, chlorhexidine hydrochloride 0.1%, liquid paraffin 2.5%, isopropyl myristate 2.5%, net price 200 mL = £3.55  
*Excipients* include cetostearyl alcohol  
**Dose** for dry and pruritic skin conditions including eczema and dermatitis, apply to skin or use as soap substitute

Emulsiderm® (Dermal)  
**Liquid emulsion**, benzalkonium chloride 0.5%, liquid paraffin 25%, isopropyl myristate 25%, net price 300 mL (with 15-mL measure) = £3.85, 1 litre (with 30-mL measure) = £12.00  
*Excipients* include polysorbate 60  
**Dose** for dry skin conditions including eczema and xeroderma, add 7–30 mL/bath or rub into dry skin until absorbed

Oilatum® Plus (Stiefel)  
**Bath additive**, benzalkonium chloride 6%, triclosan 2%, light liquid paraffin 52.5%, net price 500 mL = £6.98  
*Excipients* include acetylated lanolin alcohols, isopropyl palmitate  
**Dose** for topical treatment of eczema including eczema at risk from infection, add 1–2 capfuls/bath (INFANT over 6 months 1 mL), do not use undiluted
Barrier preparations often contain water-repellent substances such as dimeticone or other silicones. They are used on the skin around stomas, bedsores, and pressure areas in the elderly where the skin is intact. Where the skin has broken down, barrier preparations have a limited role in protecting adjacent skin. Barrier preparations are not a substitute for adequate nursing care.

Nappy rash
The first line of treatment is to ensure that nappies are changed frequently and that tightly fitting water-proof pants are avoided. The rash may clear when left exposed to the air and a barrier preparation, applied with each nappy change, can be helpful. A mild corticosteroid such as hydrocortisone 0.5% or 1% (section 13.4) can be used if inflammation is causing discomfort, but it should be avoided in neonates. The barrier preparation should be applied after the corticosteroid preparation to prevent further skin damage. Preparations containing hydrocortisone should be applied for no more than a week; the hydrocortisone should be discontinued as soon as the inflammation subsides. The occlusive effect of nappies and waterproof pants may increase absorption of corticosteroids (for cautions, see section 13.4). If the rash is associated with candidial infection, a topical antifungal such as clotrimazole cream (section 13.10.2) can be used. Topical antibacterial preparations (section 13.10.1) can be used if bacterial infection is present; treatment with an oral antibacterial may occasionally be required in severe or recurrent infection. Hydrocortisone may be used in combination with antimicrobial preparations if there is considerable inflammation, erosion, and infection.

Non-proprietary barrier preparations

Zerolatum® Plus (Thornton & Ross)

Flammable

Section 13.5.2

Medicaid® (LPC)
Cream, cetrizime 0.5% in a basis containing light liquid paraffin, white soft paraffin, cetostearyl alcohol, glyceryl monostearate, net price 50 g £1.69

Excipients include cetostearyl alcohol, fragrance, hydroxybenzoates (parabens), wool fat
For nappy rash, minor burns, and abrasions

Metanium® (Thornton & Ross)
Ointment, titanium dioxide 20%, titanium peroxide 5%, titanium salicylate 3% in a basis containing dimeticone, light liquid paraffin, white soft paraffin, and benzoin tincture, net price 30 g £2.24

Excipients none as listed in section 13.1.3
For nappy rash

Morhulin® (Actavis)
Ointment, cod-liver oil 11.4%, zinc oxide 38%, in a basis containing liquid paraffin and yellow soft paraffin, net price 50 g £1.91

Excipients include wool fat derivative
For minor wounds, varicose ulcers, pressure sores, eczema, and nappy rash

Siopel® (Demna UK)
Barrier cream, dimeticone ‘1000’ 10%, cetrizime 0.3%, arachis (peanut) oil, net price 50 g £2.15

Excipients include butylated hydroxytoluene, cetostearyl alcohol, hydroxybenzoates (parabens)
For protection against water-soluble irritants

Sprilon® (Ayrton Saunders)
Spray application, dimeticone 1.04%, zinc oxide 12.5%, in a basis containing wool alcohols, cetostearyl alcohol, dextran, white soft paraffin, liquid paraffin, propellant, net price 115-g pressurised aerosol unit £8.90

Excipients include cetostearyl alcohol, hydroxybenzoates (parabens), wool fat
For urinary rash, pressure sores, leg ulcers, moist eczema, fissures, fistulae and ileostomy care

Sudocrem® (Forest)
Cream, benzyl alcohol 0.39%, benzyl benzoate 1.01%, benzyl cinnamate 0.15%, hydrous wool fat (hydrophilic lanolin), 4%, zinc oxide 15.25%, net price 60 g £1.45, 125 g £2.15, 250 g £3.87, 400 g £5.25

Excipients include beeswax (synthetic), propylene glycol, butylated hydroxyanisole, fragrance
For nappy rash and pressure sores

13.3 Topical local anaesthetics and antipruritics

Pruritus may be caused by systemic disease (such as obstructive jaundice, endocrine disease, chronic renal disease, iron deficiency, and certain malignant diseases), skin disease (e.g. psoriasis, eczema, urticaria, and scabies), drug hypersensitivity, or as a side-effect of opioid analgesics. Where possible, the underlying causes should be treated. An emollient (section 13.2.1) may be of value where the pruritus is associated with dry skin. Pruritus that occurs in otherwise healthy elderly people can also be treated with an emollient. Levomenthol cream can be used to relieve pruritus; it exerts a cooling effect on the skin. For advice on the treatment of pruritus in palliative care, see p. 23.

Preparations containing crotamiton are sometimes used but are of uncertain value. Preparations containing calamine are often ineffective. 
A topical preparation containing **doxepin** 5% is licensed for the relief of pruritus in eczema; it can cause drowsiness and there may be a risk of sensitisation.

Pruritus is common in biliary obstruction, especially in primary biliary cirrhosis and drug-induced cholestasis. Oral administration of **colestyramine** is the treatment of choice (section 1.9.2).

Topical antihistamines and local anaesthetics are only marginally effective and occasionally cause sensitisation. For **insect stings** and **insect bites**, a short course of a topical corticosteroid is appropriate. Short-term treatment with a **sedating antihistamine** (section 3.4.1) may help in insect stings and in intractable pruritus where sedation is desirable. Calamine preparations are of little value for the treatment of insect stings or bites.

For preparations used in **pruritus ani**, see section 1.7.1.

### CALAMINE

**Indications**
- pruritus

**Contra-indications**
- avoid application prior to x-ray (zinc oxide may affect outcome of x-ray)

**Calamine** (Non-proprietary)
- **Aqueous cream**, calamine 4%, zinc oxide 3%, liquid paraffin 20%, self-emulsifying glycerol monostearate 5%, cetomacrogol emulsifying wax 5%, phenoxethanol 0.5%, freshly boiled and cooled purified water 62.5%, net price 100 mL = £1.23
- **Lotion** (=cutaneous suspension), calamine 15%, zinc oxide 5%, glycerol 5%, bentonite 3%, sodium citrate 0.5%, liquefied phenol 0.5%, in freshly boiled and cooled purified water, net price 200 mL = 88p
- **Oily lotion** (BP 1980), calamine 5%, arachis (peanut) oil 50%, oleic acid 0.5%, wool fat 1%, in calcium hydroxide solution, net price 200 mL = £1.57

### CROTAMITON

**Indications**
- pruritus (including pruritus after scabies—section 13.10.4); see notes above

**Cautions**
- avoid use near eyes, in buccal mucosa, or on broken or very inflamed skin; use on doctor’s advice for children under 3 years

**Contra-indications**
- acute exudative dermatoses

**Pregnancy**
- manufacturer advises avoid, especially during the first trimester—no information available

**Breast-feeding**
- no information available; avoid application to nipple area

**Dose**
- Pruritus, apply 2–3 times daily; **CHILD** under 3 years, apply once daily

**Eurax** ® (Novartis Consumer Health)
- **Cream**, crotamiton 10%, net price 30 g = £2.38, 100 g = £4.15
- **Excipients**
  - beeswax, fragrance, hydroxybenzoates (parabens), stearyl alcohol
- **Lotion**, crotamiton 10%, net price 100 mL = £3.14
- **Excipients**
  - cetyl alcohol, fragrance, propylene glycol, sorbic acid, stearyl alcohol

### DOXEPIN HYDROCHLORIDE

**Indications**
- pruritus in eczema; depressive illness (section 4.3.1)

**Cautions**
- susceptibility to angle-closure glaucoma; urinary retention; mania; cardiac arrhythmias; severe heart disease; avoid application to large areas; **interactions**: Appendix 1 (antidepressants, tricyclic)

**Driving**
- Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Hepatic impairment**
- manufacturer advises caution in severe liver disease

**Pregnancy**
- manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding**
- manufacturer advises use only if potential benefit outweighs risk

**Side-effects**
- drowsiness; local burning, stinging, irritation, tingling and rash; systemic side-effects such as antimuscarinic effects, headache, fever, dizziness, gastro-intestinal disturbances also reported

**Dose**
- **ADULT** and **CHILD** over 12 years, apply thinly 3–4 times daily; usual max. 3 g per application; usual total max. 12 g daily; coverage should be less than 10% of body surface area

**Xepin** ® (CHS) ®
- **Cream**, doxepin hydrochloride 5%, net price 30 g = £11.70. Label: 2, 10, patient information leaflet
- **Excipients**
  - benzyl alcohol

### LEVOMENTHOL

**Indications**
- pruritus

**Levomenthol Cream, BP** (Menthol in Aqueous Cream)
- **Cream**, levomenthol 0.5 %, net price 500 g = £16.07; 1% 100 g = £3.97, 500 g = £16.59; 2% 50 g = £1.53, 100 g = £3.67, 450 g = £17.99, 500 g = £16.97
- **Dose**
  - apply 1–2 times daily

### TOPICAL LOCAL ANAESTHETICS

**Indications**
- relief of local pain, see notes above. See section 15.2 for use in surface anaesthesia

**Cautions**
- occasionally cause hypersensitivity

**Note**
- Topical local anaesthetic preparations may be absorbed, especially through mucosal surfaces, therefore excessive application should be avoided and they should preferably not be used for more than about 3 days; not generally suitable for young children

### TOPICAL ANTIHISTAMINES

**Indications**
- see notes above

**Cautions**
- may cause hypersensitivity; avoid in eczema; photosensitivity (diphenhydramine); not recommended for longer than 3 days

### 13.4 Topical corticosteroids

Topical corticosteroids are used for the treatment of inflammatory conditions of the skin (other than those arising from an infection), in particular eczema (section 13.5.1), contact dermatitis, insect stings (p. 43), and eczema of scabies (section 13.10.4). Corticosteroids suppress the inflammatory reaction during use; they are not curative and on discontinuation a rebound exacerbation of the condition may occur. They are generally used to relieve symptoms and suppress signs of the disorder when other measures such as emollients are ineffective.

Topical corticosteroids are not recommended in the routine treatment of urticaria; treatment should only
be initiated and supervised by a specialist. Topical corticosteroids are contra-indicated in rosacea. They may worsen ulcerated or secondarily infected lesions. They should not be used indiscriminately in pruritus (where they will only benefit if inflammation is causing the itch) and are not recommended for acne vulgaris.

Systemic or very potent topical corticosteroids should be avoided or given only under specialist supervision in psoriasis because, although they may suppress the psoriasis in the short term, relapse or vigorous rebound occurs on withdrawal (sometimes precipitating severe pustular psoriasis). For the role of topical corticosteroids in the treatment of psoriasis, see section 13.5.2.

In general, the most potent topical corticosteroids should be reserved for recalcitrant dermatoses such as chronic discoid lupus erythematosus, lichen simplex chronicus, hypertrophic lichen planus, and palmoplantar pustulosis. Potent corticosteroids should generally be avoided on the face and skin flexures, but specialists occasionally prescribe them for use on these areas in certain circumstances.

When topical treatment has failed, intralesional corticosteroid injections (section 10.1.2.2) may be used. These are more effective than the very potent topical corticosteroid preparations and should be reserved for severe cases where there are localised lesions such as keloid scars, hypertrophic lichen planus, or localised alopecia areata.

Perioral lesions Hydrocortisone cream 1% can be used for up to 7 days to treat uninfected inflammatory lesions on the lips. Hydrocortisone and miconazole cream or ointment is useful where infection by susceptible organisms and inflammation co-exist, particularly for initial treatment (up to 7 days) e.g. in angular cheilitis (see also p. 175). Organisms susceptible to miconazole include Candida spp. and many Gram-positive bacteria including streptococci and staphylococci.

Children Children, especially infants, are particularly susceptible to side-effects. However, concern about the safety of topical corticosteroids in children should not result in the child being undertreated. The aim is to control the condition as well as possible; inadequate treatment will perpetuate the condition. A mild corticosteroid such as hydrocortisone 0.5% or 1% is useful for treating nappy rash (section 13.2.2) and hydrocortisone 1% for atopic eczema in childhood (section 13.5.1). A moderately potent or potent corticosteroid may be appropriate for severe atopic eczema on the limbs, for 1–2 weeks only, switching to a less potent preparation as the condition improves. In an acute flare-up of atopic eczema, it may be appropriate to use more potent formulations of topical corticosteroids for a short period to regain control of the condition. A very potent corticosteroid should be initiated under the supervision of a specialist. Continuous daily application of a mild corticosteroid such as hydrocortisone 1% is equivalent to a potent corticosteroid such as betamethasone 0.1% applied intermittently. Carers of young children should be advised that treatment should not necessarily be reserved to ‘treat only the worst areas’ and they may need to be advised that patient information leaflets may contain inappropriate advice for the patient’s condition.

Choice of formulation Water-miscible corticosteroid creams are suitable for moist or weeping lesions whereas ointments are generally chosen for dry, lichenified or scaly lesions or where a more occlusive effect is required. Lotions may be useful when minimal application to a large or hair-bearing area is required or for the treatment of exudative lesions. Occlusive polythene or hydrocolloid dressings increase absorption, but also increase the risk of side-effects; they are therefore used only under supervision on a short-term basis for areas of very thick skin (such as the palms and soles). The inclusion of urea or salicylic acid also increases the penetration of the corticosteroid.

In the BNF topical corticosteroids for the skin are categorised as ‘mild’, ‘moderately potent’, ‘potent’ or ‘very potent’ (see p. 789); the least potent preparation which is effective should be chosen but dilution should be avoided whenever possible.

Cautions Avoid prolonged use of a topical corticosteroid on the face (and keep away from eyes). In children avoid prolonged use and use potent or very potent corticosteroids under specialist supervision; extreme caution is required in dermatoses of infancy including nappy rash—treatment should be limited to 5–7 days.

Psoriasis The use of potent or very potent corticosteroids in psoriasis can result in rebound relapse, development of generalised pustular psoriasis, and local and systemic toxicity.

Contra-indications Topical corticosteroids are contra-indicated in untreated bacterial, fungal, or viral skin lesions, in acne, in rosacea, and in perioral dermatitis; potent corticosteroids are contra-indicated in widespread plaque psoriasis (see notes above).

Side-effects Mild and moderately potent topical corticosteroids are associated with few side-effects but care is required in the use of potent and very potent corticosteroids. Absorption through the skin can rarely cause adrenal suppression and even Cushing’s syndrome (section 6.3.2), depending on the area of the body being treated and the duration of treatment. Absorption is greatest where the skin is thin or raw, and from intertriginous areas; it is increased by occlusion. Local side-effects include:

- spread and worsening of untreated infection;
- thinning of the skin which may be restored over a period after stopping treatment but the original structure may never return;
- irreversible striae atrophicae and telangiectasia;
- contact dermatitis;
- perioral dermatitis;
- acne, or worsening of acne or rosacea;
- mild depigmentation which may be reversible;
- hypertrichosis also reported.

In order to minimise the side-effects of a topical corticosteroid, it is important to apply it thinly to affected areas only, no more frequently than twice daily, and to use the least potent formulation which is fully effective.

Application Topical corticosteroid preparations should be applied no more frequently than twice daily; once daily is often sufficient.

Topical corticosteroids should be spread thinly on the skin but in sufficient quantity to cover the affected areas. The length of cream or ointment expelled from a tube may be used to specify the quantity to be applied to a
given area of skin. This length can be measured in terms of a fingertip unit (the distance from the tip of the adult finger to the first crease). One fingertip unit (approximately 500 mg from a tube with a standard 5-mm diameter nozzle) is sufficient to cover an area that is twice that of the flat adult handprint (palm and fingers).

Suitable quantities of corticosteroid preparations to be prescribed for specific areas of the body

<table>

</tbody>
</table>

These amounts are usually suitable for an adult for a single daily application for 2 weeks

If a patient is using topical corticosteroids of different potencies, the patient should be told when to use each corticosteroid. The potency of each topical corticosteroid (see Topical Corticosteroid Preparation Potencies, below) should be included on the label with the directions for use. The label should be attached to the container (for example, the tube) rather than the outer packaging.

Mixing topical preparations on the skin should be avoided where possible; several minutes should elapse between application of different preparations.

Compound preparations The advantages of including other substances (such as antibacterials or antifungals) with corticosteroids in topical preparations are uncertain, but such combinations may have a place where inflammatory skin conditions are associated with bacterial or fungal infection, such as infected eczema. In these cases the antimicrobial drug should be chosen according to the sensitivity of the infecting organism and used regularly for a short period (typically twice daily for 1 week). Longer use increases the likelihood of resistance and of sensitisation.

The keratolytic effect of salicylic acid facilitates the absorption of topical corticosteroids; however, excessive and prolonged use of topical preparations containing salicylic acid may cause salicylism.

Topical corticosteroid preparation potencies

Potency of a topical corticosteroid preparation is a result of the formulation as well as the corticosteroid. Therefore, proprietary names are shown below.

Mild

- Hydrocortisone 0.1–2.5%, Dioderm, Mildison, Synalar 1 in 10 dilution
- Mild with antimicrobials: Canesten HC, Daktacort, Econacort, Fucidin H, Nystafom-HC, Terra-Cortril, Timodine

Moderate

- Betnovate-RD, Eumovate, Haelan, Modrasone, Synalar 1 in 4 Dilution, Ultralanum Plain

- Moderate with antimicrobials: Trimovate
- Moderate with urea: Alphaderm, Calmurid HC

Potent

- Beclometasone dipropionate 0.025%, Betamethasone valerate 0.1%, Betacap, Betasil, Betamousse, Betnovate, Cavitane, Diprosone, Ecloen, Hydrocortisone butyrate, Locoid, Locoid Crelo, Metoxyn, Mometasone furoate 0.1%, Neritone, Synalar
- Potent with antimicrobials: Aureocort, Betamethasone and cloquinol, Betamethasone and neomycin, Fucibet, Lotriderm, Synalar C, Synalar N
- Potent with salicylic acid: Diprosalic

Very potent

- Clarelux, Dermovate, Etrivex, Neritone Forte
- Very potent with antimicrobials: Clobetasol with neomycin and nystatin

HYDROCORTISONE

Indications mild inflammatory skin disorders such as eczemas (but for over-the-counter preparations, see below); nappy rash (see also section 13.2.2)

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Dose

- Apply thinly 1–2 times daily

Hydrocortisone (Non-proprietary) Cream, hydrocortisone 0.5%, net price, 15 g = £1.31, 30 g = £2.96; 1%, 15 g = £1.04, 30 g = £2.08, 50 g = £3.47; 2.5%, 15 g = £24.07. Label: 28, counselling, application, see above. Potency: mild

Dental prescribing on NHS Hydrocortisone Cream 1% 15 g may be prescribed

Ointment, hydrocortisone 0.5%, net price 15 g = £3.92, 30 g = £4.90; 1%, 15 g = £1.10, 30 g = £2.20, 50 g = £3.67; 2.5%, 15 g = £23.82. Label: 28, counselling, application, see above. Potency: mild

When hydrocortisone cream or ointment is prescribed and no strength is stated, the 1% strength should be supplied

Over-the-counter hydrocortisone preparations

Skin creams and ointments containing hydrocortisone (alone or with other ingredients) can be sold to the public for the treatment of allergic contact dermatitis, irritant dermatitis, insect bite reactions and mild to moderate eczema, to be applied sparingly over the affected area 1–2 times daily for max. 1 week. Over-the-counter hydrocortisone preparations should not be sold without medical advice for children under 10 years or for pregnant women; they should not be sold for application to the face, anogenital region, broken or infected skin (including cold sores, acne, and athlete’s foot); over-the-counter hydrocortisone preparations containing clotrimazole or miconazole nitrate can be sold to the public for athlete’s foot and candidal intertrigo

Proprietary hydrocortisone preparations

Dioderm® (Dermal) Cream, hydrocortisone 0.1%, net price 30 g = £2.39. Label: 28, counselling, application, see p. 788. Potency: mild

Excipients include cetostearyl alcohol, propylene glycol

Note Although this contains only 0.1% hydrocortisone, the formulation is designed to provide a clinical activity comparable to that of Hydrocortisone Cream 1% BP
### 13.4 Topical corticosteroids

**Mildison® (Astellas) (BN) Lipocream**, hydrocortisone 1%, net price 30 g = £1.71. Label: 28, counselling, application, see p. 788. Potency: mild

**Excipients** include benzyl alcohol, cetostearyl alcohol, hydroxybenzoates (parabens)

### Compound preparations

**Compound preparations** with coal tar, see section 13.5.2

**Alphaderm® (Alliance) (BN)**

**Cream**, hydrocortisone 1%, urea 10%, net price 30 g = £2.38; 100 g = £7.03. Label: 28, counselling, application, see p. 788. Potency: moderate

**Excipients** none as listed in section 13.1.3

**Note** If stinging occurs, manufacturer advises dilute to half-strength with aqueous cream for 1 week then transfer to undiluted preparation (but see section 13.1.1 for advice to avoid dilution where possible)
